Re: Radford Army Ammunition Plant, Va.
Review of Army's Final Site Screening Process Report for
Site Screening Areas 18, 72, 30, 79, 60, and 77

Dear Mr. McKenna and Ms. Holt:

The U.S. Environmental Protection Agency (EPA) and Virginia Department of Environmental Quality (VDEQ) have reviewed the U.S. Army's (Army's) December 2010 Final Site Screening Process Report for Site Screening Areas 18, 72, 30, 79, 60, and 77, located at the Radford Army Ammunition Plant (RFAAP) in Radford, Virginia. Based upon our review, the report is approved, and in accordance with Part II. (E) (5) of RFAAP's Corrective Action Permit, it can now be considered final.

If you have any questions, please call me at 215-814-3413. Thanks.

Sincerely,

William Geiger
RCRA Project Manager
Office of Remediation (3LC20)

Subject: With Certification, Site Screening Process Report for Site Screening Areas 18, 72, 30, 79, 60, and 77, Final December 2010
EPA ID# VA1 210020730

Dear Mr. Geiger and Mr. Cutler:

Enclosed is the certification for the subject document that was sent to you on December 6, 2010. Also enclosed is the 6 December 2010 transmittal email.

Please coordinate with and provide any questions or comments to myself at (540) 639-8658, Jerry Redder ATK staff (540) 639-7536 or Jim McKenna, ACO Staff (540) 731-5782.

Sincerely,

P.W. Holt, Environmental Manager

Subject: RFAAP SSP Report Final Fedex Numbers (UNCLASSIFIED)
Attachments: RTCs USEPA VDEQ March 2010 SSP Comments 10_22_2010.pdf

Importance: High

Classification: UNCLASSIFIED
Caveats: FOUO

All,
Note the contractor will ship the subject document with a copy of this email to the POCs and tracking numbers below. Also attached to this email are the response to comments on the draft report.

Certification letter will follow from Radford AAP under separate cover.

Immediately below are the POCs with tracking numbers.

Thank you in advance for your support of the Radford Army Ammunition Plant Installation Restoration Program.

Jim McKenna
540 731 5782

Following are the fedex numbers for the RFAAP SSP Report Final. I have also attached a pdf of the RTCs.

Response to USEPA/VDEQ Comments (10/22/2010)
***Draft Site Screening Process Report for Site Screening Areas 18, 72, 30, 79, 60, and 77*, dated March 2010 (Comments Received via E-mail 9/22/2010)**

GENERAL COMMENTS

1. Section 3.1, Analytical Results, states that "Historical investigation results and SSP investigation results are summarized in each site-specific section of this report." While the SSP Report does describe the historical investigation results, it does not include a discussion of the individual constituents detected above the applicable screening criteria during the SSP investigation. While a fully developed nature and extent assessment is not a requirement of the SSP Guidance Document, dated October 2001 (SSP Guidance), Section 7.0, Site Screening Process Report, of the SSP Guidance does state that "a nature and extent determination (if available)" will be presented in the SSP Report. A basic discussion of those constituents detected above screening levels at the site as well as a determination of whether the distribution of contaminants across the site are suggestive of a release would be a useful addition to the SSP Report in support of the conceptual site model, and human health and ecological risk screening evaluations. Please revise the SSP Report to include a discussion of those constituents detected above applicable screening levels at each of the sites, and discuss the distribution of these constituents as they relate to potential source areas.

   Response: A summary of chemicals detected above screening levels is provided in each site specific section in the human health risk screening section. The human health risk screenings resulted in residential and industrial site-related risks/hazards below the SSP thresholds for SSAs 18, 30, 60, and 79; therefore, further analysis of chemical distribution at the sites is not necessary.

   Note that for SSAs 30 and 79, although the screening resulted in risk/hazards below the SSP thresholds, due to the presence of bagged asbestos material at the site, institutional controls (ICs) are recommended at the sites (SSAs 30 and 79 – Asbestos Disposal Trench No. 1 and No. 2). The objective of the ICs is to maintain the sites in their current industrial/commercial state as a closed solid waste management unit and to prevent any future residential use. The areas containing the bagged asbestos material were defined via the geophysics investigation.

   For SSA 72 although cumulative risk and hazard screenings for residential scenarios were above the SSP thresholds, the screenings for the industrial scenarios were below the SSP thresholds. For SSA 77 although cumulative risk and hazard screenings for residential scenarios were above the SSP thresholds, the screenings for the industrial scenarios when considering background were below the SSP threshold. Since the sites' screenings for industrial scenarios were below SSP thresholds and the recommendation for the sites are institutional controls to

maintain the sites in their current industrial/commercial state and prevent any future residential use, further analysis of chemical distribution is not necessary.

2. For the human health risk evaluations, soil data are separated into surface soil and total soil, presumably for different exposure scenarios; however, the SSP Report does not define these soil intervals (i.e., surface soil is 0-2 feet below ground surface [bgs], total soil is 0-10 feet bgs, etc.) Please define the depths of the samples incorporated into the surface soil and total soil evaluations.

   Response: The following text will be added to Section 3.2.1: "COPCs were identified for a site by comparing the maximum detected concentration (MDC) for a detected chemical in surface soil and total soil to USEPA residential regional screening levels (R-RSLs) and industrial regional screening levels (I-RSLs) for soil and tap water regional screening levels (T-RSLs) for groundwater, if available. The two soil data groupings used for COPC screening and the cumulative risk screening (see Section 3.2.2) are surface soil (0 to 1 ft bgs) and total soil (0 ft bgs to termination depth). The total soil data grouping consists of combining surface and subsurface soil to address mixing of potential constituents in soil during construction or land development activities."

3. The SSP Report presents a summary table for each site that includes the Cumulative Human Health Risk Screening Results for Soil. An example of such a table is presented in Section 4.6.2, Cumulative Risk Screen. A column is included for risk drivers, but the SSP Report has not defined the risk drivers (i.e., constituents associated with risk greater than 1E-06 or hazard index greater than 1). Additionally, the tables should define individual chemicals as specific risk drivers, and not just "metals" as is shown in the table in Section 4.6.2. Please revise the SSP Report to clearly define what constitutes a risk driver for purposes of the summary tables, and identify individual constituents as risk drivers, rather than classes of constituents in these tables.

   Response: The following text will be added to the site specific cumulative risk section (example provided for Section 4.6.2): "The hazard drivers identified in the table above are those chemicals that primarily contribute to HIs greater than the established SSP hazard level of 1."

   The tables in each site specific cumulative risk section will be revised to include a list of the metals risk/hazard drivers.

SPECIFIC COMMENTS

4. **Section 4.2.2, Acid Sewer Survey, Page 4-4**: This section indicates that an Acid Sewer Survey and Investigation was conducted on the entire RFAAP acid sewer infrastructure between 1998 and 2000 to determine the condition of the sewers. Deteriorated or broken sections were repaired or replaced within active areas; however, no actions were taken in the area of SSA 18 since the site was inactive.

In the response to Specific Comment 4 on the *Final Work Plan Addendum 028 for Site Screening Areas 18, 72, 30, 79, 60, and 77*, dated June 2009 (WPA 028), it was noted that "an assessment of the 260 ft long 6-inch diameter plastic, gravity acid sewer line that extends from the acidic wastewater sump (SSA 72) to the SAR wastewater treatment plant was not conducted." Please revise Section 4.2.2 to note that the section of the sewer line associated with SSA 18 and 72 was not originally investigated as part of the Acid Sewer Survey discussed in Section 4.2.2. This comment also applies to Section 5.2.2, as part of the discussion of SSA 72. It is acknowledged, however, that an attempt to investigate this section of the sewer line was conducted as part of the SSP, as described in Section 5.4, SSP Field Activities.

Response: The following text will be added to Sections 4.2.2 and 5.2.2: "An assessment of the 260 ft long 6-inch diameter plastic, gravity acid sewer line that extends from the acidic wastewater sump (SSA 72) to the SAR wastewater treatment plant (SSA 18) was not conducted as part of the acid sewer survey."

5. **Section 4.6, Human Health Risk Screening, Page 4-7:** The SSP Report does not state which data were used in the human health risk screening (i.e., historical and SSP data, or SSP data only). It would appear that all data (historical and SSP data) should be included in the risk evaluations since the data were collected at different locations, and no removal actions were conducted at this site that could have removed soil associated with the sample locations. Please revise the SSP Report to clearly identify the data points that were used in the risk evaluation, and assure that all data representative of current conditions are included in the risk evaluation.

   Response: Historical data for the SSA 18 area are limited to two soil samples collected from soil boring SB08 (at the location of monitoring well MW-4) and 2007 groundwater samples from monitoring wells MW-3 and MW-4 at locations potentially downgradient of SSA 18. These soil and groundwater data will be incorporated into the COPC selection and risk screening process for potential release evaluations for this SSA. Section 4.6 will be revised to identify the historical samples and SSP samples used in the risk evaluation.

6. **Section 4.6.1, Identification of COPCs, Page 4-7:** It is unclear why the existing groundwater data from 2007 were not carried through to the contaminant of potential concern (COPC) selection process as part of the human health risk screening for SSA 18 as well as SSA 72. Section 4.6.1 states, "As presented in WPA 028, potential releases to groundwater were assessed by evaluating subsurface soil data and comparison of these data to USEPA risk-based soil-to-groundwater SSLs included in the Regional Screening Table." While a comparison to SSLs is one component of the evaluation, WPA 028 also states, in Section 2.4.3, Release Assessment to Groundwater, "Potential releases to groundwater will be evaluated using existing groundwater data collected in the site area in 2007." Based on a cursory review of the groundwater data, presented

in Table 4-3, chloroform and perchlorate were detected above the tapwater Regional Screening Levels (RSL) in wells MW-3 and/or MW-4, both locations of which the SSP Report acknowledges could be used to evaluate potential releases from SSA 18 (Section 4.2.3), and possibly SSA 72. Please revise the SSP Report to include the 2007 groundwater data in the COPC selection process for these two sites, and include any COPCs in the risk/hazard estimates and cumulative risk screening.

Response: Section 4.0 of the SSP Report for SSA 18 will be revised to include the 2007 groundwater data from MW-3 and MW-4 in the COPC selection and cumulative risk screening process for potential release evaluations for this SSA. Section 5.0 of the SSP Report for SSA 72 will be revised to include the 2007 groundwater data from monitoring well MW-3 in the COPC selection and cumulative risk screening process for potential releases evaluation for this SSA. Data from monitoring well MW-4 will not be included in the analysis for SSA 72 because of its probable crossgradient location relative to this SSA.

As presented on Table 4-3, chemicals detected at concentrations above screening levels for MW-3 and MW-4 include perchlorate and chloroform. Therefore, perchlorate and chloroform are COPCs for groundwater subject to cumulative risk screening. The results of the cumulative risk screening for COPCs identified in groundwater at SSA 18 is provided in attached Table 4-9. The screening resulted in an HI of 0.1 for perchlorate which is below the SSP threshold (1) and a risk of 9E-05 for chloroform which is above the SSP threshold (1E-05). The detected chloroform concentration (18 ug/L) is above the tap water RSL but below the MCL for THMs. Chloroform was also detected in upgradient wells.

With regard to groundwater detections of chloroform at the site, it is important to note that studies and groundwater investigations have shown the presence of chloroform in most groundwater samples collected at the facility regardless of location. The concentrations of chloroform detected in monitoring wells at the site are concentrations below the range of chloroform levels present in the water transmitted through water lines at the facility. The site is located downgradient of developed areas containing water lines that could be leaking, which may have been the source of chloroform. No additional assessment of chloroform at the site is required.

This information will be incorporated into the final report.

7. **Section 5.1.3, Surface Water, Page 5-1**: This section indicates that water is still present in the sump at SSA 72. A water sample collected from this sump in 2007 identified Alpha-BHC, heptachlor, and nine metals above their tapwater RSLs (Section 5.2.4, Oleum Plant Environmental Baseline Study – Ecology and Environment, Inc. 2007). Although it does not appear that the water from the sump has been released to the environment at potentially unacceptable levels, it is recommended that the water in this sump be properly disposed in an effort to

avoid potential future releases should the sump structure be compromised. Please revise the SSP Report to address this concern.

Response: The limited water present in the sump is likely an accumulation of rainwater due to the grated opening atop the sump. During the dry season when rainfall accumulations are minimal, the sump does not contain water; therefore, removal of periodic accumulation of water from the sump is not proposed. This information will be added to Section 5.1.3.

8. **Section 5.6, Human Health Risk Screening, Pages 5-5 through 5-7**: The cumulative risk screening for surface soil at SSA 72 is based on a single surface soil sample, B-3 Surface/72SB1A. Table 5-3, Summary of Detected Chemicals in Soil Analytical Samples, shows that several metals and polynuclear aromatic hydrocarbons (PAHs) were detected above residential and/or industrial RSLs in this sample. Using only a single surface soil sample to assess risk introduces considerable uncertainty into the risk assessment. Please revise the SSP to discuss the uncertainties associated with assessing risk with a single sample, and address whether additional assessment of surface soil in the area will be necessary to better define the extent of the contamination.

   Response: Metals in sample B-3 Surface/72SB1A detected above RSLs (aluminum, arsenic, cobalt, iron, manganese, thallium, and vanadium) are well within background ranges and are below facility wide background point estimates; therefore, these metals are not considered a concern at the site.

   The following text will be added to Section 5.6.6: "Although uncertainties in assessing risk increase when using a single surface soil sample potentially underestimates risk, the use the maximum detected concentrations for the overall risk screenings potentially overestimates risk. Based on the small size of the site (0.1 acre), the lack of potential surface soil releases due to the nature of previous activities at the SSA (acid conveyance via subsurface sump and subsurface sewer line), the low level of detections of PAHs in the sample, the industrial screening resulting in risks/hazards below SSP thresholds, no additional assessment of surface soil in the area is proposed."

9. **Table 5-3, Summary of Detected Chemicals in Soil Analytical Samples:** A note included with this table indicates that chemical concentrations that exceed the soil to groundwater risk-based soil screening level (SSL) based on a dilution attenuation factor (DAF) of 20 will be shown in bold italic text. However, this approach was not consistently applied. Nitrobenzene concentrations in samples 72SB2B and 72SB3B exceed the SSL, but the detected concentrations have not been shown in bold italics. Please revise Table 5-3 to identify all constituents that exceed applicable screening criteria, including the SSL, and assure that all tables in the SSP Report do the same.

Response: Table 5-3 will be revised and all tables will be reviewed and revised as necessary.

10. **Section 6.6.1, Identification of COPCs, Page 6-5:** Dibenzofuran was identified as a site COPC since no screening value was available for this constituent at the time of report preparation. Also, risk associated with this constituent was not incorporated into the cumulative risk screening since a RSL was not available. However, beginning in December 2009, RSLs were established for dibenzofuran. Please revise the SSP Report to incorporate updated RSLs for dibenzofuran into the COPC selection process. Based on the concentration of the detection (0.043 milligrams per kilogram [mg/kg] in sample 79SS5) and the current May 2010 residential RSL for dibenzofuran (78 mg/kg), dibenzofuran does not appear to be a concern at the site.

    Response: Per previous agreements, if an updated value changes significantly so that it would impact the conclusion for the site, an analysis of the effects of this change will be conducted. A discussion of the use of the April 2009 RSLs versus the December 2009 RSLs will be added to Section 3.2.7.2 as follows: "The use of the April 2009 Regional Screening Levels rather than the December 2009 Regional Screening Levels for the SSP human health risk screening could result in the inclusion or exclusion of chemicals based on outdated toxicity data. Therefore to lessen the uncertainty associated with the use of these screening levels, an assessment of the data was conducted with respect to the December 2009 Regional Screening Levels which did not result in the identification of any additional COPCs for the sites.

11. **Section 6.8, Conclusions and Recommendations, Page 6-14:** This section indicates that institutional controls are being implemented at SSA 30 and SSA 79, the asbestos disposal trenches. The institutional controls will provide "for advance notice, assessment, and approval of intrusive work that may occur within the plant with a general digging prohibition at sites such as this." However, the recommendations for the disposal trenches do not include maintenance of the sites. Since bagged asbestos containing material is known to be buried in the site trenches, the soil cover at these sites should be properly maintained to prevent erosion and potential exposure of the bags. Please revise the SSP to incorporate maintenance of the soil cover at SSAs 30 and 79 into the recommendations for the sites.

    Response: The following text will be added to Section 6.8: "In addition since bagged asbestos containing material is known to be buried in the site trenches, the soil cover at these sites will be maintained to prevent erosion and potential exposure of the bags."

12. **Section 7.4, SSP Field Activities, Page 7-4:** Two test pits were completed at the site, but the SSP Report does not describe the materials that were found in these test pits. The SSP Report should describe the materials found in the test pits to

confirm the historical use of the site as a demolition waste pile. Revise the SSP Report to discuss findings from the test pit activities. Additionally, please provide test pit logs for both of the test pits and clarify if the log provided for Borehole 60TP-1 in Appendix D.2.1 is a part of one of the test pits.

Response: The following text will be added to Section 7.4: "During excavation of the test pits, the material encountered included fill, gravel areas, rocks, and concrete building debris."

The test pit log for 60TP-2 will be provided in Appendix D.2.1. The log for Borehole 60TP-1 will be revised to indicate Test Pit/Borehole.

13. **Section 8.6.2, Cumulative Risk Screening, Pages 8-6 and 8-7:** 2,3,7,8-TCDD Equivalents (TEQ) (dioxins) were identified as risk drivers in both surface soil and total soil. However, it does not appear that dioxins were adequately evaluated at this site since only two surface soil samples were analyzed for these constituents, both of which reported residential and/or industrial RSL exceedances. No subsurface soil samples were analyzed for dioxins to assess the vertical extent of contamination. Additionally, the two surface soil samples analyzed for dioxins (77SB2 and 77SB3) were located immediately north of the incinerator building; surface soil in other areas of the site was not evaluated although deposition of particulate matter from the chimney is a potential release mechanism at the site. Please revise the SSP Report to address the apparent data gaps with respect to sampling for dioxins in subsurface soil and surface soil, or present additional justification for not assessing the extent of this contamination.

Response: Dioxin sampling focused on surface soil at the locations where the potential for releases were highest based on the identified release mechanisms and location of the chimney (surface spills of materials removed from the chimney cleanout and deposition of particulates from the chimney). Dioxin detections did not result in an industrial cumulative risk screening equal to or above SSP 1E-05 threshold for further assessment when considering metals background. Additional sampling for dioxins is not proposed at SSA 77 given the risk screening results, collection of samples at the likely locations and depth of highest concentrations, and the limited area around SSA 77 not covered by asphalt pavement or buildings (grass covered areas are limited to approximately 0.1 acres on a steep hillside).

Note that cumulative risk and hazard screenings for industrial scenarios are below the SSP thresholds when considering background and the recommendation for the site is institutional controls to maintain the site in its current industrial/commercial state and prevent any future residential use.

14. **Section 8.8, Conclusions and Recommendation, Page 8-12:** The first bulleted item states, "Cumulative risk and hazard screening results for industrial scenarios are below SSP thresholds for target risk and hazards." This is inconsistent with the information presented in Section 8.6.2, Cumulative Risk Screen, where it is

noted that "cumulative risk screenings were equal to the established SSP risk level of 1E-05 for the industrial scenario for surface and total soil." When excluding risk drivers below background (arsenic), site related risk falls below the established thresholds; however, this should be noted in the first bulleted item on Page 8-12. Please revise the first bulleted item in Section 8.8 to state that the risk screening results for the industrial scenario are below SSP thresholds, when excluding risk drivers below background.

Response: The first bullet of Section 8.8 will be revised as follows: "When excluding risk drivers below background (arsenic), the site related cumulative risk and hazard screening results for industrial scenarios are below SSP thresholds for target risk and hazards."

15. **Appendix D.2.1, Site Screening Process Boring Logs**: Several of the boring logs do not specify the recovery (in feet) or the results of the photoionization detector (PID) screening. These incomplete boring logs include the logs for boreholes 18SB1, 18SB2, 18SB5, 30SB1, 30SB2, 30SB3, 77SB2, 77SB3, and 77SB5. Additionally, the log for borehole 77SB3 does not include a material description. Please revise the SSP to provide complete information on recovery, PID screening, and material descriptions for the borings completed during the SSP.

Response: The SSP Report will be revised to include the additional requested information on the above referenced boring logs.

Jim, EPA/VDEQ approve the responses to these comments. The text to be added for comment #8 is a little unclear. While we understood what you were getting at, you may want to clean that up a little.

Also, I'll be out of the office Dec. 14 and 15. We can probably skip the permit call that week, or maybe reschedule it for Mon or Thurs.

Response to USEPA/VDEQ Comments (10/22/2010)
***Draft Site Screening Process Report for Site Screening Areas 18, 72, 30, 79, 60, and 77,* dated March 2010 (Comments Received via E-mail 9/22/2010)**

GENERAL COMMENTS

1. Section 3.1, Analytical Results, states that "Historical investigation results and SSP investigation results are summarized in each site-specific section of this report." While the SSP Report does describe the historical investigation results, it does not include a discussion of the individual constituents detected above the applicable screening criteria during the SSP investigation. While a fully developed nature and extent assessment is not a requirement of the SSP Guidance Document, dated October 2001 (SSP Guidance), Section 7.0, Site Screening Process Report, of the SSP Guidance does state that "a nature and extent determination (if available)" will be presented in the SSP Report. A basic discussion of those constituents detected above screening levels at the site as well as a determination of whether the distribution of contaminants across the site are suggestive of a release would be a useful addition to the SSP Report in support of the conceptual site model, and human health and ecological risk screening evaluations. Please revise the SSP Report to include a discussion of those constituents detected above applicable screening levels at each of the sites, and discuss the distribution of these constituents as they relate to potential source areas.

   Response: A summary of chemicals detected above screening levels is provided in each site specific section in the human health risk screening section. The human health risk screenings resulted in residential and industrial site-related risks/hazards below the SSP thresholds for SSAs 18, 30, 60, and 79; therefore, further analysis of chemical distribution at the sites is not necessary.

   Note that for SSAs 30 and 79, although the screening resulted in risk/hazards below the SSP thresholds, due to the presence of bagged asbestos material at the site, institutional controls (ICs) are recommended at the sites (SSAs 30 and 79 – Asbestos Disposal Trench No. 1 and No. 2). The objective of the ICs is to maintain the sites in their current industrial/commercial state as a closed solid waste management unit and to prevent any future residential use. The areas containing the bagged asbestos material were defined via the geophysics investigation.

   For SSA 72 although cumulative risk and hazard screenings for residential scenarios were above the SSP thresholds, the screenings for the industrial scenarios were below the SSP thresholds. For SSA 77 although cumulative risk and hazard screenings for residential scenarios were above the SSP thresholds, the screenings for the industrial scenarios when considering background were below the SSP threshold. Since the sites' screenings for industrial scenarios were below SSP thresholds and the recommendation for the sites are institutional controls to

maintain the sites in their current industrial/commercial state and prevent any future residential use, further analysis of chemical distribution is not necessary.

2. For the human health risk evaluations, soil data are separated into surface soil and total soil, presumably for different exposure scenarios; however, the SSP Report does not define these soil intervals (i.e., surface soil is 0-2 feet below ground surface [bgs], total soil is 0-10 feet bgs, etc.) Please define the depths of the samples incorporated into the surface soil and total soil evaluations.

   Response: The following text will be added to Section 3.2.1: "COPCs were identified for a site by comparing the maximum detected concentration (MDC) for a detected chemical in surface soil and total soil to USEPA residential regional screening levels (R-RSLs) and industrial regional screening levels (I-RSLs) for soil and tap water regional screening levels (T-RSLs) for groundwater, if available. The two soil data groupings used for COPC screening and the cumulative risk screening (see Section 3.2.2) are surface soil (0 to 1 ft bgs) and total soil (0 ft bgs to termination depth). The total soil data grouping consists of combining surface and subsurface soil to address mixing of potential constituents in soil during construction or land development activities."

3. The SSP Report presents a summary table for each site that includes the Cumulative Human Health Risk Screening Results for Soil. An example of such a table is presented in Section 4.6.2, Cumulative Risk Screen. A column is included for risk drivers, but the SSP Report has not defined the risk drivers (i.e., constituents associated with risk greater than 1E-06 or hazard index greater than 1). Additionally, the tables should define individual chemicals as specific risk drivers, and not just "metals" as is shown in the table in Section 4.6.2. Please revise the SSP Report to clearly define what constitutes a risk driver for purposes of the summary tables, and identify individual constituents as risk drivers, rather than classes of constituents in these tables.

   Response: The following text will be added to the site specific cumulative risk section (example provided for Section 4.6.2): "The hazard drivers identified in the table above are those chemicals that primarily contribute to HIs greater than the established SSP hazard level of 1."

   The tables in each site specific cumulative risk section will be revised to include a list of the metals risk/hazard drivers.

SPECIFIC COMMENTS

4. **Section 4.2.2, Acid Sewer Survey, Page 4-4**: This section indicates that an Acid Sewer Survey and Investigation was conducted on the entire RFAAP acid sewer infrastructure between 1998 and 2000 to determine the condition of the sewers. Deteriorated or broken sections were repaired or replaced within active areas; however, no actions were taken in the area of SSA 18 since the site was inactive.

In the response to Specific Comment 4 on the *Final Work Plan Addendum 028 for Site Screening Areas 18, 72, 30, 79, 60, and 77*, dated June 2009 (WPA 028), it was noted that "an assessment of the 260 ft long 6-inch diameter plastic, gravity acid sewer line that extends from the acidic wastewater sump (SSA 72) to the SAR wastewater treatment plant was not conducted." Please revise Section 4.2.2 to note that the section of the sewer line associated with SSA 18 and 72 was not originally investigated as part of the Acid Sewer Survey discussed in Section 4.2.2. This comment also applies to Section 5.2.2, as part of the discussion of SSA 72. It is acknowledged, however, that an attempt to investigate this section of the sewer line was conducted as part of the SSP, as described in Section 5.4, SSP Field Activities.

Response: The following text will be added to Sections 4.2.2 and 5.2.2: "An assessment of the 260 ft long 6-inch diameter plastic, gravity acid sewer line that extends from the acidic wastewater sump (SSA 72) to the SAR wastewater treatment plant (SSA 18) was not conducted as part of the acid sewer survey."

5. **Section 4.6, Human Health Risk Screening, Page 4-7:** The SSP Report does not state which data were used in the human health risk screening (i.e., historical and SSP data, or SSP data only). It would appear that all data (historical and SSP data) should be included in the risk evaluations since the data were collected at different locations, and no removal actions were conducted at this site that could have removed soil associated with the sample locations. Please revise the SSP Report to clearly identify the data points that were used in the risk evaluation, and assure that all data representative of current conditions are included in the risk evaluation.

   Response: Historical data for the SSA 18 area are limited to two soil samples collected from soil boring SB08 (at the location of monitoring well MW-4) and 2007 groundwater samples from monitoring wells MW-3 and MW-4 at locations potentially downgradient of SSA 18. These soil and groundwater data will be incorporated into the COPC selection and risk screening process for potential release evaluations for this SSA. Section 4.6 will be revised to identify the historical samples and SSP samples used in the risk evaluation.

6. **Section 4.6.1, Identification of COPCs, Page 4-7:** It is unclear why the existing groundwater data from 2007 were not carried through to the contaminant of potential concern (COPC) selection process as part of the human health risk screening for SSA 18 as well as SSA 72. Section 4.6.1 states, "As presented in WPA 028, potential releases to groundwater were assessed by evaluating subsurface soil data and comparison of these data to USEPA risk-based soil-to-groundwater SSLs included in the Regional Screening Table." While a comparison to SSLs is one component of the evaluation, WPA 028 also states, in Section 2.4.3, Release Assessment to Groundwater, "Potential releases to groundwater will be evaluated using existing groundwater data collected in the site area in 2007." Based on a cursory review of the groundwater data, presented

in Table 4-3, chloroform and perchlorate were detected above the tapwater Regional Screening Levels (RSL) in wells MW-3 and/or MW-4, both locations of which the SSP Report acknowledges could be used to evaluate potential releases from SSA 18 (Section 4.2.3), and possibly SSA 72. Please revise the SSP Report to include the 2007 groundwater data in the COPC selection process for these two sites, and include any COPCs in the risk/hazard estimates and cumulative risk screening.

Response: Section 4.0 of the SSP Report for SSA 18 will be revised to include the 2007 groundwater data from MW-3 and MW-4 in the COPC selection and cumulative risk screening process for potential release evaluations for this SSA. Section 5.0 of the SSP Report for SSA 72 will be revised to include the 2007 groundwater data from monitoring well MW-3 in the COPC selection and cumulative risk screening process for potential releases evaluation for this SSA. Data from monitoring well MW-4 will not be included in the analysis for SSA 72 because of its probable crossgradient location relative to this SSA.

As presented on Table 4-3, chemicals detected at concentrations above screening levels for MW-3 and MW-4 include perchlorate and chloroform. Therefore, perchlorate and chloroform are COPCs for groundwater subject to cumulative risk screening. The results of the cumulative risk screening for COPCs identified in groundwater at SSA 18 is provided in attached Table 4-9. The screening resulted in an HI of 0.1 for perchlorate which is below the SSP threshold (1) and a risk of 9E-05 for chloroform which is above the SSP threshold (1E-05). The detected chloroform concentration (18 ug/L) is above the tap water RSL but below the MCL for THMs. Chloroform was also detected in upgradient wells.

With regard to groundwater detections of chloroform at the site, it is important to note that studies and groundwater investigations have shown the presence of chloroform in most groundwater samples collected at the facility regardless of location. The concentrations of chloroform detected in monitoring wells at the site are concentrations below the range of chloroform levels present in the water transmitted through water lines at the facility. The site is located downgradient of developed areas containing water lines that could be leaking, which may have been the source of chloroform. No additional assessment of chloroform at the site is required.

This information will be incorporated into the final report.

7. **Section 5.1.3, Surface Water, Page 5-1**: This section indicates that water is still present in the sump at SSA 72. A water sample collected from this sump in 2007 identified Alpha-BHC, heptachlor, and nine metals above their tapwater RSLs (Section 5.2.4, Oleum Plant Environmental Baseline Study – Ecology and Environment, Inc. 2007). Although it does not appear that the water from the sump has been released to the environment at potentially unacceptable levels, it is recommended that the water in this sump be properly disposed in an effort to

avoid potential future releases should the sump structure be compromised. Please revise the SSP Report to address this concern.

Response: The limited water present in the sump is likely an accumulation of rainwater due to the grated opening atop the sump. During the dry season when rainfall accumulations are minimal, the sump does not contain water; therefore, removal of periodic accumulation of water from the sump is not proposed. This information will be added to Section 5.1.3.

8. **Section 5.6, Human Health Risk Screening, Pages 5-5 through 5-7**: The cumulative risk screening for surface soil at SSA 72 is based on a single surface soil sample, B-3 Surface/72SB1A. Table 5-3, Summary of Detected Chemicals in Soil Analytical Samples, shows that several metals and polynuclear aromatic hydrocarbons (PAHs) were detected above residential and/or industrial RSLs in this sample. Using only a single surface soil sample to assess risk introduces considerable uncertainty into the risk assessment. Please revise the SSP to discuss the uncertainties associated with assessing risk with a single sample, and address whether additional assessment of surface soil in the area will be necessary to better define the extent of the contamination.

   Response: Metals in sample B-3 Surface/72SB1A detected above RSLs (aluminum, arsenic, cobalt, iron, manganese, thallium, and vanadium) are well within background ranges and are below facility wide background point estimates; therefore, these metals are not considered a concern at the site.

   The following text will be added to Section 5.6.6: "Although uncertainties in assessing risk increase when using a single surface soil sample potentially underestimates risk, the use the maximum detected concentrations for the overall risk screenings potentially overestimates risk. Based on the small size of the site (0.1 acre), the lack of potential surface soil releases due to the nature of previous activities at the SSA (acid conveyance via subsurface sump and subsurface sewer line), the low level of detections of PAHs in the sample, the industrial screening resulting in risks/hazards below SSP thresholds, no additional assessment of surface soil in the area is proposed."

9. **Table 5-3, Summary of Detected Chemicals in Soil Analytical Samples:** A note included with this table indicates that chemical concentrations that exceed the soil to groundwater risk-based soil screening level (SSL) based on a dilution attenuation factor (DAF) of 20 will be shown in bold italic text. However, this approach was not consistently applied. Nitrobenzene concentrations in samples 72SB2B and 72SB3B exceed the SSL, but the detected concentrations have not been shown in bold italics. Please revise Table 5-3 to identify all constituents that exceed applicable screening criteria, including the SSL, and assure that all tables in the SSP Report do the same.

Response: Table 5-3 will be revised and all tables will be reviewed and revised as necessary.

10. **Section 6.6.1, Identification of COPCs, Page 6-5:** Dibenzofuran was identified as a site COPC since no screening value was available for this constituent at the time of report preparation. Also, risk associated with this constituent was not incorporated into the cumulative risk screening since a RSL was not available. However, beginning in December 2009, RSLs were established for dibenzofuran. Please revise the SSP Report to incorporate updated RSLs for dibenzofuran into the COPC selection process. Based on the concentration of the detection (0.043 milligrams per kilogram [mg/kg] in sample 79SS5) and the current May 2010 residential RSL for dibenzofuran (78 mg/kg), dibenzofuran does not appear to be a concern at the site.

    Response: Per previous agreements, if an updated value changes significantly so that it would impact the conclusion for the site, an analysis of the effects of this change will be conducted. A discussion of the use of the April 2009 RSLs versus the December 2009 RSLs will be added to Section 3.2.7.2 as follows: "The use of the April 2009 Regional Screening Levels rather than the December 2009 Regional Screening Levels for the SSP human health risk screening could result in the inclusion or exclusion of chemicals based on outdated toxicity data. Therefore to lessen the uncertainty associated with the use of these screening levels, an assessment of the data was conducted with respect to the December 2009 Regional Screening Levels which did not result in the identification of any additional COPCs for the sites.

11. **Section 6.8, Conclusions and Recommendations, Page 6-14:** This section indicates that institutional controls are being implemented at SSA 30 and SSA 79, the asbestos disposal trenches. The institutional controls will provide "for advance notice, assessment, and approval of intrusive work that may occur within the plant with a general digging prohibition at sites such as this." However, the recommendations for the disposal trenches do not include maintenance of the sites. Since bagged asbestos containing material is known to be buried in the site trenches, the soil cover at these sites should be properly maintained to prevent erosion and potential exposure of the bags. Please revise the SSP to incorporate maintenance of the soil cover at SSAs 30 and 79 into the recommendations for the sites.

    Response: The following text will be added to Section 6.8: "In addition since bagged asbestos containing material is known to be buried in the site trenches, the soil cover at these sites will be maintained to prevent erosion and potential exposure of the bags."

12. **Section 7.4, SSP Field Activities, Page 7-4:** Two test pits were completed at the site, but the SSP Report does not describe the materials that were found in these test pits. The SSP Report should describe the materials found in the test pits to

confirm the historical use of the site as a demolition waste pile. Revise the SSP Report to discuss findings from the test pit activities. Additionally, please provide test pit logs for both of the test pits and clarify if the log provided for Borehole 60TP-1 in Appendix D.2.1 is a part of one of the test pits.

Response: The following text will be added to Section 7.4: "During excavation of the test pits, the material encountered included fill, gravel areas, rocks, and concrete building debris."

The test pit log for 60TP-2 will be provided in Appendix D.2.1. The log for Borehole 60TP-1 will be revised to indicate Test Pit/Borehole.

13. **Section 8.6.2, Cumulative Risk Screening, Pages 8-6 and 8-7:** 2,3,7,8-TCDD Equivalents (TEQ) (dioxins) were identified as risk drivers in both surface soil and total soil. However, it does not appear that dioxins were adequately evaluated at this site since only two surface soil samples were analyzed for these constituents, both of which reported residential and/or industrial RSL exceedances. No subsurface soil samples were analyzed for dioxins to assess the vertical extent of contamination. Additionally, the two surface soil samples analyzed for dioxins (77SB2 and 77SB3) were located immediately north of the incinerator building; surface soil in other areas of the site was not evaluated although deposition of particulate matter from the chimney is a potential release mechanism at the site. Please revise the SSP Report to address the apparent data gaps with respect to sampling for dioxins in subsurface soil and surface soil, or present additional justification for not assessing the extent of this contamination.

    Response: Dioxin sampling focused on surface soil at the locations where the potential for releases were highest based on the identified release mechanisms and location of the chimney (surface spills of materials removed from the chimney cleanout and deposition of particulates from the chimney). Dioxin detections did not result in an industrial cumulative risk screening equal to or above SSP 1E-05 threshold for further assessment when considering metals background. Additional sampling for dioxins is not proposed at SSA 77 given the risk screening results, collection of samples at the likely locations and depth of highest concentrations, and the limited area around SSA 77 not covered by asphalt pavement or buildings (grass covered areas are limited to approximately 0.1 acres on a steep hillside).

    Note that cumulative risk and hazard screenings for industrial scenarios are below the SSP thresholds when considering background and the recommendation for the site is institutional controls to maintain the site in its current industrial/commercial state and prevent any future residential use.

14. **Section 8.8, Conclusions and Recommendation, Page 8-12:** The first bulleted item states, "Cumulative risk and hazard screening results for industrial scenarios are below SSP thresholds for target risk and hazards." This is inconsistent with the information presented in Section 8.6.2, Cumulative Risk Screen, where it is

noted that “cumulative risk screenings were equal to the established SSP risk level of 1E-05 for the industrial scenario for surface and total soil.” When excluding risk drivers below background (arsenic), site related risk falls below the established thresholds; however, this should be noted in the first bulleted item on Page 8-12. Please revise the first bulleted item in Section 8.8 to state that the risk screening results for the industrial scenario are below SSP thresholds, when excluding risk drivers below background.

Response: The first bullet of Section 8.8 will be revised as follows: “When excluding risk drivers below background (arsenic), the site related cumulative risk and hazard screening results for industrial scenarios are below SSP thresholds for target risk and hazards.”

15. **Appendix D.2.1, Site Screening Process Boring Logs**: Several of the boring logs do not specify the recovery (in feet) or the results of the photoionization detector (PID) screening. These incomplete boring logs include the logs for boreholes 18SB1, 18SB2, 18SB5, 30SB1, 30SB2, 30SB3, 77SB2, 77SB3, and 77SB5. Additionally, the log for borehole 77SB3 does not include a material description. Please revise the SSP to provide complete information on recovery, PID screening, and material descriptions for the borings completed during the SSP.

    Response: The SSP Report will be revised to include the additional requested information on the above referenced boring logs.

Table 4-9
SSA 18 Cumulative HHRS (Groundwater)
SSP Report for SSAs 18, 72, 30, 79, 60, and 77
Radford Army Ammunition Plant, Radford, Virginia

CAS #	Chemical	Units	Detection Frequency	MDC	Tap Water RSL	C/N	Non Carcinogenic HI	Excess Cancer Risk	Noncarcinogenic Target Organ
67-66-3	Chloroform	ug/L	2/2	18	0.19	C	--	9.E-05	--
14797-79-0	Perchlorate	ug/L	2/2	3.59	25.55	N	1.E-01	--	thyroid
							1.E-01	9.E-05	
Target Organ Segregation						Total thyroid HI =	0.1		

Notes:

µg/L = Microgram Per Kilogram
CAS = Chemical Abstracts Service
MDC = Maximum Detected Concentration
HI = Hazard Index
RSL = Regional Screening Level (RSL) from EPA April 2009 RSL Table
C = Carcinogenic per EPA RSL Table (April 2009)
N = Noncarcinogenic per EPA RSL Table (April 2009)

March 2010 SSP Comments.doc

Presented below are EPA/VDEQ comments on the *Draft Site Screening Process Report for Site Screening Areas 18, 72, 30, 79, 60, and 77*, dated March 2010, for the Radford Army Ammunition Plant (RFAAP) located in Radford, Virginia (SSP Report).

GENERAL COMMENTS

1. Section 3.1, Analytical Results, states that "Historical investigation results and SSP investigation results are summarized in each site-specific section of this report." While the SSP Report does describe the historical investigation results, it does not include a discussion of the individual constituents detected above the applicable screening criteria during the SSP investigation. While a fully developed nature and extent assessment is not a requirement of the SSP Guidance Document, dated October 2001 (SSP Guidance), Section 7.0, Site Screening Process Report, of the SSP Guidance does state that "a nature and extent determination (if available)" will be presented in the SSP Report. A basic discussion of those constituents detected above screening levels at the site as well as a determination of whether the distribution of contaminants across the site are suggestive of a release would be a useful addition to the SSP Report in support of the conceptual site model, and human health and ecological risk screening evaluations. Please revise the SSP Report to include a discussion of those constituents detected above applicable screening levels at each of the sites, and discuss the distribution of these constituents as they relate to potential source areas.

2. For the human health risk evaluations, soil data are separated into surface soil and total soil, presumably for different exposure scenarios; however, the SSP Report does not define these soil intervals (i.e., surface soil is 0-2 feet below ground surface [bgs], total soil is 0-10 feet bgs, etc.) Please define the depths of the samples incorporated into the surface soil and total soil evaluations.

3. The SSP Report presents a summary table for each site that includes the Cumulative Human Health Risk Screening Results for Soil. An example of such a table is presented in Section 4.6.2, Cumulative Risk Screen. A column is included for risk drivers, but the SSP Report has not defined the risk drivers (i.e., constituents associated with risk greater than 1E-06 or hazard index greater than 1). Additionally, the tables should define individual chemicals as specific risk drivers, and not just "metals" as is shown in the table in Section 4.6.2. Please revise the SSP Report to clearly define what constitutes a risk driver for purposes of the summary tables, and identify individual constituents as risk drivers, rather than classes of constituents in these tables.

SPECIFIC COMMENTS

4. **Section 4.2.2, Acid Sewer Survey, Page 4-4**: This section indicates that an Acid Sewer Survey and Investigation was conducted on the entire RFAAP acid sewer infrastructure between 1998 and 2000 to determine the condition of the sewers.

Deteriorated or broken sections were repaired or replaced within active areas; however, no actions were taken in the area of SSA 18 since the site was inactive. In the response to Specific Comment 4 on the *Final Work Plan Addendum 028 for Site Screening Areas 18, 72, 30, 79, 60, and 77*, dated June 2009 (WPA 028), it was noted that "an assessment of the 260 ft long 6-inch diameter plastic, gravity acid sewer line that extends from the acidic wastewater sump (SSA 72) to the SAR wastewater treatment plant was not conducted." Please revise Section 4.2.2 to note that the section of the sewer line associated with SSA 18 and 72 was not originally investigated as part of the Acid Sewer Survey discussed in Section 4.2.2. This comment also applies to Section 5.2.2, as part of the discussion of SSA 72. It is acknowledged, however, that an attempt to investigate this section of the sewer line was conducted as part of the SSP, as described in Section 5.4, SSP Field Activities.

5. **Section 4.6, Human Health Risk Screening, Page 4-7:** The SSP Report does not state which data were used in the human health risk screening (i.e., historical and SSP data, or SSP data only). It would appear that all data (historical and SSP data) should be included in the risk evaluations since the data were collected at different locations, and no removal actions were conducted at this site that could have removed soil associated with the sample locations. Please revise the SSP Report to clearly identify the data points that were used in the risk evaluation, and assure that all data representative of current conditions are included in the risk evaluation.

6. **Section 4.6.1, Identification of COPCs, Page 4-7:** It is unclear why the existing groundwater data from 2007 were not carried through to the contaminant of potential concern (COPC) selection process as part of the human health risk screening for SSA 18 as well as SSA 72. Section 4.6.1 states, "As presented in WPA 028, potential releases to groundwater were assessed by evaluating subsurface soil data and comparison of these data to USEPA risk-based soil-to-groundwater SSLs included in the Regional Screening Table." While a comparison to SSLs is one component of the evaluation, WPA 028 also states, in Section 2.4.3, Release Assessment to Groundwater, "Potential releases to groundwater will be evaluated using existing groundwater data collected in the site area in 2007." Based on a cursory review of the groundwater data, presented in Table 4-3, chloroform and perchlorate were detected above the tapwater Regional Screening Levels (RSL) in wells MW-3 and/or MW-4, both locations of which the SSP Report acknowledges could be used to evaluate potential releases from SSA 18 (Section 4.2.3), and possibly SSA 72. Please revise the SSP Report to include the 2007 groundwater data in the COPC selection process for these two sites, and include any COPCs in the risk/hazard estimates and cumulative risk screening.

7. **Section 5.1.3, Surface Water, Page 5-1**: This section indicates that water is still present in the sump at SSA 72. A water sample collected from this sump in 2007 identified Alpha-BHC, heptachlor, and nine metals above their tapwater RSLs

(Section 5.2.4, Oleum Plant Environmental Baseline Study – Ecology and Environment, Inc. 2007). Although it does not appear that the water from the sump has been released to the environment at potentially unacceptable levels, it is recommended that the water in this sump be properly disposed in an effort to avoid potential future releases should the sump structure be compromised. Please revise the SSP Report to address this concern.

8. **Section 5.6, Human Health Risk Screening, Pages 5-5 through 5-7**: The cumulative risk screening for surface soil at SSA 72 is based on a single surface soil sample, B-3 Surface/72SB1A. Table 5-3, Summary of Detected Chemicals in Soil Analytical Samples, shows that several metals and polynuclear aromatic hydrocarbons (PAHs) were detected above residential and/or industrial RSLs in this sample. Using only a single surface soil sample to assess risk introduces considerable uncertainty into the risk assessment. Please revise the SSP to discuss the uncertainties associated with assessing risk with a single sample, and address whether additional assessment of surface soil in the area will be necessary to better define the extent of the contamination.

9. **Table 5-3, Summary of Detected Chemicals in Soil Analytical Samples:** A note included with this table indicates that chemical concentrations that exceed the soil to groundwater risk-based soil screening level (SSL) based on a dilution attenuation factor (DAF) of 20 will be shown in bold italic text. However, this approach was not consistently applied. Nitrobenzene concentrations in samples 72SB2B and 72SB3B exceed the SSL, but the detected concentrations have not been shown in bold italics. Please revise Table 5-3 to identify all constituents that exceed applicable screening criteria, including the SSL, and assure that all tables in the SSP Report do the same.

10. **Section 6.6.1, Identification of COPCs, Page 6-5:** Dibenzofuran was identified as a site COPC since no screening value was available for this constituent at the time of report preparation. Also, risk associated with this constituent was not incorporated into the cumulative risk screening since a RSL was not available. However, beginning in December 2009, RSLs were established for dibenzofuran. Please revise the SSP Report to incorporate updated RSLs for dibenzofuran into the COPC selection process. Based on the concentration of the detection (0.043 milligrams per kilogram [mg/kg] in sample 79SS5) and the current May 2010 residential RSL for dibenzofuran (78 mg/kg), dibenzofuran does not appear to be a concern at the site.

11. **Section 6.8, Conclusions and Recommendations, Page 6-14:** This section indicates that institutional controls are being implemented at SSA 30 and SSA 79, the asbestos disposal trenches. The institutional controls will provide "for advance notice, assessment, and approval of intrusive work that may occur within the plant with a general digging prohibition at sites such as this." However, the recommendations for the disposal trenches do not include maintenance of the sites. Since bagged asbestos containing material is known to be buried in the site

trenches, the soil cover at these sites should be properly maintained to prevent erosion and potential exposure of the bags. Please revise the SSP to incorporate maintenance of the soil cover at SSAs 30 and 79 into the recommendations for the sites.

12. **Section 7.4, SSP Field Activities, Page 7-4:** Two test pits were completed at the site, but the SSP Report does not describe the materials that were found in these test pits. The SSP Report should describe the materials found in the test pits to confirm the historical use of the site as a demolition waste pile. Revise the SSP Report to discuss findings from the test pit activities. Additionally, please provide test pit logs for both of the test pits and clarify if the log provided for Borehole 60TP-1 in Appendix D.2.1 is a part of one of the test pits.

13. **Section 8.6.2, Cumulative Risk Screening, Pages 8-6 and 8-7:** 2,3,7,8-TCDD Equivalents (TEQ) (dioxins) were identified as risk drivers in both surface soil and total soil. However, it does not appear that dioxins were adequately evaluated at this site since only two surface soil samples were analyzed for these constituents, both of which reported residential and/or industrial RSL exceedances. No subsurface soil samples were analyzed for dioxins to assess the vertical extent of contamination. Additionally, the two surface soil samples analyzed for dioxins (77SB2 and 77SB3) were located immediately north of the incinerator building; surface soil in other areas of the site was not evaluated although deposition of particulate matter from the chimney is a potential release mechanism at the site. Please revise the SSP Report to address the apparent data gaps with respect to sampling for dioxins in subsurface soil and surface soil, or present additional justification for not assessing the extent of this contamination.

14. **Section 8.8, Conclusions and Recommendation, Page 8-12:** The first bulleted item states, "Cumulative risk and hazard screening results for industrial scenarios are below SSP thresholds for target risk and hazards." This is inconsistent with the information presented in Section 8.6.2, Cumulative Risk Screen, where it is noted that "cumulative risk screenings were equal to the established SSP risk level of 1E-05 for the industrial scenario for surface and total soil." When excluding risk drivers below background (arsenic), site related risk falls below the established thresholds; however, this should be noted in the first bulleted item on Page 8-12. Please revise the first bulleted item in Section 8.8 to state that the risk screening results for the industrial scenario are below SSP thresholds, when excluding risk drivers below background.

15. **Appendix D.2.1, Site Screening Process Boring Logs**: Several of the boring logs do not specify the recovery (in feet) or the results of the photoionization detector (PID) screening. These incomplete boring logs include the logs for boreholes 18SB1, 18SB2, 18SB5, 30SB1, 30SB2, 30SB3, 77SB2, 77SB3, and 77SB5. Additionally, the log for borehole 77SB3 does not include a material description. Please revise the SSP to provide complete information on recovery,

PID screening, and material descriptions for the borings completed during the SSP.

MEMORANDUM FOR Office of Environmental Quality, Radford Army Ammunition Plant (SJMRF-OP-EQ/Mr. Jim McKenna), P.O. Box 2, Radford, VA 24143-0002

SUBJECT: Draft Site Screening Process Report for Site Screening Areas 18, 72, 30, 79, 60, and 77, Radford Army Ammunition Plant, Virginia, March 2010

1. The US Army Public Health Command (Provisional), formerly the US Army Center for Health Promotion and Preventive Medicine, reviewed the subject document on behalf of the Office of The Surgeon General pursuant to Army Regulation 200-1 (Environmental Protection and Enhancement). We appreciate the opportunity to review the report.

2. Our comments on the previous internal draft version of the report have been addressed and we have no additional comments.

3. The document was reviewed by Mr. Dennis Druck, Environmental Health Risk Assessment Program. He can be reached at DSN 584-2953, commercial (410) 436-2953 or electronic mail, dennis.druck@us.army.mil.

FOR THE COMMANDER:

JEFFREY S. KIRKPATRICK
Director, Health Risk Management

EXECUTIVE SUMMARY

This Site Screening Process (SSP) report presents the results and findings of the Resource Conservation and Recovery Act (RCRA) investigation conducted at the Radford Army Ammunition Plant (RFAAP) for the following site screening areas (SSAs; Figure 1-1):

- SSA 18 Sulfuric Acid Recovery Plant – Waste Acid Treatment Facility
- SSA 72 Oleum Plant Acidic Wastewater Sump
- SSA 30 Asbestos Disposal Trench No. 1
- SSA 79 Asbestos Disposal Trench No. 2
- SSA 60 Rubble Pile East of the Administration Building
- SSA 77 Garbage Incinerator

SSA 18 and SSA 72 are located in close proximity to each other in the Oleum Plant area, but were assessed separately. SSA 30 and SSA 79 are co-located in the HSA and are assessed together due to similar operational histories. SSA 60 is adjacent to the main administration building near the main gate to the plant. SSA 77 is located adjacent to shipping and receiving in the MMA.

URS Group, Inc. (URS) conducted a RCRA SSP at the RFAAP for SSAs 18, 72, 30, 79, 60, and 77. The SSP was performed in accordance with the U.S. Environmental Protection Agency (USEPA) Region III and Virginia Department of Environmental Quality (VDEQ)-approved Master Work Plan (MWP) Addendum 028 (URS 2009), the requirements set forth in the 2000 RCRA permit for RFAAP (USEPA 2000), and the USEPA approved SSP Guidance Document for RFAAP (USEPA 2001, Appendix A).

The SSP was designed to assess: whether releases of hazardous substances, pollutants, chemicals, hazardous wastes, or hazardous constituents have occurred to the environment at the site evaluated, whether further investigation (i.e., risk assessment or RCRA Facility Investigation (RFI)) or an interim removal action is appropriate at a site, or whether no further action (NFA) at a site is appropriate. Five steps were completed for the SSP following the approved guidance document including: 1) performance of a desktop audit and site visit to develop the scope of the SSP Work Plan, 2) preparation of a SSP site-specific Work Plan, 3) performance of the field work in accordance with the approved SSP Work Plan, 4) evaluation of the SSP data and completion of pre-remedial risk screening, and 5) assessment of the need for further investigation, interim removal action, or preparation of a "No Further Action" Decision Document, per the RCRA Corrective Action permit based on the results of the SSP and risk screening.

Human Health Risk Screenings

Human health risk screening was conducted for each of the sites. SSAs 30 and 79 were assessed together due to their proximity and similar historical activities. Background levels of metals were the risk and hazard drivers for each of the sites except for SSA 72 (benzo(a)pyrene and Aroclor 1254) and SSA 77 (2,3,7,8-TCDD TEQ (dioxins)). SSA 72 and SSA 77 had site-related risks/hazards equal to or above the SSP thresholds of 1E-05 and 1 for the residential scenario. The site-related cumulative risks/hazards for SSA 72 and SSA 77 were below the SSP thresholds for the industrial scenario. The remaining sites (SSA 18, SSA 30, SSA 79, and SSA 60) had site-related risks and hazards below SSP thresholds of 1E-05 and 1, respectively, for residential and industrial scenarios.

Ecological Risk Screenings

Ecological risk screening was conducted for five of the six sites. SSAs 30 and 79 were assessed together due to their proximity and similar historical activities. Metals were the primary constituents of potential ecological concern (COPECs) at the sites with the exception of SSA 77 (2,3,7,8-TCDD TEQ (dioxins)). The results of the ecological risk assessments indicated there is adequate information to conclude that

ecological risks are considered negligible at SSAs 18, 30, 79, 60, and 77; therefore, there is no need for further action at these SSP sites on the basis of ecological risk. Although a limited number of surface soil samples were collected (one sample) at SSA 72, an ecological risk assessment was not conducted for the site considering the small size of the site (0.1 acre), the nature of previous activities at the site (acid conveyance via subsurface sump and subsurface sewer line), and the lack of potential surface soil releases due to the nature of previous activities at the site. Based on these factors, the potential for ecological risk at SSA 72 is considered negligible.

Conclusions and Recommendations

A summary of conclusion and recommendation based on the SSP evaluation for each site is provided below:

- SSA 18 – No Further Action based on the results of the human health screening, ecological risk screening, and SSL evaluation;
- SSA 72 – No Further Action beyond the implementation of land use controls to maintain this site as industrial precluding residential use due to cumulative risk and hazard screening results for residential scenarios equal to or above SSP thresholds for target risk and hazards;
- SSAs 30 and 79 – No Further Action beyond the implementation of land use controls to maintain this site as a closed solid waste management unit due to the presence of bagged asbestos containing material at the site within the trenches;
- SSA 60 – No Further Action based on the results of the human health screening, ecological risk screening, and SSL evaluation; and
- SSA 77 – No Further Action beyond the implementation of land use controls to maintain this site as industrial precluding residential use due to cumulative risk and hazard screening results for residential scenarios above SSP thresholds for target risk and hazards.

1.0 INTRODUCTION

This Site Screening Process (SSP) report presents the results and findings of the Resource Conservation and Recovery Act (RCRA) investigation conducted at the Radford Army Ammunition Plant (RFAAP) for the following site screening areas (SSAs; Figure 1-1):

- SSA 18 Sulfuric Acid Recovery Plant – Waste Acid Treatment Facility
- SSA 72 Oleum Plant Acidic Wastewater Sump
- SSA 30 Asbestos Disposal Trench No. 1
- SSA 79 Asbestos Disposal Trench No. 2
- SSA 60 Rubble Pile East of the Administration Building
- SSA 77 Garbage Incinerator

The work was conducted by URS Group, Inc. (URS) to fulfill the requirements set forth in the 2000 RCRA Corrective Action permit as tasked by the United States Army Corps of Engineers (USACE), Baltimore District, in accordance with Contract Number W91238-07-D-0006, Delivery Order No. DA01.

URS performed the SSP in accordance with the Site Screening Process developed for RFAAP (USEPA 2001) and Work Plan Addendum (WPA) 028 to the Master Work Plan (MWP; URS 2009), which was developed to address specific aspects of this project and to describe project-related activities not included in the MWP. These documents, approved by the United States Environmental Protection Agency (USEPA) Region III and the Virginia Department of Environmental Quality (VDEQ), contain the Master Quality Assurance Plan (MQAP), the Master Health and Safety Plan (MHSP), and associated project-specific addenda.

1.1 PURPOSE

The SSP is designed to assess:

- Whether releases of hazardous substances, pollutants, chemicals, or hazardous constituents have occurred to the environment at the site evaluated;
- Whether further investigation (i.e., risk assessment or RCRA Facility Investigation [RFI]) is required;
- Whether an interim removal action at the site is required; or
- Whether no further action (NFA) at the site is appropriate.

1.2 REPORT ORGANIZATION

Section 2.0 outlines the field investigation tasks completed for the SSP. SSP risk screening procedures and assumptions used in the site-specific evaluations are presented in Section 3.0. Historical data, SSP data, and data evaluation components for each site assessed in the SSP are included in individual sections (Sections 4.0 through 8.0) with the exception of SSAs 30 and 79, which are included in a single section (Section 6.0), since the sites are co-located and have similar operation histories.

Each site-specific section of this SSP Report begins with a brief description of the site and a summary of the current conditions including descriptions of the physical and natural features that may affect the migration and exposure pathways. This is followed by a summary of previous investigations, a description of the SSP field activities, and the results of the human health risk screening and ecological risk screening. The final component of each section presents the conclusions and recommendations for the site.

2.0 SSP INVESTIGATION PROGRAM

The SSP consisted of the following steps as outlined in the SSP Guidance (Appendix A, USEPA 2001):

- Performance of a desktop audit and site visit to develop the scope of the SSP Work Plan;
- Preparation of a SSP site-specific Work Plan;
- Performance of the field work in accordance with the approved SSP Work Plan;
- Evaluation of the SSP data and completion of pre-remedial risk screening; and
- Assessment of the need for further investigation, interim removal action, or preparation of a "No Further Action" Decision Document, per the RCRA Corrective Action permit based on the results of the SSP and risk screening.

2.1 DESKTOP AUDIT AND FIELD VISIT

A desktop audit was performed for each of the six SSP sites. This audit evaluated and documented site use and operational history, and assessed the likelihood that these operations resulted in the release of hazardous substances to the environment.

The audit included an evaluation of existing information and analytical data to identify historical uses and potential environmental factors, a visual inspection of each site, and the development of a site-specific Conceptual Site Model (CSM). The findings of the desktop audit and site inspection were evaluated to identify potential contaminant sources, migration pathways, potential human and ecological receptors, and receptor exposure pathways at each site.

2.2 SSP WORK PLAN

WPA 028 was finalized in July 2009. This work plan integrated information from the desktop audit and site visits to develop site-specific CSMs and identify data gaps. Field investigation plans were developed for each of the SSP sites based on this information.

2.3 SAMPLING AND ANALYSIS

Twenty-five surface soil samples, 21 subsurface soil samples, and 4 groundwater samples (SSAs 30 and 79) were collected for chemical analysis and eight soil samples were collected for physical soil testing during the 2009 SSP sampling activities at the six sites (Table 2-1). Field work was performed in accordance with WPA 028 (URS 2009) except for modifications described in the SSP field activities section for each site (Sections 4.0 through 8.0).

Soil samples were analyzed for the following parameters:

- Target Compound List (TCL) volatile organic compounds (VOCs) by SW-846 Method 8260B;
- TCL semi-volatile organic compounds (SVOCs) by SW-846 Method 8270C;
- Explosives (including nitroglycerin and Pentaerythritol Tetranitrate [PETN]) by SW-846 Methods 8330 and 8332;
- Target Analyte List (TAL) inorganics by SW-846 Methods 6010B, 6020, 7471A, and 9012A;
- TCL pesticides and polychlorinated biphenyls (PCBs) by SW-846 Methods 8081A and 8082;
- TCL dioxin/furans by SW-846 Method 8290 (SSA 77 only); and
- Asbestos by State of California Air Resources Board (CARB) Method 435 (SSAs 30 and 79 only).

Groundwater samples were analyzed for the following parameters:

- Asbestos by EPA Method 100.2 (SSAs 30 and 79 only).

Physical soil samples were analyzed for the following parameters:

- Grain-size analysis (ASTM D 422);
- Atterberg Limits (ASTM D 4318);
- Moisture content (ASTM D 2216);
- Total Organic Carbon (Walkley-Black); and
- pH (ASTM D 4972).

2.3.1 Soil Sampling

Samples were collected from each soil boring location for chemical analysis as presented in Table 2-2. The specific field investigation program for each SSP site is discussed within its results section (Sections 4.0 through 8.0).

2.3.2 Groundwater Sampling

Groundwater samples were collected from monitoring wells 51MW1, 51MW2, C1, and 16-4 at SSAs 30 and 79. Additional information for the groundwater sampling is included in Section 6.0.

2.4 QUALITY ASSURANCE

Quality Assurance (QA) planning defined the overall system of activities for assuring the reliability of data produced. The system integrated the quality planning, assessment, and corrective actions of various groups in the organization to provide the independent QA program necessary to establish and maintain an effective system for collection and analysis of environmental samples and related activities. The program encompasses the generation of complete data with its subsequent review, validation, and documentation.

The accuracy and integrity of SSP data were ensured through the implementation of internal quality control (QC) measures consistent with MWP Addendum 028 (URS 2009), as approved by USEPA Region III and the VDEQ. QA and QC procedures including field QC, laboratory QC, data management, and data validation of 100 percent (%) of chemical data used for risk screening were integrated into the investigation program to meet data quality objectives (DQOs) established and approved for the SSP. The data were evaluated for each of the DQO indicators as presented in Appendix G.1. The results of the data validation and usability assessments indicated that project DQOs were achieved and the data were usable for the intended purpose of release assessment and risk assessment. Data validation reports are provided in Appendix G.2. Each data validation report includes the laboratory analytical data sheets with the validation flagging and notes.

2.5 INVESTIGATION METHODOLOGY

2.5.1 Soil Sampling

Surface and subsurface soil samples were collected for chemical and physical analysis during the SSP consistent with standard operating procedure (SOP) 30.1 included in Appendix C. Soil sampling procedures for analysis of VOCs followed SOP 30.9 (Appendix C).

Surface soil samples were collected from 0 to 6-inches below ground surface (bgs) below gravel or organic layers at the surface except for VOC samples, which were collected from 6 to 12-inches bgs.

Upon retrieval of soil for sample processing, the soil was field screened for the presence of VOCs using a photoionization detector (PID). Field screening consisted of cutting a cross-sectional slice from the core

or center of the sample with a decontaminated stainless steel knife or trowel and inserting the PID probe into the gap created by the cross-sectional slice of the core. PID readings were recorded in the field logbook and on the boring log for soil boring samples. After the PID readings were recorded, a sample for VOC analysis was immediately collected from the appropriate interval using a disposable EnCore® sampler.

Once the fraction for VOC analysis was collected, the soil core interval was examined and classified by the site geologist and recorded in the field logbook and on the boring log consistent with SOPs 10.1 and 10.3, respectively (Appendix C). Soil for non-VOC analysis was then extracted from the appropriate interval, placed in a stainless steel bowl, and homogenized. The appropriate sample containers were filled, labeled, and placed into coolers with ice and maintained at 4 degrees Celsius (^{o}C).

2.5.2 Soil Borings

Two borings at SSA 30 (30SS1 and 30SS2) and three borings at SSA 60 (60SE1, 60SE2, and 60SS6) were advanced via hand auger to collect soil samples. A stainless steel hand auger with an 8-inch long, 3.25-inch diameter core sampler was used to advance each boring and collect each sample. Four samples at SSAs 30 and 79 (30SS3, 79SS1, 79SS2, and 79SS3) and five samples at SSA 60 (60SS1, 60SS2, 60SS3, 60SS4, and 60SS5) were collected using a shovel. Two samples at SSA79 (79SS4 and 79SS5) were collected using disposable hand trowels.

The remaining samples were collected from soil borings advanced using a skid steer-mounted direct push rig (Geoprobe®). This rig was equipped with 1.25-inch diameter push rods, 4-feet (ft) long, 2-inch diameter, stainless steel closed solid barrel sampler (Macro-Core®) with a disposable liner, and stainless steel cutting shoes. A percussion hammer was used to advance the sampling assembly. Following withdrawal of the Macro-Core® and removal of the liner, a cutting device was used to open the liner prior to inspection and processing of the sample cores.

Once the termination depth of the hand auger or direct push boring was reached and sample collection was completed, the borehole was backfilled with bentonite chips. Excess soil cuttings remaining after sample processing were temporarily accumulated in 55-gallon drums and staged at an Installation-approved area.

Boring logs prepared by the site geologist are included in Appendix D.2.1.

2.5.3 Test Pits

Test pits were completed using a mini-track excavator following the procedures outlined in SOP 20.4 (Appendix C). Test pit logs were completed as described in SOPs 10.3 and 20.4 and test pit activities were documented in the field log as described in SOP 10.1 (Appendix C). Equipment was decontaminated before use at each location following SOP 80.1 (Appendix C). Soil samples were collected from the test pits following subsurface techniques described in SOP 30.1 (Appendix C). Excess material excavated from the test pits was placed into 55-gallon drums and temporarily accumulated at the Installation-approved area for disposal as discussed in Section 2.5.6. Test pit boring logs are included in Appendix D.2.1.

2.5.4 Monitoring Well and Groundwater Sampling

Groundwater samples were collected from monitoring wells 51MW1, 51MW2, C1, and 16-4 at SSAs 30 and 79 using a submersible pump and the low-flow purge and sampling method as outlined in SOP 30.2 included in Appendix C.

2.5.5 Sample Locations

The location and elevation of the sample points were obtained with a Trimble Pathfinder Pro XRS global positioning system (GPS) unit. The GPS unit was used to ascertain horizontal position with sub-meter

accuracy and elevation position with 1.5 to 2.0 times horizontal accuracy. Submeter accuracy of the GPS unit is maintained to the extent possible by obtaining simultaneous measurements from a minimum of four satellites, verifying measurements as known benchmarks or surveyed locations at the sites, and by performing differential correction of the GPS data relative to a local GPS base station based in Blacksburg, Virginia. Sample location maps are contained in individual site sections. See Appendix D.6 for a complete table of sample coordinates.

Horizontal location data were recorded in the U.S. State [Virginia (South)] Plane Coordinate System (measured in U.S. survey feet) using the North American Datum 1983. Vertical control data were measured in feet using the National Geodetic Vertical Datum of 1988.

2.5.6 Management of Investigation-Derived Material

Investigation-derived materials (IDM) management activities were conducted consistent with the procedures outlined in WPA 028 (URS 2009). IDM management was documented in the field logbook and conducted as described below.

2.5.6.1 Accumulation

IDM accumulated during field sampling activities included the following materials and containers:

- Soil cuttings – twenty three 55-gallon drums;
- Personal protective equipment (PPE), probe liners, plastic sheeting, sample filters – two 55-gallon drums; and
- Decontamination water – one 55-gallon drum and one 5-gallon bucket.

IDM accumulation and labeling was conducted as outlined in SOP 70.1 (Appendix C). Drums were transferred to the Installation's approved container accumulation area at Solid Waste Management Unit (SWMU) 17.

2.5.6.2 Material Characterization

Separate IDM characterization samples were collected for the test pit material, soil from borings, and the drummed decontamination water contained in 55-gallon drums. IDM was characterized to evaluate whether it was a RCRA characteristic hazardous waste as described in Part 40 of the Code of Federal Regulations (CFR) Part 261, Subpart C (as referenced in the Virginia Hazardous Waste Management Regulations). The analytical results of this characterization indicated the IDM was non-hazardous material (Appendix D.4).

2.5.6.3 Transporter, Storage, and Disposal Facility (Soil and PPE)

Prior to disposal, waste analytical results were provided to the Installation, IDM management subcontractor, and the disposal facilities for review and approval. Manifests were reviewed and signed by Installation personnel prior to loading and transport of the IDM. The Installation maintains a record of the manifests and related information including analytical testing results and waste profiles.

First Piedmont transported the 55-gallon drums containing the soil, test pit material, and PPE to the First Piedmont Landfill on Clark Mill Road, Ringold, Virginia.

2.5.6.4 Decontamination Water

Following the waste characterization sample analysis, the Installation and RFAAP Process Water Treatment Plant engineers were provided a copy of the decontamination water IDM sample results. After receiving approval, decontamination water was discharged into the collection system of the Process Water Treatment Plant.

3.0 SSP RISK SCREENING PROCEEDURES

3.1 ANALYTICAL RESULTS

Historical investigation results and SSP investigation results are summarized in each site-specific section of this report (Sections 4.0 through 8.0). Summary tables of historical analytical results (pre-SSP) and summary tables of SSP analytical results (detected chemicals) are included at the end of each site-specific section; these tables include sample information, laboratory and data validation flags, sample method detection limit (MDLs) and reporting limit (RLs), and risk screening criteria.

The physical soil testing results for the SSP are summarized in Table 2-1. The complete physical soil testing report is included in Appendix D.1.

3.2 HUMAN HEALTH RISK SCREENING

The purpose of the SSP human health risk screening is to evaluate site data using conservative criteria so a site can be eliminated from further consideration or identify if a site requires further evaluation. The screening procedures include the following five steps:

- Identification of chemicals of potential concern (COPCs) and cumulative risk screening;
- Chemical specific screening for lead and iron;
- Comparison to soil screening levels (SSLs);
- Comparison to applicable relevant and appropriate requirements (ARARs); and
- Comparison to background point estimates (available for select metals).

3.2.1 Identification of COPCs

COPCs were identified for a site by comparing the maximum detected concentration (MDC) for detected chemicals in a specific medium to USEPA residential regional screening levels (R-RSLs) and industrial regional screening levels (I-RSLs) for soil and tap water regional screening levels (T-RSLs) for groundwater, if available. The two soil data groupings used for COPC screening and the cumulative risk screening (see Section 3.2.2) are surface soil (0 to 1 ft bgs) and total soil (0 ft bgs to termination depth). The total soil data grouping consists of combining surface and subsurface soil to address mixing of potential constituents in soil during construction or land development activities. In accordance with USEPA Region III guidance, RSLs for noncarcinogenic chemicals were adjusted downward to a Hazard Quotient (HQ) of 0.1 to ensure that chemicals with additive effects were not prematurely eliminated during screening. For the purpose of COPC identification and risk screening, data from duplicate sample pairs were averaged and treated as one result. If a chemical was detected in one of the sample pair, half the detection limit of the non-detect was averaged with the detected result, and the result was considered detected. Chemicals that had a MDC greater than the adjusted USEPA RSL or for which no screening value (NSV) existed were selected as COPCs and retained for quantitative assessment. RSL values were obtained from the most recent USEPA RSL Table at the time the screenings were prepared (USEPA 2009).

3.2.2 Cumulative Risk Screen

The cumulative human health risk screen consisted of calculating the ratios between the exposure point concentrations (EPCs) of COPCs in each medium and the corresponding RSL. For purposes of this screening process, MDCs or a 95% upper confidence limit (UCL; if appropriate) would be considered in the cumulative risk screening as representative EPCs. If the site has a small sample size, the MDC is conservatively used as a default EPC (USEPA 1992b). Due to the small number of samples at the sites, 95% UCLs were not calculated for the sites and the MDCs were used as the concentration in the cumulative risk screens.

Both carcinogenic and noncarcinogenic effects were evaluated in accordance with Section 6.1.1.2 of the SSP Guidance (Appendix A). If the cumulative cancer risk is greater than or equal to 1E-05 then a quantitative risk assessment should be performed if sufficient data is available for assessment. If sufficient data is not available for a quantitative risk assessment, further investigation or assessment of the site may be necessary. If the cumulative cancer risk for a site is less than 1E-05 and other screening criteria evaluated for the SSP are below established SSP thresholds, then NFA would be recommended for the site.

If the noncarcinogenic cumulative hazard index (HI) is greater than 1, there is a potential for adverse noncarcinogenic health effects. In such cases, COPCs are divided into categories based on the target organ affected (e.g., liver, kidney) and target organ-specific HIs are calculated. The results of the cumulative risk screens are interpreted as follows:

- If the cumulative HI for a site is greater than or equal to 0.5 for a target organ, then a quantitative risk assessment would be recommended for the site; or
- If the cumulative HI for a site is less than 0.5 for each target organ, and other screening criteria evaluated for the SSP are below established SSP thresholds, then NFA would be recommended for the site.

3.2.3 Lead and Iron Screening

If the lead concentration in soil exceeds 400 milligrams per kilogram (mg/kg) or the lead concentration in groundwater exceeds 15 micrograms per liter (µg/L), then the potential risk is evaluated using USEPA's Integrated Exposure Uptake Biokinetic (IEUBK) Model (USEPA 2007). The model predicts the probability of children expected to have blood levels of 10 microgram per deciliter (µg/dL) or greater. The lead risks are considered unacceptable if the child-blood lead level for more than 5% of children is estimated to be equal to or greater than the Center for Disease Control and Prevention (CDCP) threshold of 10 µg/dL.

If iron concentrations in soil or water result in an HQ of 0.5 or higher, then further assessment is required; this assessment consists of a "margin of exposure evaluation" where the estimated intake of iron is compared to the recommended daily allowance (RDA) and concentrations known to cause adverse health effects in children (NCEA 2006).

For the margin of exposure evaluation, the estimated iron intakes at the sites for the future resident child scenario for surface soil and total soil are calculated using the assumptions and equations provided in Appendix E. These estimated iron intake levels are then compared to the RDA for children (6 months to 10 years old) of 10 mg/day (NCEA 2006). In addition, utilizing an average child weight of 15 kg (USEPA 1989), the child intakes for surface soil and total soil are calculated and compared to the calculated provisional (reference dose) RfD of 0.7 mg/kg-day. If the estimated intake levels are above the RDA and calculated provisional RfD, further assessment of iron may be necessary.

3.2.4 SSL Comparison - Soil

3.2.4.1 Generic SSLs (Soil-to-groundwater Risk-based Screening Levels)

MDCs of chemicals found in subsurface soil will be compared to risk-based screening levels for leaching of chemicals to groundwater (i.e., soil-to-groundwater screening levels), as presented in the Regional Screening Table. A dilution attenuation factor of 20 (DAF 20), which accounts for attenuation processes in the subsurface soil zone above groundwater in addition to the mixing zone with groundwater, will be utilized in the screening.

3.2.4.2 Site-specific SSL Comparison

If organic chemicals are detected at concentrations greater than generic soil-to-groundwater screening levels, they may be evaluated utilizing site-specific SSLs calculated using site-specific physical soil characteristics.

3.2.5 Comparisons to ARARs

Based on the scope of sampling (media and constituents), ARARs potentially applicable to the SSP are associated with groundwater media sampled at SSAs 30 and 79 for the presence of asbestos and include the Federal Maximum Contaminant Level (MCL) for asbestos under the Safe Drinking Water Act.

Asbestos results for groundwater samples collected at SSAs 30 and 79 are compared to the MCL, if a detected concentration is greater than the MCL, then a recommendation is made whether further evaluation, investigation, etc. is appropriate.

3.2.6 Background Comparison

The final step in the risk screening process is the comparison of the MDCs of COPCs identified in soil to the established Facility-wide inorganic background point estimate concentrations for metals as shown in the following table (IT 2001).

Facility-Wide Background Point Estimates for Soil

Chemical	Minimum Concentration (mg/kg)	Maximum Concentration (mg/kg)	95% Upper Tolerance Limit (UTL) of the Mean (mg/kg)
Aluminum	3,620	47,900	40,041
Arsenic	1.2	35.9	15.8
Chromium	6.3	75.8	65.3
Iron	7,250	67,700	50,962
Manganese	16.7	2,040	2,543
Thallium	1.3	5	2.11
Vanadium	12.2	114	108

Based on the background comparison and other relevant information, a recommendation will be made as whether further investigation, response action, or NFA is appropriate for a site.

3.2.7 Uncertainties Analysis

Cumulative risk screening involves the use of assumptions, judgments, and incomplete data to varying degrees that contribute to the uncertainty of the final estimates of risk. Uncertainties result both from the use of assumptions or models, in lieu of actual data, and from the error inherent in the estimation of risk-related parameters; which may cause risk to be overestimated or underestimated. Based on the

uncertainties described below, this risk screening should not be construed as presenting an absolute estimate of risk to persons potentially exposed to COPCs.

Consideration of the uncertainty associated with various aspects of the cumulative risk screening allows better interpretation of the risk screening results and understanding of the potential adverse effects on human health. In general, the primary sources of uncertainty are associated with environmental sampling and analysis, selection of chemicals for evaluation, toxicological data, and exposure assessment. The effects of these uncertainties on the risk estimates are discussed below.

3.2.7.1 Environmental Sampling and Analysis

Uncertainty in environmental chemical analysis can stem from several sources including errors inherent in the sampling or analytical procedures. Analytical accuracy errors or sampling errors can result in rejection of data, which decreases the available data for use in the human health risk screening, or in the qualification of data, which increases the uncertainty in the detected chemical concentrations. There is uncertainty associated with chemicals reported in samples at concentrations below the RL but still included in data analysis and with those chemicals qualified with the letter J, indicating that the concentrations are estimated. Another issue involves the amount of blank-related contamination (i.e., B-qualified) data in the data set. The effects of using data with these uncertainties may overestimate or underestimate risks.

Another uncertainty associated with sampling and analysis concerns the inclusion of chemicals that are potentially present in the environment due to anthropogenic sources. For example, polynuclear aromatic hydrocarbons (PAH) are considered ubiquitous in soil from anthropogenic sources, such as the burning of fossil fuels, forest fires, and airborne particulates eroded from roadways and automobile tires. If such chemicals are not site-related, the risks attributable to site activities may be overestimated. This uncertainty may have a low-to-moderate effect on overestimating risks.

3.2.7.2 Selection of Chemicals for Evaluation

A comparison of MDCs to USEPA RSLs was conducted for surface soil and total soil. Chemicals whose MDCs were below their respective RSLs were not carried through the risk screening. It is unlikely that this risk-based screening excluded chemicals that should be included, based on the conservative exposure assumptions and conservatively derived toxicity criteria that are the basis of the RSLs. Although following this methodology does not provide a quantitative risk estimate for every chemical, it focuses the assessment on the chemicals accounting for the greatest risks (i.e., chemicals whose MDCs are above their respective RSLs) and the cumulative risk screening estimates would not be expected to be significantly greater. Utilizing the MDCs for the screening is conservative and could lead to a low-to-moderate overestimation of risk.

The use of the April 2009 RSLs rather than the December 2009 RSLs for the SSP human health risk screening could result in the inclusion or exclusion of chemicals based on outdated toxicity data. Therefore, to lessen the uncertainty associated with the use of these screening levels, an assessment of the data was conducted with respect to the December 2009 RSLs, which did not result in the identification of any additional COPCs for the sites.

Background concentrations of metal constituents in soil have been previously calculated and are available for use in the cumulative risk screening. However, as a conservative measure in the SSP, COPC selection excludes consideration of background data. Thus, it is unlikely that this risk-based screening excluded chemicals that should be included. Uncertainties associated with excluding the use of background data may lead to low-to-moderate overestimation of risks due to metals.

Uncertainty is introduced at the COPC selection step for chemicals that have adjusted RSLs or SSLs lower than the MDL. Specialized low-level analytical methods for SVOCs and explosive compounds

implemented for the SSP minimize this uncertainty. Essential nutrients, calcium, magnesium, potassium, and sodium were eliminated as COPCs per the SSP guidance (USEPA 2001).

3.2.7.3 Exposure Point Concentrations

In establishing EPCs, the concentrations of chemicals in the media evaluated are assumed to remain constant over time. Depending on the properties of the chemical and the media in which it was detected, this assumption could overestimate risks, depending on the degree of chemical transport to other media.

If fewer than eight samples are available, the MDC is conservatively used as a default EPC. Due to the small number of samples at the sites, 95% UCLs were not calculated for the sites and the MDCs were used as the concentration in the cumulative risk screens (USEPA 1992b). Using a value that is based on one sampling location (i.e., the maximum) has associated uncertainty and it adds a great deal of conservatism to the assessment.

3.2.7.4 Toxicological Data

Toxicological factors contributing to uncertainties associated with the human health risk screening process include the use of RSL age-adjusted ingestion and inhalation rates, the lack of toxicity criteria for some chemicals, and uncertainty associated with the lack of dermal risk estimates.

For some chemicals, toxicity criteria were unavailable. Although lack of published toxicity data could result in an underestimation of risk, an attempt is made to balance this uncertainty with the use of available toxicological data derived using conservative methodologies

Uncertainty is associated with using RSLs and SSLs because they do not consider dermal uptake. Given the conservative nature of the screening process, such as the use of the MDCs and RSLs, it is unlikely that omission of the dermal exposures in the risk screening process will result in the failure to identify a requirement for further evaluation or a response action.

3.3 ECOLOGICAL RISK SCREENING PROCESS

The purpose of the ecological risk screening is to provide conclusions and recommendations regarding potential ecological risk associated with sites. The Screening Level Ecological Risk Assessment (SLERA) was performed in accordance with the Final Process for Ecological Risk Assessment – Radford AAP (URS 2007). Refer to Appendix F.1 for a detailed description of the SLERA process utilized for the site evaluations and an example calculation.

3.3.1 Scope of Work

The SLERA includes Steps 1, 2, and 3a of Ecological Risk Assessment Guidance for Superfund [ERAGS] (USEPA 1997). Step 1 includes a screening-level problem formulation and ecological effects evaluation. Step 2 includes a preliminary exposure estimate and risk calculation. Step 3a reviews and refines the conservative assumptions used in the risk calculation (Step 2). The addition of Step 3a focuses the outcome of the SLERA, streamlines the review process, and functions as the initial basis for ecological risk management decision making. The scientific/management decision point (SMDP) reached from the ecological risk screening concludes that one of the following statements is true:

- There is adequate information to conclude that ecological risks are negligible and therefore there is no need for further action at the SSA on the basis of ecological risk;
- The information is not adequate to make a decision at this point and further refinement of data is needed to augment the ecological risk screening; or
- The information collected and presented indicates that a more thorough assessment is warranted.

In an effort to reduce redundancy, the approach to the risk screening, along with elements of the process that are common to the site areas, are summarized in the following sections and referred to in the document as appropriate.

3.3.2 Scope of Work

This ecological screening risk process includes Steps 1 and 2 of ERAGS (USEPA 1997). Step 1 includes a site visit, screening-level problem formulation, and ecological effects evaluation. Step 2 includes a preliminary exposure estimate and risk calculation. This approach will provide information pertinent to the potential interactions between site-related contamination and ecological resources upon which risk managers will be able to make conservative decisions regarding the ecological risk at individual SSAs.

3.3.3 Screening-Level Problem Formulation

The objectives of the ecological risk screening are to:

- Identify potentially complete exposure pathways between chemicals of potential ecological concern (COPECs) and receptors;
- Assess whether the COPECs exceed toxicological screening values that are considered to be protective of ecological receptors;
- Identify uncertainty and/or data gaps in the ecological risk screening; and
- Identify an appropriate SMDP for each SSA based on the ecological risk screening results.

3.3.4 Site Characterization

In addition to the information contained within the Site Background-Environmental Setting section for each site, additional site characterization is required for the ecological risk screening, which includes local ecological receptors (threatened and endangered species) and ecological resources. The results of the site reconnaissance for each site are also incorporated as part of the site characterization section.

A discussion of potential biota likely to use the site areas, and area-specific observations recorded as part of the site reconnaissance are included in each section. In addition, the Virginia Department of Game and Inland Fisheries (1999) survey recorded various species associated with the grassland communities at RFAAP. Based on their survey of the grassland habitats, the invertebrates (approximately 250 species) and birds (83 species) accounted for the majority of species observations at RFAAP (Virginia Department of Game and Inland Fisheries, 1999). Site-specific observations of wildlife are discussed in each site section.

The Virginia Department of Game and Inland Fisheries 1999 Installation-Wide Biological Survey identified three threatened wildlife species and two rare plant species (currently not on the 2009 Plant Watch List; http://www.dcr.virginia.gov/natural_heritage/documents/plantlist09.pdf) associated with RFAAP grassland communities. They include:

- Regal Fritillary Butterfly (*Speyeria idalia*);
- Henslow's Sparrow (*Ammodramus henslowii*);
- Loggerhead Shrike (*Lanius ludovicianus*);
- Midland Sedge (*Carex mescochorea*); and
- Shaggy False Gromwell (*Onosmodium hispidissimum*).

Threatened wildlife observations in 1999 at RFAAP included the Regal Fritillary Butterfly (Virginia Department of Game and Inland Fisheries, 1999). The Regal Fritillary Butterfly was documented in the east-central and eastern edges of the MMA.

3.3.5 Identification of Chemicals of Potential Ecological Concern

Since the sites consist of exclusively terrestrial grassland habitat or developed industrial areas, surface soil represents the potential exposure medium to ecological receptors.

3.3.5.1 Approach

Specific data sets collected from each site area were used to identify COPECs for that area because factors such as size, historical use, and current use affect potential habitat quality of the individual sites. Soil samples were collected from 0 to 6-inches bgs below gravel or organic layers at the surface except for VOC samples, which were collected from 6 to 12-inches bgs. This layer contains the zone of highest biological activity of soil organisms and the soil that is most frequently contacted by terrestrial biota. Although fossorial wildlife may be in contact with soil below 1 ft bgs, the preys of these animals are primarily associated with surficial soil. Furthermore, incidental exposure to the soil below 1 ft bgs is likely to be insignificant relative to surface soil exposure.

3.3.6 Identification of Exposure Pathways and Potential Receptors Analysis

Figure 3-1 provides the ecological conceptual site model (ECSM) developed for the terrestrial sites to identify potentially complete exposure pathways and potential receptors at the sites.

3.3.6.1 Terrestrial

The sites identified in this study are exclusively upland habitats that lack wetland and significant drainage features. Therefore, soil represents the potential exposure medium for ecological receptors. Potential ecological receptors may be exposed to COPECs in soil through the following exposure routes:

- Direct contact/absorption from soil;
- Direct ingestion of soil;
- Incidental ingestion of soil; and
- Direct ingestion of biota with accumulated COPECs.

Although receptors may be exposed to COPECs through inhalation or drinking surface water, sufficient literature regarding toxicity due to inhalation is lacking to evaluate such an exposure route. Given the potential mobility of COPECs between food web trophic levels, a number of terrestrial categories were selected. Individual receptor species were selected to represent five wildlife receptor categories and these species possess the following characteristics that are essential for assessing COPEC mobility within the food web:

- Highly likely to occur at the sites in relatively high abundance;
- Limited home range;
- Important role in the local food web; and
- Sufficient toxicological information is available in the literature.

Receptor categories and the species selected to represent the wildlife categories include:

- Plant communities;
- Soil invertebrate/microbial communities;
- Omnivorous birds: American Robin (*Turdus migratorius*);
- Carnivorous birds: Red-Tailed Hawk (*Buteo jamaicensis*);
- Herbivorous animals: Meadow Vole (*Microtus pennsylvanicus*);

- Omnivorous mammals: Red Fox (*Vulpes vulpes*); and
- Carnivorous mammals: Short-Tailed Shrew (*Blarina brevicauda*).

Specific species relevant to each site are identified in the individual ecological risk screening sections for each site where sampling occurred for the SSP.

3.3.7 Identification of Assessment and Measurement Endpoints

Assessment endpoints are explicit statements of ecological resources (entities) and attributes of those entities that are important to protect (USEPA 1998). Measurement endpoints represent quantifiable ecological characteristics that can be measured, interpreted, and related to ecological resources chosen as assessment endpoints. Assessment and measurement endpoints for the resources in the terrestrial sites are outlined below.

3.3.7.1 Terrestrial

Assessment and measurement endpoints for terrestrial receptors are as follows:

Assessment Endpoints	Measurement Endpoints
Survival, growth, and reproduction of terrestrial plants	MDCs for soil COPECs will be compared to concentrations representing no adverse effects thresholds to the survival of soil plant communities reported in the scientific literature
Survival, growth, and reproduction of soil invertebrates and microbial communities	MDCs for soil COPECs will be compared to concentrations representing no adverse effects thresholds to the survival of soil invertebrates or microbial communities reported in the scientific literature
Survival, growth, and reproduction of terrestrial wildlife (birds and mammals) populations and communities	MDCs for soil COPECs (non dioxin/furan) will be compared to no observable adverse effects levels (NOAELs) and lowest observable adverse effects levels (LOAELs) associated with effects on growth, reproduction, or survival of terrestrial wildlife Comparison of the maximum additive dose of dioxin/furan congeners ingested from soil and food to NOAEL and LOAEL doses associated with effects on growth, reproduction, or survival of terrestrial wildlife

3.3.8 Preliminary Exposure Estimate and Ecological Effects Evaluation

The preliminary exposure estimate and ecological effects evaluation considers the most conservative risk scenario. Highly conservative assumptions are used to estimate COPEC exposure to terrestrial receptors for pathways to be quantitatively evaluated. Conservative toxicity reference values (TRVs) are used to evaluate the ecological effects of exposure using the two approaches discussed below.

Risk is assessed by comparing the preliminary exposure estimate (MDC) of each detected chemical to the established TRV (detailed in Appendix F.1, Section 2.1). The preliminary risk is characterized in terms of a hazard quotient (HQ), which is expressed as:

HQ = MDC/TRV

where:

HQ = Hazard Quotient for the chemical (unitless)

MDC = Maximum Detected Concentration for chemical (mg/kg)

TRV = Screening Level for chemical (mg/kg)

An HQ of less than 1 indicates no or negligible risk. The potential for risk increases as the HQ increases above unity. However, this result should be considered in the context of other characteristics of the exposure area.

3.3.8.1 Direct Contact Approach

The maximum soil concentrations for detected chemicals are used as the preliminary exposure estimate concentrations to develop a conservative risk scenario for the direct contact pathway to soil invertebrates and terrestrial plants.

3.3.8.2 Dose Rate Modeling Approach

Preliminary risk characterization for wildlife receptors uses the conservative preliminary exposure estimate and ecological effects evaluation to characterize risk to potential terrestrial receptors. Risk is assessed by comparing the preliminary exposure estimate of each detected bioaccumulative chemical, as defined in Table 4-2 in *Bioaccumulative Testing and Interpretation for the Purpose of Sediment Quality Assessment, Status, and Needs*, EPA-823-R-00-001, to the TRV developed in the ecological effects evaluation. An example calculation for dose rate modeling is provided in Appendix F.1, Section 4.1, utilizing the equation below.

$$C_{TRV} = \frac{ADD \cdot BW}{(IR_{food} \ (BAF_{food} \cdot DF) + IR_s \ )AF}$$

where:

C_{TRV} = NOAEL or LOAEL-based screening level (mg chemical/kg soil)
ADD = NOAEL or LOAEL (mg COPEC/kg body weight-day)
BW = Minimum Body Weight of the receptor (kilogram - kg)
IR_{food} = Maximum Ingestion Rate of food (kg food ingested per day, dry weight)
BAF_{food} = Bioaccumulation Factor (BAF) of most contaminated dietary component used, specific to prey type and COPEC (ratio of mg of COPEC/kg fauna, wet weight to mg COPEC/ kg substrate, dry weight)
DF = Dietary Fraction (most contaminated dietary component assumed to be 100% of diet)
IR_s = Maximum Incidental Ingestion Rate of soil (kg substrate ingested per day, dry weight)
AF = 100% Area Use Factor

In the preliminary dose rate modeling approach, the maximum COPEC concentrations for detected bioaccumulative chemicals, along with assumptions of maximum ingestion rate, minimum body weight, 100% area use, and 100% bioavailability are used in the conservative risk scenario as the preliminary exposure estimate for soil and compared to the calculated TRVs.

3.3.9 Refined Exposure Estimate and Risk Characterization

Refined exposure estimates and ecological effects are developed for two major receptor categories having complete exposure pathways to be quantitatively evaluated: 1) direct contact to plants and invertebrates, and 2) wildlife ingestion (i.e., omnivorous birds and mammals, carnivorous birds and mammals, and herbivorous mammals). The refined exposure and risk characterization, Step 3a of ERAGS, reviews and

refines the conservative assumptions used in the risk calculation (USEPA 1997). In Step 3a, conservative assumptions used in the preliminary exposure and risk characterization are replaced with more environmentally realistic assumptions to evaluate risk posed by constituents identified in the preliminary risk characterization. The addition of Step 3a focuses the outcome of the SLERA, streamlines the review process, and functions as the initial basis for ecological risk management decision-making.

Generally for the refined exposure estimate and risk characterization, the 95% UCL is used as the exposure concentration rather than the MDC. Due to the limited number of samples at the sites, 95% UCLs were not calculated for the sites and the MDCs were used as the concentration in the refined exposure assessment

For the refined evaluation, risk is assessed by comparing the EPC (MDC) of each detected chemical to the TRV. The refined risk HQ is expressed as:

HQ = EPC/TRV

where:

HQ = Hazard Quotient for the chemical (unitless)

EPC = Calculated Exposure Point Concentration for chemical (mg/kg)

TRV = Screening Level for chemical (mg/kg)

An HQ of less than 1 indicates no or negligible risk. The potential for risk increases as the HQ increases above unity. However, this result should be considered in the context of other characteristics of the exposure area.

3.3.9.1 Direct Contact Approach

The refined exposure estimate for the direct contact pathway to soil invertebrate and microbial communities incorporates the 95% UCL as the exposure concentration for evaluating the COPECs using a conservative yet more realistic exposure assumption than MDCs. Due to the number of samples at the sites, a 95% UCL was not calculated; therefore, a refinement of the direct contact pathway was not conducted for the sites.

3.3.9.2 Dose Rate Modeling Approach

The conservative assumptions used in the preliminary exposure estimate and ecological effects evaluation were replaced with more environmentally realistic assumptions resulting in a more realistic estimate of potential risk. An example calculation for dose rate modeling is provided in Appendix F.1, Section 4.4, utilizing the equation below.

$$C_{TRV} = \frac{ADD \cdot BW}{(IR_{food} \sum (BAF_{food} \cdot DF) + IR_s) AF_{refined}}$$

where:

C_{TRV} = NOAEL or LOAEL-based screening level (mg chemical/kg soil)
ADD = NOAEL or LOAEL (mg COPEC/kg body weight-day)
BW = Average Body Weight of the receptor (kg)
IR_{food} = Average Ingestion Rate of food (kg food ingested per day, dry weight)
BAF_{food} = BAF of dietary component used, specific to prey type and COPEC (ratio of mg of COPEC/kg fauna, wet weight to mg COPEC/ kg substrate, dry weight)
DF = Dietary Fraction
IR_s = Average Incidental Ingestion Rate of soil (kg substrate ingested per day, dry weight)
$AF_{refined}$ = Refined Area Use Factor (detailed below)

The refined exposure estimates and ecological effects are developed for wildlife receptors having complete exposure pathways to be quantitatively evaluated (i.e., omnivorous birds, and carnivorous and herbivorous mammals). In the refined model, an average body weight and average ingestion rate are used. In addition, a realistic area use factor ($AF_{refined}$) was calculated as the ratio of the site area to the average home range of the receptor for each site as presented in the site-specific sections (Sections 4.0 through 8.0).

3.3.10 Risk Management – Scientific Management Decision Point

The findings of the ecological risk screen including site characterization and risk calculations are used as input to risk management decision-making for the sites. The SMDP reached from the ecological risk screening concludes that one of the following statements is true:

- There is adequate information to conclude that ecological risks are considered negligible and therefore there is no need for further action at the site on the basis of ecological risk;
- The information is not adequate to make a decision at this point and further refinement of data is needed to augment the ecological risk screening; or
- The information collected and presented indicates that a more thorough assessment is warranted.

3.3.11 Exposure and Risk Uncertainty Analysis

Based on this assessment, while factors such as lack of TRV and wildlife profile assumptions may create limited uncertainty, the overall result of the conservative nature of the process has produced a conservative assessment of potential ecological risks associated with the sites.

Assumptions and other factors that tend to overestimate, underestimate, or have an unknown effect on the findings of the ecological risk screening are presented below with a discussion of their uncertainty.

3.3.11.1 Data Quality

Insufficient sampling density or the analyte list may not provide a representative estimate of exposure to COPECs. Misrepresentation of exposure results in uncertainty and may lead to an overestimation or underestimation of risk. The extensive list of constituents analyzed reduces the likelihood of failing to identify a COPEC. Therefore, the uncertainty in the ecological risk screening results associated with data quality is likely minimal.

3.3.11.2 COPEC Bioavailability

Chemical analyses of exposure media measured the total levels of the COPECs rather than the more bioavailable toxic forms. The availability of the total concentrations alone assumes that the entire fraction is bioavailable and toxic. This is likely to be a very conservative assumption that varies from constituent to constituent. It was also assumed that no geochemical factors limited receptor exposure to, or the potential for toxic expression of COPECs. It is likely that COPECs may, to some degree, adsorb to fine-grained particles and/or complex with chemical complexing agents and organic ligands in the exposure media. Such actions may change the chemical speciation of the COPECs to a less toxic form, or reduce the concentrations of bioavailable chemicals and subsequent uptake by receptors. Therefore, risk is likely to be overestimated.

3.3.11.3 Wildlife Profile Assumptions

Dose rate models require a number of assumptions, which could result in either an overestimation or underestimation of risk to receptors. For example, body weights and ingestion rates are estimated from limited information. In addition, receptors are assumed to feed on specified food sources, although some such as the Red Fox may feed opportunistically on a greater variety of food types.

AFs were estimated based on the size of the sites relative to the home ranges of the receptors. However, the foraging of birds and mammals is not assessed simply by size, but rather a function of habitat suitability, habitat productivity, and species-specific foraging behaviors. Therefore, because habitat quality is not accounted for in estimating AF, the risk to terrestrial receptors in this assessment is likely to be overestimated.

3.3.11.4 Lack of Toxicological Data

The evaluation of ecological effects was limited in the direct contact and wildlife ingestion pathways due to limited toxicological data of the COPECs. The effects of many COPECs evaluated for the direct contact pathway to invertebrates and microbial communities were not quantified due to the lack of invertebrate derived TRVs. In addition, NOAEL and LOAEL TRVs were not available for receptors exposed to multiple COPECs. Therefore, due to the lack of toxicological data, the risk to potential receptors may be underestimated or unknown.

3.3.11.5 TRVs

NOAEL and LOAEL TRVs identified for wildlife receptors represent the most conservative application of toxicity test results identified from the literature. High uncertainty factors were used to provide TRVs representative of chronic exposure and sub-lethal effects. This approach is likely to overestimate the sensitivity of many ecological receptors and likely overestimates risk to potential receptors.

3.3.11.6 Exposure Point Concentrations

In establishing EPCs, the concentrations of chemicals in the media evaluated are assumed to remain constant over time. Depending on the properties of the chemical and the media in which it was detected, this assumption could overestimate risks, depending on the degree of chemical transport to other media.

Due to the small number of samples at the sites, 95% UCLs were not calculated for the sites and the MDCs were used as the concentration in the cumulative risk screens. Using a value that is based on one sampling location (i.e., the maximum) has associated uncertainty and it adds a great deal of conservatism to the assessment.

3.3.11.7 Hazard Quotients

Uncertainties in characterizing risks are primarily associated with the assumption that an HQ greater than 1 is an adequate indicator of the potential for ecological risks of individual chemicals. Given the use of conservative and realistic exposure and effects assumptions previously discussed, there is minimal uncertainty that the potential for ecological risks of individual chemicals are not identified in the ecological risk screening of the sites. Conversely, there is a strong possibility for false positive identification of ecological risks for some individual chemicals.

4.0 SSA 18 SULFURIC ACID RECOVERY PLANT, ACIDIC WASTEWATER TREATMENT FACILITY

4.1 SITE BACKGROUND – ENVIRONMENTAL SETTING

4.1.1 Site Description

SSA 18, the Sulfuric Acid Recovery (SAR) Plant (Oleum Plant), Acidic Wastewater Treatment Facility (Building 4434) is located in the northwest section of the main manufacturing area (MMA) approximately 400 to 600 ft east of the New River (Figure 1-1) and connected to SSA 72, the Oleum Plant Wastewater Sump via a gravity sewer (see Section 5.0). Sulfuric acid was recovered at the SAR Plant from spent acid generated in the trinitrotoluene (TNT) manufacturing area. Acidic wastewater generated by this process was conveyed by underground sewers to the acidic wastewater sump (SSA 72). Wastewater collected in the sump was then discharged by gravity sewer to the SAR Wastewater Treatment Facility for treatment.

Figure 4-1 shows the layout of the SSA 18. The acidic wastewater sump (SSA 72) and associated gravity sewer are assessed in Section 5.0. The gravity sewer daylights through a headwall and discharges into the steel, aboveground wastewater surge tank at SSA 18. A site photographic log for SSA 18 is included in Appendix B.

The SAR wastewater treatment facility encompasses an approximate 0.25 acre area (Figure 4-1). Ground surface elevations range from approximately 1,722 ft mean sea level (msl) to 1,726 ft msl, with a slight slope toward the north and the New River. Acidic wastewater discharged into the surge tank at the wastewater treatment facility was then pumped into the neutralization tank inside Building 4434 where it was neutralized with lime slurry, and processed through clarifiers and vacuum dry filters to remove calcium sulfate solids. Lime was delivered to the facility using a railroad spur located along the north side of Building 4434. Lime was unloaded from railroad cars into a hopper and conveyed by a screw conveyor and elevator into Building 4434 for slaking and transfer into the lime silos.

Effluent from the treatment plant originally discharged via a concrete outfall sump to the New River via Virginia Pollution Discharge Elimination System (VPDES) Outfall 004. This discharge was later modified in 1982 to discharge to Hazardous Waste Management Unit (HWMU) 7 for further treatment prior to discharge at Outfall 004 (Figure 4-2). In 1985, the discharge from wastewater treatment plant was rerouted to the C-Line Acidic Wastewater Treatment Facility for further treatment before discharge at Outfall 005. The new discharge line consisted of 8 inch diameter polytetrafluoroethylene (PTFE) lined, terra cotta above grade pipe, was installed from the concrete discharge sump to the C-Line facility.

Calcium sulfate sludge from the wastewater treatment process was disposed offsite or onsite at various SWMUs including calcium sulfate drying beds at SWMU 37, SWMU 38, and Area of Concern (AOC) Q where the sludge was dried. Dried sludge was then removed from the drying beds and delivered to RFAAP's onsite SWMU 27, 50, and HWMU 16 for disposal.

As presented on Figure 4-1, seven subunits were identified in the RCRA Facility Assessment (RFA) completed at the wastewater treatment facility (USEPA 1987) including:

- *Unit 18a Sheet Metal Wastewater Treatment Plant* – this structure contains the wastewater pH adjustment and neutralization tank (Unit 18c), vacuum drum filters (Unit 18b), and associated piping and pump system.
- *Unit 18b: Vacuum Drum Filters* – neutralized wastewater was processed through two rotary vacuum dry filters to remove calcium sulfate solids from the wastewater. Extracted solid material (calcium sulfate) was then collected and placed in calcium sulfate drying beds to be dried and then removed and delivered to onsite disposal areas.
- *Unit 18c: Lime Silos, Slakers, and Lime Slurry Mix Tank* – Lime (calcium oxide) was slaked and dumped into two conical silos located inside Building 4434, then fed into the lime-slurry mix

tank. The lime slurry was then pumped to the wastewater pH adjustment and neutralization tanks (Unit 18d), to be mixed with the acidic wastewater.

- *Unit 18d: Steel Wastewater Neutralization Tanks* – Acidic wastewater was pumped from the steel wastewater surge tank (Unit 18f) into two (2) 500 gallon pH adjustment neutralization tanks, then two 250 gallon wastewater neutralization tanks inside Building 4434. Lime slurry was added in these tanks to neutralize the wastewater.
- *Unit 18e; Concrete Clarifiers:*– Neutralized wastewater was pumped into the westernmost concrete clarifier, which contains a sweep/bottom solids rake designed to allow for calcium sulfate solids collection. Wastewater exiting this clarifier then overflowed into a second concrete clarifier. Each clarifier is 24 ft diameter and 6 ft deep. Residual solids from the clarifier bottoms were then pumped to the vacuum drum filters to remove residual solids. Effluent from the clarifiers was discharged into the concrete wastewater discharge station (Unit 18g).
- *Unit 18f; Steel Wastewater Surge Tank* – Acidic wastewater from the Sulfuric Acid Recovery Plant was pumped to an outdoor aboveground 20,000 gallon, closed top, steel wastewater surge tank. The surge tank is located within a concrete secondary containment area. Wastewater from the surge tank was then pumped into the pH adjustment and neutralization tanks inside Building 4434.
- *Unit 18g; Concrete Wastewater Discharge Station:* – Wastewater exiting the clarifiers flowed into a below grade, two compartment concrete sump, which served as the discharge point from the Treatment Facility. The sump dimensions are 16 ft long, 7 ft wide, and 7 ft deep to the foundation base. Effluent from this discharge station, most recently flowed to C-Line Acidic Wastewater Treatment Plant by an aboveground line.

4.1.2 Site History

The SAR Plant operated from 1976 until 1987, when these facilities were rendered inactive due to TNT manufacturing operations ceasing at RFAAP in 1986.

In 1994, the State Water Control Board (SWCB) issued RFAAP a Best Management Practice (BMP) Consent Order to correct total suspended solid issues in the Outfall 004 storm water ditch, which was also used to direct the wastewater discharge from SSA 18 from 1976 to 1982. During this period, storm water runoff from the nearby coal pile storage yard was also discharged directly into the Outfall 004 ditch, causing suspended solids and pH compliance issues. RFAAP implemented a BMP by dredging the length of the Outfall 004 ditch line to remove the residual coal fines, and placed stone rip-rap in the ditch to aid in stormwater flow distribution and solids deposition reduction. The BMP implemented satisfied the SWCB.

Plant wastewater utilities, acid area, and environmental personnel were consulted to determine if any spills or cleanup actions have occurred at SSA 18. No employees recalled any chemical or wastewater spills or cleanup actions from this facility during their years of operation.

Aerial photographs of the SSA 18 area for 1949, 1962, 1971, 1986, and 1990 are presented on Figures 4-3, 4-4, 4-5, 4-6, and 4-7, respectively. Photographs from 1949 and 1962 show the site area is undeveloped and surrounding by storage buildings related to manufacturing operations. The 1971 photograph shows the SAR Plant under construction and the SSA 18 area remaining undeveloped. More recent aerial photographs from 1986 and 1990 show the SSA 18 area in its general current configuration.

4.1.3 Surface Water

The closest natural surface water body to SSA 18 is the New River, which is located approximately 400 to 600 ft west/northwest of the site. SSA 18 is located at elevations above the 100 year floodplain of the New River (USHUD 1978).

At SSA 18, the concrete floor of Building 4434 has 4-inch cast iron floor drains that connect to a 6-inch cast iron drain leading to the sump at Unit 18g. Four inch floor drains are located in the vacuum pump and lime slurry tank areas. Condensate and hub drains also connect to the floor drains.

Stormwater drains or catch basins are not located in the immediate area of SSA 18. A drainage ditch is located approximately 30 to 60 ft east of units 18e and 18f and may receive some stormwater runoff from the easternmost portion of the site. This drainage ditch extends northeast for approximately 200 ft ending at the manmade ditch associated with VPDES Outfall 004. The outfall ditch, which originates approximately 1,400 ft east of the site, typically contains flowing surface water and ends at Outfall 004 located approximately 400 ft west of the site.

4.1.4 Soil

According to the *Soil Survey of Montgomery County, Virginia* (USDA 1985), the area of SSA 18 is underlain by Unison-Urban Land complex soil. This soil has moderate permeability and medium-to-strong acidity. Soil classification is not practical in urban land areas because the original soil has been physically altered or obscured. A typical profile of undisturbed Unison soil consists of a 15-inch thick surface layer of dark brown loam and a 43-inch thick subsoil of yellowish-red, sticky plastic clay underlain by a red sandy clay loam to a depth of 58 inches. In general, permeability is moderate in Unison soil, natural fertility is low, and organic matter content is low to moderate.

4.1.5 Geology

Geologic conditions were previously investigated in the Oleum Plant and surrounding areas for an Environmental Baseline Study (EBS) conducted by Ecology and the Environment, Inc. (EEI) in 2007 (EEI 2007). This investigation indicated that the site area is underlain by approximately 25 to 30 ft of alluvial terrace deposits consisting of silt and clay (ML/CL) to depths up to 19 ft bgs underlain by silty sand (SM). Limestone/dolomite bedrock of the Elbrook Formation is present at approximate depths of 25 to 30 ft bgs. Appendix D.2.2 includes boring logs for the EBS investigation conducted by EEI. Six shallow borings (7 to 10 ft bgs) were completed for the SSP investigation at SSA 18 and confirmed the presence of fine-grained terrace deposits (silt) to the depths explored. Appendix D.2.1 includes boring logs for the SSP Investigation.

4.1.6 Hydrogeology

Six monitoring wells were installed for the EBS conducted in the Oleum Plant and surrounding areas by EEI (EEI 2007). Figure 4-8 shows the locations of the monitoring wells. Groundwater monitoring well construction and water level measurement data from the EBS are summarized in Table 4-1. Groundwater was encountered under water table conditions within the lower portion of the alluvium in the area of SSA 18, where measured static water levels were approximately 24 to 26 ft bgs. South of SSA 18 at higher elevations in the SAR Plant area, groundwater was encountered within bedrock but not alluvium with potentiometric levels greater than 30 ft bgs. In the EBS Report, EEI indicated an implied groundwater flow direction of approximately 15 degrees north of west based on triangulation of potentiometric data from the three monitoring wells screened within bedrock. A similar groundwater flow direction was implied for groundwater within the alluvium. Appendix D.2.2 includes boring logs and construction data for monitoring wells installed for the EBS.

4.2 PREVIOUS INVESTIGATIONS

4.2.1 RCRA Facility Assessment – USEPA 1987

An assessment was conducted at SSA 18 (listed as Unit 18 in RFA) to evaluate potential hazardous waste or hazardous chemical releases and implement corrective actions, as necessary. The assessment consisted of a preliminary review and evaluation of available site information, personnel interviews, and a visual inspection of the site. Environmental samples were not collected at SSA 18 as part of the inspection. The assessment identified seven units at SSA 18 including: sheet metal fabricated building (unit a), vacuum

filters (unit b), lime silos (unit c), neutralization tank (unit d), concrete clarifiers (unit e), steel feed tank (unit f), and concrete discharge station (unit g). The RFA indicated that no visible signs of releases were observed during the site inspection.

4.2.2 Acid Sewer Survey

From 1998 to 2000, an Acid Sewer Survey and Investigation was conducted on the entire RFAAP acid sewer infrastructure to determine the condition of the sewers. Videotaping of the interior lines was conducted and submitted to the USEPA. An assessment of the 260 ft long 6-inch diameter plastic, gravity acid sewer line that extends from the acidic wastewater sump (SSA 72) to the SAR wastewater treatment plant (SSA 18) was not conducted as part of the acid sewer survey. Deteriorated or broken sections of sewer lines were repaired or replaced within active areas. No actions were undertaken in the area of SSA 18 due to the inactive status of the SAR Plant wastewater system and treatment facility.

4.2.3 Oleum Plant Environmental Baseline Study – Ecology and Environment, Inc. 2007

The study area for this EBS was focused on the Oleum Plant area and included the collection of soil and groundwater samples from a study area encompassing SSA 18. Specific locations sampled that may be used to evaluate potential releases from SSA 18 included: soil boring SB08/monitoring well MW04 (collocated) located north of Unit 18g and monitoring well MW03 located west/northwest and downgradient of SSA 18 (Figure 4-8). The study also included the installation of wells at locations (MW05 and MW06) that are upgradient of SSA 18. Soil and groundwater samples were analyzed for TCL VOCs, TCL SVOCs, TCL PCBs, TLC pesticides, explosives, TAL metals, nitrate/nitrite, and perchlorate (groundwater).

Detected results for the two subsurface soil samples collected from soil boring SB08 are summarized in Table 4-2. Subsurface soil samples were collected from depth intervals of 2 to 4 ft bgs and 16 to 18 ft bgs. VOCs, Aroclor 1254, pesticides, and metals were detected in one or more of the soil samples. Detected constituent concentrations were below their adjusted R-RSLs or background point estimates, with the exception of arsenic, which was detected at concentrations above its I-RSL but below the facility's background point estimate of 15.8 mg/kg.

Detected results for the groundwater samples collected from monitoring wells MW03, MW04, MW05, and MW06 are summarized in Table 4-3. VOCs, SVOCs, pesticides, explosives, and metals were detected in one or more of these samples. Perchlorate was detected in each of the samples collected from these wells. With the exception of MW06, chloroform was detected in each of the groundwater samples above its adjusted T-RSL but below the MCL for trihalomethanes. Perchlorate was detected in sample MW04 at a concentration of 3.59 µg/L, which was above the adjusted T-RSL.

4.3 WORK PLAN DATA GAP ANALYSIS

The data gap analysis presented in WPA 028 indicated that limited soil sampling and analyses had occurred at SSA 18 (URS 2009). The data gap analysis completed for SSA 18 identified data gaps for characterizing releases to surface soil and subsurface soil, and characterizing physical and geotechnical properties of site soil.

4.3.1 Release Assessment to Surface Soil

An assessment of potential releases to surface soil had not been performed at SSA 18. This data gap was filled by collecting surface soil samples for chemical analysis from the wastewater treatment facility area. Field investigation activities are discussed in Section 4.4.

4.3.2 Release Assessment to Subsurface Soil

Limited soil sampling (soil boring SB08) had been conducted in the area of SSA 18 to assess releases to subsurface soil. This data gap was filled by completing additional soil borings in the wastewater

treatment facility and collecting subsurface soil samples for chemical analysis. Field investigation activities are discussed in Section 4.4.

4.3.3 Release Assessment to Groundwater

Potential releases to groundwater were evaluated using existing groundwater data collected in the site area in 2007. Additional release assessments to groundwater were conducted by evaluating subsurface soil data and comparing these data to USEPA Region III soil-to-groundwater SSLs.

4.3.4 Physical Soil Testing

Two representative samples of soil at the site (one surface sample and one subsurface sample) were submitted for analysis of physical and geotechnical properties, as described in Section 4.4.

4.3.5 Summary of Data Gaps

The following table summarizes these identified data gaps and the completion plan to fill the data gaps from WPA 028 (URS 2009).

SSA 18 - Summary of Data Gap Analysis and Completion Plan

DATA GAPS			COMPLETION PLAN
Item	**Physical**	**Chemical**	
Releases to Soil	Surface Soil Samples	Chemical Data –VOCs, SVOCs, PCBs, pesticides, explosives, and metals	Collect surface soil samples in area of SSA 18 for chemical analysis
	Subsurface Soil Samples	Chemical Data –VOCs, SVOCs, PCBs, pesticides, explosives, and metals	Collect subsurface soil samples from area of SSA 18 for chemical analysis.
Releases to Groundwater	Subsurface Soil Samples	Use subsurface soil sample data and existing groundwater data	Compare subsurface soil data to soil-to-groundwater SSLs and compare existing groundwater data to T-RSLs.
Site-Wide Soil Characteristics	Physical / Geotechnical Properties	pH, total organic carbon (TOC), grain size, Atterberg Limits, and moisture content	Collect samples for geotechnical and physical property analysis.

4.4 SSP FIELD ACTIVITIES

Six borings were advanced in and around the site to evaluate for the presence or absence of chemicals in soil potentially associated with historical activities at the sites (Figure 4-9). Borings were advanced using a skid steer-mounted, direct-push Geoprobe® unit. Discrete samples were collected from surface and/or intermediate intervals for the borings as summarized below.

SSAs 18 and 72 Sample and Boring Information

Boring ID	Total Depth of Boring (ft bgs)	Surface Sample ID	Sample Depth (ft bgs)	Intermediate Sample ID	Sample Depth (ft bgs)
18SB1	10	18SB1A	0-1	18SB1B	8-10
18SB2	7.0	18SB2A	0-1	18SB2B	5-7
18SB3	7.0	18SB3A	0-1	18SB3B	5-7
18SB4	7.0	18SB4A	0-1	18SB4B	5-7

Boring ID	Total Depth of Boring (ft bgs)	Surface Sample ID	Sample Depth (ft bgs)	Intermediate Sample ID	Sample Depth (ft bgs)
18SB5	8.0	18SB5A	0-1	18SB5B	6-8
18SB6	10	18SB6A	0-1	18SB6B	8-10

Six surface soil samples were collected from the following locations to evaluate potential releases at SSA 18:

- Sample 18SB1A was collected adjacent to the concrete discharge station (Unit 18g) near the concrete clarifiers (Unit 18e);
- Sample 18SB2A was collected between the aboveground surge tank (Unit 18f) and Building 4343 in the area where aboveground influent piping runs from the containment area at Unit 18f to the building;
- Sample 18SB3A was collected between Building 4343 and the railroad spur where material unloading occurred from railcars;
- Sample 18SB4A was collected immediately south of the secondary containment area for the aboveground surge tank (Unit 18f) adjacent to where the aboveground influent acid sewer line enters the secondary containment area;
- Sample 18SB5A was collected from the drainage ditch/swale located east of the wastewater treatment facility; and
- Sample 18SB6A was collected from along the original alignment of the effluent discharge line between the concrete discharge station (Unit 18g) and the Outfall 004 drainage ditch.

Six subsurface soil samples were collected from the following locations to evaluate potential releases at SSA 18:

- Sample 18SB1B was collected from a direct push boring completed at the location of surface soil sample 18SB1A at a depth below the bottom elevation of the sump (1,720 ft msl) at a depth of 8 to 10 ft bgs;
- Sample 18SB2B was collected from a direct push boring completed at the location of surface soil sample 18SB2A at a depth of 5 to 7 ft bgs;
- Sample 18SB3B was collected from a direct push boring completed at the location of surface soil sample 18SB3A at a depth of 5 to 7 ft bgs;
- Sample 18SB4B was collected from a direct push boring completed at the location of surface soil sample 18SB4A at a depth of 5 to 7 ft bgs;
- Sample 18SB5B was collected from a direct push boring completed at the location of surface soil sample 18SB5A at a depth of 6 to 8 ft bgs; and
- Sample 18SB6B was collected from a direct push boring completed along the original alignment of the effluent discharge line between the concrete discharge station (Unit 18g) and the Outfall 004 drainage ditch. The sample was collected at a depth below the bottom of the effluent line from an interval of 8 to 10 ft bgs;

Soil samples were analyzed for TCL VOCs, TCL SVOCs, TCL PCBs, TCL pesticides, explosives (including nitroglycerin and PETN), and TAL inorganics. Analytical results (detected chemicals) used for the SSP are summarized in Table 4-4.

Two samples were collected for physical testing (one surface soil sample (18SB2A) and one subsurface soil sample (18SB1B)). Physical testing for each sample included: grain size analysis, Atterberg limits, soil moisture content, TOC, and pH. Analytical results for these samples are summarized in Table 2-1 and the complete results are provided in Appendix D.1.

Modifications to the proposed field investigation in WPA 028 during field sampling activities were limited to the collection of surface soil sample at 18SB8 and a subsurface sample at 18SB5. WPA 028 identified only collection of a subsurface sample at 18SB8 and a surface sample at 18SB5. For data completeness, the additional samples were collected.

4.5 CONCEPTUAL SITE MODEL (CSM)

A CSM for SSA 18 is presented on Figure 4-10. The site is located on an alluvial terrace approximately 400 to 600 ft east of the New River. Approximately 30 ft of alluvial terrace deposits overlies limestone/dolomite bedrock at the site. Groundwater is present within the lower portion of the alluvium and within underlying bedrock at depths of approximately 25 to 26 ft bgs.

Potential constituent sources at the site are related to handling and treatment of acidic wastewater, discharge of neutralized wastewater and handling materials used for wastewater treatment. Potentially affected media at the site include:

- Surface soil from leaks or spills from related to outside storage and treatment of wastewater in aboveground tanks and structures or from materials handling;
- Subsurface soil from any constituents released to surface soil; and
- Groundwater via leaching of constituents from subsurface soil.

Although current and likely future land-use scenarios are limited to industrial operations, both residential and industrial scenarios will be evaluated in the SSP human health screening (USEPA 2001).

SSA 18 is exclusively an upland habitat that lacks wetland and significant onsite drainage features. Therefore, soil represents the potential exposure medium for ecological receptors. An ECSM is provided in Section 3.0, Figure 3-1.

4.6 HUMAN HEALTH RISK SCREENING

4.6.1 Identification of COPCs

4.6.1.1 Soil

Tables 4-5 and 4-6 present the results of the COPC evaluations for surface soil and total soil, respectively. SSP samples and two samples from boring SB08 (see Table 4-2) from the Oleum Plant Environmental Baseline Study are used in the screening. COPCs identified for surface soil and total soil included:

TAL metals: aluminum, arsenic, cobalt, iron, manganese, vanadium;

TCL Pesticides: none;

TCL PCBs: none;

TCL VOCs: none;

TAL SVOCs: none; and

Explosives: not detected.

4.6.1.2 Groundwater

Due to the locations of monitoring well MW04 located north of Unit 18g and monitoring well MW03 located west/northwest and downgradient of SSA 18, the groundwater data from these locations will be used to evaluate potential releases to groundwater from the site. As presented on Table 4-3, COPCs identified in groundwater included:

TAL metals: none;

TCL Pesticides: not detected;

TCL PCBs: not detected;

TCL VOCs: chloroform;

TAL SVOCs: not detected;

Explosives: none; and

Perchlorate: perchlorate.

Potential releases to groundwater were also assessed by evaluating subsurface soil data and comparison of these data to USEPA risk-based soil-to-groundwater SSLs included in the Regional Screening Table (USEPA 2009; Section 4.6.4).

4.6.2 Cumulative Risk Screen

4.6.2.1 Soil

The cumulative risk screening for surface soil is presented on Table 4-7. The cumulative risk screening for total soil is presented on Table 4-8. A summary of the screening results is presented below:

Cumulative Human Health Risk Screening Results for Soil

	Surface Soil			Total Soil		
	Above/ Below/ Equal	**Risk/ Hazard**	**Drivers**	**Above/ Below/ Equal**	**Risk/ Hazard**	**Drivers**
Residential Risk	Below	7.E-06	--	Below	8.E-06	--
Industrial Risk	Below	2.E-06	--	Below	2.E-06	--
Residential Hazard	Above	2	Aluminum, Cobalt, Iron, Manganese	Above	4	Aluminum, Cobalt, Iron, Manganese
Industrial Hazard	Below	0.2	--	Below	0.3	--

*Note: Above, below, or equal to established SSP risk and hazard levels.

The cumulative human health risk screens were below the established SSP risk level of 1E-05 and above the established SSP hazard level of 1 for the residential scenario for surface and total soil. Cumulative risk screenings were below the established SSP risk and hazard levels of 1E-05 and 1, respectively, for the industrial scenarios. The hazard drivers identified in the table above are those chemicals that primarily contribute to HIs greater than the established SSP hazard level of 1.

Due to multiple chemicals contributing to a residential HI greater than 1, as presented on Table 4-7 (surface soil) and Table 4-8 (total soil), the HIs have been segregated based on primary target organs for chronic exposure. The HI segregation for surface and total soil resulted in values equal to or higher than the cumulative SSP HI target organ threshold of 0.5 for the following target organs: blood, central nervous system (CNS), gastrointestinal (GI) tract, and liver.

4.6.2.2 Groundwater

The cumulative risk screening for groundwater is presented on Table 4-9. A summary of the screening results is presented below:

Cumulative Human Health Risk Screening Results for SSA 18 – Groundwater

	Above/ Below/ Equal	Risk/ Hazard	Drivers
Risk	Above	9E-05	Chloroform
Hazard	Below	0.1	--

*Note: Above, below, or equal to established SSP risk and hazard levels.

The cumulative human health risk screen was below the established SSP hazard level of 1 and above the established SSP risk level 1E-05 for groundwater.

4.6.3 Lead and Iron Screening

Detected soil lead concentrations at the site were below 400 mg/kg; therefore, lead modeling was not conducted for the site.

Since iron concentrations in soil result in an HQ of greater than 0.5, further assessment is required. This assessment consists of a "margin of exposure evaluation" where the estimated intake of iron is compared to the RDA and concentrations known to cause adverse health effects in children (NCEA 2006). Appendix E.1 presents the margin of exposure evaluation for surface soil and total soil. A summary of the results for SSA 18 is presented below.

Iron Margin of Exposure Evaluation – Future Child Resident

	Surface Soil			Total Soil		
	Above/ Below	**Estimated Site Intake**	**Exposure Screening Level**	**Above/ Below**	**Estimated Site Intake**	**Exposure Screening Level**
RDA Screen (mg/day)	Below	6	10	Below	7	10
Provisional Reference Dose (RfD) Screen (mg/kg-day)	Below	0.4	0.7	Below	0.5	0.7

The iron exposure assessment results for the hypothetical future child resident were below the applicable iron margin of exposure screening criteria for SSA 18.

4.6.4 SSL Comparison - Soil

4.6.4.1 Generic SSLs (Soil-to-groundwater Risk-based Screening Levels)

An SSL screening was conducted for detected chemicals in subsurface soil to evaluate the potential for leaching of chemicals from soil to groundwater. As presented in Table 4-9, the detected concentrations for each chemical in subsurface soil were compared to their USEPA risk-based SSLs included in the Regional Screening Table (USEPA 2009), if available. The comparisons of subsurface soil concentrations to generic SSLs (DAF 20) for detected chemicals indicated that arsenic, cobalt, iron, and manganese were above their SSLs (Table 4-10).

4.6.4.2 Site-specific SSL Comparison

Organic chemical were not detected in subsurface soil at concentrations above their generic SSLs (DAF 20); therefore, site-specific SSLs were not calculated.

4.6.5 Background Comparison - Soil

The final step in the risk screening process is the comparison of the MDCs of COPCs identified in soil to the established Facility-wide inorganic background point estimate concentrations for metals (IT 2001). No metals identified as COPCs in surface soil and total soil were above their background point estimates (Table 4-11).

4.6.6 Human Health Risk Screening Summary

Soil COPCs with screening values were limited to metals. The cumulative human health risk screens were below the established SSP risk level of 1E-05 and above hazard level of 1.0 for the residential scenario for surface and total soil. Cumulative risk screenings were below the established SSP risk and hazard levels of 1E-05 and 1.0, respectively, for the industrial scenario.

The noncarcinogenic residential soil hazard screenings were above the established SSP threshold (HI=1) for surface and total soil primarily due to metals. As presented Table 4-11, metal COPCs (aluminum, arsenic, cobalt, iron, manganese, and vanadium) were below background point estimates and are therefore not a concern at the site.

Detected lead concentrations at the site were below 400 mg/kg; therefore, lead modeling was not conducted for the site. The iron exposure assessment results for the hypothetical future child resident were below the applicable iron margin of exposure screening criteria for SSA 18.

The comparisons of subsurface soil to generic risk-based SSLs (DAF 20) for detected chemicals indicated that arsenic, cobalt, and iron were above their SSLs (Table 4-10). Although arsenic, cobalt, and iron were above their SSLs, detected concentrations were below their background point estimates and are not considered a concern at the site.

Groundwater COPCs were limited to chloroform and perchlorate. The noncarcinogenic hazard screening for groundwater was below the established SSP threshold (HI=1).

The cumulative human health risk screen was below the established SSP hazard level of 1 and above the SSP risk level 1E-05 and for groundwater. The maximum detected chloroform concentration (18 µg/L) is above the tap water RSL but below the MCL for trihalomethanes. Cholorform was also detected in upgradient wells.

With regard to groundwater detections of chloroform in groundwater at the site, it is important to note that studies and groundwater investigations have shown the presence of chloroform in most groundwater samples collected at the facility regardless of location. The concentrations of chloroform detected in monitoring wells at the site are concentrations below the range of chloroform levels present in the water transmitted through water lines at the facility. The site is located downgradient of developed areas

containing water lines that could be leaking, which may have been the source of chloroform. No additional assessment of chloroform at the site is required.

4.7 ECOLOGICAL RISK SCREENING

4.7.1 Ecological Site Characterization

An overview of the site physiography, water resources, soil, and geology for SSA 18 is presented in Section 4.1. The SAR wastewater treatment facility encompasses an approximate 0.25 acre area (Figure 4-1) consisting primarily of concrete impervious areas, tanks, and buildings; therefore, the site provides minimal habitat value to wildlife potentially occurring in the area.

Observations made during the site reconnaissance indicate that the area surrounding SSA 18 is a viable herbaceous vegetation community (see photographic log – Appendix B). Signs of chemical vegetative stress were not observed during the reconnaissance. Based on information from the Installation-Wide Biological Survey (ref) and observations made during the site reconnaissance, the grassland vegetative community at the site is typical of other meadow-grassed areas that are regularly maintained at RFAAP.

The habitat could support some ecological use (i.e., shelter and foraging) by some smaller common species in the area. Given its limited size, impervious area, tanks, and buildings, few individuals would be expected to utilize the area for a lengthy period.

Threatened, rare, or endangered species were not observed during the site reconnaissance. These species are not likely to be present within the boundaries of the site. Threatened, rare, and endangered species information for RFAAP is discussed in Section 3.3.4.

4.7.1.1 Data Organization

The following table identifies the soil samples used for the SLERA. These samples were analyzed for TAL inorganics, TCL pesticides, TCL PCBs, TCL VOCs, TCL SVOCs, and explosives (including nitroglycerin and PETN). Refer to Table 2-2 for a detailed list of samples and analytes.

Soil Samples Evaluated for SLERA

SSAs 18 and 72	
18SB1A	18SB4A
18SB2A	18SB5A
18SB3A	18SB6A

Detected chemical occurrence and distribution tables for surface soil are presented in Table F.2-1. Refer to Table 4-1 for a complete list of results for detected analytes. In addition, to evaluate the adequate sensitivity of the MDL for the necessary screening levels, Table F.2-2 provides a screening of the maximum MDL versus available ecological screening values for non-detected chemicals in surface soil.

4.7.1.2 Ecological Conceptual Site Model (ECSM)

The terrestrial ECSM is presented on Figure 3-1. Surface soil is a potential exposure medium of concern based on historical activities at the site. Based on the site characterization and data, the terrestrial receptor exposure to surface soil pathway exists.

4.7.2 Preliminary Exposure Estimate and Ecological Effects Evaluation

The preliminary exposure estimate and ecological effects evaluation considers the most conservative risk scenario. Highly conservative assumptions are used to estimate COPEC exposure to terrestrial receptors for pathways to be quantitatively evaluated. Conservative TRVs are used to evaluate the ecological effects of exposure using the two approaches discussed below.

4.7.2.1 Direct Contact Approach

The MDC for detected chemicals are used as the preliminary exposure estimate concentrations to develop a conservative risk scenario for the direct contact pathway to soil invertebrates and terrestrial plants. The results of the preliminary exposure assessments for plants and invertebrates are provided below.

Terrestrial Plants

Preliminary direct contact HQs calculated for plants are presented in Table F.2-6 for detected chemicals. Of the detected chemicals for which screening values were available, the concentrations of aluminum, chromium, cobalt, manganese, and vanadium resulted in HQ values that were greater than 1.

Soil Invertebrates and Microbial Communities

Preliminary direct contact HQs calculated for invertebrates are presented in Table F.2-8 for detected chemicals. Of the detected chemicals for which screening values were available, the concentrations of chromium, iron, manganese, vanadium, and cyanide resulted in HQ values that were greater than 1.

4.7.2.2 Dose Rate Modeling Approach

Quantitative risk characterization for terrestrial wildlife is limited to direct ingestion of biota and incidental ingestion of soil. The preliminary risks for detected bioaccumulative chemicals are summarized in Table F.2-24 for each terrestrial wildlife receptor and the chemicals with HQs greater than 1 are characterized as follows:

Receptor	NOAEL Only HQ>1	NOAEL and LOAEL HQ>1
Meadow Vole	cadmium	arsenic, selenium
Short-tailed Shrew	arsenic, cadmium, chromium	none
Red Fox	arsenic, chromium, lead, selenium, zinc	cadmium
American Robin	cadmium	chromium, lead, zinc
Red-tailed Hawk	none	none

4.7.3 Refined Exposure Estimate and Risk Characterization

4.7.3.1 Direct Contact Approach

The refined exposure estimate for the direct contact pathway to soil invertebrate and microbial communities incorporates the 95% UCL as the exposure concentration for evaluating the COPECs using a conservative yet more realistic exposure assumption than MDCs. Due to the number of samples at the site, a 95% UCL was not calculated; therefore, a refinement of the direct contact pathway was not conducted.

4.7.3.2 Dose Rate Modeling Approach

The refined exposure estimates and ecological effects are developed for wildlife receptors having complete exposure pathways to be quantitatively evaluated (i.e., omnivorous birds, and carnivorous and herbivorous mammals). In the refined model, an average body weight, average ingestion rate, and a 95% UCL as the EPC are used. Due to the small number of samples at the site, a 95% UCL was not calculated for the site and the MDC was used as the EPC for the refinement. Refined receptor-specific exposure parameters are presented on Table F.2-9 (Appendix F.2). In addition, a realistic $AF_{refined}$ was calculated as the ratio of the site area to the average home range of the receptor which is also presented in Table F.2-9 (Appendix F.2). A summary of the results of the refined exposure assessment for terrestrial wildlife is provided below.

Terrestrial Wildlife

The refined risk characterization results are presented in Table F.2-24 and summarized below for each of the receptors with chemical HQs greater than 1:

Receptor	NOAEL Only HQ>1	NOAEL and LOAEL HQ>1
Meadow Vole	none	none
Short-tailed Shrew	none	none
Red Fox	none	none
American Robin	none	none
Red-tailed Hawk	none	none

4.7.4 Background Comparison - Soil

The final step in the risk screening process is the comparison of the MDCs of COPECs identified in soil to the established Facility-wide inorganic background point estimate concentrations for metals (IT 2001). No MDCs of COPECs were identified above their background point estimates (Table 4-10). Note that background point estimates were not available for selenium and cyanide; therefore, background comparisons were not conducted.

4.7.5 Risk Management – Scientific Management Decision Point

The findings of the ecological risk screen including site characterization and risk calculations are used as input to risk management decision-making for the site. The SMDP reached from the ecological risk screening concludes that one of the following statements is true:

- There is adequate information to conclude that ecological risks are considered negligible and therefore there is no need for further action at the site on the basis of ecological risk;
- The information is not adequate to make a decision at this point and further refinement of data is needed to augment the ecological risk screening; or
- The information collected and presented indicates that a more thorough assessment is warranted.

Terrestrial plant COPECs with HQs greater than 1 included: aluminum (HQ=480), chromium (HQ=38), cobalt (HQ=1.2), manganese (HQ=4.5), and vanadium (HQ=28). Aluminum, chromium, cobalt, manganese, and vanadium are below background point estimates (Table 4-10); therefore, these chemicals are not considered site-related.

Soil invertebrates and microbial processes COPECs with HQs greater than 1 included chromium (HQ=95), iron (HQ=160), manganese (HQ=2.2), vanadium (HQ=2.8), and cyanide (HQ=2). Chromium, iron, manganese, and vanadium are below background point estimates (Table 4-10); therefore, these chemicals are not considered site-related. Although the HQ for cyanide (2) is greater than 1 and no background point estimate is available, this risk considered to present low to negligible risk to invertebrates and microbial processes at the site.

The refined risk characterization for wildlife resulted in the identification of no chemicals with a LOAEL-based HQ greater than 1.

After consideration of the limited metals concentrations primarily below background point estimates but above ecological screening levels for plants and invertebrates and the lack of refined LOAEL-based HQs greater than 1 for terrestrial receptors, the SMDP is the following:

There is adequate information to conclude that ecological risks are considered negligible and therefore there is no need for further action at the site on the basis of ecological risk.

4.8 CONCLUSIONS AND RECOMMENDATION

No further action is recommended for SSA 18 based on the following results of the SSP screening:

- Cumulative risk and hazard screening results for industrial scenarios are below SSP thresholds for target risk and hazards;
- Site-related cumulative risk and hazard screening results for residential scenarios are below SSP thresholds for target risk and hazards;
- Chloroform detections in groundwater are not considered site related;
- The MDC for lead in soil is below the SSP screening level of 400 mg/kg;
- The iron exposure assessment results for the hypothetical future child resident are below the applicable iron margin of exposure screening criteria;
- Chemicals at concentrations above their generic SSLs are limited to metals at concentrations below background and therefore not considered a concern at the site; and
- There is adequate information to conclude that ecological risks are considered negligible and therefore there is no need for further action at SSA 18 based on ecological risk.

Notes:

CAS = Chemical Abstracts Service
ft bgs = Feet Below Ground Surface
mg/kg = Milligram Per Kilogram
µg/kg = Microgram Per Kilogram
TAL = Target Analyte List
TCL = Target Compound List
PCB = Polychlorinated Biphenyl
VOC = Volatile Organic Compound
SVOC = Semi-volatile Organic Compound
MDL = Method Detection Limit
RL = Reporting Limit
LQ = Laboratory Qualifier
VQ = Validation Qualifier
r = Reason Code
NT = Not Tested

[A] = Facility-Wide Background Point Estimate as Reported in the Facility-Wide Background Study Report (IT 2001)
RSL = Regional Screening Level (RSL) from April 2009 RSL Table
Adjusted RSLs = a Hazard Quotient (HQ) of 0.1 applied to non-carcinogens
Key: c = cancer
n = noncancer
* = where: n SL < 100X c SL
** = where n SL < 10X c SL
m = concentration may exceed ceiling limit
s = concentration may exceed Csat
-- = No Screening Value Available

[1] = Mercuric chloride soil RSLs value used
[2] = Endrin soil RSLs used
[3] = Pyrene soil RSLs used

= Concentration Exceeds Adjusted Soil Residential RSL

= Concentration Exceeds Adjusted Soil Industrial RSL

underline = Concentration Exceeds Facility Background Point Estimate

bold italic = Concentration Exceeds Soil-to-Groundwater Risk-based SSL (DAF 20)

Data Qualifiers:

Laboratory Qualifiers
- B Analyte found in associated blank as well as in the sample.
- J Analyte present. Reported value may not be accurate or precise.
- U The compound was analyzed for but not detected. The reporting limit will be adjusted to reflect any dilution, and for soil, the percent moisture.

Validation Qualifiers
- B Not detected substantially above the level reported in laboratory or field blanks.
- J Analyte present. Reported value may not be accurate or precise.
- L Analyte present. Reported value may be biased low. Actual value is expected to be higher.

Reason Codes
- GC/MS Organics
  - x Field and/or equipment blank contamination
  - z Method blank and/or storage blank contamination
- Inorganics and Conventionals
  - o Calibration blank contamination
  - m MS/MSD recovery failure
  - s Serial dilution failure
  - x CRDL standard recovery failure
- GC and HPLC Organics
  - g Dual column confirmation imprecision
  - x Trip blank contamination

Notes:

COPC = Chemical of Potential Concern
mg/kg = Milligram Per Kilogram
CAS = Chemical Abstracts Service
TAL = Target Analyte List
TCL = Target Compound List
PCB = Polychlorinated Biphenyl
VOC = Volatile Organic Compound
SVOC = Semi-volatile Organic Compound

RSL = Regional Screening Level (RSL) from EPA April 2009 RSL Table
Adjusted RSLs = a Hazard Quotient (HQ) of 0.1 applied to non-carcinogens
Key: c = cancer
n = noncancer
c* = where: n SL < 100X c SL
c** = where n SL < 10X c SL
m = concentration may exceed ceiling limit
s = concentration may exceed Csat
-- = No Screening Value Available

[1] = Mercuric chloride soil RSLs value used
[2] = Endrin soil RSLs used
[3] = Aroclor 1254 Noncancer Soil Residential RSL used
[4] = Pyrene soil RSLs used

ARAR = Applicable, Relevant, and Appropriate Requirement
TBC = To-Be-Considered
IND = Adjusted Industrial RSL
RDA = Recommended Daily Allowance

ARES = Above Residential RSL
ARES/IND = Above Residential RSL/Industrial RSL
BSL = Below Residential/Industrial RSLs
NSV = No Screening Value Available

5.0 SSA 72 OLEUM PLANT ACIDIC WASTEWATER SUMP

5.1 SITE BACKGROUND – ENVIRONMENTAL SETTING

5.1.1 Site Description

SSA 72, the Oleum Plant Acidic Wastewater Sump, is located in the northwest section of the MMA approximately 400 to 600 ft east of the New River (Figure 1-1). Acidic wastewater generated in TNT manufacturing was conveyed by underground sewers to the acidic wastewater sump (SSA 72). Wastewater collected in the sump was then discharged by gravity sewer to the SAR Wastewater Treatment Facility (see Section 4.0) for treatment.

Figure 5-1 shows the layout of the SSA 72 area which encompasses approximately 0.1 acre. The acidic wastewater sump is located near the northwest corner of Building 4429 within the SAR Plant area. Sump dimensions are approximately 9.5 ft long, 5 ft wide and 6 ft deep. The inside of the reinforced concrete sump is lined with 2-inch thick acid resistant brick. Design plans indicate that the top elevation of the concrete sump is 1,747.17 ft msl. The top of the sump has a manhole for access with the remaining portions covered with grates. Twelve inch diameter acid sewer lines enter the sump. Acidic wastewater discharges from the sump via a 6-inch diameter, gravity acid sewer line (at 6.63% grade), which runs 260 ft north to the SAR Acidic Wastewater Treatment Plant (SSA 18). The sewer daylights through a headwall and discharges into the steel, aboveground wastewater surge tank at SSA 18. Sewer profiles indicate an invert elevation of 1,742.17 ft msl for the 6-inch line exiting the sump and an invert elevation of 1,726.3 ft msl where the line enters the surge tank (Figure 5-2). A site photographic log for SSA 72 is included in Appendix B.

5.1.2 Site History

The SAR Plant and the associated acid wastewater collection system (including SSA 79) operated from 1976 until 1987, when these facilities were rendered inactive due to TNT manufacturing operations ceasing at RFAAP in 1986.

Plant wastewater utilities, acid area, and environmental personnel were consulted to determine if any spills or cleanup actions have occurred at SSA 72. No employees recalled any chemical or wastewater spills or cleanup actions from these facilities during their years of operation.

Aerial photographs of the SSA 72 area for 1949, 1962, 1971, 1986, and 1990 are presented on Figures 5-3, 5-4, 5-5, 5-6, and 5-7, respectively. Photographs from 1949 and 1962 show the site area is undeveloped and surrounding by storage buildings related to manufacturing operations. The 1971 photograph shows the SAR Plant under construction and the SSA 72 area developed. More recent aerial photographs from 1986 and 1990 show the SSA 72 area in their general current configuration.

5.1.3 Surface Water

The closest natural surface water body to SSA 72 is the New River, which is located approximately 400 to 600 ft west/northwest of the site. SSA 72 is located at elevations above the 100 year floodplain of the New River (USHUD 1978).

Stormwater drains or catch basins are not associated with the SSA 72. The top of the sump is raised above the ground surface so that stormwater runoff will not flow into the sump. Water is present in the sump and water samples have been collected from the sump during previous investigations conducted at the Oleum Plant in 2004 and 2007 as discussed in Section 5.2. The limited water present in the sump is likely an accumulation of rainwater due to the grated opening atop the sump. During the dry season when rainfall accumulations are minimal, the sump does not contain water.

5.1.4 Soil

According to the *Soil Survey of Montgomery County, Virginia* (USDA 1985), the area of SSA 72 is underlain by Unison-Urban Land complex soil. This soil has moderate permeability and medium-to-

strong acidity. Soil classification is not practical in urban land areas because the original soil has been physically altered or obscured. A typical profile of undisturbed Unison soil consists of a 15-inch thick surface layer of dark brown loam and a 43-inch thick subsoil of yellowish-red, sticky plastic clay underlain by a red sandy clay loam to a depth of 58 inches. In general, permeability is moderate in Unison soil, natural fertility is low, and organic matter content is low to moderate.

5.1.5 Geology

Geologic conditions were previously investigated in the Oleum Plant and surrounding areas for an EBS conducted by EEI in 2007 (EEI 2007). This investigation indicated that the site area is underlain by approximately 25 to 30 ft of alluvial terrace deposits consisting of ML/CL to depths up to 19 ft bgs underlain by SM. Limestone/dolomite bedrock of the Elbrook Formation is present at approximate depths of 25 to 30 ft. Appendix D.2.2 includes boring logs for the EBS investigation conducted by EEI. Three shallow soil borings (8 to 10 ft bgs) were completed for the SSP investigation and confirmed the presence of fine-grained alluvial deposits (silt) to the depths explored. Appendix D.2.1 includes boring logs for the SSP investigation.

5.1.6 Hydrogeology

Six monitoring wells were installed for the EBS conducted in the Oleum Plant and surrounding areas by EEI (EEI 2007). Figure 5-8 shows the locations of the monitoring wells. Groundwater monitoring well construction and water level measurement data from the EBS are summarized in Table 4-1. Groundwater was encountered under water table conditions within the lower portion of the alluvium in the area of SSA 18, where measured static water levels were approximately 24 to 26 ft bgs. South of SSA 18 at higher elevations in the SAR Plant area groundwater was encountered within bedrock but not alluvium with potentiometric levels greater than 30 ft bgs. In the EBS Report, EEI indicated an implied groundwater flow direction of approximately 15 degrees north of west based on triangulation of potentiometric data from the three monitoring wells screened within bedrock. A similar groundwater flow direction was implied for groundwater within the alluvium. Appendix D.2.2 includes boring logs and construction data for monitoring wells installed for the EBS.

5.2 PREVIOUS INVESTIGATIONS

5.2.1 RCRA Facility Assessment – USEPA 1987

An assessment was conducted at SSA 72 (listed as Unit 72 in RFA) to evaluate potential hazardous waste or hazardous chemical releases and implement corrective actions, as necessary. The assessment consisted of a preliminary review and evaluation of available site information, personnel interviews, and a visual inspection of the site. Environmental samples were not collected at SSA 72 as part of the inspection. The RFA indicated that no visible signs of releases were observed during the site inspection.

5.2.2 Acid Sewer Survey

From 1998 to 2000, an Acid Sewer Survey and Investigation was conducted on the entire RFAAP acid sewer infrastructure to determine the condition of the sewers. Videotaping of the interior lines was conducted and submitted to the USEPA. An assessment of the 260 ft long 6-inch diameter plastic, gravity acid sewer line that extends from the acidic wastewater sump (SSA 72) to the SAR wastewater treatment plant (SSA 18) was not conducted as part of the acid sewer survey. Deteriorated or broken sections of sewer lines were repaired or replaced within active areas. No actions were undertaken in the area of SSA 72 due to the inactive status of the SAR Plant wastewater system and treatment facility.

5.2.3 Oleum Plant Site Screening Investigation - Draper Aden Associates 2004

In June 2004, Draper Aden Associates advanced four soil borings (B-1, B-2, B-3, and B-4) within the vicinity of the process sewers in the Oleum Plant. Soil samples were collected from the surface and the approximate depth of the sewer invert (6 ft bgs). The soil samples were analyzed for TCL VOCs, TCL SVOCs, PAHs, explosives, and TAL inorganics by SW-846 Methods. One surface soil sample (B-4) also

was analyzed for TCL pesticides and TCL PCBs by SW-846 Methods. Samples B-1, B-2, and B-4 were collected near sumps not associated with SSA 72 and are therefore not applicable to the site. Boring B-3 which was completed adjacent to the Oleum Plant Acidic Wastewater Sump (SSA 72) is presented on Figure 5-8. In addition, one water sample (B-3 Drain) was collected from the acidic wastewater sump and analyzed for perchlorate by USEPA Method 314.0.

Detected results for B-3 surface and subsurface soil samples collected at SSA 72 are summarized in Table 5-1. VOCs, SVOCs, and metals were detected these soil samples. Organic constituents detected in B-3 samples above their adjusted R-RSLs were limited to three PAHs, with benzo(a)pyrene also detected at a concentration above its current adjusted I-RSL. Detected metals concentrations were below their adjusted R-RSLs or their facility background point estimates. Perchlorate was not detected in the water sample collected from the acidic wastewater sump (Table 5-2).

5.2.4 Oleum Plant Environmental Baseline Study – Ecology and Environment, Inc. 2007

The study area for this EBS was focused on the Oleum Plant area and included the collection of soil and groundwater samples from a study area encompassing SSA 18 (see Section 4.0) and a water sample from the acidic wastewater sump at SSA 72. Water samples were analyzed for TCL VOCs, TCL SVOCs, TCL PCBs, TLC pesticides, explosives, TAL metals, nitrate/nitrite, and perchlorate. The groundwater samples reflect general conditions at the Oleum Plant. The groundwater results are discussed previously in Section 4.2.3.

Detected results from the water sample collected from the acidic wastewater sump at SSA 72 are summarized in Table 5-2. VOCs, SVOCs, pesticides, explosives, and metals were detected in this sample. Alpha-BHC and heptachlor were detected above their adjusted T-RSLs in addition to nine metals. Arsenic and antimony were detected at concentrations above their MCLs and lead was detected at a concentration above its action level.

5.3 WORK PLAN DATA GAP ANALYSIS

The data gap analysis presented in WPA 028 indicated that limited soil sampling and analyses had occurred at SSA 72 (URS 2009). The data gap analysis completed for SSA 72 identified data gaps for characterizing releases to surface soil and subsurface soil, and characterizing physical and geotechnical properties of site soil.

5.3.1 Release Assessment to Surface Soil

At SSA 72, the surface soil sample collected adjacent to SSA 72 as part of the Oleum Plant Site Screening Investigation (Draper Aden 2004) was not analyzed for TCL PCBs or pesticides. This data gap was filled by collecting another surface sample from this location for analysis of PCBs and pesticides. Field investigation activities are discussed in Section 5.4.

5.3.2 Release Assessment to Subsurface Soil

At SSA 72, the subsurface sample B-3 collected by Draper Aden adjacent to the acidic water sump was collected below the invert depth of the sewer leaving the sump but not significantly below the depth of the sump bottom (Draper Aden 2004). In addition, subsurface sampling had not been conducted along the sewer running from SSA 72 to SSA 18. These data gaps were filled by completing additional soil borings to evaluate potential releases to subsurface soil in these areas and collecting subsurface soil samples for chemical analysis. Field investigations activities are discussed in Section 5.4.

5.3.3 Release Assessment to Groundwater

Release assessments to groundwater were conducted by evaluating subsurface soil data and comparing these data to USEPA Region III soil-to-groundwater SSLs.

5.3.4 Physical Soil Testing

Physical samples were collected at adjacent site SSA 18, which has the same soil type and characteristics as SSA 72.

5.3.5 Summary of Data Gaps

The following table summarizes these identified data gaps and the completion plan to fill the data gaps from WPA 028 (URS 2009).

SSA 72 - Summary of Data Gap Analysis and Completion Plan

DATA GAPS			COMPLETION PLAN
Item	**Physical**	**Chemical**	
Releases to Soil	Surface Soil Samples	Chemical Data –PCBs, pesticides	Collect surface soil sample adjacent to SSA 72 for chemical analysis
	Subsurface Soil Samples	Chemical Data –VOCs, SVOCs, PCBs, pesticides, explosives, and metals	Collect subsurface soil samples from area of SSA 72 for chemical analysis.
Sewer Pipe Integrity	No Closed Circuit Television (CCTV) of Sewer Line	Not applicable	Complete CCTV inspection of sewer line to evaluate line integrity.
Releases to Groundwater	Subsurface Soil Samples	Use subsurface soil sample data and existing groundwater data	Compare subsurface soil data to soil-to-groundwater SSLs.

5.4 SSP FIELD ACTIVITIES

Three borings were advanced in and around the site to evaluate for the presence or absence of chemicals in soil potentially associated with historical activities at the sites (Figure 5-9). Borings were advanced using a skid steer-mounted, direct-push Geoprobe® unit. Discrete samples were collected from surface and/or intermediate intervals for the borings as summarized below.

SSAs 72 Sample and Boring Information

Boring ID	Total Depth of Boring (ft bgs)	Surface Sample ID	Sample Depth (ft bgs)	Intermediate Sample ID	Sample Depth (ft bgs)
72SB1	10	72SB1A	0-1	72SB1B	8-10
72SB2	10	--	--	72SB2B	8-10
72SB3	8	--	--	72SB3B	6-8

One surface soil sample was collected from the following location to evaluate potential releases at SSA 72:

- Sample 72SB1A was collected adjacent to the acidic wastewater sump at the previous Draper Aden sample location for PCB and pesticide analysis.

Three subsurface soil samples were collected from the following locations to evaluate potential releases at SSA 72:

- Sample 72SB1B was collected from a direct push boring completed at the location of surface soil sample 72SB1A at a depth of 8 to 10 ft bgs; and
- Samples 72SB2B and 72SB3B were collected from direct push borings completed along the sewer alignment between SSA 72 and SSA 18 at depths of 2 to 4 ft below the bottom of the sewer pipe.

Soil samples were analyzed for TCL VOCs, TCL SVOCs, TCL PCBs, TCL pesticides, explosives (including nitroglycerin and PETN), and TAL inorganics. Surface soil sample 72SB1A was collected adjacent to the acidic wastewater sump at the previous Draper Aden sample location and analyzed for TCL PCBs and TCL pesticides. Analytical results (detected chemicals) used for the SSP are summarized in Table 5-3. Physical samples were collected at adjacent site SSA 18, which has the same soil type and characteristics as SSA 72.

During field sampling activities, modifications to the Work Plan were necessary to adjust for field conditions. During the CCTV inspection of the 6-inch acid sewer line, a blockage was noted 3 feet into the line so the CCTV inspection of the line could not be completed. Therefore, subsurface samples (72SB2B and 72SB3B) were collected from the sample locations as presented in WPA 028 (URS 2009), as shown on Figure 5-9 of this report.

5.5 CONCEPTUAL SITE MODEL (CSM)

A CSM for SSA 72 is presented on Figure 5-10. The site is located on an alluvial terrace approximately 400 to 600 ft east of the New River. Approximately 30 ft of alluvial terrace deposits overlies limestone/dolomite bedrock at the site. Groundwater is present within the lower portion of the alluvium and within underlying bedrock at depths of approximately 25 to 26 ft bgs.

Potential constituent sources at the site are related to handling of acidic wastewater in the sewer system. Potentially affected media at the site include:

- Subsurface soil from any constituents released to surface soil;
- Subsurface soil from possible leaks from below ground sumps, wastewater drains or wastewater lines; and
- Groundwater via leaching of constituents from subsurface soil.

Although current and likely future land-use scenarios are limited to industrial operations, both residential and industrial scenarios will be evaluated in the SSP human health screening (USEPA 2001).

SSA 72 is exclusively an upland habitat that lacks wetland and significant onsite drainage features. Therefore, soil represents the potential exposure medium for ecological receptors. An ECSM is provided in Section 3.0, Figure 3-1.

5.6 HUMAN HEALTH RISK SCREENING

5.6.1 Identification of COPCs

Tables 5-4 and 5-5 present the results of the COPC evaluations for surface soil and total soil, respectively. COPCs identified for surface soil and total soil included:

TAL metals: aluminum, arsenic, cobalt, iron, manganese, thallium, vanadium;

TCL Pesticides: none;

TCL PCBs: Aroclor 1254;

TCL VOCs: none;

TAL SVOCs: benzo(a)anthracene, benzo(a)pyrene, benzo(b)fluoranthene; and

Explosives: none.

Release assessment to groundwater was conducted by evaluating subsurface soil data and comparing these data to USEPA risk-based soil-to-groundwater SSLs included in the Regional Screening Table (USEPA 2009; Section 5.6.4).

5.6.2 Cumulative Risk Screen

The cumulative risk screening for surface soil is presented on Table 5-6. The cumulative risk screening for total soil is presented on Table 5-7. A summary of the screening results is presented below:

Cumulative Human Health Risk Screening Results for Soil

	Surface Soil			Total Soil		
	Above/ Below/ Equal	**Risk/ Hazard**	**Drivers**	**Above/ Below/ Equal**	**Risk/ Hazard**	**Drivers**
Residential Risk	Above	4.E-05	Arsenic, Benzo(a)pyrene	Above	4.E-05	Arsenic, Benzo(a)pyrene
Industrial Risk	Below	4.E-06	--	Below	5.E-06	--
Residential Hazard	Above	2	Aluminum, Cobalt, Iron, Manganese	Above	3	Aluminum, Cobalt, Iron, Manganese, Aroclor 1254
Industrial Hazard	Below	0.2	--	Below	0.2	--

*Note: Above, below, or equal to established SSP risk and hazard levels.

The cumulative human health risk screens were above the established SSP risk and hazard levels of 1E-05 and 1, respectively, for the residential scenario for surface and total soil. Cumulative risk screenings were below the established SSP risk and hazard levels of 1E-05 and 1, respectively, for the industrial scenarios. The risk/hazard drivers identified in the table above are those chemicals that primarily contribute to HIs or risks greater than the established SSP hazard level of 1 or risk level of 1E-05, respectively.

Due to multiple chemicals contributing to a residential HI greater than 1, as presented on Table 5-6 (surface soil) and Table 5-7 (total soil), the HIs have been segregated based on primary target organs for chronic exposure. The HI segregation for surface soil resulted in values equal to or higher than the cumulative SSP HI target organ threshold of 0.5 for the following target organs: blood, CNS, GI tract, and liver. The HI segregation for total soil resulted in values equal to or higher than the cumulative SSP HI target organ threshold of 0.5 for the following target organs: blood, CNS, GI tract, liver, and eyes.

5.6.3 Lead and Iron Screening

Detected lead concentrations at the site were below 400 mg/kg; therefore, lead modeling was not conducted for the site.

Since iron concentrations in soil result in an HQ of greater than 0.5, further assessment is required. This assessment consists of a "margin of exposure evaluation" where the estimated intake of iron is compared to the RDA and concentrations known to cause adverse health effects in children (NCEA 2006). Appendix E.2 presents the margin of exposure evaluation for surface soil and total soil. A summary of the results for SSA 72 is presented below.

Iron Margin of Exposure Evaluation – Future Child Resident

	Surface Soil			Total Soil		
	Above/ Below	**Estimated Site Intake**	**Exposure Screening Level**	**Above/ Below**	**Estimated Site Intake**	**Exposure Screening Level**
RDA Screen (mg/day)	Below	7	10	Below	7	10
Provisional Reference Dose (RfD) Screen (mg/kg-day)	Below	0.5	0.7	Below	0.5	0.7

The iron exposure assessment results for the hypothetical future child resident were below the applicable iron margin of exposure screening criteria for SSA 72.

5.6.4 SSL Comparison - Soil

5.6.4.1 Generic SSLs (Soil-to-groundwater Risk-based Screening Levels)

An SSL screening was conducted for detected chemicals in subsurface soil to evaluate the potential for leaching of chemicals from soil to groundwater. As presented in Table 5-8, the detected concentrations for each chemical in subsurface soil were compared to their USEPA risk-based SSLs included in the Regional Screening Table (USEPA 2009), if available. The comparisons of subsurface soil concentrations to generic SSLs (DAF 20) for detected chemicals indicated that arsenic, cobalt, iron, Aroclor 1254, benzo(a)pyrene, and nitrobenzene were above their SSLs (Table 5-8).

5.6.4.2 Site-specific SSL Comparison

If organic chemicals are detected at concentrations greater than generic soil-to-groundwater screening levels, they may be evaluated utilizing site-specific SSLs calculated using site-specific physical soil characteristics. Physical testing results for samples collected at SSA 18 would be appropriate for use for SSA 72 due to the close proximity and soil characteristics (Table 2-1). Site specific SSLs were not calculated for the SSA 72 due to the average fraction of organic carbon in soil (0.002) being equivalent to the value used for default SSL calculation.

5.6.5 Background Comparison - Soil

The final step in the risk screening process is the comparison of the MDCs of COPCs identified in soil to the established Facility-wide inorganic background point estimate concentrations for metals (IT 2001). No metals, identified as COPCs in surface soil and total soil, were above their background point estimates (Table 5-9).

5.6.6 Human Health Risk Screening Summary

Soil COPCs with screening values were limited to metals, PCBs, and SVOCs. The soil cumulative human health risk screens were above the established SSP risk and hazard levels of 1E-05 and 1.0, respectively, for the residential scenario for surface and total soil. Cumulative risk screenings were below the established SSP risk and hazard levels of 1E-05 and 1.0, respectively, for the industrial scenario.

The results of the carcinogenic residential risk screening were above the established SSP threshold (1E-05) for surface soil and total soil primarily due to benzo(a)pyrene. As presented on Table 5-10 (surface soil) and Table 5-11 (total soil), the potential site-related risk, when excluding metals risk drivers detected below background (arsenic) in surface and total soil, is 3E-05 which is above the SSP risk threshold of 1E-05 primarily due to benzo(a)pyrene.

The noncarcinogenic residential hazard screening was above the established SSP threshold (HI=1) for surface soil primarily due to metals at concentrations below background (Table 5-9) and is therefore not considered a concern for the site. Although uncertainties in assessing risk increase when using a single surface soil sample thereby potentially overestimating or underestimating risk at the site, utilizing the MDCs for the screening and calculations is conservative and could likely lead to a low-to-moderate overestimation of risk. Therefore, based on the use of an MDC in the risk screening and calculations, the small size of the site (0.1 acre), the lack of potential surface soil releases due to the nature of previous activities at the SSA (acid conveyance via subsurface sump and sewer line), the low level detections of PAHs in the sample, and the industrial screening resulting in risks/hazards below SSP thresholds, no additional assessment of surface soil in the area is proposed.

The noncarcinogenic residential hazard screening was above the established SSP threshold (HI=1) for total soil primarily due to metals and Aroclor 1254. As presented in Table 5-11, when taking background and target organs into account, the HI segregation for total soil resulted in a value equal to the cumulative SSP HI target organ threshold of 0.5 for eyes due to Aroclor 1254.

Detected lead concentrations at the site were below 400 mg/kg; therefore, lead modeling was not conducted for the site. The iron exposure assessment results for the hypothetical future child resident were below the applicable iron margin of exposure screening criteria for SSA 72.

The comparisons of subsurface soil to generic risk-based SSLs (DAF 20) for detected chemicals indicated that arsenic, cobalt, iron, Aroclor 1254, benzo(a)pyrene, and nitrobenzene were above their SSLs (Table 5-8). Although arsenic, cobalt, and iron were above their SSLs, detected concentrations were below their background point estimates and are not considered a concern at the site. Site specific SSLs were not calculated for the SSA 72 due to the average fraction of organic carbon in soil (0.002) being equivalent to the value used for default SSL calculation. While SSL exceedances indicate a theoretical potential for impact to groundwater, the groundwater data collected from monitoring wells MW-3 and MW-4 located downgradient of SSA 72 reflecting general conditions at the Oleum Plant (Figure 4-8) did not result in detectable levels of Aroclor 1254, benzo(a)pyrene, and nitrobenzene (Table 4-3); therefore, the migration of these chemicals to groundwater is not considered a concern at the site.

5.7 ECOLOGICAL RISK SCREENING

Although a limited number of surface soil samples were collected (one sample) at the site, an ecological risk assessment was not conducted for the site considering the small size of the site (0.1 acre), the nature of previous activities at the site (acid conveyance via subsurface sump and subsurface sewer line), and the lack of potential surface soil releases due to the nature of previous activities at the site. Based on these factors, the potential for ecological risk is considered negligible.

5.8 CONCLUSIONS AND RECOMMENDATION

No further action beyond the implementation of land use controls to maintain this site as industrial precluding residential use is recommended for SSA 72 based on the following results of the SSP screening:

- Cumulative risk and hazard screening results for industrial scenarios are below SSP thresholds for target risk and hazards;
- Cumulative risk and hazard screening results for residential scenarios are equal to or above SSP thresholds for target risk and hazards;
- The MDC for lead is below the SSP screening level of 400 mg/kg;
- The iron exposure assessment results for the hypothetical future child resident are below the applicable iron margin of exposure screening criteria;
- Chemicals at concentrations above their generic SSLs are limited to metals at concentrations below background and organic chemicals not detected in groundwater. Therefore they are not considered a concern at the site; and
- There is adequate information to conclude that ecological risks are considered negligible and therefore there is no need for further action at the SSA on the basis of ecological risk.

Institutional controls (ICs) are being implemented at the site (SSA 72 – Oleum Plant Acidic Wastewater Sump) within the boundaries depicted on Figure 5-1. The objective of the ICs is to maintain the site in its current industrial/commercial state as a closed solid waste management unit and to prevent any future residential use. Specifically the site has been incorporated into plant management manual to ensure long-term protection of human health and the environment. The management manual provides for advance notice, assessment, and approval of intrusive work that may occur within the plant with a general digging prohibition at sites such as this. In the event the property is transferred or leased, equivalent ICs will be put into terms and conditions of the deed or lease, which are no less restrictive than the IC objectives described above. Furthermore, the transferee or lessee will be responsible for ensuring IC compliance by any future users. However, the Army acknowledges the responsibility for all original liability under CERCLA and its right and responsibility to enforce ICs.

Table 5-3
Summary of Detected Chemicals in Soil Analytical Samples
Site Screening Area 72
SSP Report for SSAs 18, 72, 30, 79, 60, and 77
Radford Army Ammunition Plant, Radford, Virginia

Notes:

CAS = Chemical Abstracts Service
ft bgs = Feet Below Ground Surface
mg/kg = Milligram Per Kilogram
µg/kg = Microgram Per Kilogram
TAL = Target Analyte List
TCL = Target Compound List
PCB = Polychlorinated Biphenyl
VOC = Volatile Organic Compound
SVOC = Semi-volatile Organic Compound
MDL = Method Detection Limit
RL = Reporting Limit
LQ = Laboratory Qualifier
VQ = Validation Qualifier
r = Reason Code
ND = Not Detected
NT = Not Tested

[1] = Mercuric chloride soil RSLs value used
[2] = Aroclor 1254 Unadjusted Soil Residential RSL used
[3] = Pyrene soil RSLs used

[A] = Facility-Wide Background Point Estimate as Reported in the Facility-Wide Background Study Report (IT 2001)
RSL = Regional Screening Level (RSL) from April 2009 RSL Table
Adjusted RSLs = a Hazard Quotient (HQ) of 0.1 applied to non-carcinogens
Key: c = cancer
n = noncancer
* = where: n SL < 100X c SL
** = where n SL < 10X c SL
m = concentration may exceed ceiling limit
s = concentration may exceed Csat
-- = No Screening Value Available

= Concentration Exceeds Adjusted Soil Residential RSL

= Concentration Exceeds Adjusted Soil Industrial RSL

underline = Concentration Exceeds Facility Background Point Estimate

bold italic = Concentration Exceeds Soil-to-Groundwater Risk-based SSL (DAF 20)

Data Qualifiers:

Laboratory Qualifiers

B	Analyte found in associated blank as well as in the sample.
J	Analyte present. Reported value may not be accurate or precise.
U	The compound was analyzed for but not detected. The reporting limit will be adjusted to reflect any dilution, and for soil, the percent moisture.

Validation Qualifiers

B	Not detected substantially above the level reported in laboratory or field blanks.
J	Analyte present. Reported value may not be accurate or precise.
K	Analyte present. Reported value may be biased high. Actual value is expected to be lower.
L	Analyte present. Reported value may be biased low. Actual value is expected to be higher.
R	Unreliable result. Analyte may or may not be present in the sample. Supporting data necessary to confirm result.
UL	Not detected, quantitation limit is probably higher.

Reason Codes

GC/MS Organics

l	MS/MSD recovery failure
z	Method blank and/or storage blank contamination

Inorganics and Conventionals

a	Matrix spike/matrix spike duplicate recovered low
b	Blank contamination in the calibration blank; result <5x blank contamination
f	Field duplicate imprecision
o	Calibration blank contamination
m	MS/MSD recovery failure
s	Serial dilution failure
x	CRDL standard recovery failure

GC and HPLC Organics

c	Calibration failure; poor or unstable (%D) response
g	Dual column confirmation imprecision

Table 5-4

Notes:

COPC = Chemical of Potential Concern
mg/kg = Milligram Per Kilogram
CAS = Chemical Abstracts Service
TAL = Target Analyte List
TCL = Target Compound List
VOC = Volatile Organic Compound
SVOC = Semi-volatile Organic Compound

RSL = Regional Screening Level (RSL) from EPA April 2009 RSL Table
Adjusted RSLs = a Hazard Quotient (HQ) of 0.1 applied to non-carcinogens
Key: c = cancer
n = noncancer
c* = where: n SL < 100X c SL
c** = where n SL < 10X c SL
m = concentration may exceed ceiling limit
s = concentration may exceed Csat
-- = Not Available

[1] = Pyrene soil RSLs used

ARAR = Applicable, Relevant, and Appropriate Requirement
TBC = To-Be-Considered
IND = Adjusted Industrial RSL
RDA = Recommended Daily Allowance

ARES = Above Residential RSL
ARES/IND = Above Residential RSL/Industrial RSL
BSL = Below Residential/Industrial RSLs
NSV = No Screening Value Available

THIS PAGE LEFT INTENTIONALLY BLANK

6.0 SSA 30 ASBESTOS DISPOSAL TRENCH NO. 1 AND SSA 79 ASBESTOS DISPOSAL TRENCH NO. 2

6.1 SITE BACKGROUND – ENVIRONMENTAL SETTING

6.1.1 Site Description

Asbestos Disposal Trench No. 1 (SSA 30) and Asbestos Disposal Trench No. 2 (SSA 79) are located in the southeastern horseshoe area of RFAAP (Figure 1-1). SSA 30 and SSA 79 are parallel trenches orientated in continuous line approximately 450 ft long with long axis (northwest to southeast) parallel to SWMU 51, TNT waste neutralization pit (Figure 6-1). The trench areas are reportedly 15 ft wide with a maximum depth of 15 ft (USEPA 1987). The asbestos trench areas have been filled to grade and vegetated with grass. A fence surrounds the site area and aboveground power lines cross the middle of the site. The closest structures are storage magazine buildings located north (Building 4601-13), east (Building 4601-13), and west (Building 4601-12) of SSA 30 and SSA 79.

SSA 30 and SSA 79 are located within an elevated plateau area of the horseshoe area. Ground surface in the site area slopes from east to west from a maximum elevation of approximately 1,834 ft msl to a minimum elevation of 1,824 ft msl. A local topographic high exists between the site area and landfill areas (closed sanitary landfill areas SWMU 26 and 52 and hazardous waste landfill SWMU 16) east of the site. A site photographic log for SSA 30 and SSA 79 is included in Appendix B.

6.1.2 Site History

Asbestos Disposal Trench No. 1 (SSA 30) and Asbestos Disposal Trench No. 2 (SSA 79) were used for disposal of asbestos containing material from 1982 to 1987 (USEPA 1987). The trenches received 250 to 500 pounds of double bagged asbestos material per day, 3 to 5 days per week, when asbestos removal activities were ongoing at RFAAP. Daily soil cover was placed on the double bagged asbestos material. The total volume of asbestos materials placed in the trench areas is unknown. Based on the SSP investigation, a minimum of 1 foot of soil cover is present over the asbestos trenches.

Aerial photographs of SSA 30 and SSA 79 area for 1971, 1986, and 1990 are presented as Figures 6-2, 6-3, and 6-4, respectively. The 1971 photograph shows the site area before excavation of the trenches for asbestos disposal and the recently backfilled and re-vegetating area of SWMU 51 located adjacent to and west of the future trench areas. In 1986, the aerial photograph clearly shows the location of the active and backfilled portions of an asbestos trench in the eastern half of the SSA 30 and SSA 79 area. The northern half of the eastern trench is active and white objects (likely double bagged asbestos material) are apparent in the bottom middle of the trench area. The remaining area is backfilled to grade with soil. The closed trench area of SWMU 51 is clearly visible on the 1986 aerial photograph as a rectangular dark green vegetated area adjacent to the asbestos trench area. In 1990, the aerial photograph shows that the area of the eastern asbestos trench has been backfilled and re-vegetated. Perimeter fences around the area of SWMU 51 and the area of SSA 30 and SSA 79 are visible in the area of the photograph. A cinder road is visible east of SWMU 51 and the asbestos trench area.

6.1.3 Surface Water

Surface water bodies, drainage ditches, manholes, catch basins, or preferential flow paths for surface water flow are not located in the area of former asbestos disposal trenches. Overland flow of stormwater across the site is expected to follow topographic slope (east to west). The closest surface water body to the site is the New River located approximately 1,200 ft south of the sites.

6.1.4 Soil

According to the *Soil Survey of Montgomery County, Virginia* (USDA 1985), the site area is underlain by the Braddock Loam with gentle slopes of 2 to 7%. Reaction of Braddock soils ranges from very strongly acid to strongly acid. The organic matter content of this soil is moderately low and permeability is

moderate. Available water capacity of the Braddock soil is moderate and surface runoff is medium. The Braddock soil does not have a seasonally high water table within 60 inches of the surface. A typical profile of the Braddock soil consists of a seven-inch thick surface layer of dark yellowish brown loam underlain by a minimum 60-inch thick subsoil of yellowish-red clay and red clay. Depth to bedrock is greater than 60 inches.

Physical data for four soil samples collected from monitoring well borings 51MW1 and 51MW2 installed for a 1992 RFI conducted at SWMU 51 (Dames & Moore, 1992b) adjacent to SSA 30 and SSA 79 are summarized in the following table. Monitoring well locations are shown on Figure 6-5.

Summary of Physical Soil Data (Dames & Moore, 1992)

Sample No.	Sample Depth (ft bgs)	Moisture (%)	Grain Size Distribution			Atterberg Limits (LL/PL)	USCS Classification
			Gravel (%)	Sand (%)	Fines (%)		
51MW1	10-11.3	8.6	65.8	22.0	12.2	38/18	SC
51MW1	30-32	125	5.3	17.0	77.7	60/26	MH
51MW2	10-12	21.9	0.0	77.5	22.5	32/8	SM
51MW2	25-27	18.6	12.0	66.9	21.1	36/13	SC

Notes: Gravel = retained on #4 sieve, Sand = passed #4 sieve and retained on #200 sieve, Fines = passed #200 sieve., LL = liquid limit, PL = plastic limit, MH = elastic silt, SC = clayey sand, SM = silty sand.

In addition, two physical samples were collected as part of the SSP investigation in 2009 (79SB2A and 79SB2B). The results for these samples are provided in Table 2-1.

6.1.5 Geology

Geologic conditions were previously investigated in the area of SSA 30 and SSA 79 for RFIs conducted at adjacent SWMU 51. Soil and rock borings also were completed adjacent to the site for monitoring wells C1 and 16-4 associated with adjacent landfills SWMU 26, SWMU 52, and HWMU 16 (Figure 6-5). These investigations indicate that the site area is underlain by approximately 40 to 50 ft of unconsolidated deposits consisting of alluvial terrace material and underlying residual soil weathered from underlying bedrock. Alluvial terrace deposits are typically 30 to 35 ft thick and consist of upper layers of silt/clay (ML/CL), silty sand (SM), and clayey sand (SC), and a lower layer of silty gravel (river jack). Residual soil weathered from underlying bedrock is typically clay or silt saprolite containing relict shale or siltstone structure. Coring of bedrock at borings 51MW2, 16-4, and C1 indicated interbedded green shale, siltstone, and dolomite/limestone bedrock of the Cambrian Age Elbrook Formation. The uppermost intervals of bedrock are typically variably weathered with a moderate to high degree of fracturing.

Appendix D.2.3 includes several geologic cross-sections developed by Shaw for the SWMU 51 RFI/CMS Report (Shaw 2008b) illustrating subsurface conditions in the site area and boring logs for monitoring wells 51MW1, 51MW2, C1, and 16-4.

Six soil borings were completed to a depth of 18 ft bgs for the SSP investigation. Soil encountered in these borings confirmed the presence of alluvial terrace deposits to the depths explored. Appendix D.2.1 includes SSP boring logs for SSA 30 and SSA 79.

6.1.6 Hydrogeology

Hydrogeology in the area of SSA 30 and SSA 79 has been previously characterized by the installation of two groundwater monitoring wells for the SWMU 51 RFI (51MW1 and 51MW2) and the installation of two groundwater monitoring wells (C1 and 16-4) to monitor groundwater conditions upgradient of the

SWMU 26 and 52 landfills and the HWMU 16 landfill. Construction and hydrogeologic data for these wells are summarized below.

Monitoring Well Construction Data – Area of SSA 30 and SSA 79

Well ID	Installation Date	Total Depth (ft)	Screen Depth Interval (ft bgs)	Unit Monitored	Slug Test Result (cm/sec)
51MW1	09/24/91	35.0	25.0-35.0	UA	--
51MW2	09/09/91	53.0	43.0-53.0	UA/Bedrock	4.17E-05*
C1	07/29/80	70.0	55.0-70.0	Bedrock	--
16-4	11/02/84	80.0	45.0-80.0	Bedrock	--

Note: UA = unconsolidated alluvium, cm/sec = centimeters per second. * Rising head slug test conducted by Dames & Moore (1992).

These investigations indicate that groundwater in the site area is present within bedrock with measured water levels in wells near the top of competent bedrock. At 51MW2, groundwater also is present within the overburden overlying bedrock. Groundwater studies conducted in the horseshoe area by Shaw (2005, 2006, and 2007) indicate that precipitation infiltrates in high areas of the horseshoe area and recharges the bedrock aquifer with groundwater flow through the bedrock aquifer to the floodplain of the New River and into the New River. The SWMU 51 RFI (Shaw 2008b) conducted by Shaw indicated that groundwater flow in the site area is radial outward toward the west and south. Select groundwater elevation data and a groundwater contour map from the SWMU 51 RFI/CMS Report illustrating these conditions are included Appendix D.2.3.

Potentiometric measurements were obtained from wells C-1, 16-4, 51MW1, and 51MW2 sampled during the SSP as summarized in the following table. This table also includes groundwater measurement data from the RFI conducted at adjacent SWMU 51 that was used by Shaw to develop the groundwater contour map in Appendix D.2.3. Note that the groundwater depths are below the depth of the waste asbestos material (approximately 15 ft bgs).

Groundwater Measurement Data – Area of SSA 30 and SSA 79

		Shaw SWMU 51 RFI		URS SSP SSA 30 and SSA 79	
Well ID	Elevation TOC (ft msl)	DTW (ft TOC) 4/2006	Water Elevation (ft msl)	DTW (ft TOC) 8/2009	Water Elevation (ft msl)
51MW1	1823.13	33.08	1790.05	31.60	1791.53
51MW2	1834.77	50.07	1784.70	44.68	1790.09
C1	1840.14	50.78	1789.36	47.40	1792.74
16-4	1836.76	52.91	1783.85	49.41	1787.35

Notes: TOC = top of casing, msl = mean sea level: datum is NVGD 1929.

6.2 PREVIOUS INVESTIGATION

6.2.1 RCRA Facility Assessment – USEPA 1987

An assessment was conducted at SSA 30 (listed as Unit 30 in RFA) and SSA 79 (listed as Unit 79 in RFA) to evaluate potential hazardous waste or hazardous chemical releases and implement corrective actions, as necessary. The assessment consisted of a preliminary review and evaluation of available site information, personnel interviews, and a visual inspection of the site. Environmental samples were not collected at SSA 30 or SSA 70 as part of the inspection. The assessment indicated that the closure status of SSA 30 was "uncertain due to the active status" of SSA 79. The RFA indicated that no data indicating releases had been collected.

6.2.2 Installation Assessment – USEPA 1992

The Environmental Photographic Interpretation Center (EPIC), under the direction of USEPA, performed an assessment of multiple SWMUs at RFAAP using selected aerial photographs from 1937 to 1986 (USEPA 1992a). The photogeologic analysis was performed to locate waste management areas, identify the location of sinkholes that existed prior to the construction of the RFAAP, and map fracture traces. A specific assessment was not conducted for the asbestos disposal trenches; however, an assessment was conducted for adjacent SWMU 51. The aerial photographic analysis of SWMU 51 indicated that activity was first noted at SWMU 51 in 1975, where an empty trench was visible on the photograph. By 1981, the trench had been filled and a re-vegetating ground scar was the sole remaining feature.

6.2.3 RCRA Facility Investigation at SWMU 51 - Dames & Moore 1992

In 1992, Dames & Moore reported the results of an RFI conducted at SWMU 51 located adjacent to SSA 30 and SSA 79. The RFI focused on evaluating potential releases to groundwater in the area of SWMU 51 and at adjacent landfill areas to the east and north of the site. Monitoring wells sampled around the periphery of the SSA 30 and SSA 79 area included 51MW1, 51MW2, C1, and 16-4 (Figure 6-5). Groundwater samples collected from these wells were analyzed for VOCs, SVOCs, explosives, dissolved metals, TOC, total organic halogens (TOX), and pH. Sample results are summarized in Table 6-1 for detected constituents. Bis(2-ethylhexyl)phthalate and 2,6-dinitrotoluene were detected in wells 16-4 and 51MW2 (2,6-dinitrotoluene only) at concentrations above their USEPA Region III adjusted T-RSLs. The concentration of bis(2-ethylhexyl)phthalate detected in 16-4 also was above its MCL.

6.2.4 Geophysical Survey at SWMU 51 – Argonne National Laboratory 2002

A geophysical survey was conducted in the SWMU 51 area in 2002 to characterize the lateral and vertical extent of the former TNT neutralization-sludge disposal trench. Surface geophysical surveys performed included electromagnetic (EM) 31/34 terrain-conductivity mapping, two-dimensional electrical resistivity imaging (2D-ERI), and seismic refraction tomography. Downhole seismic velocity profiling and electrical logging was conducted at wells 51MW1, 51MW2, and 16-4 to assist in constraining the resistivity models. A copy of the Argonne National Laboratory geophysical report is included in Appendix D.2.3.

The geophysical survey showed a high conductivity anomaly for EM-31 and low resistivity anomaly along profile L-4 in the general trench area shown on the 1986 photograph (Figures B-5 and B-6 in the geophysical report provided in Appendix D.2.3).

6.2.5 Eastern Horseshoe Area Groundwater Sampling – Shaw 2006

In 2006, Shaw reported the results of area wide groundwater sampling in the eastern horseshoe area including wells 51MW1, 51MW2, C1, and 16-4 located in the area of SSA 30 and SSA 79 (Shaw 2006). Groundwater samples were analyzed for TCL VOCs, TCL SVOCs, TCL pesticides, TCL PCBs, TCL dioxin/furans, PAHs, TAL metals (total), and perchlorate. Sample results in Table 6-2 are summarized for detected constituents. Constituents detected in one or more samples at concentrations above their current adjusted T-RSLs included VOCs methylene chloride (“B” flagged due to blank contamination), tetrachloroethene, and 1,1-dichloroethane, pesticides alpha-chlordane and heptachlor epoxide, and total antimony. Detected concentrations were below MCLs.

6.2.6 RCRA Facility Investigation/Corrective Measures Study at SWMU 51 – Shaw 2008

In 2008, Shaw reported the results of an RFI/CMS conducted at SWMU 51 located adjacent to SSA 30 and SSA 79 (Shaw 2008b). Soil sampling was limited to the immediate area of the SWMU 51 trench. Samples were analyzed for TCL VOCs, TCL SVOCs, pesticides, PCBs, herbicides, explosives, TAL metals, and dioxin/furans. The soil samples were not analyzed for asbestos. Existing 2006 groundwater data from the Eastern Horseshoe Area groundwater sampling for 51MW1, 51MW2, C1, and 16-4 were used in the RFI assessment.

6.3 WORK PLAN DATA GAP ANALYSIS

As presented in WPA 028, the data gap analysis completed for SSA 30 and SSA 79 identified data gaps for delineating asbestos trench areas, evaluating potential releases to soil and groundwater from asbestos disposal activities, and characterizing physical and geotechnical properties of site soil (URS 2009).

6.3.1 Delineation of Trench Areas

The precise limits of the asbestos trench area had not been delineated at the site and subsurface investigations specific to the trenches had not been conducted. This data gap was filled by completing surface geophysical investigations across the site area where the trenches are located. Soil borings were completed within the site area to confirm and supplement the geophysical results. Field investigation activities are discussed in Section 6.4.

6.3.2 Soil Release Assessment

Soil sampling had not been performed at SSA 30 and SSA 79 to evaluate potential releases to soil from previous asbestos waste disposal activities or potential commingling of waste with soil cover. This data gap was filled by collecting surface soil samples from the trench areas for analysis of asbestos, TCL VOCs, TCL SVOCs, TCL PCBs, TCL pesticides, explosives, and TAL inorganics. Subsurface soil samples were not collected from within or directly below the trench areas due to the nature of disposal activities and waste (double bagged asbestos material) and associated risk of inadvertently releasing asbestos into the environment. Data gaps for releases to deeper subsurface soil were filled by completing soil borings adjacent to the trench areas and collecting subsurface soil samples for asbestos analysis at depths below the bottom of the trench. Field investigation activities are discussed in Section 6.4.

6.3.2.1 Groundwater

Groundwater monitoring wells 51MW1, 51MW2, C1, and 16-4 located around the perimeter of SSA 30 and SSA 79 had been sampled to evaluate releases from SWMU 51 and adjacent landfill areas; however, these wells had not been sampled for asbestos to evaluate releases to groundwater from the asbestos disposal trenches. Additional groundwater samples were collected from these wells for analysis of asbestos to evaluate potential releases to groundwater and fill this data gap, as described in Section 6.4.

6.3.2.2 Other

Physical soil testing of soil in the site area was limited to one boring completed within the SWMU 51 area, which penetrated sludge material not considered representative of site soil and four soil samples collected from well borings 51MW1 and 51MW2 for limited parameters (grain size analysis, Atterberg limits, moisture content, and soil classification). Additional physical testing of representative surface soil and surface soil was conducted to fill this data gap and more completely characterize physical and geotechnical properties of site soil, as described in Section 6.4.

6.3.3 Summary of Data Gaps

The following table summarizes these identified data gaps and the completion plan to fill the data gaps from WPA 028 (URS 2009).

SSA 30 and SSA 79 - Summary of Data Gap Analysis and Completion Plan

DATA GAPS			COMPLETION PLAN
Item	**Physical**	**Chemical**	
Delineation of Trench Areas	Geophysical Survey and Soil Borings	Not Applicable	Complete geophysical survey and soil borings
Releases to Soil	Surface Soil Samples	Chemical Data – asbestos, VOCs, SVOCs, PCBs, pesticides, explosives, and metals	Collect surface soil samples within trench area for chemical analysis
	Subsurface Soil Samples	Chemical Data – asbestos, VOCs, SVOCs, PCBs, pesticides, explosives, and metals	Collect subsurface soil samples from soil borings completed adjacent to trench areas at depths below trench.
Releases to Groundwater	Groundwater Samples	Chemical Data – Asbestos	Sample existing groundwater monitoring wells 51MW1, 51MW2, C1, and 16-4.
Site-Wide Soil Characteristics	Physical / Geotechnical Properties	pH, TOC, grain size, Atterberg Limits, and moisture content	Collect samples for geotechnical and physical property analysis.

6.4 SSP FIELD ACTIVITIES

An initial surface geophysical survey was conducted at SSAs 30 and 79 in July 2009 by ATS International (ATS) under the direction of URS. Based on the presence of some anomalies in the initial survey, the survey boundaries were expanded and an additional geophysical study was conducted by ATS (Figure 6-6) in September 2009. The expanded survey identified the presence of trench areas surrounding SWMU 51 to the north, east, and west as shown on Figure 6-6. The geophysical survey confirmed previous reports of approximate waste depths up to 15 ft below ground surface. The geophysical survey report prepared by ATS is provided in Appendix D.5.

Fourteen soil borings were advanced in and around the trench areas to evaluate for the presence or absence of chemicals in soil potentially associated with asbestos disposal. Sample and boring information is summarized in the table below and sample locations are shown on Figure 6-7. Six surface soil samples were collected within the trench area located east of SWMU 51 and three soil borings were advanced outside the perimeter of this trench area. Two surface soil samples were collected within the trench area located west of SWMU 51 and two borings were advanced outside the perimeter of this trench area. Surface samples within the trench areas were collected from 0 to 0.5 ft bgs using a hand auger and/or shovel, with the exception of VOC samples which were collected from 0.5 to 1 ft bgs. Outside the perimeter of the trenches, borings were advanced to 3 ft below the bottom of the trenches (approximately 18 ft bgs), as determined from the geophysical survey, using a skid steer-mounted, direct-push Geoprobe® unit. Discrete samples were collected from surface (within the units) or intermediate (outside the perimeter of the trenches) intervals as summarized below.

SSAs 30 and 79 SSP Samples and Boring Information

Boring ID	Location	Total Depth of Boring (ft bgs)	Surface Sample ID	Sample Depth (ft bgs)	Intermediate Sample ID	Sample Depth (ft bgs)
30SS1	Eastern Trench Area	1.0	30SS1	0-1	--	--
30SS2	Eastern Trench Area	1.0	30SS2	0-1	--	--
30SS3	Eastern Trench Area	1.0	30SS3	0-1	--	--
30SB1	Eastern Trench Area	18	--	--	30SB1B	16-18
30SB2	Eastern Trench Area	18	--	--	30SB2B	16-18
30SB3	Eastern Trench Area	18	--	--	30SB3B	16-18
79SS1	Eastern Trench Area	1.0	79SS1	0-1	--	--
79SS2	Eastern Trench Area	1.0	79SS2	0-1	--	--
79SS3	Eastern Trench Area	1.0	79SS3	0-1	--	--
79SS4	Western Trench Area	1.0	79SS4	0-1	--	--
79SS5	Western Trench Area	1.0	79SS5	0-1	--	--
79SB1	Western Trench Area	18	--	--	79SB1B	16-18
79SB2	Eastern Trench Area	18	79SB2A*	0-1	79SB2B	16-18
79SB3	Western Trench Area	18	--	--	79SB3B	16-18

Note: *Sample 79SB2A analyzed for physical soil parameters only.

Soil samples were analyzed for TCL VOCs, TCL SVOCs, TCL PCBs, TCL pesticides, explosives (including nitroglycerin and PETN), TAL inorganics, and asbestos. For the SSP, groundwater samples were collected from monitoring wells 51MW1, 51MW2, C1, and 16-4 and analyzed for asbestos. Analytical results (detected chemicals) used for the SSP are summarized in Tables 6-3 (soil) and 6-4 (groundwater).

Two samples were collected for physical testing (one surface soil sample (79SB2A) and one subsurface soil sample (79SB2B)). Physical testing for each sample included: grain size analysis, Atterberg limits, soil moisture content, TOC, and pH. Analytical results for these samples are summarized in Table 2-1 and the complete results are provided in Appendix D.1.

During field sampling activities, modifications to the Work Plan were necessary to adjust for field conditions. Based on the presence of some anomalies in the initial survey, the survey boundaries were expanded and an additional geophysical study was conducted in September 2009 (Figure 6-6). The expanded survey identified trench areas to the north, east, and west of SWMU 51. Borings 79SB1 and 79SB3 were therefore repositioned to locations adjacent to the western trench areas outside the fence and two additional surface soil samples were collected from the western trench areas (Figure 6-6) that were not identified in WPA 028.

6.5 CONCEPTUAL SITE MODEL (CSM)

A CSM for SSAs 30 and 79 is presented on Figure 6-8. The site is located on the highest level alluvial terrace within the eastern horseshoe area at RFAAP. Approximately 40 to 50 ft of unconsolidated material overlies competent bedrock in the site area. Groundwater occurs near the overburden/bedrock interface and within bedrock at depths of approximately 30 to 40 ft below the bottom of the asbestos trenches. Groundwater flows radially from the site area toward the west and south. Surface water bodies,

drainage ditches, manholes, catch basins, or preferred drainage paths or features are not present at SSA 30 or SSA 79. The heavy tall grass and weed vegetation present on the sites would reduce storm water runoff. Any overland runoff from the site area would follow the approximately 5% topographic slope toward the west.

Potential constituent sources at the site are related to the disposal of double bagged asbestos waste material in the trench areas to depths up to 15 ft. As presented in Section 6.1.2, the total volume of asbestos material placed in the trenches is unknown. Daily soil cover was placed over the disposed bagged material. Potentially affected media at the site include:

- Surface and subsurface soil from asbestos disposal activities;
- Subsurface soil via leaching of asbestos material from the trench areas; and
- Groundwater via leaching of asbestos material from subsurface soil.

Although current and likely future land-use scenarios are limited to industrial operations, both residential and industrial scenarios will be evaluated in the SSP human health screening (USEPA 2001).

SSAs 30 and 79 are exclusively an upland habitat that lacks wetland and significant onsite drainage features. Therefore, soil represents the potential exposure medium for ecological receptors. An ECSM is provided in Section 3.0, Figure 3-1.

6.6 HUMAN HEALTH RISK SCREENING

6.6.1 Identification of COPCs

Tables 6-5 and 6-6 present the results of the COPC evaluations for surface soil and total soil, respectively. COPCs identified for surface soil and total soil included:

TAL metals: aluminum, arsenic, cobalt, iron, manganese, vanadium;

TCL Pesticides: none;

TCL PCBs: none;

TCL VOCs: none;

TAL SVOCs: benzo(a)pyrene, dibenz(a,h)anthracene, dibenzofuran (NSV);

Explosives: none; and

Asbestos: not detected.

As presented in WPA 028, potential releases to groundwater were assessed by evaluating subsurface soil data and comparison of these data to USEPA risk-based soil-to-groundwater SSLs included in the Regional Screening Table (USEPA 2009; Section 6.6.4). Table 6-2 presents the results for asbestos in groundwater. Asbestos was not detected in groundwater; therefore, asbestos is not a COPC for groundwater. The SWMU 51 RFI (Shaw 2008b) investigation of the groundwater in the same area did not identify groundwater at the sites as a risk to human health or the environment.

6.6.2 Cumulative Risk Screen

The cumulative risk screenings for surface soil and total soil are presented on Tables 6-7 and 6-8, respectively. A summary of the screening results is presented below:

Cumulative Human Health Risk Screening Results for Soil

	Surface Soil			Total Soil		
	Above/ Below/ Equal	**Risk/ Hazard**	**Drivers**	**Above/ Below/ Equal**	**Risk/ Hazard**	**Drivers**
Residential Risk	Equal	1.E-05	Arsenic, PAHs	Equal	1.E-05	Arsenic, PAHs
Industrial Risk	Below	2.E-06	--	Below	3.E-06	--
Residential Hazard	Above	2	Aluminum, Arsenic, Cobalt, Iron, Manganese	Above	3	Aluminum, Arsenic, Cobalt, Iron, Manganese
Industrial Hazard	Below	0.2	--	Below	0.2	--

*Note: Above, below, or equal to established SSP risk and hazard levels.

The cumulative human health risk screens were equal to the established SSP risk level of 1E-05 and above the hazard level of 1 for the residential scenario for surface and total soil. Cumulative risk screenings were below the established SSP risk and hazard levels of 1E-05 and 1, respectively, for the industrial scenarios. The risk/hazard drivers identified in the table above are those chemicals that primarily contribute to HIs or risks greater than the established SSP hazard level of 1 or risk level of 1E-05, respectively.

Due to multiple chemicals contributing to a residential HI greater than 1, as presented on Table 6-7 (surface soil) and Table 6-8 (total soil), the HIs have been segregated based on primary target organs for chronic exposure. The HI segregations for surface soil and total soil resulted in values equal to or higher than the cumulative SSP HI target organ threshold of 0.5 for the following target organs: blood, CNS, GI tract, and liver.

6.6.3 Lead and Iron Screening

Detected lead concentrations at the sites were below 400 mg/kg; therefore, lead modeling was not conducted for the sites.

Since iron concentrations in soil result in an HQ of greater than 0.5, further assessment is required. This assessment consists of a "margin of exposure evaluation" where the estimated intake of iron is compared to the RDA and concentrations known to cause adverse health effects in children (NCEA 2006). Appendix E.3 presents the margin of exposure evaluation for surface soil and total soil. A summary of the results for SSAs 30 and 79 is presented below.

Iron Margin of Exposure Evaluation – Future Child Resident

	Surface Soil			Total Soil		
	Above/ Below	**Estimated Site Intake**	**Exposure Screening Level**	**Above/ Below**	**Estimated Site Intake**	**Exposure Screening Level**
RDA Screen (mg/day)	Below	7	10	Below	8	10
Provisional Reference Dose (RfD) Screen (mg/kg-day)	Below	0.4	0.7	Below	0.6	0.7

The iron exposure assessment results for the hypothetical future child resident were below the applicable iron margin of exposure screening criteria for SSAs 30 and 79.

6.6.4 SSL Comparison - Soil

6.6.4.1 Generic SSLs (Soil-to-groundwater Risk-based Screening Levels)

An SSL screening was conducted for detected chemicals in subsurface soil to evaluate the potential for leaching of chemicals from soil to groundwater. As presented in Table 6-9, the detected concentrations for each chemical in subsurface soil were compared to their USEPA risk-based SSLs included in the Regional Screening Table (USEPA 2009), if available. The comparisons of subsurface soil concentrations to generic SSLs (DAF 20) for detected chemicals indicated that arsenic, iron, and nitrobenzene were above their SSLs (Table 6-9).

6.6.4.2 Site-specific SSL Comparison

Site-specific SSLs were not calculated.

6.6.5 Background Comparison - Soil

The final step in the risk screening process is the comparison of the MDCs of COPCs identified in soil to the established Facility-wide inorganic background point estimate concentrations for metals (IT 2001). No metals identified as COPCs in surface soil and total soil were above their background point estimates (Table 6-10).

6.6.6 Human Health Risk Screening Summary

Soil COPCs with screening values were limited to metals and SVOCs. Asbestos, the primary chemical of concern for the sites, was not detected in soil. The soil cumulative human health risk screens were equal to the established SSP risk level of 1E-05 and above the hazard level of 1 for the residential scenario for surface and total soil. Cumulative risk screenings were below the established SSP risk and hazard levels of 1E-05 and 1, respectively, for the industrial scenario.

The results of the carcinogenic residential risk screenings were equal to the established SSP threshold (1E-05) for surface soil and total soil primarily due to arsenic concentrations below the background point estimate. As presented in Table 6-11 (surface soil) and Table 6-12 (total soil), the site-related risks, when excluding metals risk drivers detected below background (arsenic) in surface and total soil, is 6.E-06 which is below the SSP risk threshold of 1E-05.

The noncarcinogenic residential hazard screenings were above the established SSP threshold (HI=1) for surface and total soil primarily due to metals at concentrations below background (Table 6-10) and are therefore not considered a concern for the sites.

Detected lead concentrations at the sites were below 400 mg/kg; therefore, lead modeling was not conducted for the sites. The iron exposure assessment results for the hypothetical future child resident were below the applicable iron margin of exposure screening criteria for SSAs 30 and 79.

The comparisons of subsurface soil to generic risk-based SSLs (DAF 20) for detected chemicals indicated that arsenic, iron, and nitrobenzene were above their SSLs (Table 6-9). Although arsenic and iron were above their SSLs, detected concentrations were below their background point estimates and are not considered a concern at the sites. In addition, nitrobenzene detections were limited to one sample and nitrobenzene was not detected in groundwater at the site.

Asbestos, the primary chemical of concern for the sites, was not detected in groundwater. The SWMU 51 RFI (Shaw 2008b) investigation of the groundwater in the same area did not identify groundwater at the sites as a risk to human health or the environment.

6.7 ECOLOGICAL RISK SCREENING

6.7.1 Ecological Site Characterization

An overview of the site physiography, water resources, soil, and geology for SSAs 30 and 79 is presented in Section 6.1. SSAs 30 and 79 area is an approximate 1.6-acre grass area that provides habitat to wildlife potentially occurring in the area. The closest structures are storage magazine buildings located north (Building 4601-13), east (Building 4601-13), and west (Building 4601-12) of SSA 30 and SSA 79. The sites are bordered by a road to the south.

Observations made during the site reconnaissance indicate that a viable herbaceous vegetation community occurs at the site (Appendix B). Signs of chemical vegetative stress were not observed during the reconnaissance. Based on information from the Installation-Wide Biological Survey and observations made during the site reconnaissance, the grassland vegetative community at the site is typical of other meadow-grassed areas that are regularly maintained at RFAAP. The habitat could support some ecological use (i.e., shelter and foraging) by some smaller common species in the area.

Threatened, rare, or endangered species were not observed during the site reconnaissance. These species are not likely to be present within the boundaries of the site. Threatened, rare, and endangered species information for RFAAP is discussed in Section 3.3.4.

6.7.1.1 Data Organization

The following table identifies the soil samples used for the SLERA. These samples were analyzed for TAL inorganics, TCL pesticides, TCL PCBs, TCL VOCs, TCL SVOCs, explosives (including nitroglycerin and PETN), and asbestos. Refer to Table 2-2 for a detailed list of samples and analytes.

Soil Samples Evaluated for SLERA

SSAs 30 and 79	
30SS1	79SS2
30SS2	79SS3
30SS3	79SS4
79SS1	79SS5

Detected chemical occurrence and distribution tables for surface soil are presented in Table F.3-1. Refer to Table 6-1 for a complete list of results for detected analytes. In addition, to evaluate the adequate sensitivity of the MDL for the necessary screening levels, Table F.3-2 provides a screening of the maximum MDL versus available ecological screening values for non-detected chemicals in surface soil.

6.7.1.2 Ecological Conceptual Site Model (ECSM)

The terrestrial ECSM is presented on Figure 3-1. Surface soil is a potential exposure medium of concern based on historical activities at the site. Based on the site characterization and data, the terrestrial receptor exposure to surface soil pathway exists.

6.7.2 Preliminary Exposure Estimate and Ecological Effects Evaluation

The preliminary exposure estimate and ecological effects evaluation considers the most conservative risk scenario. Highly conservative assumptions are used to estimate COPEC exposure to terrestrial receptors for pathways to be quantitatively evaluated. Conservative TRVs are used to evaluate the ecological effects of exposure using the two approaches discussed below.

6.7.2.1 Direct Contact Approach

The MDC for detected chemicals are used as the preliminary exposure estimate concentrations to develop a conservative risk scenario for the direct contact pathway to soil invertebrates and terrestrial plants. The results of the preliminary exposure assessments for plants and invertebrates are provided below.

Terrestrial Plants

Preliminary direct contact HQs calculated for plants are presented in Table F.3-6 for detected chemicals. Of the detected chemicals for which screening values were available, the concentrations of aluminum, chromium, manganese, and vanadium resulted in HQ values that were greater than 1.

Soil Invertebrates and Microbial Communities

Preliminary direct contact HQs calculated for invertebrates are presented in Table F.3-8 for detected chemicals. Of the detected chemicals for which screening values were available, the concentrations of chromium, iron, manganese, mercury, and vanadium resulted in HQ values that were greater than 1.

6.7.2.2 Dose Rate Modeling Approach

Quantitative risk characterization for terrestrial wildlife is limited to direct ingestion of biota and incidental ingestion of soil. The preliminary risks for detected bioaccumulative chemicals are summarized in Table F.3-24 for each terrestrial wildlife receptor and the chemicals with HQs greater than 1 are characterized as follows:

Receptor	NOAEL Only HQ>1	NOAEL and LOAEL HQ>1
Meadow Vole	cadmium	arsenic, selenium
Short-tailed Shrew	arsenic, chromium, Aroclor 1254	cadmium
Red Fox	chromium, lead, selenium, zinc, Aroclor 1254, Aroclor 1260	arsenic, cadmium
American Robin	mercury, selenium	cadmium, chromium, lead, zinc
Red-tailed Hawk	zinc	none

6.7.3 Refined Exposure Estimate and Risk Characterization

6.7.3.1 Direct Contact Approach

The refined exposure estimate for the direct contact pathway to soil invertebrate and microbial communities incorporates the 95% UCL as the exposure concentration for evaluating the COPECs using a conservative yet more realistic exposure assumption than MDCs. Due to the number of samples at the sites, a 95% UCL was not calculated; therefore, a refinement of the direct contact pathway was not conducted.

6.7.3.2 Dose Rate Modeling Approach

The refined exposure estimates and ecological effects are developed for wildlife receptors having complete exposure pathways to be quantitatively evaluated (i.e., omnivorous birds, and carnivorous and herbivorous mammals). In the refined model, an average body weight, average ingestion rate, and a 95% UCL as the EPC are used. Due to the small number of samples at the sites, a 95% UCL was not calculated for the sites and the MDC was used as the EPC for the refinement. Refined receptor-specific exposure parameters are presented on Table F.3-9 (Appendix F.3). In addition, a realistic area use factor ($AF_{refined}$) was calculated as the ratio of the site area to the average home range of the receptor which is also presented in Table F.3-9 (Appendix F.3). A summary of the results of the refined exposure assessment for terrestrial wildlife is provided below.

Terrestrial Wildlife

The refined risk characterization results are presented in Table F.3-24 and summarized below for each of the receptors with chemical HQs greater than 1:

Receptor	NOAEL Only HQ>1	NOAEL and LOAEL HQ>1
Meadow Vole	none	none
Short-tailed Shrew	none	none
Red Fox	none	none
American Robin	chromium (1.1), lead (1.8), zinc (2.8)	none
Red-tailed Hawk	none	none

*Note: (1.1) = NOAEL-based HQ

6.7.4 Background Comparison - Soil

The final step in the risk screening process is the comparison of the MDCs of COPECs identified in soil to the established Facility-wide inorganic background point estimate concentrations for metals (IT 2001). The comparison of MDCs for metals identified as COPECs in surface soil with their background point estimates resulted in site soil MDCs above background point estimates for cadmium and lead (Table 6-10). Note that a background point estimate is not available for selenium; therefore, a background comparison was not conducted.

6.7.5 Risk Management – Scientific Management Decision Point

The findings of the ecological risk screen including site characterization and risk calculations are used as input to risk management decision-making for the sites. The SMDP reached from the ecological risk screening concludes that one of the following statements is true:

- There is adequate information to conclude that ecological risks are considered negligible and therefore there is no need for further action at the sites on the basis of ecological risk;
- The information is not adequate to make a decision at this point and further refinement of data is needed to augment the ecological risk screening; or
- The information collected and presented indicates that a more thorough assessment is warranted.

Terrestrial plant COPECs with HQs greater than 1 included: aluminum (HQ=620), chromium (HQ=27), manganese (HQ=5.5), and vanadium (HQ=32). Aluminum, chromium, manganese, and vanadium are below background point estimates (Table 6-10); therefore, these chemicals are not considered site-related.

Soil invertebrates and microbial processes COPECs with HQs greater than 1 included chromium (HQ=68), iron (HQ=180), manganese (HQ=2.7), mercury (HQ=1.1), and vanadium (HQ=3.2).

Chromium, iron, manganese, mercury, and vanadium are below background point estimates (Table 6-10); therefore, these chemicals are not considered site-related.

The refined risk characterization for wildlife resulted in the identification of no chemicals with a LOAEL-based HQ greater than 1.

After consideration of the limited metals concentrations above ecological screening levels for plants and invertebrates but below background point estimates and the lack of refined LOAEL-based HQs greater than 1 for terrestrial receptors, the SMDP is the following:

There is adequate information to conclude that ecological risks are considered negligible and therefore there is no need for further action at the site on the basis of ecological risk.

6.8 CONCLUSIONS AND RECOMMENDATION

No further action beyond the implementation of institutional controls (due to the presence of bagged asbestos containing material at the site within the trenches) is recommended for SSAs 30 and 79 based on the following results of the SSP screening:

- Cumulative risk and hazard screening results for industrial scenarios are below SSP thresholds for target risk and hazards;
- Site-related cumulative risk and hazard screening results for residential scenarios are below SSP thresholds for target risk and hazards;
- The MDC for lead is below the SSP screening level of 400 mg/kg;
- The iron exposure assessment results for the hypothetical future child resident are below the applicable iron margin of exposure screening criteria;
- Chemicals at concentrations above their generic SSLs are limited to metals at concentrations below background and therefore not considered a concern at the sites;
- Evidence of the release of asbestos outside the trenches was not indicated based on the results of the SSP investigation (asbestos was not detected in any soil or groundwater samples); and
- There is adequate information to conclude that ecological risks are considered negligible and therefore there is no need for further action at SSAs 30 and 79 based on ecological risk.

Institutional controls (ICs) are being implemented at the sites (SSAs 30 and 79 – Asbestos Disposal Trench No. 1 and No. 2) within the boundaries depicted on Figure 6-1. The objective of the ICs is to maintain the sites in their current industrial/commercial state as a closed solid waste management unit and to prevent any future residential use. Specifically these sites have been incorporated into plant management manual to ensure long-term protection of human health and the environment. The management manual provides for advance notice, assessment, and approval of intrusive work that may occur within the plant with a general digging prohibition at sites such as this. In addition, since bagged asbestos-containing material is known to be buried in the site trenches, the soil cover at these sites will be maintained to prevent erosion and potential exposure of the bags. In the event the property is transferred or leased, equivalent ICs will be put into terms and conditions of the deed or lease, which are no less restrictive than the IC objectives described above. Furthermore, the transferee or lessee will be responsible for ensuring IC compliance by any future users. However, the Army acknowledges the responsibility for all original liability under CERCLA and its right and responsibility to enforce ICs.

Notes:

CAS = Chemical Abstracts Service
ft bgs = Feet Below Ground Surface
mg/kg = Milligram Per Kilogram
µg/kg = Microgram Per Kilogram
pg/g = Picogram Per Gram
TAL = Target Analyte List
TCL = Target Compound List
PCB = Polychlorinated Biphenyl
VOC = Volatile Organic Compound
SVOC = Semi-volatile Organic Compound
MDL = Method Detection Limit
RL = Reporting Limit
LQ = Laboratory Qualifier
VQ = Validation Qualifier
r = Reason Code
ND = None Detected
NT = Not Tested

[A] = Facility-Wide Background Point Estimate as Reported in the Facility-Wide Background Study Report (IT 2001)
RSL = Regional Screening Level (RSL) from April 2009 RSL Table
Adjusted RSLs = a Hazard Quotient (HQ) of 0.1 applied to non-carcinogens
Key: c = cancer
n = noncancer
* = where: n SL < 100X c SL
** = where n SL < 10X c SL
m = concentration may exceed ceiling limit
s = concentration may exceed Csat
-- = No Screening Value Available

[1] = Mercuric chloride soil RSLs usec
[2] = Aroclor 1254 Unadjusted Soil Residential RSL usec
[3] = Pyrene soil RSLs used

= Concentration Exceeds Adjusted Soil Residential RSL

= Concentration Exceeds Adjusted Soil Industrial RSL

underline = Concentration Exceeds Facility Background Point Estimate

bold italic = Concentration Exceeds Soil-to-Groundwater Risk-based SSL (DAF20)

Data Qualifiers:

Laboratory Qualifiers
- B Analyte found in associated blank as well as in the sample.
- E Concentration exceeded the upper level of the calibration range of the instrument.
- J Analyte present. Reported value may not be accurate or precise.
- U The compound was analyzed for but not detected. The reporting limit will be adjusted to reflect any dilution, and for soil, the percent moisture.

Validation Qualifiers
- B Not detected substantially above the level reported in laboratory or field blanks.
- J Analyte present. Reported value may not be accurate or precise.
- K Analyte present. Reported value may be biased high. Actual value is expected to be lowe
- L Analyte present. Reported value may be biased low. Actual value is expected to be highe
- UL Not detected, quantitation limit is probably higher.

Reason Codes

GC/MS Organics
- f Field duplicate imprecision
- l MS/MSD recovery failure
- q Concentration exceeded the linear range
- x Field and/or equipment blank contamination
- y Trip blank contamination
- z Method blank and/or storage blank contamination

Inorganics and Conventionals
- f Field duplicate imprecision
- o Calibration blank contamination
- m MS/MSD recovery failure
- x CRDL standard recovery failure

GC and HPLC Organics
- c Calibration failure; poor or unstable (%D) response
- g Dual column confirmation imprecision
- x Trip blank contamination

Table 6-4
Summary of Asbestos in Groundwater Analytical Samples
SSP Report for SSAs 18, 72, 30, 79, 60, and 77
Radford Army Ammunition Plant, Radford, Virginia

Sample ID	Sample Date	MCL	Units	Asbestos			
				Result	LQ, VQ, r	MDL	RL

Table 6-5
SSAs 30 and 79 COPC Determination - Surface Soil
SSP Report for SSAs 18, 72, 30, 79, 60, and 77
Radford Army Ammunition Plant, Radford, Virginia

Notes:

COPC = Chemical of Potential Concern
mg/kg = Milligram Per Kilogram
CAS = Chemical Abstracts Service
TAL = Target Analyte List
TCL = Target Compound List
PCB = Polychlorinated Biphenyl
VOC = Volatile Organic Compound
SVOC = Semi-volatile Organic Compound

RSL = Regional Screening Level (RSL) from EPA April 2009 RSL Table
Adjusted RSLs = a Hazard Quotient (HQ) of 0.1 applied to non-carcinogens

Key:
- c = cancer
- n = noncancer
- c* = where: n SL < 100X c SL
- c** = where n SL < 10X c SL
- m = concentration may exceed ceiling limit
- s = concentration may exceed Csat

-- = Not Available

[1] = Mercuric chloride soil RSLs used
[2] = Aroclor 1254 Noncancer Soil Residential RSL used
[3] = Pyrene soil RSLs used

ARAR = Applicable, Relevant, and Appropriate Requirement
TBC = To-Be-Considered
IND = Adjusted Industrial RSL
RDA = Recommended Daily Allowance

ARES = Above Residential RSL
ARES/IND = Above Residential RSL/Industrial RSL
BSL = Below Residential/Industrial RSLs
NSV = No Screening Value Available

Table 6-6
SSAs 30 and 79 COPC Determination - Total Soil
SSP Report for SSAs 18, 72, 30, 79, 60, and 77
Radford Army Ammunition Plant, Radford, Virginia

Exposure point	CAS #	Chemical	Minimum Concentration	Maximum Concentration	Units	Location of Maximum Concentration	Detection Frequency	Range of Detection Limits	Concentration Used for Screening	Screening Toxicity Value (N/C)		Potential ARAR/TBC Value		Potential ARAR/TBC Source	COPC Flag (Y/N)	Rationale for Selection or Deletion

Table 6-6
SSAs 30 and 79 COPC Determination - Total Soil
SSP Report for SSAs 18, 72, 30, 79, 60, and 77
Radford Army Ammunition Plant, Radford, Virginia

Notes:

COPC = Chemical of Potential Concern
mg/kg = Milligram Per Kilogram
CAS = Chemical Abstracts Service
TAL = Target Analyte List
TCL = Target Compound List
PCB = Polychlorinated Biphenyl
VOC = Volatile Organic Compound
SVOC = Semi-volatile Organic Compound

RSL = Regional Screening Level (RSL) from EPA April 2009 RSL Table
Adjusted RSLs = a Hazard Quotient (HQ) of 0.1 applied to non-carcinogens

Key:
- c = cancer
- n = noncancer
- c* = where: n SL < 100X c SL
- c** = where n SL < 10X c SL
- m = concentration may exceed ceiling limit
- s = concentration may exceed Csat

-- = Not Available

[1] = Mercuric chloride soil RSLs used
[2] = Aroclor 1254 Noncancer Soil Residential RSL used
[3] = Pyrene soil RSLs used

ARAR = Applicable, Relevant, and Appropriate Requirement
TBC = To-Be-Considered
IND = Adjusted Industrial RSL
RDA = Recommended Daily Allowance

ARES = Above Residential RSL
ARES/IND = Above Residential RSL/Industrial RSL
BSL = Below Residential/Industrial RSLs
NSV = No Screening Value Available

Table 6-7

7.0 SSA 60 RUBBLE PILE EAST OF ADMINSTRATION BUILDING (BUILDING 220)

7.1 SITE BACKGROUND – ENVIRONMENTAL SETTING

7.1.1 Site Description and Topography

The rubble pile east of Administration Building 220 (SSA 60) is located in the southern portion of the MMA (Figure 1-1). SSA 60 is an approximate 1.5 acre fill area of demolition waste and construction waste material (Figure 7-1). Soil and gravel material were used to cover the fill material and level the area with an approximate 4% slope toward the west. The northern and eastern edges of fill material have steeper side slopes to the base of the fill area. Grass vegetation covers the fill area and side slopes. Maximum and minimum elevations of the site area are approximately 1,914 ft msl at the western edge of the site and 1,880 ft at the easternmost base of the fill area.

Structures at SSA 60 are limited to a meteorological tower constructed on the site in 1990 to monitor weather conditions and provide emergency response information. Aboveground power lines run along the western edge of the site adjacent to the main entry road to the plant area. In addition, a gravel area was added to the area to allow for access to the meteorological tower located at the site. Tanks and subsurface utilities are not located on or in the immediate vicinity of the site. Administrative Building 220 is located approximately 150 ft west of SSA 60 across the main entry road to the plant area. A site photographic log for SSA 60 is included in Appendix B.

7.1.2 Site History

The rubble pile was created in 1985 to accept demolition waste (fill dirt and concrete slab materials) cleaned up from the remains of an explosion in the Nitroglycerin Area Number 1 and highway construction debris (fill dirt and blasted rock) from nearby Route 114 in the late 1980s. Soil and gravel were placed and compacted over the rubble pile and graded level with the intention of building a parking lot for Building 220 employees. The parking lot was not constructed. Fill activities ceased at the site in 1988. Pre-1985 topographic maps indicate that a narrow valley area between two ridges was filled at the site with fill depths likely greater than 20 ft in the center and eastern portions of the site area. Based on the SSP investigation, surface sampling and test pits indicated a minimum one foot of cover over rubble material.

According the Virginia Solid Waste Management Regulations Title 9; VAC 20-80-60.D.7, the rubble pile site is conditionally exempt from the requirements of this chapter. The exemption states “landfilling of solid waste which includes only rocks, brick, block, dirt, broken concrete and road pavement, and which contain no paper, yard or wood wastes” is exempt from the regulation.

Figure 7-2 presents a 1990 aerial photograph of SSA 60 after fill activities had ceased and the meteorological tower had been constructed. A well defined drainage ditch is visible on the photograph extending from the easternmost base of fill area toward the east. A second drainage ditch appears to originate at the base of the fill area and merges with the main drainage channel less than 100 ft from the fill area. A later aerial photograph from 2002 shown on Figure 7-3 shows the same drainage features.

7.1.3 Surface Water

Surface water bodies, manholes, or catch basins are not located within SSA 60. Any surface water runoff that does not infiltrate into the subsurface at the site would flow toward the east across the site and down the steeper vegetated side slopes of the fill area. Runoff from the site that reaches the base of the fill slopes would potentially leave the site area via a drainage ditch that extends from the site down a valley approximately 600 ft before ending at an alluvial valley area that is enclosed on all sides by steep slopes and road embankments.

7.1.4 Soil

According to the *Soil Survey of Montgomery County, Virginia* (USDA 1985), the area of SSA 60 is underlain by Unison-Urban Land complex soil. This soil has moderate permeability and medium-to-strong acidity. Soil classification is not practical in urban land areas because the original soil has been physically altered or obscured. A typical profile of undisturbed Unison soil consists of a 15-inch thick surface layer of dark brown loam and a 43-inch thick subsoil of yellowish-red, sticky plastic clay underlain by a red sandy clay loam to a depth of 58 inches. In general, permeability is moderate in Unison soil, natural fertility is low, and organic matter content is low to moderate.

7.1.5 Geology

Subsurface investigations have not been previously conducted at the site. Bedrock of the Cambrian Age Elbrook Formation is mapped below SSA 60 (Bartholomew and Schultz 2000). Residual clayey soil from limestone/dolomite bedrock of Cambrian Age Elbrook Formation is expected to be present below fill material placed at the site. The Elbrook Formation in the site area is typically gray to dark gray, fine to medium grained limestone and dolomite, with laminar to medium beds for dolomite and medium beds for limestone. Outcrops of bedrock occur at higher elevations immediately south of the site.

7.1.6 Hydrogeology

Groundwater investigations have not been previously conducted at the site. Based on groundwater conditions investigated at similar areas of RFAAP, groundwater is expected to occur within fractures and voids of underlying bedrock. The expected groundwater depth at SSA 60 of greater than 75 ft below the fill material is based on the assumption that potentiometric elevations in the upland area of the facility are similar for sites whose ground surface elevations are similar. SWMU 17 and SWMU 40 are located to the west of SSA 60 and have similar ground surface elevations to SSA 60 prior to filling (1,880 to 1,910 ft msl).

Select Groundwater Elevation Data – SWMU 17 and SWMU 40

Well ID	Location	Top of Casing at Measurement Point	Ground Surface Elevation (ft msl)	Depth to Groundwater (bgs)	Groundwater Elevation (12/10/07)
17MW2	SWMU 17	1905.88	1903.99	102.90	1801.09
17PZ1	SWMU 17	1906.90	1904.70	104.16	1800.54
40MW6	SWMU 40	1884.25	1882.61	98.68	1783.93

As shown in the above table, the depth to groundwater below the ground surface at SWMU 17 and SWMU 40 within relatively undisturbed areas is greater than 98 ft and therefore it has been conservatively assumed that the depth to groundwater below the fill material at SSA 60 is greater than 75 ft.

7.2 PREVIOUS INVESTIGATIONS

7.2.1 RCRA Facility Assessment – USEPA 1987

An assessment was conducted at SSA 60 (listed as Unit 60 in RFA) to evaluate potential hazardous waste or hazardous chemical releases and implement corrective actions, as necessary. The assessment consisted of a preliminary review and evaluation of available site information, personnel interviews, and a visual inspection of the site. Environmental samples were not collected at SSA 60 as part of the inspection. The RFA indicated that there were no documented releases from the unit.

7.3 WORK PLAN DATA GAP ANALYSIS

The data gap analysis presented in WPA 028 indicated that no soil sampling and analyses had occurred at SSA 60 (URS 2009). The data gap analysis completed for SSA 60 identified data gaps for evaluating potential releases to surface soil, subsurface soil, and the drainage ditch area from previous fill activities, and characterizing physical and geotechnical properties of site soil.

7.3.1 Release Assessment to Surface Soil

An assessment of potential releases to surface soil had not been performed at SSA 60. This data gap was filled by collecting surface soil samples from the fill area and at the base of the fill embankment where potential mass transport of material from the fill area would occur from stormwater runoff. Field investigation activities are discussed in Section 7.4.

7.3.2 Release Assessment to Drainage Ditch

An assessment of potential releases to the drainage ditch located at the base of the fill area had not been performed at SSA 60. This data gap was filled by collecting surface soil samples from the drainage ditch located at the base of the fill area. Field investigation activities are discussed in Section 7.4.

7.3.3 Release Assessment to Subsurface Soil

An assessment of potential releases to subsurface soil had not been performed at SSA 60. This data gap was filled by collecting subsurface soil samples below the fill material. Field investigation activities are discussed in Section 7.4.

7.3.4 Groundwater

Given the lack of data at the site and anticipated significant depth to groundwater, potential releases to groundwater were assessed by evaluating subsurface soil data and a comparison of these data to USEPA risk-based soil-to-groundwater SSLs included in the Regional Screening Table (USEPA 2009).

7.3.5 Other

Two representative samples of soil at the site (one surface sample and one subsurface sample) were submitted for analysis of physical and geotechnical properties, as described in Section 7.4

7.3.6 Summary of Data Gaps

The following table summarizes these identified data gaps and the completion plan to fill the data gaps from WPA 028 (URS 2009).

SSA 60 - Summary of Data Gap Analysis and Completion Plan

DATA GAPS			COMPLETION PLAN
Item	**Physical**	**Chemical**	
Releases to Soil	Surface Soil Samples	Chemical Data – VOCs, SVOCs, PCBs, pesticides, explosives, and metals	Collect surface soil samples from fill area and at base of fill embankment
	Subsurface Soil Samples	Chemical Data – VOCs, SVOCs, PCBs, pesticides, explosives, and metals	Collect subsurface samples below fill material
Release to Drainage Ditch Soil/Sediment	Surface Soil Samples	Chemical Data – VOCs, SVOCs, PCBs, pesticides, explosives, and metals	Collect surface soil or sediment samples from drainage ditch area proximate to fill area

DATA GAPS			COMPLETION PLAN
Item	Physical	Chemical	
Releases to Groundwater	Subsurface Soil Samples	Use subsurface soil sample data	Compare subsurface soil data collected below fill material to soil-to-groundwater SSLs
Site-Wide Soil Characteristics	Physical / Geotechnical Properties	pH, TOC, grain size, Atterberg Limits, and moisture content	Collect samples for geotechnical and physical property analysis.

7.4 SSP FIELD ACTIVITIES

Seven surface soil samples and two test pits were advanced in and around the site to evaluate for the presence or absence of chemicals in soil potentially associated with historical activities (Figure 7-4). During excavation of the test pits, the material encountered included fill, gravel areas, rocks, and concrete building debris. Three surface soil samples were collected from the fill area, two surface soil samples were collected from the base of the fill area, and two surface soil samples were collected from within the ditch located at the base of the fill area. In addition, two test pits were completed at the site and one subsurface sample was collected from test pit 1 while not enough soil was present in test pit 2 to obtain a soil sample. An additional boring (60SS6) was completed horizontally into the base of the fill area to obtain an additional subsurface sample. Discrete samples were collected from surface or intermediate intervals for the samples as summarized below.

SSA 60 SSP Samples and Boring Information

Boring ID	Total Depth of Boring (ft bgs)	Surface Sample ID	Sample Depth (ft bgs)	Intermediate Sample ID	Sample Depth (ft bgs)
60SE1	1.0	60SE1	0-1	--	--
60SE2	1.0	60SE2	0-1	--	--
60SS1	1.0	60SS1	0-1	--	--
60SS2	1.0	60SS2	0-1	--	--
60SS3	1.0	60SS3	0-1	--	--
60SS4	1.0	60SS4	0-1	--	--
60SS5	1.0	60SS5	0-1	--	--
60SS6	1.0*	60SS6	0-1	--	--
60TP1	16	--	--	60TP1	14-16

Note: * 60SS6 was completed horizontally into the base of the fill area to obtain an additional subsurface sample approximately 12-14 ft below the upper level surface of SSA 60.

Soil samples were analyzed for TCL VOCs, TCL SVOCs, TCL pesticides, TCL PCBs, explosives (including nitroglycerin and PETN), and TAL inorganics . SSP analytical results (detected chemicals) are summarized in Table 7-1.

Two samples were collected for physical testing (one surface soil sample (60SS3) and one subsurface soil sample (60SS6)). Physical testing for each sample included: grain size analysis, Atterberg limits, soil

moisture content, TOC, and pH. Analytical results for these samples are summarized in Table 2-1 and the complete results are provided in Appendix D.1.

7.5 CONCEPTUAL SITE MODEL (CSM)

A CSM for SSA 60 is presented on Figure 7-5. The site is located in the upland area outside the fenced area containing manufacturing operations at RFAAP. Rubble fill material consisting of demolition debris and highway construction debris has been placed within a former valley area to estimated maximum depths greater than 20 ft. Soil cover has been placed over the fill area to level the site. Grass covers the fill area and side slopes. Groundwater is expected to occur within fractures and voids of underlying bedrock at estimated depths greater than 75 ft below the fill material placed at SSA 60. A drainage ditch at the base of the fill area is expected to convey runoff from the site area during significant storm events. This drainage ditch leads to a valley area approximately 600 ft from the site that is surrounded on all sides by steep slopes associated with ridges and road embankments and would eventually discharge to Stroubles Creek.

Fill material placed in the rubble pile represents the potential constituent source at SSA 60. Material placed in the rubble pile reportedly consisted of demolition waste (fill dirt and concrete slab materials) from the remains of an explosion in the Nitroglycerin Area Number 1 and highway construction debris (fill direct and blast rock). The volume of material placed in the rubble pile is unknown. Potentially affected media at the site include:

- Surface and subsurface soil via placement of fill material;
- Surface soil/deposited material at the base of the fill area from stormwater runoff (erosion and mass transport) from the fill area;
- Soil or sediment in the drainage ditch at base of fill area from stormwater runoff (erosion and mass transport) from the fill area;
- Subsurface soil via leaching of constituents from fill material place; and
- Groundwater via leaching of constituents released to subsurface soil.

Although current and likely future land-use scenarios are limited to industrial operations, both residential and industrial scenarios will be evaluated in the SSP human health screening (USEPA 2001).

SSA 60 is exclusively an upland habitat that lacks wetland or perennial surface water features. Therefore, soil represents the potential exposure medium for ecological receptors. An ECSM is provided in Section 3.0, Figure 3-1.

7.6 HUMAN HEALTH RISK SCREENING

7.6.1 Identification of COPCs

Tables 7-2 and 7-3 present the results of the COPC evaluations for surface soil and total soil, respectively. COPCs identified for surface soil and total soil included:

TAL metals:	aluminum, arsenic, cobalt, iron, manganese;
TCL Pesticides:	none;
TCL PCBs:	none;
TCL VOCs:	none;
TAL SVOCs:	benzo(a)pyrene, dimethyl phthalate (NSV); and
Explosives:	not detected.

7.6.2 Cumulative Risk Screen

The cumulative risk screening for surface soil is presented on Table 7-4. The cumulative risk screening for total soil is presented on Table 7-5. A summary of the screening results is presented below:

Cumulative Human Health Risk Screening Results for Soil

	Surface Soil			Total Soil		
	Above/ Below/ Equal	**Risk/ Hazard**	**Drivers**	**Above/ Below/ Equal**	**Risk/ Hazard**	**Drivers**
Residential Risk	Above	4.E-05	Arsenic	Above	5.E-05	Arsenic
Industrial Risk	Below	8.E-06	--	Equal	1.E-05	Arsenic
Residential Hazard	Above	2	Aluminum, Arsenic, Cobalt, Iron, Manganese	Above	3	Aluminum, Arsenic, Cobalt, Iron, Manganese
Industrial Hazard	Below	0.2	--	Below	0.2	--

*Note: Above, below, or equal to established SSP risk and hazard levels.

The cumulative human health risk screens were above the established SSP risk and hazard levels of 1E-05 and 1, respectively, for the residential scenario for surface and total soil. The cumulative human health risk screens for the industrial scenario were below the established SSP risk level of 1E-05 for surface soil and equal to the risk level for total soil. Cumulative hazard screening was below the established SSP hazard level of 1 for the industrial scenario for total and surface soil. The risk/hazard drivers identified in the table above are those chemicals that primarily contribute to HIs or risks greater than the established SSP hazard level of 1 or risk level of 1E-05, respectively.

Due to multiple chemicals contributing to a residential HI greater than 1, as presented on Table 7-4 (surface soil) and Table 7-5 (total soil), the HIs were segregated based on primary target organs for chronic exposure. The HI segregations for surface and total soil resulted in values equal to or higher than the cumulative SSP HI target organ threshold of 0.5 for the following target organs: blood, CNS, skin, vascular, GI tract, and liver.

7.6.3 Lead and Iron Screening

Detected lead concentrations at the site were below 400 mg/kg; therefore, lead modeling was not conducted for the site.

Since iron concentrations in soil result in an HQ of greater than 0.5, further assessment is required. This assessment consists of a "margin of exposure evaluation" where the estimated intake of iron is compared to the RDA and concentrations known to cause adverse health effects in children (NCEA 2006). Appendix E.4 presents the margin of exposure evaluation for surface soil and total soil. A summary of the results for SSA 60 is presented below.

Iron Margin of Exposure Evaluation – Future Child Resident

	Surface Soil			Total Soil		
	Above/ Below	**Estimated Site Intake**	**Exposure Screening Level**	**Above/ Below**	**Estimated Site Intake**	**Exposure Screening Level**
RDA Screen (mg/day)	Below	6	10	Below	7	10
Provisional Reference Dose (RfD) Screen (mg/kg-day)	Below	0.4	0.7	Below	0.5	0.7

The iron exposure assessment results for the hypothetical future child resident were below the applicable iron margin of exposure screening criteria for SSA 60.

7.6.4 SSL Comparison - Soil

7.6.4.1 Generic SSLs (Soil-to-groundwater Risk-based Screening Levels)

An SSL screening was conducted for detected chemicals in subsurface soil to evaluate the potential for leaching of chemicals from soil to groundwater. As presented in Table 7-6, the detected concentrations for each chemical in subsurface soil were compared to their USEPA risk-based SSLs included in the Regional Screening Table (USEPA 2009), if available. The comparisons of subsurface soil concentrations to generic SSLs (DAF 20) for detected chemicals indicated that arsenic and iron were above their SSLs (Table 7-6).

7.6.4.2 Site-specific SSL Comparison

Organic chemical were not detected in subsurface soil at concentrations above their generic SSLs (DAF 20); therefore, site-specific SSLs were not calculated.

7.6.5 Background Comparison - Soil

The final step in the risk screening process is the comparison of the MDCs of COPCs identified in soil to the established Facility-wide inorganic background point estimate concentrations for metals (IT 2001). The comparison of MDCs for metals identified as COPCs in surface soil and total soil with their background point estimates resulted in a site soil MDC above its background point estimate for arsenic for total soil (Table 7-7). Note that, although the MDC for arsenic in total soil (16 mg/kg) was slightly above the background point estimate (15.8 mg/kg), the detected concentration was within the range of arsenic concentrations in background at the facility (1.2 – 35.9 mg/kg).

7.6.6 Human Health Risk Screening Summary

Soil COPCs with screening values were limited to metals and SVOCs. The soil cumulative human health risk screens were above the established SSP risk and hazard levels of 1E-05 and 1.0, respectively, for the residential scenario for surface and total soil. The cumulative human health risk screens for the industrial scenario were below the established SSP risk level of 1E-05 for surface soil and equal to the risk level for total soil. Cumulative hazard screening was below the established SSP hazard level of 1 for the industrial scenario for total and surface soil.

The results of the carcinogenic residential risk screening were above the established SSP threshold (1E-05) for surface soil and total soil primarily due to arsenic. Although the MDC for arsenic in total soil (16 mg/kg) was slightly above the background point estimate (15.8 mg/kg), the detected concentration was within the range of arsenic concentrations in background at the facility (1.2 – 35.9 mg/kg) and the

remaining samples were all below the background point estimate; therefore, arsenic is not considered a concern at the site. As presented on Tables 7-8 and 7-9 the site-related risk, when excluding arsenic in surface and total soil, is 5E-06 which is below the SSP risk threshold of 1E-05.

The noncarcinogenic residential hazard screening was above the established SSP threshold (HI=1) for surface and total soil primarily due to metals at concentrations within background (Table 7-7) and are therefore not considered a concern for the site.

Detected lead concentrations at the site were below 400 mg/kg; therefore, lead modeling was not conducted for the sites. The iron exposure assessment results for the hypothetical future child resident were below the applicable iron margin of exposure screening criteria for SSA 60.

The MDC comparisons of total soil to generic SSLs (DAF 20) for detected chemicals indicated that arsenic and iron were above their SSLs (Table 7-6). The iron concentrations are not a concern at the site since the detected concentrations are below its background point estimate. Although the MDC for arsenic in total soil (16 mg/kg) was slightly above the background point estimate (15.8 mg/kg), the detected concentration was within the range of arsenic concentrations in background at the facility (1.2 – 35.9 mg/kg) and the remaining samples were all below the background point estimate; therefore, arsenic is not considered a concern at the site.

7.7 ECOLOGICAL RISK SCREENING

7.7.1 Ecological Site Characterization

An overview of the site physiography, water resources, soil, and geology for SSA 60 is presented in Section 7.1. SSA 60 is an approximate 1.5 acre fill area of demolition waste and construction waste material that due to the nature of the fill material provides minimal habitat value to wildlife potentially occurring in the area (see photographic log – Appendix B).

Based on information from the Installation-Wide Biological Survey and observations made during the site reconnaissance, the grassland vegetative community at the site is typical of other meadow-grassed areas that are regularly maintained at RFAAP.

The habitat could support some ecological use (i.e., shelter and foraging) by some smaller common species in the area. Given its limited size, substrate (gravel), asphalt roads, adjacent buildings, and potential use as a parking area, few individuals would be expected to utilize the area for a lengthy period.

Threatened, rare, or endangered species were not observed during the site reconnaissance. These species are not likely to be present within the boundaries of the site. Threatened, rare, and endangered species information for RFAAP is discussed in Section 3.3.4.

7.7.1.1 Data Organization

The following table identifies the soil samples used for the SLERA. These samples were analyzed for TAL inorganics, TCL pesticides, TCL PCBs, TCL VOCs, TCL SVOCs, and explosives (including nitroglycerin and PETN). Refer to Table 2-1 for a detailed list of samples and analytes.

Soil Samples Evaluated for SLERA

SSA 60	
60SS1	60SS5
60SS2	60SE1
60SS3	60SE2
60SS4	

Detected chemical occurrence and distribution tables for surface soil are presented in Table F.4-1. Refer to Table 7-1 for a complete list of results for detected analytes. In addition, to evaluate the adequate

sensitivity of the MDL for the necessary screening levels, Table F.4-2 provides a screening of the maximum MDL versus available ecological screening values for non-detected chemicals in surface soil.

7.7.1.2 Ecological Conceptual Site Model (ECSM)

The terrestrial ECSM is presented on Figure 3-1. Surface soil is a potential exposure medium of concern based on historical activities at the site. Based on the site characterization and data, the terrestrial receptor exposure to surface soil pathway exists.

7.7.2 Preliminary Exposure Estimate and Ecological Effects Evaluation

The preliminary exposure estimate and ecological effects evaluation considers the most conservative risk scenario. Highly conservative assumptions are used to estimate COPEC exposure to terrestrial receptors for pathways to be quantitatively evaluated. Conservative TRVs are used to evaluate the ecological effects of exposure using the two approaches discussed below.

7.7.2.1 Direct Contact Approach

The MDC for detected chemicals are used as the preliminary exposure estimate concentrations to develop a conservative risk scenario for the direct contact pathway to soil invertebrates and terrestrial plants. The results of the preliminary exposure assessments for plants and invertebrates are provided below.

Terrestrial Plants

Preliminary direct contact HQs calculated for plants are presented in Table F.4-6 for detected chemicals. Of the detected chemicals for which screening values were available, the concentrations of aluminum, chromium, lead, manganese, selenium, and vanadium resulted in HQ values that were greater than 1.

Soil Invertebrates and Microbial Communities

Preliminary direct contact HQs calculated for invertebrates are presented in Table F.4-8 for detected chemicals. Of the detected chemicals for which screening values were available, the concentrations of chromium, iron, manganese, vanadium, zinc, and cyanide resulted in HQ values that were greater than 1.

7.7.2.2 Dose Rate Modeling Approach

Quantitative risk characterization for terrestrial wildlife is limited to direct ingestion of biota and incidental ingestion of soil. The preliminary risks for detected bioaccumulative chemicals are summarized in Table F.4-24 for each terrestrial wildlife receptor and the chemicals with HQs greater than 1 are characterized as follows:

Receptor	NOAEL Only HQ>1	NOAEL and LOAEL HQ>1
Meadow Vole	cadmium, lead	arsenic, selenium
Short-tailed Shrew	cadmium, chromium, lead, selenium, zinc, Aroclor 1254, Aroclor 1260, benzo(g,h,i)perylene	arsenic
Red Fox	chromium, copper, lead, Aroclor 1254, Aroclor 1260, benzo(a)pyrene, benzo(b)fluoranthene, benzo(g,h,i)perylene	arsenic, cadmium, selenium, zinc
American Robin	cadmium, mercury, selenium, 4,4'-DDD, 4,4'-DDE, Aroclor 1254	chromium, lead, zinc
Red-tailed Hawk	lead, zinc	none

7.7.3 Refined Exposure Estimate and Risk Characterization

7.7.3.1 Direct Contact Approach

The refined exposure estimate for the direct contact pathway to soil invertebrate and microbial communities incorporates the 95% UCL as the exposure concentration for evaluating the COPECs using a conservative yet more realistic exposure assumption than MDCs. Due to the number of samples at the sites, a 95% UCL was not calculated; therefore, a refinement of the direct contact pathway was not conducted.

7.7.3.2 Dose Rate Modeling Approach

The refined exposure estimates and ecological effects are developed for wildlife receptors having complete exposure pathways to be quantitatively evaluated (i.e., omnivorous birds, and carnivorous and herbivorous mammals). In the refined model, an average body weight, average ingestion rate, and a 95% UCL as the EPC are used. Due to the small number of samples at the site, a 95% UCL was not calculated for the site and the MDC was used as the EPC for the refinement. Refined receptor-specific exposure parameters are presented on Table F.4-9 (Appendix F.4). In addition, a realistic area use factor ($AF_{refined}$) was calculated as the ratio of the site area to the average home range of the receptor which is also presented in Table F.4-9 (Appendix F.4). A summary of the results of the refined exposure assessment for terrestrial wildlife is provided below.

Terrestrial Wildlife

The refined risk characterization results are presented in Table F.4-24 and summarized below for each of the receptors with chemical HQs greater than 1:

Receptor	NOAEL Only HQ>1	NOAEL and LOAEL HQ>1
Meadow Vole	arsenic (1.3)	none
Short-tailed Shrew	arsenic (2.5)	none
Red Fox	none	none
American Robin	chromium (1.5), lead (4.5), zinc (3.0)	none
Red-tailed Hawk	none	none

*Note: (1.3) = NOAEL-based HQ

7.7.4 Background Comparison - Soil

The final step in the risk screening process is the comparison of the MDCs of COPECs identified in soil to the established Facility-wide inorganic background point estimate concentrations for metals (IT 2001). The comparison of MDCs for metals identified as COPECs in surface soil with their background point estimates resulted in site soil MDCs above background point estimates for cadmium and lead (Table 7-7). Note that background point estimates are not available for cyanide and selenium; therefore, background comparisons were not conducted.

7.7.5 Risk Management – Scientific Management Decision Point

The findings of the ecological risk screen including site characterization and risk calculations are used as input to risk management decision-making for the site. The SMDP reached from the ecological risk screening concludes that one of the following statements is true:

- There is adequate information to conclude that ecological risks are considered negligible and therefore there is no need for further action at the site on the basis of ecological risk;

- The information is not adequate to make a decision at this point and further refinement of data is needed to augment the ecological risk screening; or
- The information collected and presented indicates that a more thorough assessment is warranted.

Terrestrial plant COPECs with HQs greater than 1 included: aluminum (HQ=500), chromium (HQ=39), lead (HQ=1.1), manganese (HQ=3), selenium (HQ=1.3), and vanadium (HQ=22). Aluminum, chromium, manganese, and vanadium are below background point estimates (Table 7-7); therefore, these chemicals are not considered site-related. Even though the refined HQ for lead (HQ=1.1) is greater than 1 and concentrations at the site are above the background point estimate, this risk is considered to present low to negligible risk to plants at the site. Even though the refined HQ for selenium (HQ=1.3) is greater than 1 and no background point estimate is available, this risk is considered to present low to negligible risk to plants at the site.

Soil invertebrates and microbial processes COPECs with HQs greater than 1 included chromium (HQ=98), iron (HQ=150), manganese (HQ=1.5), vanadium (HQ=2.2), zinc (HQ=1.1), and cyanide (HQ=2.9). Chromium, iron, manganese, vanadium, and zinc are below background point estimates (Table 7-7); therefore, these chemicals are not considered site-related. Even though the refined HQ for cyanide (2.9) is greater than 1 and no background point estimate is available, this risk is considered to present low to negligible risk to invertebrates and microbial processes at the site.

The refined risk characterization for wildlife resulted in the identification of no chemicals with a LOAEL-based HQ greater than 1.

After consideration of the limited metals concentrations above ecological screening levels for plants and invertebrates, the lack of refined LOAEL-based HQs greater than 1 for terrestrial receptors, and the nature of activities at the site, the SMDP is the following:

There is adequate information to conclude that ecological risks are considered negligible and therefore there is no need for further action at the site on the basis of ecological risk.

7.8 CONCLUSIONS AND RECOMMENDATION

No further action is recommended for SSA 60 based on the following results of the SSP screening:

- Site-related cumulative risk and hazard screening results for industrial scenarios are below SSP thresholds for target risk and hazards;
- Site-related cumulative risk and hazard screening results for residential scenarios are below SSP thresholds for target risk and hazards;
- The MDC for lead is below the SSP screening level of 400 mg/kg;
- The iron exposure assessment results for the hypothetical future child resident are below the applicable iron margin of exposure screening criteria;
- Chemicals at concentrations above their generic SSLs are limited to metals at concentrations within background and nitrobenzene which was not detected in groundwater and therefore not considered a concern at the site; and
- There is adequate information to conclude that ecological risks are considered negligible and therefore there is no need for further action at SSA 60 based on ecological risk.

Notes:

CAS = Chemical Abstracts Service
ft bgs = Feet Below Ground Surface
mg/kg = Milligram Per Kilogram
µg/kg = Microgram Per Kilogram
pg/g = Picogram Per Gram
TAL = Target Analyte List
TCL = Target Compound List
PCB = Polychlorinated Biphenyl
VOC = Volatile Organic Compound
SVOC = Semi-volatile Organic Compound
MDL = Method Detection Limit
RL = Reporting Limit
LQ = Laboratory Qualifier
VQ = Validation Qualifier
r = Reason Code
NT = Not Tested

*60SS6 was completed horizontally into the base of the fill area to obtain an additional subsurface sample approximately 12-14 ft below the upper level surface of SSA60.

[A] = Facility-Wide Background Point Estimate as Reported in the Facility-Wide Background Study Report (IT 2001)
RSL = Regional Screening Level (RSL) from April 2009 RSL Table
Adjusted RSLs = a Hazard Quotient (HQ) of 0.1 applied to non-carcinogens
Key: c = cancer
n = noncancer
* = where: n SL < 100X c SL
** = where n SL < 10X c SL
m = concentration may exceed ceiling limit
s = concentration may exceed Csat
-- = No Screening Value Available

[1] = Mercuric chloride soil RSLs value used
[2] = Chlordane soil RSLs used
[3] = Aroclor 1254 Unadjusted Soil Residential RSL used
[4] = Pyrene soil RSLs used

= Concentration Exceeds Adjusted Soil Residential RSL

= Concentration Exceeds Adjusted Soil Industrial RSL

underline = Concentration Exceeds Facility Background Point Estimate

bold italic = Concentration Exceeds Soil-to-Groundwater Risk-based SSL (DAF20)

Data Qualifiers:

Laboratory Qualifiers
- B — Analyte found in associated blank as well as in the sample.
- J — Analyte present. Reported value may not be accurate or precise.
- U — The compound was analyzed for but not detected. The reporting limit will be adjusted to reflect any dilution, and for soil, the percent moisture.

Validation Qualifiers
- B — Not detected substantially above the level reported in laboratory or field blanks.
- J — Analyte present. Reported value may not be accurate or precise.
- K — Analyte present. Reported value may be biased high. Actual value is expected to be lower.
- L — Analyte present. Reported value may be biased low. Actual value is expected to be higher.
- U — Not detected. The associated number indicates the approximate sample concentration necessary to be detected.
- UJ — Not detected, quantitation limit may be inaccurate or imprecise.

Reason Codes
GC/MS Organics
- i — LCS recovery failure
- m — Internal standard failure
- s — Surrogate failure
- x — Field and/or equipment blank contamination
- z — Method blank and/or storage blank contamination

Inorganics and Conventionals
- f — Field duplicate imprecision
- o — Calibration blank contamination
- m — MS/MSD recovery failure
- s — Serial dilution failure
- x — CRDL standard recovery failure

GC and HPLC Organics
- g — Dual column confirmation imprecision
- x — Trip blank contamination

Table 7-2
SSA 60 COPC Determination - Surface Soil
SSP Report for SSAs 18, 72, 30, 79, 60, and 77
Radford Army Ammunition Plant, Radford, Virginia

Notes:

COPC = Chemical of Potential Concern
mg/kg = Milligram Per Kilogram
CAS = Chemical Abstracts Service
TAL = Target Analyte List
TCL = Target Compound List
PCB = Polychlorinated Biphenyl
VOC = Volatile Organic Compound
SVOC = Semi-volatile Organic Compound

RSL = Regional Screening Level (RSL) from EPA April 2009 RSL Table
Adjusted RSLs = a Hazard Quotient (HQ) of 0.1 applied to non-carcinogens

Key:
- c = cancer
- n = noncancer
- c* = where: n SL < 100X c SL
- c** = where n SL < 10X c SL
- m = concentration may exceed ceiling limit
- s = concentration may exceed Csat

-- = Not Available

[1] = Mercuric chloride soil RSLs value used
[2] = Chlordane soil RSLs used
[3] = Aroclor 1254 Noncancer Soil Residential RSL used
[4] = Pyrene soil RSLs used

ARAR = Applicable, Relevant, and Appropriate Requirement
TBC = To-Be-Considered
IND = Adjusted Industrial RSL
RDA = Recommended Daily Allowance

ARES = Above Residential RSL
ARES/IND = Above Residential RSL/Industrial RSL
BSL = Below Residential/Industrial RSLs
NSV = No Screening Value Available

Table 7-3
SSA 60 COPC Determination - Total Soil
SSP Report for SSAs 18, 72, 30, 79, 60, and 77
Radford Army Ammunition Plant, Radford, Virginia

Notes:

COPC = Chemical of Potential Concern
mg/kg = Milligram Per Kilogram
CAS = Chemical Abstracts Service
TAL = Target Analyte List
TCL = Target Compound List
PCB = Polychlorinated Biphenyl
VOC = Volatile Organic Compound
SVOC = Semi-volatile Organic Compound

RSL = Regional Screening Level (RSL) from EPA April 2009 RSL Table
Adjusted RSLs = a Hazard Quotient (HQ) of 0.1 applied to non-carcinogens

Key:
- c = cancer
- n = noncancer
- c* = where: n SL < 100X c SL
- c** = where n SL < 10X c SL
- m = concentration may exceed ceiling limit
- s = concentration may exceed Csat

-- = Not Available

[1] = Mercuric chloride soil RSLs value used
[2] = Chlordane soil RSLs used
[3] = Aroclor 1254 Noncancer Soil Residential RSL used
[4] = Pyrene soil RSLs used

ARAR = Applicable, Relevant, and Appropriate Requirement
TBC = To-Be-Considered
IND = Adjusted Industrial RSL
RDA = Recommended Daily Allowance

ARES = Above Residential RSL
ARES/IND = Above Residential RSL/Industrial RSL
BSL = Below Residential/Industrial RSLs
NSV = No Screening Value Available

Table 7-4

THIS PAGE LEFT INTENTIONALLY BLANK

8.0 SSA 77 GARBAGE INCINERATOR (BUILDING 7219)

8.1 SITE BACKGROUND – ENVIRONMENTAL SETTING

8.1.1 Site Description

The garbage incinerator (SSA 77) at Building 7219 is located in the southern part of the MMA at RFAAP (Figure 1-1). SSA 77 consists of a 29 ft by 25 ft concrete block/brick building with a 52 ft tall brick chimney formerly used to incinerate cardboard, paper products, wood, and other municipal waste materials. The building is located between the Shipping and Receiving Building 534 and Contaminated Scrap Burning Area (SWMU 17) in the southern portion of the MMA. Building 7219 is built into a hillside and has a basement and first floor (Figure 8-1). Paved asphalt roads encircle the building area. The first floor of the building is at grade with the asphalt road to the south of the building (approximately elevation 1,900 ft msl), while the basement is at grade with the asphalt road to the north of the building (approximate 1,890 ft msl). Grass covers the hillside area around Building 7219 between the asphalt pavement areas. A site photographic log for SSA 77 is included in Appendix B.

Equipment formerly contained in the building has been removed. A significant portion of the building roof has collapsed into the first floor of the building. Subsurface piping in the building area includes a sewer pipe extending from the southwest corner building to a partially aboveground, concrete septic tank approximately 30 ft north of the building. This pipe received water from a bathroom area and floor drains located on the charging floor (first floor). According to building plans, the sewer pipe is 4-inch diameter cast iron until it reaches the asphalt road area where the pipe is 6-inch diameter terracotta. This plan does not show a drainage field associated with the septic tank, contrasted with a drain field shown for a septic tank located west of the Shipping and Receiving Building.

Other subsurface utilities located in the site area include a 6-inch water line, which runs across the asphalt area approximately 30 ft south of Building 7219.

8.1.2 Site History

The garbage incinerator operated at the location of Building 7219 from the 1940s until 1974, when it was shutdown, rendered inactive, and equipment was removed. Building 7219 was reconstructed and improved in 1953. The basement floor of the building was the “firing floor” and contained the incinerator furnace and a bathroom area. The incinerator furnace was connected to the chimney by fire brick lined breeching. The first floor of the building was the “charging floor” where garbage was brought into the building for charging into the incinerator furnace via a charging throat. A heat recovery system was installed in the building and included water heater pipe coils at the incinerator furnace, hot water pipe, hot-water storage tank, and heat stove. The concrete floor of the first floor was sloped toward two six-inch diameter floor drains that were connected by 4-inch diameter cast iron pipes to the buildings sanitary line, which lead to a septic tank north of the building. A double sink area on the second floor also was connected to the sanitary system.

After incineration operations ceased in 1974, Building 7219 was then used to store rat bait and bee spray pesticides; however, these materials were removed in 1987 when the building’s roof began leaking. Building 7219 is currently inactive with no plans to reactivate.

Figures 8-2, 8-3, 8-4, and 8-5 are aerial photographs from 1949, 1962, 1971, and 1986 that show Building 7219 area. A small white rectangular object is visible in these photographs to the north of the building is likely a concrete vault associated with the building septic system.

8.1.3 Surface Water

Surface water bodies, manholes, or catch basins are not located in the immediate site area. Stormwater runoff would be expected to follow topography and flow across pavement surfaces and grass vegetated areas toward the north and SWMU 17.

8.1.4 Soil

According to the *Soil Survey of Montgomery County, Virginia* (USDA 1985), the area of SSA 77 is underlain by Unison-Urban Land complex soil. This soil has moderate permeability and medium-to-strong acidity. Soil classification is not practical in urban land areas because the original soil has been physically altered or obscured. A typical profile of undisturbed Unison soil consists of a 15-inch thick surface layer of dark brown loam and a 43-inch thick subsoil of yellowish-red, sticky plastic clay underlain by a red sandy clay loam to a depth of 58 inches. In general, permeability is moderate in Unison soil, natural fertility is low, and organic matter content is low to moderate.

8.1.5 Geology

Geologic and subsurface conditions have been assessed as part of investigations conducted in the SWMU 17 area immediately north and northeast of the site, which includes the Former Lead Furnace Area (FLFA). Deep borings were completed into bedrock at locations 150 ft east (wells 17PZ1 and 17MW2) and 85 ft north (well LFMW01) of the site (Figure 8-6). Numerous soil borings also were completed in the SWMU 17/FLFA area. Gray brown argillaceous limestone of the Elbrook Formation underlies the site area. Depth to bedrock is expected to be less than 10 ft in the immediate area of SSA 77 given its ridge top location and shallow bedrock depth encountered in borings 17PZ1 and 17MW2. Residual soil weathered from bedrock is typically silt and clay (ML/CL). Sinkhole areas are located north site and bedrock in the site area has karst characteristics with clay filled weathered zones and voids.

Appendix D.2.4 includes several geologic cross-sections included in the Shaw Draft FLFA RFI/CMS Report (Shaw 2008a) illustrating subsurface conditions in the site area and boring logs for monitoring wells 17PZ1, 17MW2, and LFMW01.

8.1.6 Hydrogeology

A dye trace study conducted by Engineering Science, Inc. in 1994 at SWMU 17 identified a specific flow path connecting the SWMU 17A sinkhole to a spring in the New River (Appendix D.2.4). Dye placed in the injection point (INJ1) within this sinkhole traveled 4,800 ft to the spring in less than 24 hours. Groundwater in the site area occurs within bedrock in fractures and water saturated karst features. Recent static water levels measurements from wells in the site area have been in the range of 1,800 to 1,810 ft msl or approximately 90 to 100 ft below the elevation of the Building 7219 area. Groundwater flow toward the west-northwest was indicated by the Shaw groundwater measurements obtained for the FLFA RFI/CMS, which was the same direction as the preferential flow path identified by the dye trace study (Shaw 2008a). Appendix D.2.4 includes a groundwater flow map from the Draft Shaw FLFA RFI/CMS Report (Shaw 2008a).

8.2 PREVIOUS INVESTIGATIONS

Environmental sampling specific to SSA 77 has not been conducted. Several investigations have been conducted at SWMU 17A and FLFA located immediately north of the site.

8.2.1 RCRA Facility Assessment – USEPA 1987

An assessment was conducted at SSA 77 (listed as Unit 77 in RFA) to evaluate potential hazardous waste or hazardous chemical releases and implement corrective actions, as necessary. The assessment consisted of a preliminary review and evaluation of available site information, personnel interviews, and a visual inspection of the site. Environmental samples were not collected at SSA 77 as part of the inspection. The RFA did not identify any release history for the site.

8.2.2 Installation Assessment – USEPA 1992

EPIC, under the direction of USEPA, performed an assessment of multiple SWMUs at RFAAP using selected aerial photographs from 1937 to 1986 (USEPA 1992a). The photogeologic analysis was performed to locate waste management areas, identify the location of sinkholes that existed prior to the

construction of the RFAAP, and map fracture traces. A specific assessment was not conducted for SSA 77; however, an assessment was conducted for adjacent SWMU 17 (burning areas). The aerial photographic analysis of SWMU 17 indicated that activity was noted from 1949 through 1986. Mounded material, containers, and possible stains were noted within the SWMU 17 area.

8.2.3 RCRA Facility Investigation - Dames & Moore 1992

The RFI conducted by Dames & Moore at SWMU 17 in 1992 included the installation of piezometer 17PZ1 approximately 150 ft east of Building 7219. Initially this piezometer was dry after installation. Later static water levels were approximately 90 ft bgs. Groundwater samples were not collected from this piezometer for this investigation.

8.2.4 RCRA Facility Investigation – Parsons Engineering Science 1996

As part of an RFI conducted at SWMU 17, Parsons collected groundwater samples from monitoring wells 17MW2 and 17PZ1 located approximately 150 ft east of Building 7219 for analysis of explosives, total metals, dissolved metals, TOC, and TOX. Explosives were not detected in these samples. Dissolved metals that were detected in the samples included barium and lead. The concentration of dissolved beryllium detected in 17MW2 (4.26 µg/L) and 17PZ1 (4.28 µg/L) were above the MCL of 4 µg/L. Dissolved barium was detected in sample 17MW2 (63.2 µg/L) and 17PZ1 (110 µg/L) at concentrations that were below the adjusted T-RSL.

8.2.5 RCRA Facility Investigation/Corrective Measures Study – Shaw 2008

This report presented the results of five previous investigations conducted at the FLFA by Shaw and others and included additional sampling of soil and groundwater in 2007 to complete the RFI/CMS Report. For purposes of the RFI/CMS and remedial actions, the FLFA has been defined as an approximate 0.78 acre area within the SWMU 17A Stage and Burn Area. The limits of this area extend to the northern edge of the asphalt road across from Building 7219. A small portion of the study area for the Building 7219 SSP, which includes several feet of below ground, terracotta sewer pipe and a septic tank, is located within the FLFA defined area.

Shaw conducted extensive sampling across the FLFA area to delineate the extent of lead, PCBs, dioxins, and other chemicals in soil. Lead was identified as the primary chemical of concern (COC) at the site driving corrective measures for soil under future industrial and residential scenarios. Dioxin/furans were identified as a secondary COC. The southwestern edge of the proposed residential remedial goal excavation area extends near the edge of the Building 7219 study area associated with the terracotta sewer pipe and septic tank. The recommended alternative for soil consists of soil excavation and offsite disposal with concentrations above residential remedial goals established for lead, dioxins, PCBs, arsenic, and copper. The FLFA surface soil data near the terracotta sewer pipe and septic tank indicated lead concentrations in surface soil below the residential action level of 400 mg/kg. One surface soil sample LSS04 collected along the asphalt road near the terracotta sewer pipe had dioxin concentrations above the residential and industrial screening level but lead concentrations below 400 mg/kg. Subsurface soil data was not collected in the areas near the Building 7219 study area. Appendix D.2.4 includes several figures showing sample results, the identified excavation areas for industrial and residential remedial goals. A table including the sample result from LSS04 is also included in this appendix.

In 2007, groundwater samples were collected from wells 17MW2, 17PZ1, and LFMW01 located near Building 7219 as part of the RFI/CMS conducted at FLFA. Samples were analyzed for TCL organics, PAHs, explosives, herbicides, TAL metals, and perchlorate. Detected analyte results are summarized in Table 8-1 and included chloroform, tetrachloroethene, perchlorate, total metals, and dioxins. Chloroform, tetrachloroethene, perchlorate, and dioxins were detected at concentrations above their adjusted T-RSLs in one or more samples but below applicable MCLs (Table 8-1). Total aluminum and total iron also were detected in sample LFMW01 collected from the sinkhole at SWMU 17 at concentrations above their adjusted T-RSLs; the higher concentrations were attributed in the RFI/CMS to elevated turbidity levels (greater than 900 Nephelometric Turbidity Units [NTUs]) in the sample.

8.3 WORK PLAN DATA GAP ANALYSIS

The data gap analysis presented in WPA 028 indicated that no soil sampling and analyses had occurred at SSA 77 (URS 2009). The data gap analysis completed for SSA 77 identified data gaps for evaluating potential releases to surface soil and subsurface soil from previous site activities, and characterizing physical and geotechnical properties of site soil.

8.3.1 Release Assessment to Surface Soil

An assessment of potential releases to surface soil had not been performed at SSA 77. This data gap was filled by collecting surface soil samples from around the building area. Field investigation activities are discussed in Section 8.4

8.3.2 Release Assessment to Subsurface Soil

An assessment of potential releases to subsurface soil had not been performed at SSA 77. This data gap was filled by collecting subsurface soil samples around the building area, adjacent to the sewer pipe, and adjacent to the septic tank. Field investigation activities are discussed in Section 8.4.

8.3.3 Groundwater

Potential releases to groundwater were assessed by evaluating subsurface soil data and comparison of these data to USEPA risk-based soil-to-groundwater SSLs included in the Regional Screening Table (USEPA 2009). Existing groundwater data for monitoring wells located in close proximity to the site (FLFA and SWMU 17 area) also were used for the release evaluation.

8.3.4 Other

Two representative samples of soil at the site (one surface sample and one subsurface sample) were submitted for analysis of physical and geotechnical properties, as described in Section 8.4.

8.3.5 Summary of Data Gaps

The following table summarizes these identified data gaps and the completion plan to fill the data gaps from WPA 028 (URS 2009).

SSA 77 - Summary of Data Gap Analysis and Completion Plan

DATA GAPS			COMPLETION PLAN
Item	**Physical**	**Chemical**	
Releases to Soil	Surface Soil Samples	Chemical Data – VOCs, SVOCs, PCBs, pesticides, explosives, metals, and dioxin/furans	Collect surface soil samples around building area
	Subsurface Soil Samples	Chemical Data – VOCs, SVOCs, PCBs, pesticides, explosives, and metals	Complete borings and collect subsurface samples around building area and adjacent to the sewer and septic tank
Releases to Groundwater	Subsurface Soil Samples	Use subsurface soil sample data	Compare subsurface soil data to soil-to-groundwater SSLs and evaluate existing groundwater data from the FLFA and SWMU 17 area
Site-Wide Soil Characteristics	Physical / Geotechnical Properties	pH, TOC, grain size, Atterberg Limits, and moisture content	Collect samples for geotechnical and physical property analysis

8.4 SSP FIELD ACTIVITIES

Six borings were advanced in and around the site to evaluate for the presence or absence of chemicals in soil potentially associated with historical site activities (Figure 8-7). Three direct push soil borings, 77SB1, 77SB2, and 77SB3, were completed around the area of Building 7219 to evaluate for potential releases to surface and subsurface soil. Boring 77SB1 was completed adjacent to western building entrance where waste material was brought into the building. Boring 77SB2 was completed adjacent to the chimney area and northwest corner of the building where incinerator was located and sewer line runs adjacent to the building. Boring 77SB3 was completed near the northeast corner of the building near the entrance to the basement firing floor.

Three direct push borings, 77SB4, 77SB5, and 77SB6, were completed in the septic tank area. Boring 77SB4 was completed near the area where the terracotta pipe enters the tank. Borings 77SB5 and 77SB6 were completed at distances 20 ft east and west of the concrete vault to evaluate for the presence of a drain field. Note that borings 77SB5 and 77SB6 were completed in the septic tank area, but no visual identification of septic use was apparent; therefore samples were not collected from these borings, but a sample was collected from boring 77SB4 in accordance with WPA 028. Borings were advanced to a maximum depth of 8 ft bgs using a skid steer-mounted, direct-push Geoprobe® unit. Discrete samples were collected from surface and/or intermediate intervals for the borings as summarized below.

SSA 77 SSP Samples and Boring Information

Boring ID	Total Depth of Boring (ft bgs)	Surface Sample ID	Sample Depth (ft bgs)	Intermediate Sample ID	Sample Depth (ft bgs)
77SB1	6.0	77SB1A	0-1	77SB1B	4-6
77SB2	5.5	77SB2A	0-1	77SB2B	4-5.5
77SB3	5.0	77SB3A	0-1	77SB3B	4-5
77SB4	8.0	--	--	77SB4B	6-8
77SB5	8.0	--	--	--	--
77SB6	8.0	--	--	--	--

Soil samples were analyzed for TCL VOCs, TCL SVOCs, TCL PCBs, TCL pesticides, explosives (including nitroglycerin and PETN), and TAL inorganics. Analytical results (detected chemicals) used for the SSP are summarized in Table 8-2. 2,3,7,8-TCDD Equivalents (TEQ) calculations for dioxins are provided in Table 8-3.

Two samples were collected for physical testing (one surface soil sample (77SB2A) and one subsurface soil sample (77SB2B). Physical testing for each sample included: grain size analysis, Atterberg limits, soil moisture content, TOC, and pH. Analytical results for these samples are summarized in Table 2-1 and the complete results are provided in Appendix D.1.

8.5 CONCEPTUAL SITE MODEL (CSM)

A CSM for SSA 77 is presented on Figure 8-8. Building 7219 is located on a hillside overlooking the sinkhole at SWMU 17A. Depth to bedrock is expected to be less than 10 ft at the site with residual silt and clay soil overlying limestone bedrock. Groundwater is present within limestone bedrock at estimated depths of 90 to 100 ft bgs at the site.

Potential release sources would be related to historical garbage handling activities within and around the building area, potential releases from the sewer pipe and septic tank receiving wastewater from building floor drains, and waste by products associated with incineration including bottom ash, emission of flue

gases and particulate matter. Post incinerator related constituent sources potentially would be related to storage of pesticides and rat bait in the building.

Potentially affected media at the site include:

- Surface soil from waste management activities in and around the building area and potential deposition of particulate matter from the incinerator chimney;
- Subsurface soil via leaching of any constituents released to surface soil;
- Subsurface soil from potential leaks in the wastewater sewer pipe (terracotta pipe) leading from the building to the septic tank;
- Subsurface soil from potential leaks from the septic tank or drain field area if present; and
- Groundwater via leaching of constituents released to subsurface soil.

Although current and likely future land-use scenarios are limited to industrial operations, both residential and industrial scenarios will be evaluated in the SSP human health screening (USEPA 2001).

The SSA 77 site area is exclusively an upland habitat that lacks wetland and significant drainage features. Therefore, soil represents the potential exposure medium for ecological receptors. An ECSM is provided in Section 3.0, Figure 3-1.

8.6 HUMAN HEALTH RISK SCREENING

8.6.1 Identification of COPCs

Tables 8-4 and 8-5 present the results of the COPC evaluations for surface soil and total soil, respectively. COPCs identified for surface soil and total soil included:

TAL metals: aluminum, arsenic, cobalt, iron, manganese, vanadium;

TCL Pesticides: none;

TCL PCBs: Aroclor 1254, Aroclor 1260;

TCL VOCs: none;

TAL SVOCs: benzo(a)pyrene, dibenz(a,h)anthracene; and

Dioxin/Furans: 2,3,7,8-TCDD TEQ (dioxins).

The FLFA RFI (Shaw 2008a) investigation of the groundwater in the same area did not identify groundwater at the sites as a risk to human health or the environment.

8.6.2 Cumulative Risk Screen

The cumulative risk screening for surface soil is presented on Table 8-6. The cumulative risk screening for total soil is presented on Table 8-7. A summary of the screening results is presented below:

Cumulative Human Health Risk Screening Results for Soil

	Surface Soil			**Total Soil**		
	Above/ Below/ Equal	**Risk/ Hazard**	**Drivers**	**Above/ Below/ Equal**	**Risk/ Hazard**	**Drivers**
Residential Risk	Above	5.E-05	Arsenic, 2,3,7,8-TCDD TEQ (dioxins)	Above	5.E-05	Arsenic, 2,3,7,8-TCDD TEQ (dioxins)

	Surface Soil			Total Soil		
	Above/ Below/ Equal	**Risk/ Hazard**	**Drivers**	**Above/ Below/ Equal**	**Risk/ Hazard**	**Drivers**
Industrial Risk	Equal	1.E-05	Arsenic, 2,3,7,8-TCDD TEQ (dioxins)	Equal	1.E-05	Arsenic, 2,3,7,8-TCDD TEQ (dioxins)
Residential Hazard	Above	4	Aluminum, Arsenic, Cobalt, Iron, Manganese, 2,3,7,8-TCDD TEQ (dioxins)	Above	4	Aluminum, Arsenic, Cobalt, Iron, Manganese, 2,3,7,8-TCDD TEQ (dioxins)
Industrial Hazard	Below	0.4	--	Below	0.4	--

*Note: Above, below, or equal to established SSP risk and hazard levels.

The cumulative human health risk screens were above the established SSP risk and hazard levels of 1E-05 and 1, respectively, for the residential scenario for surface and total soil. Cumulative risk screenings were equal to the established SSP risk level of 1E-05 for the industrial scenario for surface and total soil. Cumulative hazard screening was below the established SSP hazard level of 1 for the industrial scenario for total and surface soil. The risk/hazard drivers identified in the table above are those chemicals that primarily contribute to HIs or risks greater than the established SSP hazard level of 1 or risk level of 1E-05, respectively.

Due to multiple chemicals contributing to a residential HI greater than 1, as presented on Table 8-6 (surface soil) and Table 8-7 (total soil), the HIs have been segregated based on primary target organs for chronic exposure. The HI segregation for surface and total soil resulted in values equal to or higher than the cumulative SSP HI target organ threshold of 0.5 for the following target organs: blood, CNS, GI tract, and liver.

8.6.3 Lead and Iron Screening

Detected lead concentrations at the sites were below 400 mg/kg; therefore, lead modeling was not conducted for the site.

Since iron concentrations in soil result in an HQ of greater than 0.5, further assessment is required. This assessment consists of a "margin of exposure evaluation" where the estimated intake of iron is compared to the RDA and concentrations known to cause adverse health effects in children (NCEA 2006). Appendix E.5 presents the margin of exposure evaluation for surface soil and total soil. A summary of the results for SSA 77 is presented below.

Iron Margin of Exposure Evaluation – Future Child Resident

	Surface Soil			Total Soil		
	Above/ Below	**Estimated Site Intake**	**Exposure Screening Level**	**Above/ Below**	**Estimated Site Intake**	**Exposure Screening Level**
RDA Screen (mg/day)	Below	7	10	Below	8	10

	Surface Soil			Total Soil		
	Above/ Below	**Estimated Site Intake**	**Exposure Screening Level**	**Above/ Below**	**Estimated Site Intake**	**Exposure Screening Level**
Provisional Reference Dose (RfD) Screen (mg/kg-day)	Below	0.5	0.7	Below	0.5	0.7

The iron exposure assessment results for the hypothetical future child resident were below the applicable iron margin of exposure screening criteria for SSA 77.

8.6.4 SSL Comparison - Soil

8.6.4.1 Generic SSLs (Soil-to-groundwater Screening Levels)

An SSL screening was conducted for detected chemicals in subsurface soil to evaluate the potential for leaching of chemicals from soil to groundwater. As presented in Table 8-8, the detected concentrations for each chemical in subsurface soil were compared to their USEPA risk-based SSLs included in the Regional Screening Table (USEPA 2009), if available. The comparisons of subsurface soil concentrations to generic SSLs (DAF 20) for detected chemicals indicated that arsenic and iron were above their SSLs (Table 8-8).

8.6.4.2 Site-specific SSL Comparison

Organic chemical were not detected in subsurface soil at concentrations above their generic SSLs (DAF 20); therefore, site-specific SSLs were not calculated.

8.6.5 Background Comparison - Soil

The final step in the risk screening process is the comparison of the MDCs of COPCs identified in soil to the established Facility-wide inorganic background point estimate concentrations for metals (IT 2001). No metals identified as COPCs in surface soil and total soil were above their background point estimates (Table 8-9).

8.6.6 Human Health Risk Screening Summary

Soil COPCs with screening values were limited to metals, PCBs, SVOCs, and 2,3,7,8-TCDD TEQ (dioxins). The soil cumulative human health risk screens were above the established SSP risk and hazard levels of 1E-05 and 1, respectively, for the residential scenario for surface and total soil. As presented on Table 8-10 (surface soil) and Table 8-11 (total soil) when excluding risk drivers below background (arsenic), the potential site-related risk is 4E-05 which is above the SSP risk screening level of 1E-05 primarily due to 2,3,7,8-TCDD TEQ (dioxins). The cumulative risk screenings were equal to the established SSP risk level of 1E-05 for the industrial scenario for surface and total soil. When excluding risk drivers below background (arsenic), the potential site-related risk is 8E-06 which is below the SSP risk screening level of 1E-05. The cumulative hazard screening was below the established SSP hazard level of 1 for the industrial scenario for total and surface soil.

The noncarcinogenic residential hazard screening was above the established SSP threshold (HI=1) for surface and total soil primarily due to metals and 2,3,7,8-TCDD TEQ. As presented Table 8-10 (surface soil) and Table 8-11 (total soil) when taking background and target organs into account, the HI segregation for surface soil resulted in values equal to or higher than the cumulative SSP HI target organ threshold of 0.5 for the following target organs: liver (HI=2) due to 2,3,7,8-TCDD TEQ (dioxins).

Detected lead concentrations at the sites were below 400 mg/kg; therefore, lead modeling was not conducted for the site. The iron exposure assessment results for the hypothetical future child resident were below the applicable iron margin of exposure screening criteria for SSA 77.

The comparisons of subsurface soil concentrations to generic SSLs (DAF 20) for detected chemicals indicated that arsenic and iron were above their SSLs (Table 8-8). The arsenic and iron concentrations above their SSLs are not a concern because the detected concentrations are below their background point estimates.

8.7 ECOLOGICAL RISK SCREENING

8.7.1 Ecological Site Characterization

An overview of the site physiography, water resources, soil, and geology for SSA 77 is presented in Section 7.1. SSA 77 consists of a 29 ft by 25 ft concrete block/brick building with a 52 ft tall brick chimney formerly used to incinerate cardboard, paper products, wood, and other municipal waste materials. The building is located between the Shipping and Receiving Building 534 and Contaminated Scrap Burning Area (SWMU 17) in the southern portion of the MMA.

Based on information from the Installation-Wide Biological Survey and observations made during the site reconnaissance, the grassland vegetative community at the site is typical of other meadow-grassed areas that are regularly maintained at RFAAP. The habitat could support some ecological use (i.e., shelter and foraging) by some smaller common species in the area. Given its limited size, proximity asphalt roads and buildings, and its frequent disturbance by facility operations, few individuals would be expected to utilize the area for a lengthy period.

Threatened, rare, or endangered species were not observed during the site reconnaissance. These species are not likely to be present within the boundaries of the site. Threatened, rare, and endangered species information for RFAAP is discussed in Section 3.3.4.

8.7.1.1 Data Organization

The following table identifies the soil samples used for the SLERA. These samples were analyzed for TAL inorganics, TCL pesticides, TCL PCBs, TCL VOCs, TCL SVOCs, and explosives (including nitroglycerin and PETN). Samples 77SB2A and 77SB3A were also analyzed for dioxin/furans. Refer to Table 2-2 for a detailed list of samples and analytes.

Soil Samples Evaluated for SLERA

SSA 77	
77SB1A	77SB3A
77SB2A	

Detected chemical occurrence and distribution tables for surface soil are presented in Table F.5-1. Refer to Table 8-2 for a complete list of results for detected analytes. In addition, to evaluate the adequate sensitivity of the MDL for the necessary screening levels, Table F.5-2 provides a screening of the maximum MDL versus available ecological screening values for non-detected chemicals in surface soil.

8.7.1.2 Ecological Conceptual Site Model (ECSM)

The terrestrial ECSM is presented on Figure 3-1. Surface soil is a potential exposure medium of concern based on historical activities at the site. Based on the site characterization and data, the terrestrial receptor exposure to surface soil pathway exists.

8.7.2 Preliminary Exposure Estimate and Ecological Effects Evaluation

The preliminary exposure estimate and ecological effects evaluation considers the most conservative risk scenario. Highly conservative assumptions are used to estimate COPEC exposure to terrestrial receptors for pathways to be quantitatively evaluated. Conservative TRVs are used to evaluate the ecological effects of exposure using the two approaches discussed below.

8.7.2.1 Direct Contact Approach

The maximum soil concentrations for detected chemicals are used as the preliminary exposure estimate concentrations to develop a conservative risk scenario for the direct contact pathway to soil invertebrates and terrestrial plants. The results of the preliminary exposure assessments for plants and invertebrates are provided below.

Terrestrial Plants

Preliminary direct contact HQs calculated for plants are presented in Table F.5-6 for detected chemicals. Of the detected chemicals for which screening values were available, the concentrations of aluminum, chromium, copper, manganese, mercury, vanadium, and zinc resulted in HQ values that were greater than 1.

Soil Invertebrates and Microbial Communities

Preliminary direct contact HQs calculated for invertebrates are presented in Table F.5-8 for detected chemicals. Of the detected chemicals for which screening values were available, the concentrations of chromium, copper, iron, manganese, mercury, vanadium, and zinc resulted in HQ values that were greater than 1.

8.7.2.2 Dose Rate Modeling Approach

Quantitative risk characterization for terrestrial wildlife is limited to direct ingestion of biota and incidental ingestion of soil. The preliminary risks for detected bioaccumulative chemicals are summarized in Table F.5-24 for each terrestrial wildlife receptor and the chemicals with HQs greater than 1 are characterized as follows:

Receptor	NOAEL Only HQ>1	NOAEL and LOAEL HQ>1
Meadow Vole	cadmium, copper, lead	arsenic, selenium, 2,3,7,8-TCDD Equivalents
Short-tailed Shrew	arsenic, cadmium, chromium, copper, lead, zinc, dieldrin, Aroclor 1254	2,3,7,8,-TCDD Equivalents, Aroclor 1260
Red Fox	lead, selenium, dieldrin	arsenic, cadmium, chromium, copper, zinc, 2,3,7,8-TCDD Equivalents, Aroclor 1254, Aroclor 1260
American Robin	selenium, dieldrin, Aroclor 1254, Aroclor 1260	cadmium, chromium, lead, mercury, zinc, 2,3,7,8-TCDD Equivalents, 4,4'-DDT
Red-tailed Hawk	chromium, lead, zinc	2,3,7,8-TCDD Equivalents

8.7.3 Refined Exposure Estimate and Risk Characterization

8.7.3.1 Direct Contact Approach

The refined exposure estimate for the direct contact pathway to soil invertebrate and microbial communities incorporates the 95% UCL as the exposure concentration for evaluating the COPECs using a conservative yet more realistic exposure assumption than MDCs. Due to the number of samples at the sites, a 95% UCL was not calculated; therefore, a refinement of the direct contact pathway was not conducted.

8.7.3.2 Dose Rate Modeling Approach

The refined exposure estimates and ecological effects are developed for wildlife receptors having complete exposure pathways to be quantitatively evaluated (i.e., omnivorous birds, and carnivorous and herbivorous mammals). In the refined model, an average body weight, average ingestion rate, and a 95% UCL as the EPC are used. Due to the small number of samples at the site, a 95% UCL was not calculated for the site and the MDC was used as the EPC for the refinement. Refined receptor-specific exposure parameters are presented on Table F.5-9 (Appendix F.5). In addition, a realistic area use factor ($AF_{refined}$) was calculated as the ratio of the site area to the average home range of the receptor which is also presented in Table F.5-9 (Appendix F.5). A summary of the results of the refined exposure assessment for terrestrial wildlife is provided below.

Terrestrial Wildlife

The refined risk characterization results are presented in Table F.5-24 and summarized below for each of the receptors with chemical HQs greater than 1:

Receptor	NOAEL Only HQ>1	NOAEL and LOAEL HQ>1
Meadow Vole	none	2,3,7,8-TCDD Equivalents (12/1.2)
Short-tailed Shrew	none	2,3,7,8-TCDD Equivalents (480/48)
Red Fox	none	none
American Robin	4,4'-DDT (1.1)	2,3,7,8-TCDD Equivalents (26/2.6)
Red-tailed Hawk	none	none

*Note: (12/1.2) = NOAEL-based HQ/LOAEL-based HQ

8.7.4 Background Comparison - Soil

The final step in the risk screening process is the comparison of the MDCs of COPECs identified in soil to the established Facility-wide inorganic background point estimate concentrations for metals (IT 2001). The comparison of MDCs for metals identified as COPECs in surface soil with their background point estimates resulted in site soil MDCs above background point estimates for cadmium, copper, lead, and mercury (Table 8-9). Note that a background point estimate is not available for selenium; therefore, a background comparison was not conducted.

8.7.5 Risk Management – Scientific Management Decision Point

The findings of the ecological risk screen including site characterization and risk calculations are used as input to risk management decision-making for the site. The SMDP reached from the ecological risk screening concludes that one of the following statements is true:

- There is adequate information to conclude that ecological risks are considered negligible and therefore there is no need for further action at the site on the basis of ecological risk;
- The information is not adequate to make a decision at this point and further refinement of data is needed to augment the ecological risk screening; or

- The information collected and presented indicates that a more thorough assessment is warranted.

Terrestrial plant COPECs with HQs greater than 1 included: aluminum (HQ=740), chromium (HQ=53), copper (HQ=1.2), manganese (HQ=3), mercury (HQ=3.3), vanadium (HQ=33), and zinc (HQ=1.1). Aluminum, chromium, manganese, vanadium, and zinc are below background point estimates (Table 8-9); therefore, these chemicals are not considered site-related. Even though the refined HQs for copper (HQ=1.2) and mercury (HQ=3.3) are greater than 1 and concentrations at the site are above the background point estimate, this risk present low to negligible risk to plants at the site.

Soil invertebrates and microbial processes COPECs with HQs greater than 1 included chromium (HQ=130), copper (HQ=1.1), iron (HQ=200), manganese (HQ=1.5), mercury (HQ=10), vanadium (HQ=3.3), and zinc (HQ=1.4). Chromium, iron, manganese, vanadium, and zinc are below background point estimates (see Table 8-9); therefore, these chemicals are not considered site-related. Even though the refined HQs for copper (HQ=1.1) and mercury (HQ=10) are greater than 1 and concentrations at the site are above the background point estimate, this risk present low to negligible risk to invertebrates and microbial processes at the site.

The refined risk characterization for wildlife resulted in the identification of 2,3,7,8-TCDD Equivalents with LOAEL-based HQs greater than 1 for the meadow vole (1.2), short-tailed shrew (48), and American robin (2.6).

Although the SLERA resulted in HQs greater than 1, due to the small size of the site, the limited habitat present at the site (primarily covered with impervious material such as the incinerator building and asphalt), and level of activity near the site due to presence of shipping and receiving, the potential for ecological risks are negligible. After consideration of the results of the SLERA, background concentrations, and the site setting, the SMDP is the following:

There is adequate information to conclude that ecological risks are considered negligible and therefore there is no need for further action at the SSA on the basis of ecological risk.

8.8 CONCLUSIONS AND RECOMMENDATION

No further action beyond the implementation of land use controls to maintain this site as industrial precluding residential use is recommended for SSA 77 based on the following results of the SSP screening:

- When excluding risk drivers below background (arsenic), the site-related cumulative risk and hazard screening results for industrial scenarios are below SSP thresholds for target risk and hazards;
- Cumulative risk and hazard screening results for residential scenarios are above SSP thresholds for target risk and hazards;
- The MDC for lead is below the SSP screening level of 400 mg/kg;
- The iron exposure assessment results for the hypothetical future child resident are below the applicable iron margin of exposure screening criteria;
- Chemicals at concentrations above their generic SSLs are limited to metals at concentrations below background and are not considered a concern at the site; and
- There is adequate information to conclude that ecological risks are considered negligible and therefore there is no need for further action at the SSA on the basis of ecological risk.

Institutional controls (ICs) are being implemented at the site (SSA 77 – Garbage Incinerator – Building 7219) within the boundaries depicted on Figure 8-1. The objective of the ICs is to maintain the site in its current industrial/commercial state as a closed solid waste management unit and to prevent any future residential use. Specifically the site has been incorporated into plant management manual to ensure long-

term protection of human health and the environment. The management manual provides for advance notice, assessment, and approval of intrusive work that may occur within the plant with a general digging prohibition at sites such as this. In the event the property is transferred or leased, equivalent ICs will be put into terms and conditions of the deed or lease, which are no less restrictive than the IC objectives described above. Furthermore, the transferee or lessee will be responsible for ensuring IC compliance by any future users. However, the Army acknowledges the responsibility for all original liability under CERCLA and its right and responsibility to enforce ICs.

Notes:
CAS = Chemical Abstracts Service
ft bgs = Feet Below Ground Surface
mg/kg = Milligram Per Kilogram
µg/kg = Microgram Per Kilogram
pg/g = Picogram Per Gram
TAL = Target Analyte List
TCL = Target Compound List
PCB = Polychlorinated Biphenyl
VOC = Volatile Organic Compound
SVOC = Semi-volatile Organic Compound
TEQ = Toxicity Equivalency Factor
NT = Not Tested
MDL = Method Detection Limit
RL = Reporting Limit
LQ = Laboratory Qualifier
VQ = Validation Qualifier
r = Reason Code

[A] = Facility-Wide Background Point Estimate as Reported in the Facility-Wide Background Study Report (IT 2001)
RSL = Regional Screening Level (RSL) from April 2009 RSL Table
Adjusted RSLs = a Hazard Quotient (HQ) of 0.1 applied to non-carcinogens
Key: c = cancer
n = noncancer
* = where: n SL < 100X c SL
** = where n SL < 10X c SL
m = concentration may exceed ceiling limit
s = concentration may exceed Csat
-- = No Screening Value Available

[1] = Mercuric chloride soil RSLs value used
[2] = Chlordane soil RSLs used
[3] = Endosulfan soil RSLs used
[4] = Endrin soil RSLs used
[5] = Aroclor 1254 Unadjusted Soil Residential RSL used
[6] = Pyrene soil RSLs used

= Concentration Exceeds Adjusted Soil Residential RSL

= Concentration Exceeds Adjusted Soil Industrial RSL

underline = Concentration Exceeds Facility Background Point Estimate

bold italic = Concentration Exceeds Soil-to-Groundwater Risk-based SSL (DAF20)

Data Qualifiers:
Laboratory Qualifiers
- A Amount detected is less than the Lower Calibration Limit.
- B Analyte found in associated blank as well as in the sample.
- E Concentration exceeded the upper level of the calibration range of the instrument for that specific analysis.
- J Analyte present. Reported value may not be accurate or precise.
- U The compound was analyzed for but not detected. The reporting limit will be adjusted to reflect any dilution, and for soil, the percent moisture.

Validation Qualifiers
- B Not detected substantially above the level reported in laboratory or field blanks.
- J Analyte present. Reported value may not be accurate or precise.
- K Analyte present. Reported value may be biased high. Actual value is expected to be lower.
- L Analyte present. Reported value may be biased low. Actual value is expected to be higher.
- U Not detected. The associated number indicates the approximate sample concentration necessary to be detected.
- UJ Not detected. Quantitation limit may be inaccurate or imprecise.

Reason Codes
GC/MS Organics
- d MS/MSD or LCS/LCSD RPD imprecision
- f Field duplicate imprecision
- i LCS recovery failure
- m Internal standard failure
- q Concentration exceeded the linear range
- z Method blank and/or storage blank contamination

Inorganics and Conventionals
- o Calibration blank contamination
- m MS/MSD recovery failure

GC and HPLC Organics
- c Calibration failure; poor or unstable (%D) response
- g Dual column confirmation imprecision
- m Air bubble (> 6 mm or ¼ inch) in VOC vials
- x Trip blank contamination

Total 2,3,7,8-TCDD Equivalents	--	4.5E+00	c*	1.8E+01	c*		129.451		28.462	

Notes:

CAS = Chemical Abstracts Service
pg/g = Picogram per gram
LQ = Laboratory Qualifier
VQ = Validation Qualifier
r = Reason Code
TEF = Toxicity Equivalency Factor (WHO 2005)

Total 2,3,7,8-TCDD Equivalents are calculated by summing the detected concentration times the TEF for each chemical. Non-detects, R-flagged data, and B-flagged data are excluded from summed total.

Key per April 2009 EPA Regional RSL Table:
c = cancer
n = noncancer
c* = cancer where n SL < 100X c SL
c** = cancer where n SL < 10X c SL
m = concentration may exceed ceiling
s = concentration may exceed Csat

RSL = Regional Screening Level (RSL) from EPA April 2009 RSL Table
Adjusted RSLs = a Hazard Quotient (HQ) of 0.1 applied to non-carcinogens
-- = No Value Available

Data Qualifiers:
A = Amount detected is less than the Lower Calibration Limit.
B = Not detected substantially above the level reported in laboratory or field blanks.
E = Concentration exceeded the upper level of the calibration range of the instrument for the analysis.
J = Analyte present. Reported value may not be accurate or precise.
L = Analyte present. Reported value may be biased low. Actual value is expected to be higher.
d = MS/MSD or LCS/LCSD RPD imprecision.
m = MS/MSD recovery failure.
q = Concentration exceeded the linear range.
z = Field and/or equipment blank contamination.

= Concentration Exceeds Adjusted Soil Residential RSL

= Concentration Exceeds Adjusted Soil Industrial RSL

Notes:

COPC = Chemical of Potential Concern
mg/kg = Milligram Per Kilogram
CAS = Chemical Abstracts Service
TAL = Target Analyte List
TCL = Target Compound List
PCB = Polychlorinated Biphenyl
VOC = Volatile Organic Compound
SVOC = Semi-volatile Organic Compound

RSL = Regional Screening Level (RSL) from EPA April 2009 RSL Table
Adjusted RSLs = a Hazard Quotient (HQ) of 0.1 applied to non-carcinogens
Key: c = cancer
n = noncancer
c* = where: n SL < 100X c SL
c** = where n SL < 10X c SL
m = concentration may exceed ceiling limit
s = concentration may exceed Csat

-- = Not Available

[1] = Mercuric chloride soil RSLs value used
[2] = Chlordane soil RSLs used
[3] = Endosulfan soil RSLs used
[4] = Endrin soil RSLs used
[5] = Aroclor 1254 Noncancer Soil Residential RSL used
[6] = Pyrene soil RSLs used

ARAR = Applicable, Relevant, and Appropriate Requirement
TBC = To-Be-Considered
IND = Adjusted Industrial RSL
RDA = Recommended Daily Allowance

ARES = Above Residential RSL
ARES/IND = Above Residential RSL/Industrial RSL
BSL = Below Residential/Industrial RSLs
NSV = No Screening Value Available

Notes:

COPC = Chemical of Potential Concern
mg/kg = Milligram Per Kilogram
CAS = Chemical Abstracts Service
TAL = Target Analyte List
TCL = Target Compound List
PCB = Polychlorinated Biphenyl
VOC = Volatile Organic Compound
SVOC = Semi-volatile Organic Compound

RSL = Regional Screening Level (RSL) from EPA April 2009 RSL Table
Adjusted RSLs = a Hazard Quotient (HQ) of 0.1 applied to non-carcinogens
Key: c = cancer
n = noncancer
c* = where: n SL < 100X c SL
c** = where n SL < 10X c SL
m = concentration may exceed ceiling limit
s = concentration may exceed Csat

-- = Not Available

[1] = Mercuric chloride soil RSLs value used
[2] = Chlordane soil RSLs used
[3] = Endosulfan soil RSLs used
[4] = Endrin soil RSLs used
[5] = Aroclor 1254 Noncancer Soil Residential RSL used
[6] = Pyrene soil RSLs used

ARAR = Applicable, Relevant, and Appropriate Requirement
TBC = To-Be-Considered
IND = Adjusted Industrial RSL
RDA = Recommended Daily Allowance

ARES = Above Residential RSL
ARES/IND = Above Residential RSL/Industrial RSL
BSL = Below Residential/Industrial RSLs
NSV = No Screening Value Available

9.0 CONCLUSIONS AND RECOMMENDATION FOR FUTURE ACTION

An SSP has been completed for SSAs 18, 72, 30, 79, 60, and 77 following the USEPA approved site screening process for RFAAP (USEPA 2001a). The SSP included sampling of soil and groundwater to evaluate releases to the environment and completion of human health and ecological risk screening elements outlined in the SSP guidance.

The SSP was designed to assess: whether releases of hazardous substances, pollutants, chemicals, hazardous wastes, or hazardous constituents have occurred to the environment at the site evaluated, whether further investigation (i.e., risk assessment or RFI) or an interim removal action is appropriate at a site, or whether NFA at a site is appropriate. Five steps were completed for the SSP following the approved guidance document including: 1) performance of a desktop audit and site visit to develop the scope of the SSP Work Plan, 2) preparation of a SSP site-specific Work Plan, 3) performance of the field work in accordance with the approved SSP Work Plan, 4) evaluation of the SSP data and completion of pre-remedial risk screening, and 5) assessment of the need for further investigation, interim removal action, or preparation of a "No Further Action" Decision Document, per the RCRA Corrective Action permit based on the results of the SSP and risk screening.

Human Health Risk Screenings

Human health risk screening was conducted for each of the sites. SSAs 30 and 79 were assessed together due to their proximity and similar historical activities. Background levels of metals were the risk and hazard drivers for each of the sites except for SSA 72 (benzo(a)pyrene and Aroclor 1254) and SSA 77 (2,3,7,8-TCDD TEQ (dioxins)). SSA 72 and SSA 77 had site-related risks/hazards equal to or above the SSP thresholds of 1E-05 and 1 for the residential scenario. The site-related cumulative risks/hazards for SSA 72 and SSA 77 were below the SSP thresholds for the industrial scenario. The remaining sites (SSA 18, SSA 30, SSA 79, and SSA 60) had site-related risks and hazards below SSP thresholds of 1E-05 and 1, respectively, for residential and industrial scenarios.

Ecological Risk Screenings

Ecological risk screening was conducted for five of the six sites. SSAs 30 and 79 were assessed together due to their proximity and similar historical activities. Metals were the primary constituents of potential ecological concern (COPECs) at the sites with the exception of SSA 77 (2,3,7,8-TCDD TEQ (dioxins)). The results of the ecological risk assessments indicated there is adequate information to conclude that ecological risks are considered negligible at SSAs 18, 30, 79, 60, and 77; therefore, there is no need for further action at these SSP sites on the basis of ecological risk. Although a limited number of surface soil samples were collected (one sample) at SSA 72, an ecological risk assessment was not conducted for the site considering the small size of the site (0.1 acre), the nature of previous activities at the site (acid conveyance via subsurface sump and subsurface sewer line), and the lack of potential surface soil releases due to the nature of previous activities at the site. Based on these factors, the potential for ecological risk at SSA 72 is considered negligible.

Summary of Conclusions and Recommendations

A summary of conclusion and recommendation based on the SSP evaluation for each site is provided below:

- SSA 18 – No Further Action based on the results of the human health screening, ecological risk screening, and SSL evaluation;
- SSA 72 – No Further Action beyond the implementation of land use controls to maintain this site as industrial precluding residential use due to cumulative risk and hazard screening results for residential scenarios equal to or above SSP thresholds for target risk and hazards;

- SSAs 30 and 79 – No Further Action beyond the implementation of land use controls to maintain this site as a closed solid waste management unit due to the presence of bagged asbestos containing material at the site within the trenches;
- SSA 60 – No Further Action based on the results of the human health screening, ecological risk screening, and SSL evaluation; and
- SSA 77 – No Further Action beyond the implementation of land use controls to maintain this site as industrial precluding residential use due to cumulative risk and hazard screening results for residential scenarios above SSP thresholds for target risk and hazards.

APPENDIX A

SSP GUIDANCE DOCUMENT

THIS PAGE LEFT INTENTIONALLY BLANK

1.0 INTRODUCTION

The Radford Army Ammunition Plant (RFAAP) is an active military installation located in the mountains of southwest Virginia, and covers approximately 4,080 acres in Montgomery and Pulaski County, Virginia.

The United States Environmental Protection Agency (USEPA) issued a RCRA Corrective Action Permit to Alliant Ammunition and Powder Company (Alliant) and the U.S. Department of the Army (Army) on October 31, 2000. Within the RCRA Corrective Action permit is a listing of 31 identified Site Screening Areas (SSAs) which are to be investigated in accordance with this EPA approved Site Screening Process (SSP). Should additional SSAs be identified at RFAAP, a site screening will need to be completed in accordance with this SSP.

This SSP has been developed as the central document describing how site screening will be applied to the RFAAP. Overall, the SSP is devised to expedite investigations of SSAs at RFAAP to determine what level of evaluation is appropriate for these identified areas. The SSP will help determine whether there have been releases of hazardous substances, pollutants, contaminants, hazardous wastes, or hazardous constituents to the environment from an SSA, and determine whether an SSA should proceed further through the RFI process, be the subject of an interim removal action or be considered for no further action.

Once a SSA is identified, the following five distinct tasks will be undertaken:

- Performance of a Desktop Audit and site visit to determine the scope of the SSP site-specific Work Plan(s);
- Development of an SSP site-specific Work Plan outlining a Sampling and Analysis Plan as well as a risk screening plan (human health and ecological, as appropriate) for EPA approval;
- Performance of SSP field work in accordance with the approved SSP Work Plan;
- Evaluation of SSP data and completion of pre-remedial risk screening; and
- Determination of the need for further investigation of the SSA, an interim removal action at the SSA or preparation of a No Further Action Decision Document, per the RCRA Corrective Action permit, based on results of the SSP and risk screening.

The following sections detail these SSP tasks.

2.0 SITE VISIT AND DESKTOP AUDIT

The purpose of the Desktop Audit is to evaluate and document, through review of existing information, if operations at the SSA(s) have resulted in the release of hazardous substances, pollutants, contaminants, hazardous wastes or hazardous constituents to the environment. The Desktop Audit process includes a search of all documents related to operations at the SSA as well as interviews with personnel knowledgeable about the site. Available information for each SSA, including location and a site map, description of past and current land uses, and a description of releases and associated cleanups, will form the basis for the Desktop Audit. Other information sources will include the administrative record and other local, state and federal documentation containing information pertinent to the site.

Typical existing information that will be examined during the Desktop Audit will include site use, ownership and operational history, groundwater and surface water use and characteristics, soil exposure characteristics, and air exposure pathways. This information can be obtained from maps, publications by the United States Geological Survey (USGS) and state geological surveys, regional databases and geographic information systems, and aerial photography. On the basis of information collected during the Desktop Audit, a list of chemicals potentially stored, handled, released, or disposed at each SSA will be compiled.

In addition to the Desktop Audit, a site visit will be conducted at each SSA. The site visit will include a visual inspection of the SSA to aid in site characterization, including identifying potential contaminant sources; chemical migration pathways; potential human and ecological receptors; and receptor exposure pathways. Additionally, potential media to be sampled and sampling locations will be identified for the SSP.

Results of the Desktop Audit and site visit will be presented in a summary report. Included in the report will be an SSA-specific Conceptual Site Model (CSM) depicting potential contaminant sources, environmental and exposure pathways of concern, and potential human and ecological receptors. The CSM will maximize the usability of analytical data derived from site characterization efforts for subsequent risk assessments, and will form the basis for any additional data collection to support the human health and ecological risk screening. These results will be used in formulating the SSP Work Plan, including the need for human health and ecological risk screening.

3.0 DEVELOPMENT OF SITE SCREENING INSPECTION SAMPLING AND ANALYSIS STRATEGY

A site-specific Work Plan will be developed for each SSA investigated under the SSP. The Work Plans will reference the Desktop Audit Summary, providing a detailed description of historical information, SSA conditions, results of previous investigative work and results of the site visit. The Work Plans will also present a Sampling and Analysis Plan (SAP) that describes the number, types and locations of samples to be collected, sample analyses, and the rationale for the sampling plan. The purpose of sample collection and analysis will be to assess the presence or absence of hazardous substances, contaminants, hazardous wastes, or hazardous constituents, and to provide data for performing human health and ecological risk screening in order to evaluate if there is a potential threat to human health or the environment at the SSA.

Media sampled during the SSP will be identified based upon Desktop Audit and site visit findings, and approval of the USEPA Region III.

Potential media of interest in the SSP may include surface soil (0 to 1 feet below ground surface [bgs] 0-6 inches for constituents other than VOCs, 6-12 inches for VOCs), subsurface soil, groundwater, surface water, sediment, and animal and plant tissue (e.g., fish). Where appropriate, geophysical techniques will be used to aid in placement of groundwater and soil sample locations and to confirm and delineate suspected buried waste material identified during the Desktop Audit and site visit. Field screening for explosives using immunoassay-type sampling kits can be performed at SSAs (a complete list of all explosive compounds and respective detection limits using this method will be included in the Work Plan). However, immunoassay-type analytical data cannot be used for risk screening, unless it can be shown through confirmation sampling and analysis that the results of the field test kits are of equivalent precision and accuracy to standard methods of analysis.

Groundwater samples collected during SSP investigations may be obtained via direct push techniques (DPT) or from groundwater monitoring wells, depending on site conditions and data needs. For groundwater samples collected from monitoring wells, only unfiltered organic and metals results will be considered in the assessments (except in circumstances where monitoring wells do not produce samples with sufficiently low solids for a reasonable risk screening to be performed). For DPT groundwater samples, only the filtered metals and unfiltered organic results will be considered in the assessment. Groundwater parameters measured during field activities should include pH, Eh, dissolved oxygen, specific conductance, temperature, salinity, and turbidity, as appropriate, depending on the medium- and SSA-specific conditions.

All environmental media samples collected during the SSP will be analyzed for the full suite of Contract Laboratory Procedure (CLP) constituents and other constituents based on the findings of the Desktop Audit including additional analytes requested by EPA. The analytical target list will include Target Compound List (TCL) volatile organic compounds (VOCs), semivolatile organic compounds (SVOCs), pesticides, polychlorinated biphenyls (PCBs) and dioxins, and Target Analyte List (TAL) inorganic chemicals, including cyanide. Based on past uses of specific SSAs for explosives treatment, and the results of field screening immunoassay methods, it may be necessary to analyze specific samples for nitramine/nitroaromatic compounds. Depending on the history of the SSA and other available information, it may be necessary to

analyze specific samples for perchlorates. Soil samples should be analyzed for physical properties (e.g., bulk density, grain size, specific gravity, percent moisture, and total organic carbon [TOC]), as necessary.

Analytical methods used in the SSP will generally be USEPA CLP/Standard Methods and/or SW-846 Methods. Polynuclear aromatic hydrocarbons (PAHs) and pesticides/PCBs may be analyzed using low detection methods. For example, the National Oceanographic and Atmospheric Administration (NOAA) Status and Trends Methods (USEPA Method No. 1668 [GC/MS, congener standards]; USEPA, 1995d) will be used to meet PCB method detection limits (MDLs) required for the human health and ecological risk screening. An analysis of risk-based concentrations (RBCs) and Biological Technical Assistance Group (BTAG) screening levels relative to analytical reporting limits (RLs) will be conducted as part of Work Plan preparation to ensure that RLs do not exceed screening concentrations (to the greatest extent practicable).

CLP laboratory analytical data will be subjected to data validation in accordance with the Innovative Approaches for Validation of Organic and Inorganic Data, as amended by USEPA Region III (USEPA, 1995a). Section 5 describes the data validation and data evaluation process that will be used in the SSP.

4.0 PERFORMANCE OF FIELD WORK

All SSP field work at SSAs will be performed in accordance with the Master Project Plans for RFAAP and the SSA-specific SSP Work Plan described in Section 3.0 above. The Master Project Plan, including a Field Sampling Plan, Quality Assurance Project Plan, and Health and Safety Plan, addresses the full range of potentially applicable activities that could be required throughout the SSP.

5.0 DATA VERIFICATION, VALIDATION AND USABILITY ASSESSMENT

5.1 Data Verification

Data will be verified in accordance with USEPA Region III Innovative Approaches for Data Validation (USEPA, 1995). Verification for organic data will be performed at Manual Level M2 and the verification for inorganic data will be performed at Manual Level IM1 (if a determination is made that an SSA does require a RFI and formal baseline risk assessment, the existing SSP data will be re-validated at the M3 and IM2 level, respectively). Particular emphasis will be placed on holding time compliance, equipment calibration, spike recoveries, and blank results, although all required elements of the verification process will be considered. The analytical results for nonCLP parameters will be verified based on the Region III Modifications to the National Functional Guidelines further modified to reflect the acceptance specifications of the referenced method to the extent that those specifications differ from those in the Region III Modifications to the National Functional Guidelines. Data qualifiers will be assigned based on the results of verification findings. Laboratory deliverable packages will be equivalent to USEPA CLP deliverable packages, containing complete quality control (QC) summary reports, quality assurance (QA) documentation, and raw data.

Data qualifiers provide information pertaining to the degree of confidence to be considered relative to the presence (or absence) of reported chemicals, and also identify numerical results considered to be less accurate and/or precise than is normal for the method. A list of the data qualifiers that may be applied during the verification effort and their definitions are presented below.

Data Qualifier Codes	
J	The analyte was positively identified. The associated result is the approximate concentration of the analyte in the sample.
K	The analyte was detected. Reported value may be biased high.
R	Serious analytical problems were encountered and quality control criteria were not met. The data point is rejected. The analyte may or may not be present in the sample.
N	Tentative identification. Consider present. Special methods may be needed to confirm its presence or absence in future sampling efforts
L	The analyte was detected. Reported value may be biased low.
U	The analyte was analyzed for, but not detected above the reported quantitation limit.
UL	The analyte was not detected. The reported quantitation limit is approximate and may be lower.
UJ	The analyte was not detected. The reported quantitation limit is approximate and may be inaccurate or imprecise.
B	The analyte was analyzed for, but was not detected substantially above the level reported in the laboratory or field blanks.

Data tables must report non-detects with the following format: < xx, where xx is the sample reporting limit (but not the method detection limit, the instrument detection limit, the contract detection limit, etc.). Thus, all data tables will have either a blank to show that a constituent was not analyzed, a number to show the numeric value of the detected constituent, or a less than symbol followed by the sample reporting limit. The usual data qualifiers will be added as necessary. A data validation report with hand annotated Form 1s will be prepared to present data validation findings.

5.2 Data Validation and Usability Assessment

Data that are compliant with the minimum specifications of the subject analytical methods, still may not provide sufficient qualitative and/or quantitative quality to make decisions at the requisite statistical confidence. To assess risks associated with chemicals of potential concern (COPCs) at a SSA, data of known quality must be used (USEPA, 1992a). An understanding of analytical data quality is necessary for evaluation of uncertainties related to the data, and consideration of these uncertainties in the decision-making process for the SSAs. To facilitate this goal, data from the SSPs will be evaluated for quality and usability prior to its use in the human health and ecological risk screening.

Guidance such as Guidance for the Data Quality Objective Process (EPA QA/G-4, 1994), Guidance for the Data Quality Assessment Process (EPA QA/G-9, 2000), Risk Assessment Guidance for Superfund, Volume I (USEPA, 1989), and Guidance for Data Usability in Risk Assessment (USEPA, 1992a) will be used to evaluate data for usability in the human health and ecological risk screening. Data will be evaluated for quality based on information in the data verification report. Specifically, data will be evaluated for appropriateness of analytical methods and qualifiers, significant blank contamination, and tentatively identified compounds (TICs). Further, and perhaps more importantly, biases and variability inherent in the data will be assessed in relation to the relative interval between the risk screening level and the reported concentration. Additionally, given that a statistical relationship can be defined between variability, the number of samples in a given data set, and the statistical confidence with which a given conclusion may be drawn, the sampling plan and reported results will be evaluated in relationship to the DQOs established during the planning process.

All validated data that is not qualified and data that is qualified with J, L, K, U, UL, UJ, and B will be used to identify COPCs in the risk screening process, unless the inherent limitations of the analytical method and/or matrix effects obviate this use. Data qualified as rejected (i.e., R) will not be used in COPC identification.

Analytical results for the essential nutrients, calcium, sodium, potassium, and magnesium, in both solid and aqueous media, will not be considered in the assessments. All other metals, including iron, and all organic chemicals, including laboratory contaminants not disqualified in the data verification and validation processes, will be considered in the COPC identification process if detected at least once in environmental samples at an SSA.

5.3 Tentatively Identified Compounds

Chemical analysis to identify and quantify organic compounds is performed with gas chromatography-mass spectrometry (GC-MS) methods. The GC-MS instrument is calibrated for a series of target analytes using chemical standards of known concentration and purity. Quantification of these target analytes is performed against specific internal standards as identified in the respective method. Identification of these target analytes is based on a comparison of the unknown analyte to the chemical standards used during calibration based on the analyte's retention time and mass spectra.

Chromatographic peaks in volatile/semivolatile fractions analyses that are not target analytes, surrogates, or internal standards are potential Tentatively Identified Compounds (TICs). TICs must be qualitatively identified by a National Institute of Standards and Technology (NIST) mass spectral library search and the identification assessed by the data reviewer. For each sample, the laboratory conducts a mass spectral search of the NIST library and report the possible identity for the 10 VOC and/or 20 SVOC largest fraction peaks that are not surrogates, internal standards, or target compounds, but that have an area or height greater than 10 percent of the area or height of the nearest internal standard. TIC results are reported for each sample on the Organic Analyses Data Sheet (Form I - VOC-TIC or SVOC -TIC)

TICs will be reported and included in the COPC identification based upon the degree of match, evidence of similar pattern, analyst professional judgment, availability of toxicity data (e.g., IRIS, HEAST, or NCEA reference doses and/or slope factors), and consultation with EPA Region III (see Section 6.1.1.1). The top 20 TICs will be reported by name and CAS Registry number and may be quantified. Quantification of TICs will be based on input from EPA staff. Positive identification and quantification of TICs will be accomplished by acquiring the appropriate standards and calibrating the GC-MS for the tentatively identified compounds. TICs that lack toxicity data will be discussed in the uncertainty section of the screening risk assessment results.

6.0 SCREENING PROCEDURES

Human health and ecological screening procedures will be performed as a part of the SSP. Section 6.1 presents the methodology for the human health screening procedures and Section 6.2 presents the methodology for the ecological risk screening .

6.1 Human Health Screening Procedures

Human health screening procedures will be conducted in accordance with the USEPA Risk Assessment Guidance for Superfund (RAGS) (USEPA, 1989 and 1991b) and USEPA Region III guidance (USEPA, 1991c, 1993a, and 1998a) with modifications. The purpose of the screening step is to evaluate site data with respect to conservative criteria so that sites requiring no further action can be eliminated from further consideration. This process will also be used to identify sites requiring further evaluation to proceed through additional steps. The conceptual site model (CSM) developed in Section 2.0 will be used to identify those media that are associated with identified exposure pathways. If potential current and future exposure pathways associated with a particular medium are determined to be incomplete, then it may not be necessary to carry that medium through the screening process, given approval by EPA.

The screening procedure will involve the following steps:

1. Identification of COPCs and Cumulative Risk Screening

2. Chemical-Specific Screening for Lead and Iron

3. Comparison to Soil Screening Levels (SSLs)

4. Comparison to ARARs

5. Background Comparisons

These steps are described in the following sections.

6.1.1 Identification of COPCs and Cumulative Risk Screening

6.1.1.1 Identification of COPCs for Human Health Cumulative Risk Screening

As stated previously, chemicals detected at least once in environmental samples at an SSA will be evaluated in the COPC identification stage of the human health screening. The essential nutrients calcium, sodium, potassium, and magnesium; chemicals disqualified in the validation process; and TICs not positively identified, will be eliminated as COPCs.

COPCs will be identified by comparing maximum detected concentrations (MDCs) in a specific medium with chemical-specific risk-based screening criteria, unless the data display the statistical properties required to calculate a valid 95% upper confidence limit (UCL). If this is the case, then the 95% UCL will be employed. Chemicals with MDCs exceeding risk-based

criteria will be identified as COPCs and will be carried through to the cumulative risk screening step of the assessment.

Soil and Sediment. COPCs in surface and subsurface soil and sediment will be identified by comparing MDCs (or a 95% UCL if appropriate) in these media to Risk-Based Concentrations (RBCs) in the most recent version of the USEPA Region III Risk-Based Concentration Table for soil ingestion using the residential and industrial scenarios (USEPA 2000).

For soils and sediments that are exposed a significant portion of the year (i.e., > 6 months/year), screening levels shall correspond, or be adjusted to correspond, to an increased cancer risk of 1 x 10-6 and a noncancer Hazard Quotient (HQ) of 0.1. COPCs can be identified if the MDCs (or a 95% UCL if appropriate) are greater than the screening values for the ingestion and/or inhalation pathways. For sediments that are not exposed, comparisons to adjusted soil screening levels may be used to decide on the need for further evaluation (e.g., quantitative risk assessment), further investigation or response action.

Groundwater and Surface Water. COPCs in groundwater and surface water will be identified by comparing MDCs (or a 95% UCL if appropriate) of chemicals in these media to RBCs in the most recent version of the USEPA Region III Risk-Based Concentration Table for tap water (USEPA 2000), and to federal and state Maximum Contaminant Levels (MCLs) for groundwater and surface water used as a source of drinking water.

For groundwater, as well as surface water that may be a source of drinking water, RBC screening levels shall correspond, or be adjusted to correspond, to an increased cancer risk of 1 x 10-6 and a noncancer Hazard Quotient (HQ) of 0.1. For other surface water, comparisons to adjusted groundwater screening levels may be used to decide on the need for further evaluation (e.g., quantitative risk assessment), further investigation, or response action. Note that all ground water is considered a source of drinking water unless deemed non-potable (i.e., Class III).

Fish. COPCs in fish will be identified by comparing MDCs (or a 95% UCL if appropriate) of chemicals in fish tissue samples to screening level RBCs for fish in the USEPA Region III Risk-Based Concentration Table (USEPA, 2000). Screening levels shall correspond, or be adjusted to correspond, to an increased cancer risk of 1 x 10-6 and a noncancer Hazard Quotient (HQ) of 0.1.

Chemicals Lacking RBCs

For chemicals lacking Region III published RBCs, but having available associated toxicity data that are peer-reviewed, risk assessors will obtain information from the following sources, which are listed in order of preference: USEPA's Integrated Risk Information System (IRIS), Health Effects Assessment Summary Tables (HEAST), and provisional values from the National Center for Environmental Assessment (NCEA). From these sources, the Army will make a good faith effort to propose alternative screening values, for EPA concurrence.

Summary. In summary, a detected chemical will be retained as a COPC for a specific medium if the MDC (or a 95% UCL if appropriate) is greater than the corresponding screening criteria described above.

6.1.1.2 Cumulative Risk Screening

The cumulative risk screening process will consist of calculating ratios between the maximum exposure point concentrations (EPCs) of COPCs in an environmental medium and the corresponding USEPA Region III residential and industrial RBCs. COPCs are those chemicals brought forward from the COPC identification step (see Section 6.1.1.1). Carcinogenic and noncarcinogenic effects will be evaluated for exposure to chemicals in each environmental medium sampled.

6.1.1.2.1 Estimation of Exposure Point Concentrations

For purposes of this screening process, maximum detected concentrations (MDCs) (or a 95% UCL if appropriate) will be considered in the cumulative risk screening as representative exposure point concentrations (EPCs) for the SSA as a conservative measure. The selection of the MDC for the exposure point concentration in most cases is motivated by the recognition that in many cases when the number of samples is small, the alternative approach reverts to the maximum detected concentration because the calculated 95% UCL exceeds the MDC.

6.1.1.2.2 Human Health Effects - Carcinogens

The potential for carcinogenic risk will be evaluated by estimating excess cancer risk for each COPC. Using the maximum EPC and the respective screening level RBC value, excess residential and industrial cancer risk can be estimated using the following formula:

$$Excess\,Cancer\,Risk = TR\frac{Max.EPC_i}{RBC_i}$$

Where:

	TR	=	The target lifetime cancer risk of 1x10-6
	EPCi	=	EPC of COPCi detected in soils and fish (mg/kg) or water (g/L)
	RBCi	=	RBC for COPCi in soils and fish (mg/kg) or water (g/L) based on carcinogenic effects at the TR stated above

Finally, the cumulative residential and industrial excess cancer risk is estimated for each SSA. The cumulative excess cancer risk for exposure to multiple COPCs is estimated using the following equation:

$$Cumulative\ Excess\ Cancer\ Risk = \sum \left[TR\ x \frac{Max.EPC_i}{RBC_i} \right]$$

In accordance with 40 Code of Federal Regulations (C.F.R.) 300.430, carcinogenic risk within the benchmark range of 1x10-4 (1 cancer case in 10,000) to 1x10-6 (1 cancer case in 1,000,000) is generally considered acceptable. The following statement is from 40 C.F.R. 300.430 (2000): "For known or suspected carcinogens, acceptable exposure levels are generally concentration levels that represent an excess upper bound lifetime cancer risk to an individual of between 10-4 to 10-6 using information on the relationship between dose and response. The 10-6 risk level shall be used as the point of departure for determining remediation goals for alternatives when ARARs are not available or are not sufficiently protective because of the presence of multiple contaminants at a site or multiple pathways of exposure."

Multiplying the EPC/RBC ratio by USEPA's point of departure risk level, 10-6, results in an excess cancer risk estimate for the COPC. Excess cancer risk estimates for all COPCs will be summed to account for potential carcinogenic effects associated with multiple chemical exposures (USEPA, 1989) for each medium. The results of cumulative risk screening will be evaluated as follows:

- If the calculated cumulative excess cancer risk is greater than or equal to 1×10^{-5} for any of the medium, then a quantitative risk assessment would be performed for the SSA, or

- If the calculated cumulative excess cancer risk is: 1) below 1×10^{-5} for all media; and 2) no other screening criteria, as defined by this document, have been exceeded, then no further action (NFA) would be recommended for the SSA.

6.1.1.2.3 Human Health Effects - Noncarcinogens

The potential for adverse noncarcinogenic health effects will be evaluated by calculating a residential and industrial HQ for each COPC. Using the maximum EPC and a respective noncarcinogenic RBC, a residential or industrial HQ can be estimated with the following formula:

$$HQ = THQ \frac{Max.EPC_i}{RBC_i}$$

Where: THQ = The target HQ of 0.1
EPCi = EPC of COPCi detected in soils and fish (mg/kg) or groundwater (g/L)
RBCi = RBC for COPCi in soils and fish (mg/kg) or Groundwater (g/L) based on noncarcinogenic effects at the THQ stated above.

Finally, the cumulative residential and industrial non-carcinogenic hazard index (HI) for exposure to multiple COPCs is estimated as follows:

$$Cumulative\ Noncarcinogenic\ HI = \sum \left[THQ\, x \frac{Max.EPC_i}{RBC_i} \right]$$

Per USEPA guidance for a Baseline Risk Assessment, when the HI exceeds 1, there is a potential for adverse noncarcinogenic health effects (USEPA, 1989). Generally, the more the HI exceeds unity, the greater the potential for adverse health effects. Additionally, when the HI exceeds 1, and multiple chemicals contribute to the exceedance, the HI is segregated on the basis of toxic effects and target organs (i.e., hepatic, renal, respiratory, cardiovascular, gastrointestinal, hematological, musculoskeletal, dermal, ocular effects, neurological, reproductive, developmental, and immune system).

For the cumulative risk screening procedure, HI segregation will involve obtaining the most recent and reliable noncarcinogenic health effects data for COPCs, such as data in the Integrated Risk Information System database (EPA) and databases developed by the Agency for Toxic Substances and Disease Registry (ATSDR). Health effects will be considered for only chronic exposure to COPCs. For COPCs with multiple target organs, the organ that the chemical primarily targets will be considered in hazard segregation.

The results of the cumulative hazard screening will be evaluated as follows:

- In accordance with Region III guidance for risk screening, if the cumulative noncarcinogenic HI for a SSA, computed by this method, is greater or equal than 0.5 for any target organ, then a quantitative risk assessment would be performed for the SSA, or

- If the cumulative noncarcinogenic HI for an SSA, computed by this method, is: 1) less than 0.5 for all target organs; and 2) no other screening criteria, as defined by this document, have been exceeded, then NFA would be recommended for the SSA.

6.1.1.3 Uncertainty Analysis

Uncertainties associated with the cumulative risk screening will be qualitatively evaluated to determine the accuracy of the approach. Factors that may contribute to uncertainty include the use of RBC age-adjusted ingestion and inhalation rates, the use of toxicity information provided by NCEA when RBCs are not available, and the level of uncertainty due to a lack of dermal risk estimates. Uncertainty in the assessment could also arise if health-based RBCs are less than analytical method detection limits.

Uncertainty is associated with the use of RBCs and SSLs because they do not consider dermal uptake. The Site Screening Process is geared towards a risk-based identification of COPCs and preliminary assessment of human and ecological risks that is objective and quantitative. As such, it hinges on the availability of appropriate, risk-based screening levels. No such levels have been identified for dermal exposures to soil, sediment, water or air. Given the conservative nature of the screening process (e.g., use of MDC for exposure point concentrations, use of residential screening level RBCs for soil and groundwater), it is considered very unlikely that omission of

dermal exposures in the risk screening process will result in failure to identify a SSA that would require further investigation or response. To guard against this possibility, contaminant concentrations at all SSAs that pass the risk screening will be scrutinized for the occurrence of contaminants that are known to be easily absorbed through the skin, and if necessary, dermal risks for selected contaminants will be calculated in accordance with USEPA's Dermal Exposure Guidance (USEPA, 1992c, 1997a). These dermal risks may be added to the Cumulative Excess Cancer Risk or Cumulative Noncarcinogenic HI computed above.

6.1.2 Chemical-Specific Screening for Lead and Iron

6.1.2.1 Lead

If lead concentrations in soil are greater than 400 mg/kg (USEPA, 1994a), or lead concentrations in groundwater or surface water are greater than 15 g/L (USEPA 1996b), then potential risk associated with lead will be evaluated using the IEUBK model (USEPA, 1994b). The model will be run using site-specific input parameters based on SSP findings and consultation with USEPA Region III. If the percentage of children expected to have blood lead levels of 10 micrograms per deciliter (μg/dL) or greater exceeds 5%, then further investigation or response action will be required for the SSA.

6.1.2.2 Iron

If iron concentrations in soil or water result in an HQ of 0.5 or greater, then a "margin of exposure" evaluation will be performed. Risks from exposure to iron will be characterized by comparing estimated iron intake to the recommended dietary allowance (RDA) and concentrations known to cause adverse effects in children (NCEA, 1996).

6.1.3 Comparison to Soil Screening Levels (SSLs)

USEPA's Soil Screening Guidance (USEPA, 1996a) will be used as the source of information for three types of SSLs, which address:

- Chemical migration of VOCs from subsurface soil to air;
- Chemical migration of contaminants from soil to air via fugitive dust; and
- Chemical migration of contaminants from soil to groundwater.

MDCs (or a 95% UCL if appropriate) of chemicals found in soil and sediment will be compared to screening levels for leaching of contaminants to groundwater, i.e., soil-to-groundwater screening levels (USEPA, 1996a). Many soil-to-groundwater screening values can be found in the USEPA Region III RBC Tables. A dilution attenuation factor (DAF) of 20 may be used unless groundwater is considered to be shallow. In this case, a site-specific DAF should be calculated. Chemicals found at concentrations exceeding soil-to-groundwater screening levels will be evaluated in a qualitative manner to assess the need for further assessment, investigation, or response action. Geotechnical information such as Total Organic Carbon (TOC), pH, groundwater characteristics, etc., will be an integral part of the qualitative evaluation. In

particular, the SSL comparison will be evaluated with respect to its application to site conditions, such as the karst environment which is present throughout RFAAP. Based on the qualitative evaluation, and other relevant information, a recommendation will be made as to whether further evaluation, investigation, or response action should take place for the SSA.

6.1.4 Comparison to ARARs

MDCs (or a 95% UCL if appropriate) of chemicals found at each SSA will be compared to Applicable or Relevant and Appropriate Requirements (ARARs), including, but not limited to: federal and Virginia Maximum Contaminant Levels (MCLs) under the Safe Drinking Water Act, federal Ambient Water Quality Standards under the Clean Water Act, Virginia Water Quality Criteria, Virginia AST/UST TPH guidance level for soil (100 mg/kg) and Virginia AST/UST TPH guidance level for groundwater (1 mg/L) (VDEQ, 1995). Chemicals which are found at concentrations greater than ARARs will be identified. If an MDC (or a 95% UCL if appropriate) is greater than one or more ARARs, a recommendation will be made as to whether further evaluation, investigation, or response action should take place for the SSA. EPA may decide that further evaluation, investigation or response action is required at a SSA, based upon consultation with the Commonwealth if State ARARs are involved.

6.1.5 Background Comparison

As a final step in the human health screening process, MDCs of chemicals identified as COPCs will be compared to the EPA-approved site-specific background concentrations shown in the following table. This table includes inorganic chemicals whose 95% upper tolerance limit (UTL) are greater than residential RBC values and are based on the inorganic background data collected at RFAAP.

Facility-Wide Point Estimates for Soil

[Units in mg/kg]

Chemical	Minimum Concentration	Maximum Concentration	95% UTL of the Mean
Aluminum	3,620	47,900	40,041
Arsenic	1.2	35.9	15.8
Chromium	6.3	75.8	65.3
Iron	7,250	67,700	50,962
Manganese	16.7	2,040	2,543
Thallium	1.3	5	2.11
Vanadium	12.2	114	108

Based on the background comparison, and other relevant information, a recommendation will be made as to whether further investigation or response action is warranted at each SSA.

6.1.6 Summary of Human Health Risk Screening Procedures

The results of each screen will be summarized. If COPCs have been identified, in a particular medium, the SSA will be subject to further evaluation, such as a quantitative risk assessment. The results of the SSP will also be used to further refine the CSM.

6.2 Ecological Risk Screening Procedures

The USEPA Risk Assessment Forum (1992) recommended a general framework for conducting ecological risk assessments (ERAs). The Forum framework is presented in Figure 6-1. USEPA has since refined the framework and prepared ERA guidance (USEPA 1997). The approach taken for the SSA ecological screening at RFAAP follows the ERA eight-step approach in the USEPA guidance. Other guidance documents which may be consulted during the ecological risk screening process include the USEPA Region III BTAG ERA guidelines (USEPA 1995b), and the Tri-Service Procedural Guidelines for ERAs, Volume 1 (Wentsel et al, 1996).

The eight-step process is summarized in Figure 6-2. Since this is an ecological risk screen, the process focuses on Steps 1 and 2. These steps are intended to provide a foundation of information pertaining to ecological resources and potential interactions with site-related contamination in order that risk managers can make conservative decisions regarding ecological risks at individual SSAs.

The following steps will be followed for the ecological risk screening :

Site Reconnaissance

Problem Formulation

Exposure Assessment

Ecological Effects Assessment

Risk Characterization

Figure 6-1 Ecological Risk Assessment Framework (USEPA, 1997)

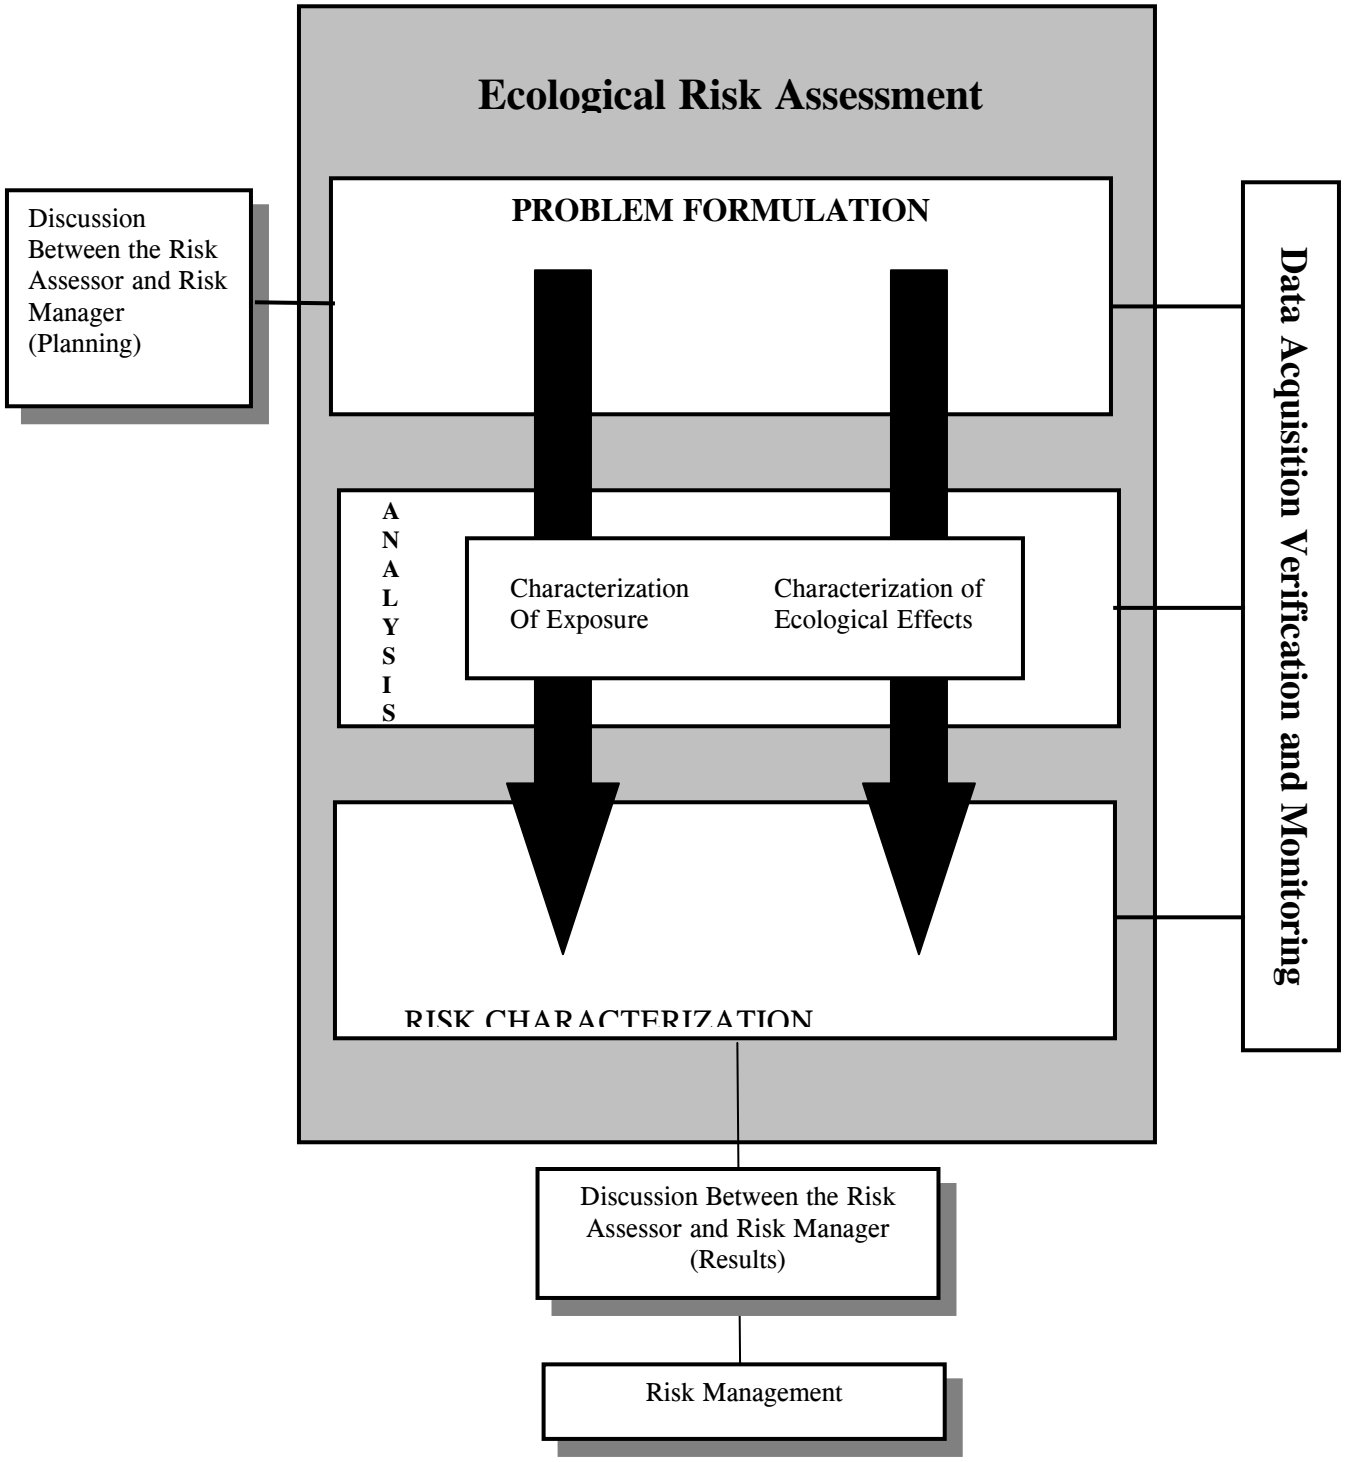

Figure 6-2 Eight-Step Ecological Risk Assessment Process for Superfund (USEPA, 1997)

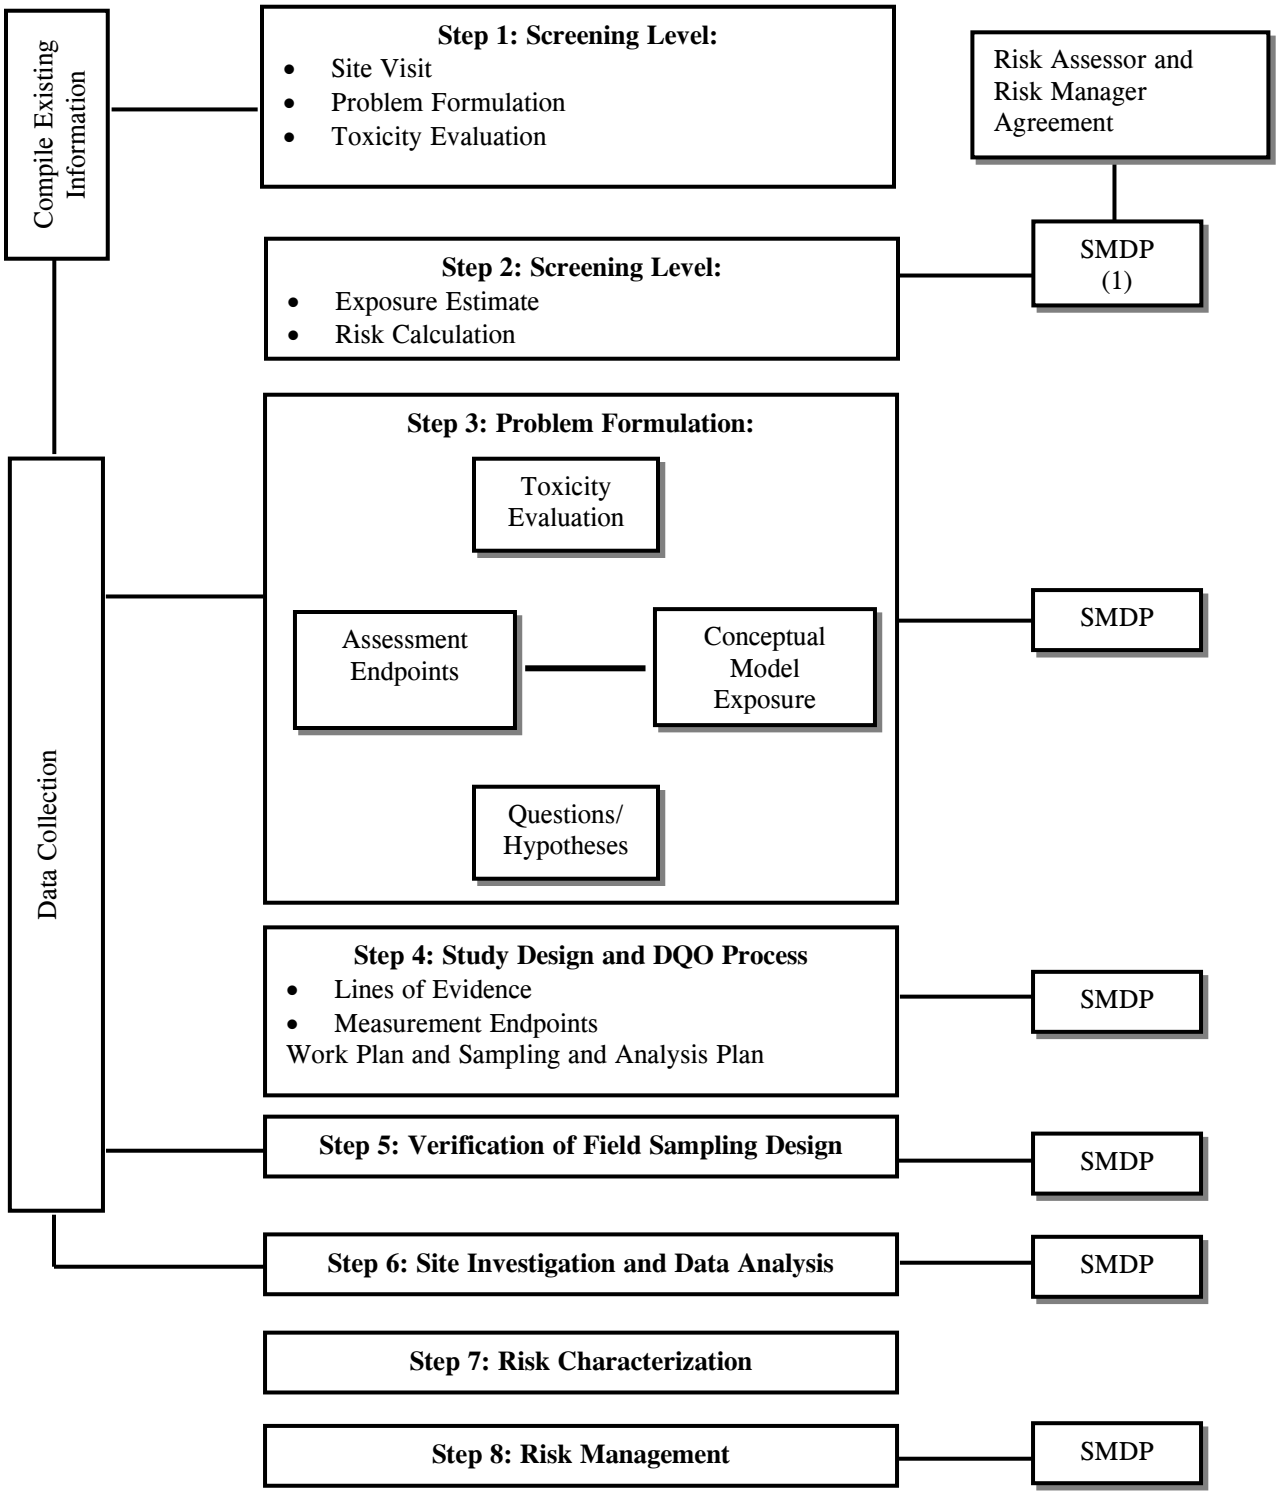

The ecological risk screening will provide conclusions and recommendations regarding ecological risk at the site. The Army will use these data to make ecological risk management recommendations for each SSA. The scientific/management decision point reached from the ecological risk screening will include one of the following:

- There is adequate information to conclude that ecological risks are negligible and therefore there is no need for further action at the SSA on the basis of ecological risk;

- The information is not adequate to make a decision at this point and further refinement of data is needed to augment the ecological risk screening; or

- The information collected and presented indicates that a more thorough assessment is warranted.

6.2.1 Problem Formulation

Problem formulation is the first phase of a ecological risk screening and discusses the goals, breadth, and focus of the screening. It involves the collection and analysis of existing data to the greatest extent possible. Problem formulation includes general descriptions of RFAAP SSAs, with emphasis on size of the SSAs, proximity to operational areas and/or sensitive habitats, and the habitats and ecological receptors present. This phase also involves characterization of site contaminants, contaminant sources, migration routes, and an evaluation of complete routes of contaminant exposure to important ecological receptors. Assessment and measurement endpoints that will be evaluated are also selected. Finally, a conceptual model is developed that describes how contaminants associated with the sites in question may come into contact with ecological receptors. Much of this step will have been completed during the site reconnaissance, the review of historical information, and the development of the work plan, as discussed in Sections 2.0 and 3.0, respectively.

The following sections provide more detailed descriptions of the steps involved in the development of the problem formulation component of the ecological risk screening.

6.2.1.1 Site Characterization

The objectives of this step are to initially identify and characterize the site(s) ecological resources, and to preliminarily describe the nature and extent of chemical contamination at the site(s) in question. Information pertaining to site land-use (past, current and future), size, proximity to operable areas and/or sensitive habitats, and habitats and ecological resources will be developed during the site characterization. The SSP is a screening level process that will be used to determine if a site should proceed further through the RFI stage. As such, detailed field sampling and quantitative analysis of biota will not be performed during the SSP. If contamination is identified which may impact ecological receptors, a recommendation in the SSP report would include biota sampling.

This step will actually begin with the site visit discussed in Section 2.0. Information about local ecological resources (including threatened and endangered species) will also be obtained from maps of the study area, available scientific literature, and federal and state agencies (e.g., U.S.

Fish and Wildlife Service, Virginia Department of Game and Inland Fisheries, Department of Natural Heritage database, etc.). The site characterization will also describe likely contaminant sources, release mechanisms, complete migration pathways, the fate of chemicals resulting from site-related activities, as well as important ecological resources that could be adversely affected by these chemicals.

6.2.1.2 Identification of Chemicals of Potential Ecological Concern

COPCs will be identified by comparison of maximum site concentrations to approved Region III BTAG screening values and/or by simple food-web modeling. Initial screening of analytical data will be conducted using general screening values considered protective of all wildlife. Chemicals with MDCs (or a 95% UCL if appropriate) exceeding screening values and/or chemicals for which no screening values are available will be initially identified as COPCs to be carried through to the risk characterization step of the ecological risk screening. Values may be derived from sources such as, Federal and state standard Ambient Water Quality Criteria, Ontario Ministry of the Environment LEL values for freshwater habitats (Ontario Ministry of Environment and Energy, 1993), Great Lakes Research TEL values (Smith et al., 1996) for freshwater habitats, and EPA and ORNL surface soil screening levels (USEPA, 2000b and Will and Suter, 1995a).

6.2.1.3 Identification of Exposure Pathways and Potential Receptors for Analysis

The pathways by which ecological receptors may be exposed to COPCs at the site(s) will be identified along with the receptor groups that could be adversely affected by these chemicals. Several potential exposure pathways may exist at the site(s). For example, terrestrial vegetation may be exposed to contaminants via direct aerial deposition and root translocation, although aerial deposition is highly variable and difficult to quantify. Terrestrial animals may be exposed to soil contaminants through ingestion of contaminated food items and by incidentally ingesting soil while grooming fur, preening feathers, digging, grazing close to the soil, or feeding on items to which soil has adhered (such as roots and tubers). Terrestrial animal receptors may also come into contact with contaminants in surface water by using surface water for drinking water, although this exposure route represents a negligible portion of total exposure for most receptors.

Aquatic and semi-aquatic organisms at the RFAAP may be exposed to contaminants via direct contact with surface water and sediments, incidental ingestion of surface water and sediments, and consumption of contaminated food items. Aquatic and semi-aquatic organisms may also be exposed to constituents from contaminated groundwater that flows into surface water.

For purpose of the SSA ecological risk screening, exposure pathways representing important and likely meaningful routes of contaminate uptake will be assessed for appropriate receptor groups. If sufficient information exists to examine more obscure exposure routes (e.g. aerial deposition or inhalation) or if the assessment of an exposure route will substantially contribute to the risk understanding (e.g. drinking water) it will be examined to assess whether it warrants the evaluation.

Based on the identification of site-specific habitats, food webs, COPCs, and exposure pathways, recommendations will be made for species or species groups to be selected for evaluation in the risk screening. These may include the following receptor groups:

- For terrestrial systems: terrestrial plants, terrestrial invertebrates, reptiles and amphibians, invertebrate-eating birds (e.g., robin), invertebrate-eating mammals (e.g., shrew), carnivorous mammals (e.g. red fox), and carnivorous birds (e.g., red-tailed hawk) may be included. In addition, plant-eating mammals (e.g., rabbit), and omnivorous mammals (e.g. raccoon) may be included.

- For aquatic systems: aquatic plants, benthic invertebrates, fish, reptiles and amphibians, fish-eating birds (e.g. great blue heron), and fish-eating mammals (e.g. mink) may be included.

6.2.1.4 Identification of Assessment and Measurement Endpoints

One of the major tasks in screening problem formulation is the selection of assessment and measurement endpoints. An assessment endpoint is defined as "an explicit expression of actual environmental values that are to be protected" (USEPA, 1992d). Measurement endpoints are "measurable ecological characteristics that are related to the valued characteristic chosen as the assessment endpoint" (USEPA 1992d). Measurement endpoints serve as tools for ranking and evaluating environmental values that are to be protected. While declines in populations and shifts in community structure can be quantified, studies of this nature are generally time-consuming and difficult to interpret. However, measurement endpoints indicative of observed effects on individuals are relatively easy to measure in laboratory toxicity studies and can be related to the site specific assessment endpoint.

Toxicity data and assessment endpoints shall be discussed with BTAG, and agreed upon, in accordance with the USEPA Guidance (USEPA 1997). This step also includes the development of a conceptual site model (CSM) and identification of the specific objectives and scope of the ecological risk screening. The CSM is designed to diagrammatically identify potentially exposed receptor populations and applicable exposure pathways, based on the physical nature of the site and the potential contaminant source areas. Generally, a separate CSM will be developed for each SSA because the contaminant source, migration pathways, assessment and measurement endpoint, and exposure pathways are site-specific. However, in appropriate cases, more than one SSA can be included in a single CSM if, for example, there are common exposure and/or migration pathways.

6.2.2 Exposure Assessment

This section of the ecological risk screening includes identification of contaminant concentration data used to represent ecological exposure in various media. For each exposure pathway selected for quantitative evaluation, conservative exposure point concentrations (EPCs) will be used and the receptor specific exposure will be quantified. EPCs will be estimated using environmental sampling data either alone or in conjunction with simple environmental fate and transport models.

The food chain modeling will be performed in accordance with current USEPA CERCLA guidance for ecological risk assessment, and use conservative exposure parameter values (maximum ingestion rate, minimum body weight, 100% bioavailability) (USEPA, 1993b). The ecological exposure assessment will consist of two phases. The first, most conservative, phase will be based on conservative exposure assumptions such as:

Maximum analytical results for each medium of concern used as EPCs; and

Site use factor equals 1

The second phase will be based on conservative yet more realistic exposure assumptions such as:

- Site use factor determined based on the size of the SSA, proximity to operational areas and/or sensitive habitats, the quality of habitat present, and behavior of important ecological receptors; and

- Use of average body weight and average intake for selected wildlife receptors.

6.2.3 Ecological Effects Assessment

This step in the ecological risk screening develops toxic reference values (TRVs) for ecological receptors, to be used in the risk characterization. Acknowledging that data pertaining to ecological risk characterization is continually being updated, the Army shall consult with EPA on the most-up-to-date and appropriate data sources, when reaching this stage in the screening process. The toxicity of COPCs to terrestrial and aquatic organisms will be summarized using relevant toxicity data for the selected receptor species. The TRVs to be used in the evaluation of potential adverse effects to terrestrial and aquatic species will be derived from the literature, where possible.

In food web modeling, calculated doses will be compared to toxicological thresholds (no observed adverse effect levels [NOAELs] and lowest observed adverse effect levels [LOAELs]). The Army shall develop TRVs for wildlife receptors derived from NOAELs and LOAELs taken from various literature sources. BTAG will review these values and may provide technical assistance in selecting wildlife derived NOAELs and LOAELs. Only EPA and BTAG approved TRVs will be used in identifying COPCs at SSAs.

6.2.4 Risk Characterization

This step compares exposure point contaminant concentrations with benchmark concentrations protective of ecological receptors. The ratio of the maximum contaminant concentration to the benchmark value is called the HQ or Ecological Effects Quotient (EEQ), and is defined as follows:

$$EEQ = Emax/TRV$$

Where: EEQ = Ecological Effects Quotient for contaminant (unitless)

Emax = Maximum Concentration for contaminant (mg/L or mg/kg)

TRV = Toxicity Reference Value for contaminant (mg/L or mg/kg)

When the ratio of the maximum concentration to its respective benchmark value exceeds 1.0, further assessment may be needed. The EEQ value should not be construed as being probabilistic; rather, it is a numerical indicator of the extent to which a maximum concentration exceeds or is less than a benchmark. When EEQ values exceed 1.0, it is an indication that ecological receptors are potentially at risk based on conservative exposure assumptions.

The preliminary risk characterization will be based on the conservative preliminary exposure assumptions. A major part of the risk characterization is the interpretation of the preliminary estimates of risk in light of the conservative assumptions and uncertainties (see Section 6.2.5).

Additional evaluation of site-specific data may be necessary to confirm with greater certainty whether ecological receptors are actually at risk at the site, especially since most benchmarks are based on conservative exposure assumptions. A refined estimate of EEQs will be made using the refined exposure factors (Section 6.2.2). The results of the conservative and refined risk estimates will be evaluated in light of the uncertainties of the risk assessment process (Section 6.2.5). Furthermore, other factors, such as low frequency of detection, may mitigate potential risks for a COPC with an elevated EEQ value.

6.2.5 Uncertainty Analysis

When the above steps are completed, the results are interpreted and the uncertainties associated with the ecological risk screening are addressed. General uncertainties associated with the ecological risk screening will be qualitatively evaluated to determine the conservatism of the approach. For example, uncertainty in this site screening could arise if ecological based criteria are less than analytical method detection limits. In addition, background screening will be performed at this stage to aid in risk management decisions. Maximum detected concentrations of inorganic constituents may be compared to background values (see Section 6.1.4) to assist in assessing whether or not potential ecological risk is associated with site-related conditions.

7.0 SITE SCREENING PROCESS REPORT

Results of the desktop audit, nature and extent determination (if available), and the human health and ecological screening procedures will be presented in an SSP Report for each SSA with a recommendation for future action. The EPA will review the SSP Report for each SSA and based on results of the screening procedures, a decision will be made as to whether each SSA should be recommended for no further action, or for further action. A need for further action will be based on but not limited to the following: historical use of the SSA, history of documented release (if any), analytical data from the SSA, and the overall weight of the evidence. In general, further action at an SSA may be required under the following circumstances:

- Cumulative Excess Cancer Risk (CECR) greater than 1x10-5
- HI greater than 0.5 per target organ
- Maximum Detected Concentration > SSL for chemical migration from soil to ground water or other screening values (e.g., Virginia AST/UST TPH guidance level for soil; Virginia State and Federal MCLs, Virginia AST/UST TPH guidance level for ground water; or Federal and State Ambient Water Quality Criteria for surface water)
- Ecological risk considerations per Section 6.2

If none of the above circumstances occur, EPA may recommend no further action and memorialize this recommendation in a Decision Document.

If any of the above circumstances occur, further action may be required. Further action may consist of one or more of the following:

- Interim Removal Action, followed by sampling to confirm that risks have been reduced to acceptable levels
- Focused RFI (including additional sampling)
- RFI/CMS

8.0 DISPUTE RESOLUTION

Disputes arising during the course of the SSP shall be resolved using the dispute resolution procedures of the RCRA Corrective Action Permit, Part I, C.

STANDARD OPERATING PROCEDURE 10.1
FIELD LOGBOOK

1.0 SCOPE AND APPLICATION

The purpose of this standard operating procedure (SOP) is to delineate protocols for recording daily site investigation activities.

Records should contain sufficient information so that anyone can reconstruct the sampling activity without relying on the collector's memory.

2.0 MATERIALS

- Field Logbook;
- Indelible ink pen; and
- Clear tape.

3.0 PROCEDURE

Information pertinent to site investigations will be recorded in a bound logbook. Each page/form will be consecutively numbered, dated, and signed. All entries will be made in indelible ink, and all corrections will consist of line out deletions that are initialed and dated. If only part of a page is used, the remainder of the page should have an "X" drawn across it. At a minimum, entries in the logbook will include but not be limited to the following:

- Project name (cover);
- Name and affiliation of personnel on site;
- Weather conditions;
- General description of the field activity;
- Sample location;
- Sample identification number;
- Time and date of sample collection;
- Specific sample attributes (e.g., sample collection depth flow conditions or matrix);
- Sampling methodology (grab or composite sample);
- Sample preservation, as applicable;
- Analytical request/methods;
- Associated quality assurance/quality control (QA/QC) samples;
- Field measurements/observations, as applicable; and
- Signature and date of personnel responsible for documentation.

4.0 MAINTENANCE

Not applicable.

5.0 PRECAUTIONS

None.

STANDARD OPERATING PROCEDURE 10.2
SURFACE WATER, GROUNDWATER, AND SOIL/SEDIMENT FIELD LOGBOOKS

1.0 SCOPE AND APPLICATION

The purpose of this standard operating procedure (SOP) is to delineate protocols for recording surface water, groundwater, and soil/sediment sampling information, as well as instrument calibration data in field logbooks.

2.0 MATERIAL

- Applicable field logbook (see attached forms); and
- Indelible ink pen.

3.0 PROCEDURE

All information pertinent to surface water, groundwater, or soil/sediment sampling will be recorded in the appropriate logbook. Each page/form of the logbook will be consecutively numbered. All entries will be made with an indelible ink pen. All corrections will consist of line out deletions that are initialed and dated.

3.1 SOIL/SEDIMENT

3.1.1 Field Parameters/Logbook (Form 10.2-a)

1. HIGH CONCENTRATION EXPECTED?: Answer "Yes" or "No.";
2. HIGH HAZARD?: Answer "Yes" or "No.";
3. INSTALLATION/SITE: Record the complete name of the installation or site;
4. AREA: Record the area designation of the sample site;
5. INST. NAME: Record the two-letter installation name for Radford Army Ammunition Plant – "RD";
6. SAMPLE MATRIX CODE: Record the appropriate sample matrix code. Common codes are "SD" for solid - sediment, "SI" for soil - gas, "SL for solid sludge, "SO" for surface other, "SS" for solid – soil, "SW" for surface wipe, "WD" for water – potable, "WG" for water – ground, "WS" water – surface, "WT" – water treated and "WW" water -waste;
7. SITE ID: Record a code up to 20 characters or numbers that is unique to the site;
8. ENV. FIELD SAMPLE IDENTIFIER: Record a code up to 20 characters specific for the sample;
9. DATE: Enter the date the sample was taken;
10. TIME: Enter the time (12-hour or 24-hour clock acceptable as long as internally consistent) the sample was taken;
11. AM PM: Circle "AM" or "PM" to designate morning or afternoon (12-hour clock);
12. SAMPLE PROG: Record "RFI" (RCRA Facility Investigation) or other appropriate sample program;
13. DEPTH (TOP): Record the total depth sampled;
14. DEPTH INTERVAL: Record the intervals at which the plug will be sampled;

15. UNITS: Record the units of depth (feet, meters);
16. SAMPLE MEASUREMENTS: Check the appropriate sampling method;
17. CHK: Check off each container released to a laboratory;
18. ANALYSIS: Record the type of analysis to be performed on each sample container;
19. SAMPLE CONTAINER: Record the sample container type and size;
20. NO.: Record the number of containers;
21. REMARKS: Record any remarks about the sample;
22. TOTAL NUMBER OF CONTAINERS FOR SAMPLE: Record the total number of containers;
23. SITE DESCRIPTION: Describe the location where the sample was collected;
24. SAMPLE FORM: Record the form of the sample (i.e., clay, loam, etc.) using The Unified Soil Classification System (USCS);
25. COLOR: Record the color of the sample as determined from standard Munsell Color Charts;
26. ODOR: Record the odor of the sample or "none";
27. PID: Record the measured PID values or other similar measurement instrument value;
28. UNUSUAL FEATURES: Record anything unusual about the site or sample;
29. WEATHER/TEMPERATURE: Record the weather and temperature; and
30. SAMPLER: Record your name.

3.1.2 Map File Form (refer to form 10.2-c)

1. SITE ID: Record the Site ID from the field parameter form;
2. POINTER: Record the field sample number for the sample being pointed to;
3. DESCRIPTION/MEASUREMENTS: Describe the location where the sample was taken, along with distances to landmarks;
4. SKETCH/DIMENSIONS: Diagram the surroundings and record the distances to landmarks;
5. MAP REFERENCE: Record which U.S.G.S. Quad Map references the site;
6. COORDINATE DEFINITION: Write the compass directions and the X- and Y-coordinates of the map run;
7. COORDINATE SYSTEM: Write "UTM" (Universal Transverse Mercator);
8. SOURCE: Record the 1-digit code representing the Map Reference;
9. ACCURACY: Give units (e.g., write "1-M" for 1 meter);
10. X-COORDINATE: Record the X-coordinate of the sample site location;
11. Y-COORDINATE: Record the Y-coordinate of the sample site location;
12. UNITS: Record the units used to measure the map sections;
13. ELEVATION REFERENCE: Record whether topography was determined from a map or a topographical survey;
14. ELEVATION SOURCE: Record the 1-digit code representing the elevation reference;

15. ACCURACY: Record the accuracy of the map or survey providing the topographical information;
16. ELEVATION: Record the elevation of the sampling site;
17. UNITS: Write the units in which the elevation is recorded; and
18. SAMPLER: Write your name.

3.2 SURFACE WATER

3.2.1 Field Parameter Logbook (Forms 10.2-b and 10.2-c)

1. CAL REF: Record the calibration reference for the pH meter;
2. pH: Record the pH of the sample;
3. TEMP: Record the temperature of the sample in degrees Celsius;
4. COND: Record the conductivity of the water;
5. Description of site and sample conditions (refer to 10.2-b);
6. Map File Form (refer to Section 3.1.2).

3.3 GROUNDWATER (FORMS 10.2- D)

3.3.1 Field Parameter Logbook (Form 10.2.b)

Refer to Section 3.2.1.

3.3.2 Map File and Purging Forms

1. WELL NO. OR ID: Record the abbreviation appropriate for where the sample was taken. Correct abbreviations can be found on pages 18-21 of the IRDMIS User's Guide for chemical data entry;
2. SAMPLE NO.: Record the reference number of the sample;
3. WELL/SITE DESCRIPTION: Describe the location where the sample was taken, along with distances to landmarks;
4. X-COORD AND Y-COORD: Record the survey coordinates for the sampling site;
5. ELEV: Record the elevation where the sample was taken;
6. UNITS: Record the units the elevation was recorded in;
7. DATE: Record the date in the form MM/DD/YY;
8. TIME: Record the time, including a designation of AM or PM;
9. AIR TEMP.: Record the air temperature, including a designation of C or F (Celsius or Fahrenheit);
10. WELL DEPTH: Record the depth of the well in feet and inches;
11. CASING HEIGHT: Record the height of the casing in feet and inches;
12. WATER DEPTH: Record the depth (underground) of the water in feet and inches;
13. WELL DIAMETER: Record the diameter of the well in inches;
14. WATER COLUMN HEIGHT: Record the height of the water column in feet and inches;
15. SANDPACK DIAM.: Record the diameter of the sandpack. Generally, this will be the same as the bore diameter;

16. EQUIVALENT VOLUME OF STANDING WATER: Use one of the following equations to determine one equivalent volume (EV);

    1 EV = volume in casing + volume in saturated sandpack. Or:

    $1\ EV = [\pi R_w^2 h_w + 0.30p(R_s^2 - R_w^2)h_s] * (0.0043)$

Where:

R_s = radius of sandpack in inches
R_w = radius of well casing in inches
h_s = height of sandpack in inches
h_w = water depth in inches

$0.0043 = gal/in^3$

and filter pack porosity is assumed as 30%, or

Volume in casing =
$(0.0043\ gal/in^3)(p)(12\ in/ft)(R_c^2)(W_h)$

Where:

R_c = radius of casing in inches, and
W_h = water column height in feet

Vol. in sandpack =
(0.0043 gal/in3)(p)(12 in/ft)(Rb2 - Rc2)(Wh)(0.30)

(if Wh is less than the length of the sandpack), or

Vol. in sandpack =
(0.0043 gal/in3)(p)(12 in/ft)(Rb2 - Rc2)(Sh)(0.30)

(if Wh is greater than the length of the sandpack).

where:

Rb = radius of the borehole, and
Sh = length of the sandpack.

Show this calculation in the comments section.

1. PUMP RATE: Record pump rate;
2. TOTAL PUMP TIME: Record total purge time and volume;
3. WELL WENT DRY? Write “YES” or “NO”;
4. PUMP TIME: Record pump time that made the well go dry;
5. VOLUME REMOVED: Record the volume of water (gal) removed before the well went dry;
6. RECOVERY TIME: Record the time required for the well to refill;

7. PURGE AGAIN?: Answer “YES” or “NO”;
8. TOTAL VOL. REMOVED: Record the total volume of water (in gallons) removed from the well;
9. CAL REF.: Record the calibration reference for the pH meter;
10. TIME: Record time started (INITIAL T(0)), 2 times DURING the sampling and the time sampling ended (FINAL);
11. pH: Record the pH at start of sampling (INITIAL), twice DURING the sampling, and at the end of sampling (FINAL);
12. TEMP: Record the water temperature (Celsius) at the start of sampling, twice DURING the sampling, and at the end of sampling (FINAL);
13. COND: Record the conductivity of the water at the start of sampling, twice DURING the sampling, and at the end of sampling (FINAL);
14. D.O.: Record the dissolved oxygen level in the water at the start of sampling, twice DURING the sampling, and at the end of sampling (FINAL);
15. TURBIDITY: Record the readings from the turbidity meter (nephelometer) and units at the start of sampling, twice DURING the sampling, and at the end of sampling (FINAL);
16. ORD: Record the oxidation/reduction (RedOx) potential of the water sample at the start of sampling, twice DURING the sampling, and at the end of sampling (FINAL);
17. HEAD SPACE: Record any positive readings from organic vapor meter reading taken in well headspace before sampling;
18. NAPL: Record the presence and thickness of any non-aqueous phase liquids (LNAPL and DNAPL)
19. COMMENTS: Record any pertinent information not already covered in the form; and
20. SIGNATURE: Sign the form.

3.4 FIELD CALIBRATION FORMS (REFER TO FORM 10.2-E)

1. Record time and date of calibration;
2. Record calibration standard reference number;
3. Record meter ID number;
4. Record initial instrument reading, recalibration reading (if necessary), and final calibration reading on appropriate line;
5. Record value of reference standard (as required);
6. COMMENTS: Record any pertinent information not already covered on form; and
7. SIGNATURE: Sign form.

4.0 MAINTENANCE

Not applicable.

5.0 PRECAUTIONS

None.

STANDARD OPERATING PROCEDURE 10.3
BORING LOGS

1.0 INTRODUCTION

The purpose of this standard operating procedure (SOP) is to describe the methods to be followed for classifying soil and rock, as well as preparing borehole logs and other types of soil reports.

2.0 MATERIALS

The following equipment is required for borehole logging:

- HTRW ENG Form 5056-R and 5056A-R boring log forms;
- Daily inspection report forms;
- Chain-of-custody forms;
- Request for analysis forms;
- ASTM D 2488 classification flow chart;
- Soil and/or Rock color chart (i.e., Munsell®);
- Grain size and roundness chart;
- Graph paper;
- Engineer's scale;
- Previous reports and boring logs;
- Pocketknife or putty knife;
- Hand lens;
- Dilute hydrochloric acid (10% volume);
- Gloves;
- Personal protective clothing and equipment, as described in work plan addenda health and safety plan;
- Photoionization detector or other appropriate monitoring equipment per site-specific health and safety plan; and
- Decontamination supplies (SOP 80.1).

3.0 PROCEDURE

Each boring log should fully describe the subsurface environment and the procedures used to obtain this description.

Boring logs should be prepared in the field on USACE Engineer Form 5056-R and 5056-R. Logs should be recorded in the field directly on the boring log form and not transcribed from a field book.

A "site geologist" should conduct borehole logging and soil/rock identification and description or other professional trained in the identification and description of soil/rock.

3.1 BORING LOG INFORMATION

As appropriate, the following information should be recorded on the boring log during the course of drilling and sampling activities:

- Project information including name, location, and project number;
- Each boring and well should be uniquely numbered and located on a sketch map as part of the log;
- Type of exploration;
- Weather conditions including events that could affect subsurface conditions;
- Dates and times for the start and completion of borings, with notations by depth for crew shifts and individual days;
- Depths/heights in feet and in decimal fractions of feet;
- Descriptions of the drilling equipment including rod size, bit type, pump type, rig manufacturer and model, and drilling personnel;
- Drilling sequence and descriptions of casing and method of installation;
- Description and identification of soils in accordance with ASTM Standard D 2488;
- Descriptions of each intact soil sample for the parameters identified in Section 3.2;
- Descriptions and classification of each non-intact sample (e.g., wash samples, cuttings, auger flight samples) to the extent practicable;
- Description and identification of rock;
- Description of rock (core(s)) for the parameters identified in Section 3.7;
- Scaled graphic sketch of the rock core (included or attached to log) according to the requirements identified in Section 3.7;
- Lithologic boundaries, with notations for estimated boundaries;
- Depth of water first encountered in drilling, with the method of first determination (any distinct water level(s) below the first zone will also be noted);
- Interval by depth for each sample taken, classified, and/or retained, with length of sample recovery and sample type and size (diameter and length);
- Blow counts, hammer weight, and length of fall for driven samplers;
- Rate of rock coring and associated rock quality designation (RQD) for intervals cored;
- Drilling fluid pressures, with driller's comments;
- Total depth of drilling and sampling;
- Drilling fluid losses and gains should be recorded;
- Significant color changes in the drilling fluid returned;
- Soil gas or vapor readings with the interval sampled, with information on instrument used and calibration;

- Depth and description of any in-situ test performed; and
- Description of other field tests conducted on soil and rock samples.

3.2 SOIL PARAMETERS FOR LOGGING

In general, the following soil parameters should be included on the boring log when appropriate:

- Identification per ASTM D 2488 with group symbol;
- Secondary components with estimated percentages per ASTM D 2488;
- Color;
- Plasticity per ASTM D 2488;
- Density of non-cohesive soil or consistency of cohesive soil;
- Moisture condition per ASTM D 2488 (dry, moist, or wet);
- Presence of organic material;
- Cementation and HCl reaction testing per ASTM D 2488;
- Coarse-grained particle description per ASTM D 2488 including angularity, shapes, and color;
- Structure per ASTM D 2488 and orientation;
- Odor; and
- Depositional environment and formation, if known.

ASTM D 2488 categorizes soils into 13 basic groups with distinct geologic and engineering properties based on visual-manual identification procedures. The following steps are required to classify a soil sample:

1. Observe basic properties and characteristics of the soil. These include grain size grading and distribution, and influence of moisture on fine-grained soil.
2. Assign the soil an ASTM D 2488 classification and denote it by the standard group name and symbol.
3. Provide a written description to differentiate between soils in the same group if necessary.

Many soils have characteristics that are not clearly associated with a specific soil group. These soils might be near the borderline between groups, based on particle distribution or plasticity characteristics. In such a case, assigning dual group names and symbols (e.g., GW/GC or ML/CL) might be an appropriate method of describing the soil. The two general types of soils, for which classification is performed, coarse- and fine-grained soils, are discussed in the following sections.

3.3 COURSE-GRAINED SOIL IDENTIFICATION

For soils in the coarse-grained soils group, more than half of the material in the soil matrix will be retained by a No. 200 sieve (75-μm).

1. Coarse-grained soils are identified on the basis of the following:
   a) Grain size and distribution;
   b) Quantity of fine-grained material (i.e., silt and clay as a percentage); and
   c) Character of fine-grained material.
2. The following symbols are used for classification:

Basic Symbols			Modifying Symbols
G	=	gravel	W = well graded
S	=	sand	P = poorly graded
			M = with silty fines
			C = with clayey fines

3. The following basic facts apply to coarse-grained soil classification.

- The basic symbol G is used if the estimated percentage of gravel is greater than that for sand. In contrast, the symbol S is used when the estimated percentage of sand is greater than the percentage of gravel.
- Gravel ranges in size from 3-inch to 1/4-inch (No. 4 sieve) diameter. Sand ranges in size from the No. 4 sieve to No. 200 sieve. The Grain Size Scale used by Engineers (ASTM Standard D 422-63) is the appropriate method to further classify grain size as specified by ASTM D 2488.
- Modifying symbol W indicates good representation of all particle sizes.
- Modifying symbol P indicates that there is an excess or absence of particular sizes.
- The symbol W or P is used only when there are less than 15% fines in a sample.
- Modifying symbol M is used if fines have little or no plasticity (silty).
- Modifying symbol C is used if fines have low to high plasticity (clayey).

Figure 10.03a is a flowchart for identifying coarse-grained soils by ASTM D 2488.

3.4 FINED-GRAINED SOIL IDENTIFICATON

If one-half or more of the material will pass a No. 200 sieve (75 μm), the soil is identified as fine-grained.

1. Fine-grained soils are classified based on dry strength, dilatancy, toughness, and plasticity.
2. Classification of fine-grained soils uses the following symbols:

Basic Symbols			Modifying Symbols		
M	=	silt (non plastic)	L	=	low liquid limit (lean)
C	=	clay (plastic)	H	=	high liquid limit (fat)
O	=	organic			
Pt	=	peat			

3. The following basic facts apply to fine-grained soil classification:
    - The basic symbol M is used if the soil is mostly silt, while the symbol C applies if it consists mostly of clay.
4. Use of symbol O (group name OL/OH) indicates that organic matter is present in an amount sufficient to influence soil properties. The symbol Pt indicates soil that consists mostly of organic material.

- Modifying symbols (L and H) are based on the following hand tests conducted on a soil sample:
    - — Dry strength (crushing resistance).
    - — Dilatancy (reaction to shaking).
    - — Toughness (consistency near plastic limit).

- Soil designated ML has little or no plasticity and can be recognized by slight dry strength, quick dilatency, and slight toughness.
- CL indicates soil with slight to medium plasticity, which can be recognized by medium to high dry strength, very slow dilatancy, and medium toughness.

Criteria for describing dry strength per ASTM D 2488 are as follows:

Description	Criteria
None	Dry sample crumbles into powder with pressure of handling
Low	Dry specimen crumbles into powder with some finger pressure
Medium	Dry specimen breaks into pieces or crumbles with considerable finger pressure
High	Dry specimen cannot be broken with finger pressure but will break into pieces between thumb and a hard surface
Very high	Dry specimen cannot be broken between the thumb and a hard surface stiffness

Criteria for describing dilatancy per ASTM D 2488 are as follows:

None	No visible change in the sample
Slow	Water appears slow on the surface of the sample during shaking and does not disappear or disappears slowly upon squeezing
Rapid	Water appears quickly on the surface of the sample during shaking and disappears quickly upon squeezing

Criteria for describing toughness per ASTM D 2488 are as follows:

Description	Criteria
Low	Only slight pressure is required to roll the thread near the plastic limit and the thread and lump are weak and soft
Medium	Medium pressure is required to roll the thread to near the plastic limit and the thread and lump have medium stiffness
High	Considerable pressure is required to roll the thread to near the plastic limit and the thread and lump have very high stiffness

Figure 10.03b is a flowchart for identifying fine-grained soils by ASTM D 2488.

3.5 DENSITY AND CONSISTENCY

Relative density for coarse-grained soils and consistency for fine-grained soils can be estimated using standard penetration test blow count data (ASTM D 1586). The number of blows required for each 6 inches of penetration or fraction thereof is recorded. If the sampler is driven less than 18 inches, the number of blows per each complete 6-inch interval and per partial interval is recorded.

For partial increments, the depth of penetration should be recorded to the nearest 1 inch. If the sampler advances below the bottom of the boring under the weight of rods (static) and/or hammer, then this information should be recorded on the log.

The following are some "rule-of-thumb" guidelines for describing the relative density of coarse-grained soils:

Blow Count	Relative Density for Sand
0–4	Very loose
4–10	Loose

10–30	Medium dense
30–50	Dense
>50	Very Dense

The following are some "rule-of-thumb" guidelines for describing the consistency of fine-grained soils:

Blow Count	Consistency for Clays	Description
0–2	Very Soft	Sample sags or slumps under its own weight
2–4	Soft	Sample can be pinched in two between the thumb and forefinger
4–8	Medium Stiff	Sample can be easily imprinted with fingers
8–16	Stiff	Sample can be imprinted only with considerable pressure of fingers
16–32	Very Stiff	Sample can be imprinted very slightly with fingers
>32	Hard	Sample cannot be imprinted with fingers; can be pierced with pencil

3.6 OTHER DESCRIPTIVE INFORMATION

The approximate percentage of gravel, sand, and fines (use a percentage estimation chart) should be recorded per ASTM D 2488 as follows:

Modifiers	Descriptions
Trace	Less than 5%
Few	5%–10%
Little	15%–25%
Some	30%–45%
Mostly	50%–100%

Color/discoloration should be recorded and described using a soil color chart, such as the Munsell® Soil Color Charts. A narrative and numerical description should be given from the color chart, such as Brown 10 YR, 5/3 (Munsell®). Odor should be described if organic or unusual.

Plasticity should be described as follows:

Description	Criteria
Non-plastic	A 1/8-inch thread cannot be rolled at any water content
Low	Thread can barely be rolled and lump cannot be formed when drier than plastic limit.
Medium	Thread is easy to roll; plastic limit can be reached with little effort and lump crumbles when drier than plastic limit.
High	Considerable time is required to reach the plastic limit and lump can be formed without crumbling when drier than plastic limit

Moisture condition should be recorded as dry (absence of moisture), moist (damp but no visible water) or wet (visible free water).

Cementation should be recorded (carbonates or silicates) along with the results of HCL reaction testing. The reaction with HCL should be described as none (no visible reaction), weak (some reaction with slowly forming bubbles) or strong (violent reaction with bubbles forming immediately).

Particle description information for coarse-grained soil should be recorded where appropriate per ASTM D 2488 including maximum particle size, angularity (angular, subangular, subrounded, or rounded), shape (flat, elongated or flat and elongated), and color.

Structure (along with orientation) should be reported using the following ASTM D 2488 descriptions:

Description	Criteria
Stratified	Alternating layers of varying material or color with layers greater than 6 millimeters thick
Laminated	Alternating layers of varying material or color with layers less than 6 millimeters thick
Fissured	Breaks along definite planes of fracture with little resistance
Slickensided	Fracture planes that appear polished or glossy, can be striated
Blocky	Inclusion of small pockets of different soils
Homogeneous	Same color and appearance throughout

3.7 ROCK CORE PARAMETERS FOR LOGGING

In general, the following parameters should be included on the boring log when rock coring is conducted:

- Rock type;
- Formation;
- Modifier denoting variety;
- Bedding/banding characteristics;
- Color;
- Hardness;
- Degree of cementation;
- Texture;
- Structure and orientation;
- Degree of weathering;
- Solution or void conditions;
- Primary and secondary permeability including estimates and rationale; and
- Lost core interval and reason for loss.

A scaled graphic sketch of the core should provided on or attached to the log, denoting by depth, location, orientation, and nature (natural, coring-induced, or for fitting into core box) of all core breaks. Where fractures are too numerous to be shown individually, their location may be drawn as a zone.

The RQD values for each core interval (run) should be calculated and included on the boring log. The method of calculating the RQD is as follows per ASTM D 6032:

RQD = [Σ length of intact core pieces > 100 mm (4-inches)] x 100%/total core length.

3.8 PROCEDURES FOR ROCK CLASSIFICATION

For rock classification record mineralogy, texture, and structural features (e.g., biotite and quartz fine grains, foliated parallel to relict bedding oriented 15 to 20 degrees to core axis, joints coated with iron oxide). Describe the physical characteristics of the rock that are important for engineering considerations such as fracturing (including minimum, maximum, and most common and degree of spacing), hardness, and weathering.

1. The following is to be used as a guide for assessing fracturing:

AEG Fracturing	Spacing
Crushed	up to 0.1 foot
Intense	0.1–0.5 foot
Moderate	0.5 foot–10 feet
Slight	1.0 foot–3.0 feet
Massive	>3.0 feet

2. Record hardness using the following guidelines:

Hardness	Criteria
Soft	Reserved for plastic material
Friable	Easily crumbled by finger pressure
Low	Deeply gouged or carved with pocketknife
Moderate	Readily scratched with knife; scratch leaves heavy trace of dust
Hard	Difficult to scratch with knife; scratch produces little powder and is often faintly visible
Very Hard	Cannot be scratched with knife

3. Describe weathering using the following guidelines:

Weathering	**Decomposition**	**Discoloration**	**Fracture Condition**
Deep	Moderate to complete alteration of minerals feldspars altered to clay, etc.	Deep and thorough	All fractures extensively coated with oxides, carbonates, or clay
Moderate	Slight alteration of minerals, cleavage surface lusterless and stained	Moderate or localized and intense	Thin coatings or stains
Weak	No megascopic alteration of minerals	Slight and intermittent and localized	Few strains on fracture surfaces
Fresh	Unaltered, cleavage, surface glistening		

3.9 PROCEDURE FOR LOGGING REFUSE

The following procedure applies to the logging of subsurface samples composed of various materials in addition to soil as may be collected from a landfill or other waste disposal site.

1. Observe refuse as it is brought up by the hollow stem auger, bucket auger, or backhoe.
2. If necessary, place the refuse in a plastic bag to examine the sample.
3. Record observations according to the following criteria:
   - Composition (by relative volume), e.g., paper, wood, plastic, cloth, cement, or construction debris. Use such terms as “mostly” or “at least half.” Do not use percentages;
   - Moisture condition: dry, moist, or wet;
   - State of decomposition: highly decomposed, moderately decomposed, slightly decomposed, etc.;
   - Color: obvious mottling and/or degree of mottling;

- Texture: spongy, plastic (cohesive), friable;
- Odor;
- Combustible gas readings (measure down hole and at surface); and
- Miscellaneous: dates of periodicals and newspapers, ability to read printed materials, degree of drilling effort (easy, difficult, and very difficult).

3.10 SUBMITTAL REQUIREMENTS

Each original boring log should be submitted to the Contracting Officer Representative (CRO) after completion of the boring. When a monitoring well will be installed in a boring, the boring log and well installation diagram should be submitted together.

STANDARD OPERATING PROCEDURE 10.4
CHAIN-OF-CUSTODY FORM

1.0 SCOPE AND APPLICATION

The purpose of this standard operating procedure (SOP) is to delineate protocols for use of the chain-of-custody form. An example is provided as part of this SOP. Other formats with similar levels of detail are acceptable.

2.0 MATERIALS

- Chain-of-custody form; and
- Indelible ink pen.

3.0 PROCEDURE

1. Record the project name and number.
2. Record the project contact's name and phone number.
3. Print sampler's names in "Samplers" block.
4. Enter the Field Sample No.
5. Record the sampling dates for all samples.
6. List the sampling times (military format) for all samples.
7. Indicate, "grab" or "composite" sample with an "X."
8. Record matrix (e.g., aqueous, soil).
9. List the analyses/container volume across top.
10. Enter the total number of containers per Field Sample No. in the "Subtotal" column.
11. Enter total number of containers submitted per analysis requested.
12. State the carrier service and airbill number, analytical laboratory, and custody seal numbers.
13. List any comments or special requests in the "Remarks" section.
14. Sign, date, and time the "Relinquished By" section when the cooler is relinquished to the next party.
15. Upon completion of the form, retain the shipper copy and place the forms and the other copies in a zip seal bag to protect from moisture. Affix the zip seal bag to the inside lid of the sample cooler to be sent to the designated laboratory.

4.0 MAINTENANCE

Not applicable.

5.0 PRECAUTIONS

None.

STANDARD OPERATING PROCEDURE 20.3
WELL AND BORING ABANDONMENT

1.0 SCOPE AND APPLICATION

The purpose of this standard operating procedure (SOP) is to establish the protocols by which all borings and wells will be abandoned. The primary objective of boring or well abandonment activities is to permanently abandon the boring or well so that the natural migration of groundwater or soil vapor is not significantly influenced.

2.0 MATERIALS

- Well abandonment equipment including appropriate grout mixing/placement equipment, and heavy equipment as appropriate (drill rig, crane, backhoe, etc.);
- Pure sodium bentonite powder with no additives (bentonite);
- Bentonite pellets (seal);
- Cement (Portland Type II); and
- Approved source water.

3.0 PROCEDURE

The volume of grout required for borehole or well abandonment should be calculated prior to proceeding with abandonment. These calculations should consider loss of material to the formation, changes in borehole diameter, potential zones of washout, and shrinkage of material. Calculations should be recorded on an abandonment record (see Section 3.1.4).

In general, cement grout should be used for boring and well abandonment per the specifications in Section 3.1 and procedures identified in the following sections. Specialized narrow diameter soil borings (3-inches or less) associated with direct push methods or hand augers may be abandoned using bentonite pellets or chips (see Section 3.5).

Any replacement borings or wells associated with the abandonment should be offset at least 20 feet from any abandoned site in a presumed up- or cross-gradient direction.

3.1 GROUT

Grout used in construction will be composed by weight of the following:

- Type II Portland cement (Type IV Portland Cement if sulfate concentrations are greater than 1,500 ppm);
- Bentonite (2 to 5% dry bentonite per 94-lb sack of dry cement); and
- A maximum of 6 to 7 gallons of approved water per 94-lb sack of cement.

Neither additives nor borehole cuttings will be mixed with the grout. Bentonite will be added after the required amount of cement is mixed with the water.

All grout material will be combined in an aboveground container and mechanically blended to produce a thick, lump-free mixture. The mixed grout will be recirculated through the grout pump before placement.

Grout placement will be performed using a commercially available grout pump and a rigid tremie pipe. Removal and grouting will be accomplished in stages, aquifer by aquifer, sealing the boring from the bottom to ground surface. This will be accomplished by placing a grout pipe to the bottom and pumping grout through the pipe until undiluted grout reaches the bottom of the next higher section of casing or, for the top-most section, until grout flows from the boring at ground surface.

After 24 hours, the abandoned drilling site will be checked for grout settlement. Any settlement will be filled with grout and rechecked 24 hours later. This process will be repeated until firm grout remains at the ground surface.

3.2 BORINGS

The term "borings" as used in this SOP applies to any drilled hole made that is not completed as a well. This includes soil test borings, soil sampling borings, and deep stratigraphic borings. Whether completed to the planned depth or aborted for any reason before reaching that depth, borings will be grouted and will be normally closed within 12 hours.

To achieve an effective seal, the borehole to be abandoned should be free of debris and foreign matter that may restrict the adhesion of the grout to the borehole wall. Borehole flushing with a tremie pipe may be required to remove such materials prior to grouting.

Each boring to be abandoned should be sealed by grouting from the bottom of the boring to the ground surface. This will be accomplished by placing a tremie pipe to the bottom of the borehole and pumping grout through the pipe at a steady rate. The grouting should be completed slowly and continuously to prevent channeling of material. The tremie pipe should be raised when pumping pressure increases significantly or when undiluted grout reaches the surface.

After 24 hours of completing the abandonment, the abandoned boring or well should be checked for any grout settlement. The settlement depression should be filled with grout and rechecked 24 hours later. Grout should be placed with a tremie pipe if the open hole is 15 feet or deeper or if the hole is not dry. Otherwise, the grout may be poured from the surface.

3.3 NARROW BORINGS

Narrow borings, those with diameter less than 3 inches, advanced by hand auger or direct push methods, may be sealed using bentonite pellets or chips rather than a grout mixture. Often times a grout pump is not available to mix the grout when these methods have been used. Bentonite pellets or chips will be poured into the boring from the ground surface. Then bentonite will hydrate by absorbing moisture from the ground; unapproved water should not be added to the boring. After 24 hours, the abandoned boring will be checked, and any grout settlement will be topped off with more bentonite. The process will be repeated until bentonite remains at ground surface unless site condition indicates otherwise.

3.4 WELLS

The following procedure applies to wells aborted before completion and existing wells determined to be ineffective or otherwise in need of closure.

General Considerations

A number of techniques are available for abandoning monitoring wells and other monitoring devices including:

- Abandonment in place by grouting the well screen and casing in place;
- Removal of the well by pulling; and
- Overdrilling.

The particular method used for abandonment should be specified in the work plan addenda developed for a site-specific investigation. Several factors must be considered when selecting the appropriate abandonment technique including well construction, well condition, and subsurface conditions.
In general the preferred method for abandonment of wells is to remove all existing well materials to:

- Reduce the potential for the formation of a vertical conduit to occur at the contact between the casing and annular seal;
- Reduce the potential for well materials interfering with the abandonment procedures; and
- Decrease the potential for reaction between the well materials and grout used for abandonment.

In general, all well materials will be removed during abandonment (including screen and casing) by either pulling out the casing, screen, and associated materials or by overdrilling using a rotary or hollow stem auger drilling procedure.

Abandonment with Well Materials In Place

In the event that it is not possible to remove the casing and screen, the casing and screen will be perforated using a suitable tool. A minimum of four rows of perforations several inches long and a minimum of five perforations per linear foot of casing or screen is recommended.

After the screen and casing have been appropriately perforated, the well should be abandoned by grouting from the bottom of the well to the ground surface using a tremie pipe as described in Section 3.2. The tremie pipe should be raised when pumping pressure increases significantly or when undiluted grout reaches the surface.

After 24 hours of completing the abandonment, the abandoned well should be checked for any grout settlement. The settlement depression should be filled with grout and rechecked 24 hours later. Grout should be placed with a tremie pipe if the open hole is 15 feet or deeper or if the hole is not dry. Otherwise, the grout may be poured from the surface.

Abandonment by Removal

Site conditions permitting, relatively shallow monitoring wells may be successfully abandoned by removal providing that the well is generally good condition and sections of casing (including screen) can be successfully removed with materials intact.

This method of abandonment is generally accomplished by removing (pulling) sections of casing and screen out of the subsurface using a drill rig, backhoe, crane, etc. of sufficient capacity. Materials with lower tensile strength such as polyvinyl chloride (PVC) generally cannot be removed by pulling if they have been appropriately cemented in place.

Once the well materials have been removed from the borehole, the borehole should be abandoned by grouting in the same manner discussed for borings in Section 3.2. If the borehole collapses after removal of well materials, then the borehole should be over drilled to remove all material and then grouted to the surface.

Overdrilling

With this method of abandonment, the well materials are removed by overdrilling (overreaming) the well location. Overdrilling using rotary techniques may be accomplished using an overreaming tool. This tool consists of a pilot bit that is approximately the same size as the inner diameter of well casing and a reaming bit that is slightly larger than the diameter of the borehole. As drilling proceeds, all well materials are destroyed and returned to the surface. After completion of the overdrilling, the borehole should be immediately grouted with a tremie pipe as described in Section 3.2.

In the case of overburden wells, a hollow stem auger may be used for overdrilling providing that this method of drilling appropriate for the subsurface conditions. The hollow stem auger should be equipped with outward facing carbide-cutting teeth with a diameter 2 to 4 inches larger than the well casing. With this method, the casing guides the cutting head and remains inside the auger. When the auger reaches the bottom of the well boring and the well materials have been removed, the borehole may be grouted with a tremie pipe (Section 3.2) through the augers as the augers are gradually withdrawn.

Considerations for Fractured Bedrock and Karst Wells

Multi-cased wells completed into bedrock as screened wells, open wells, or open-lined wells may be abandoned with the outer casing left in place providing that the integrity of this casing and associated annular seal is good. A cement bond log (acoustic amplitude boring geophysical log) may be used to evaluate the integrity of the casing and annular seal, if the outer casing is to be left in place.

Borings or wells completed in karst zones may be difficult to abandon because of the potential presence of large conduits, which may make it difficult to grout. Where large conduits exist or difficulties are encountered when abandoning a boring or well, fill the portion of the borehole penetrating the solution cavity with inert gravel (quartz, claystone, etc.). Packers can be used to isolate critical intervals for filling with grout above and below these zones.

3.5 RESTORATION

All work areas around the borings or wells abandoned should be restored to a condition essentially equivalent to that before the borings and wells were installed.

3.6 INVESTIGATION-DERIVED MATERIAL

Investigation-derived material should be managed in accordance with the requirements of SOP 70.1 and the work plan addenda associated with the site investigation

3.7 DOCUMENTATION

For each abandoned boring or well, a record should be prepared to include the following as appropriate:

- Project and boring/well designation;
- Location with respect to replacement boring well (if any);
- Open depth of well/annulus/boring prior to grouting;
- Casing or items left in hole by depth, description, composition, and size;
- Copy of the boring log;
- Copy of construction diagram for abandoned well;

- Reason for abandonment;
- Description and total quantity of grout used initially;
- Description and daily quantities of grout used to compensate for settlement;
- Disposition of investigation-derived material;
- Water or mud level prior to grouting and date measured; and
- Remaining casing above ground surface, height above ground surface, size, and disposition of each.

Daily investigation activities at the site related to boring and well abandonment should be recorded in field logbooks as described in SOPs 10.1 and 10.2.

4.0 PRECAUTIONS

Refer to the health and safety plan associated with the Work Plan Addenda and the Master Health and Safety Plan.

STANDARD OPERATING PROCEDURE 20.4
TEST PITS

1.0 SCOPE AND APPLICATION

The purpose of this standard operating procedure (SOP) is to delineate protocols for the excavation of test pits and provide general guidelines for sample collection from the test pits.

Test pit excavations are conducted to investigate and identify possible areas of contamination. Thus, samples taken from the excavation will be positively biased according to visual inspection (i.e., soil discoloration, soil staining) and field screening. Areas showing evidence of possible contamination will be sampled directly. If no evidence of contamination is present during excavation, then samples will be collected in two equally spaced intervals or at intervals specified in work plan addenda for site-specific investigations. In either case, no less than two representative samples per excavation site should be collected. Excavation (and sampling) shall terminate if the water table is encountered before terminal depth.

2.0 MATERIALS

- Master Work Plan;
- Work Plan Addenda;
- Field log books;
- Appropriate health and safety equipment for monitoring conditions in the work zone and excavation area including a photoionization detector (PID) or other types of monitoring equipment;
- Personal protective equipment and clothing (PPE) per the site-specific health and safety plan;
- Backhoe and associated equipment;
- Appropriate soil sampling equipment such as stainless steel scoops, trowels, spoons, and bowls/trays SOP 30.1);
- Appropriate sample bottles, labels, chain-of-custody forms, and sample shipping supplies etc;
- Tarps or plastic sheeting;
- Measuring tape;
- Camera and film; and
- Decontamination equipment and supplies.

3.0 PROCEDURE

3.1 DOCUMENTATION

Field activities and sampling information should be recorded in the field logbooks as outlined in SOPs 10.1 and 10.2.

Cross-sections and sketches of the layout will be prepared upon completion of the excavation. The sketches will indicate soil horizons and geologic observations. Soil horizons will be differentiated based upon variations in soil color (i.e., Munsell Chart), texture, coarse fragment content, structure, and consistence. Refer to SOP 10.3 for boring log completion procedures. In addition, depth and thickness of horizontal depth

to bedrock (if encountered) and indicators of seasonal high water table (presence of redoximorphic features) will be recorded. Sketches will also indicate the location of any samples collected. Photographs of the excavation will be taken and locations noted on the field map.

3.2 DECONTAMINATION

Decontamination of the backhoe, trowels or spoons, bowls, field tape measure, and other associated equipment will be carried out before use and between each test pit as outlined in work plan addenda and SOP 80.1.

3.3 SITE PREPARATION

Mark out dimensions of excavation and possible hazards (e.g., utilities, former structures). The backhoe must be equipped with a protective shield and the operator properly trained in the use of level B respiratory and dermal protection. The backhoe bucket and arm must be thoroughly decontaminated by steam cleaning before use and between each test pit location as described in work plan addenda and SOP 80.1. Discuss all hazards with equipment operator before any intrusive activities.

Set up exclusion zone with caution tape and position backhoe upwind of excavation site. All activities must be conducted in accordance with the health and safety plan developed for work plan addenda.

3.4 EXCAVATION AND SAMPLING

The backhoe operator shall be directed to excavate until the sampler indicates the desired depth has been reached. If the pit is less than 3 ft deep, the sampler can enter the pit and collect the samples using a decontaminated stainless steel trowel or spoon as described in SOP 30.1. As the pit becomes deeper, the sampler will collect the soil samples directly from the center of the bucket of the backhoe in an area not in contact with the sides of the bucket. The samples will then be transferred from the bucket into the appropriate sample container following sampling techniques outlined in SOP 30.1. Screening processes and analytical parameters for field screening soil samples will vary from site to site as specified per scope of work.

Begin excavating in increments of 6 to12 inches per pass. Deeper passes may be necessary if the soil is rocky. Total excavation width will be of adequate dimensions to visually characterize the soil profile as observed on the excavation walls, typically not exceeding the width of the backhoe bucket. However, total width of the excavation will be dependent on the depth of the excavation, thus wider dimensions may be necessary for characterization of deeper pits. Excavation will be continuously monitored with health and safety monitoring equipment. Safety measures must be exercised when working near and around the backhoe arm and excavation pit. Health and safety procedures and any installation safety procedures must be strictly followed.

All soil removed during excavation shall be placed on a tarp or plastic sheeting. Soil exhibiting signs of contamination based on visual or olfactory observations, as well as monitoring results, will be separated from uncontaminated soil and containerized for site removal.

Samples will be collected at desired intervals as specified in work plan addenda. Sampling procedures will follow the requirement of work plan addenda and SOP 30.1.

3.5 BACK FILL

Once the terminal depth of the excavation is reached or the water table is encountered and all samples are collected, the trench will be backfilled with certified clean fill. Soils removed during excavation shall be containerized and disposed of at an approved landfill or moved to an approved storage area for subsequent disposal. All backfilled material will be tamped to a proper compacted level to ensure no major settling will occur. After all backfilling and compacting procedures are complete, the area will be raked and seeded or resurfaced with asphalt, as appropriate. When the area is properly secured, decontamination procedures shall begin.

4.0 PRECAUTIONS

- Appoint an excavation competent person;
- Conduct daily inspections of excavation and surrounding area;
- Excavation entry is prohibited without approval of the excavation competent person;
- Protect employees in excavations deeper than four feet by means of properly designed protective systems;
- Protective systems must comply with 29 CFR 1926 Subpart P Appendices B, D, and E;
- Excavations will be clearly identified and barricaded to keep unauthorized individuals out.

STANDARD OPERATING PROCEDURE 20.6
GROUND-PENETRATING RADAR SURVEYS

1.0 PURPOSE

The purpose of this standard operating procedure (SOP) is to provide a general description and technical management guidance concerning the use of Ground-Penetrating Radar (GPR) Surveys.

2.0 MATERIALS

- Work plans;
- Field logbook;
- Site maps;
- GPR and associated equipment;
- Data Sheets;
- Personal protective equipment and clothing (PPE) per site-specific health and safety plan.

3.0 PROCEDURE

3.1 DESCRIPTION OF METHODS

3.1.1 Theory and Principles of Operation

Commercially available Ground-Penetrating Radar (GPR) equipment operates on the principle of time-domain reflectometry, in which the differences in strength and the time delay between a transmitted electromagnetic pulse and its reflection from an object are measured. The time delay (t) is directly related to the propagation velocity of the electromagnetic waves (v) and to the distance between the transmitter and the object (D) as follows:

$$t = \frac{2D}{v}$$

Because surface GPR is normally used at or near the surface of the ground, the distance (D) corresponds directly to the depth of the buried targets that reflect the radar signals.

The strength of a radar signal is a complex function of the distance traveled through the medium, the dielectric constant, the magnetic permeability, and the electrical conductivity. Radar signals are attenuated rapidly in materials with a high dielectric constant. The attenuation of radar signals in subsurface media is a strong function of the mineralogy and the water content. Thus, materials such as dry sands and gravels are least absorptive of radar signals, whereas wet clays are highly absorptive. The absorptive properties of the medium limit the penetration depth, i.e., and the depth at which targets can be detected.

In operation, the GPR repetitively transmits short-duration (typically 5-10 nanoseconds) pulses of high-frequency (typically 50 GHz) electromagnetic energy through a transmitting antenna that is moved along the ground surface at a constant speed. Reflected pulses are detected by a receiving antenna at a location corresponding to the distance traveled by the antenna during the transmission and reflection of the pulse, at

which point another pulse is transmitted. At a typical antenna speed of 2 miles per hour (3 ft per second), a complete transmit/receive cycle occurs about every 2 inches along the path of the antenna.

Radar antennas are available that operate at frequencies centered on 50, 80, 120, 300, 500, and 900 MHz and 1 GHz. Whereas the higher frequencies are able to detect smaller targets, the penetration depth is roughly inversely proportional to frequency. Thus, each GPR survey requires an analysis of the trade-off between resolution and depth of penetration so that the optimal frequency can be selected.

The strength of a radar reflection is a function of the composition, size, shape, and depth of the target. Reflections are strong from objects exhibiting large differences in dielectric constant from the surrounding medium and that are large in size compared with the radar signal wavelength.

3.1.2 General Applicability

GPR signals are reflected from any interface that corresponds to an abrupt change in dielectric constant. Therefore, both metallic and nonmetallic objects (including voids), as well as changes in geologic structure, can be detected by this method. Because of the higher frequencies used, target resolution is considerably improved over seismic or resistivity sounding methods. However, the high frequencies also result in strong attenuation of the signals, particularly in clay materials with high moisture content. At 100 MHz, the useful penetration depth in clay soil with 20% moisture content is about 3 feet, whereas in dry clay or sand with 20% moisture the penetration depth extends to about 30 feet. By changing the frequency of the antenna, greater or lesser depths of penetration can be accomplished.

GPR can be a powerful method for locating and mapping buried drums, wooden objects, foundations, non-containerized wastes, underground utilities, and any other artifacts (including historical artifacts) at a site. Depending on whether sufficient penetration can be achieved, the method can also be used to map saturated zones and bedrock contours and locate sinkholes or fracture systems. GPR has also been used to map contaminants indirectly, both polar and non-polar.

3.1.3 Instrumentation

The standard array of GPR instrumentation consists of transmitting and receiving antennas, which are pulled along the ground; a control unit, containing power supply and signal processing circuitry, which is connected to the antenna by a cable; and an oscillograph or analog tape recorder. The system can be vehicle-mounted, and the transmitter can be connected via radio link to the signal processing and recording equipment. Systems have been modified to include digitizing, onsite computer processing, and digital, graphic display equipment.

3.2 DATA ACQUISITION

3.2.1 Field Procedures

Establishing a grid of parallel survey lines across the site and moving the radar antenna along each of these lines perform GPR surveys. A suitable means must be provided for determining the location of the radar unit along each of the lines and for documenting this information on the recording medium. Typical systems measure the time and velocity of antenna motion, or determine the position of the antenna by synchronization signals from the wheels or tracks of the vehicle used to tow the antenna or by means of an electronic marking device.
Depending on the data quality objectives and site conditions, different frequency antennas are needed. The GRP contractor will beta-test all methods in one small representative area to verify that the selected antennas produce reasonable, defensible data. In the event selected antennas or the GPR method does not meet the project's data quality objectives, the antennas and method will be eliminated from the survey.

To assess the depth of anomalies noted on radar traces, it is necessary to convert the travel time data that are actually recorded. The velocity of electromagnetic waves in the subsurface medium at the site is determined

at a particular site by excavation to observed targets or known test targets and measuring their depths. The velocity should be determined at several points in the area of interest. Another method to determine the depth to a target is by assessing the velocity of the medium. This can be accomplished by performing wide-angle reflection/refraction measurements known as WARR. Separating the transmitter and receiver portions of the antenna at a constant rate over a known distance and recording the refraction pattern accomplish this. By determining the slope of the refraction pattern, a velocity can be obtained.

Electronic data generated during GPR surveys shall backed up at the end of every data for both field and processed data. A backup of all hard copy data shall also be maintained.

3.2.2 Data Format

Reflected radar signals are electronically processed and displayed as an intensity-modulated time spectrum, where the time corresponds to target depth as described above. The series of signals corresponding to the reflected pulses as the antenna moves along a path forms a three-dimensional data set containing distance of traverse, depth, and intensity information.

Typically, the data are recorded on magnetic tape and/or displayed on an X-Y oscillograph, with distance displayed along the X-axis, time (depth) displayed along the Y-axis, and the intensity given by the degree of darkness of the trace. In a typical survey, a series of parallel tracks are traversed by the GPR, and the series of resulting oscillograph traces thus provide XYZ location information on, as well the intensity of reflection from targets of interest.

Although much of the data obtained in a GPR survey are automatically recorded by the instrumentation, additional information to unambiguously identify and interpret each trace should be recorded on standard data sheets. As a minimum, the data sheet should contain the following information:

- Project name, number and location;
- Company or organization;
- Date and time of day;
- Operator's name;
- Line and trace designation (also recorded directly on the signal recording medium);
- Receiving levels and filter settings;
- Antenna frequency(s);
- Direction and speed of antenna movement;
- Weather and temperature;
- Relative soil moisture content and soil type;
- Site map coordinates at the beginning and end of the trace. At least one point in the survey must be tied into the state plane coordinate system for follow-on work;
- Notes, remarks, or comments; and
- Electromagnetic velocity in the subsurface medium at the nearest calibration point.

3.3 DATA INTERPRETATION

Except for those systems that provide extensive data processing, interpretation of anomalies in GPR traces requires considerable subjective evaluation by a qualified geophysicist. Extensive experience is essential to

distinguish target reflections from inherent system noise and interferences. In many cases, the anomalies from targets of interest are small compared with varying reflections from the antenna system, the ground surface, geologic perturbations, and other interferences. Similarly, an acceptable interpretation of target depth from travel time data requires knowledge of geophysical and geological characteristics across the site.
A radar antenna transmits a "cone" rather than a thin beam of electromagnetic energy. Therefore, reflections are obtained from objects not directly below the antenna. As the antenna moves across the plane of an object, reflections are obtained for a considerable distance along the antenna path. The signal travel times vary during this process, corresponding to the distance between the antenna and the object. A discrete spherical target, therefore, will exhibit a hyperbolic reflection pattern on the radar trace, with the apex of the hyperbola corresponding to the location and depth of the object. Multiple or odd-shaped targets or targets of considerable size (compared with the radar wavelength) will exhibit complex reflection patterns consisting of overlapping hyperbolas. Thus, a true "picture" of subsurface objects is not obtained, and experience is necessary to translate the complex tracings into information on target depths size or shape.

Radar signals can be digitized which permits digital recording, computer processing and enhanced display of the location and intensity data. Typical computer processing includes removing extraneous signal interferences, changing hyperbolic reflection patterns to signals more representative of the size or shape of targets, color-coding of intensity data, blocking of data sets to correspond to the site map, and map-view displays of targets at a given depth.

3.4 APPLICATIONS MANAGEMENT

3.4.1 Prerequisites

Appropriate planning of GPR surveys requires an understanding of the geohydrological and geophysical characteristics of the site. The type and structure of soils and geologic formations should be indicated. The description of the site should include the depth, size, and shape and type of potential targets to be detected, as well as obstructive site features such as terrain and underground structures. Additionally, existence of and depth to known buried objects should be listed and mapped, and electromagnetic sources of interference to the survey should be considered.

3.4.2 Work Planning and Scheduling

If possible, GPR surveys should be performed concurrently (if warranted) with other geophysical surveys and in advance of excavation or drilling at a site. Radar data complements information from other geophysical methods such as, electromagnetic induction, seismic refraction, magnetometry, terrain conductivity, and resistivity, in arriving at an interpretation of subsurface geohydrologic features and buried waste materials.

The time and effort required to perform GPR surveys varies greatly depending on the sophistication of the available equipment and the complexity of the site. Assuming a two-person team, simple hand-operated radar systems can cover from ¼ to ½ acre per day for the survey, proper documentation, and simple interpretation. Vehicle-mounted systems with automatic data recording and processing can cover from 2 to 5 acres per day. Sophisticated data processing, detailed interpretations, and high-quality displays require considerable computer usage and approximately twice the time required for the actual field survey.
The specific objectives of the GPR survey should be defined in work plan addenda and should include the following elements:

- Type of survey (level of detail) to be accomplished, and area to be covered;
- Type, depth, size, and composition of targets of interest;
- Locational accuracy required;
- Schedule limitations;

- Degree of sophistication required for data presentation and interpretation;
- Specific deliverables required; and
- Logistics.

3.4.3 Quality Control (QC)

3.4.4 General

Because of the specialized nature of the method and the highly subjective interpretations needed to process the data, GPR surveys are subject to misapplication, erroneous interpretation, and collection of inadequate or incomplete data. This susceptibility to misuse requires that an adequate quality control program be established. Quality control aspects common to most geophysical field programs include the following:

- Program management personnel (i.e., the project geologist or geophysicist, RI leader, or site manager) with technical expertise in the subject for preparation of statements of work, proposal reviews, work plans, and reports.
- Defined scope of work, specifications, and data validation procedures.
- Defined field quality control procedures.
- No data should be rejected from a data set without appropriate justification; field data sheets should contain all observed data and the conditions that could affect data validation.
- All field data parameters should be recorded in permanent ink in a bound logbook with each page signed and dated by the operator. Original unaltered logbooks should be retained in the RI/FS contractor's files.
- Properly calibrated instruments provide an added measure of data validity and permit correlation and comparison of the associated data with site features and geohydrologic characteristics not evident at the time of the field effort. Some geophysical survey objectives can be met by relative measurements across an area or with depth.
- An evaluation should be made of noise, interferences, and obstructions at a site and should be recorded in the field. These real-time quality control procedures aid field personnel in correction of noise sources, validating suspected external sources, and early detection of problems that may jeopardize the survey objectives.

3.4.5 Calibration

The determination of target depth from travel time measurements requires calibration of the instrumentation for these two parameters. Travel time is calibrated periodically in the field by using a secondary-standard, previously calibrated pulse generator to produce timing marks directly on the radar trace. The travel time to a target is determined by the position of the target reflection along the timing marks. This calibration should be performed several times daily, and each radar trace should be referenced to the most recent calibration.
Calibration of the radar traces for depth determination may be performed as follows:

- For reconnaissance surveys or for surveys where lateral resolution is more important than depth, the traces can be roughly calibrated by estimating the velocity of electromagnetic materials in the media at the site. The crudeness of the calibration is evidenced by considering that the velocity can vary by more than an order of magnitude, depending on the soil/rock properties and the moisture content.
- For surveys requiring reasonable resolution of target depth, the travel time to targets of known depths must be determined at each site. A radar trace is made over the known targets, and the reflection

patterns then provide direct depth-calibration points on the trace. Sites with uniform lithology may require only a few depth calibrations, but generally, it is necessary to perform these calibrations at several locations and at several depths throughout the area of interest because dielectric constants may vary across the site. Each radar trace should be referenced to the calibration most representative of the trace coordinates at the site. The preferred method is to use buried objects of known depth as calibration targets or to excavate to detected objects and measure the depth. A less desirable (but often necessary) procedure is to bury standard targets at various depths within the area of interest.

- WARR measurements should be made on a daily basis at various positions at the site, especially in areas where subsurface conditions may vary greatly.

3.4.6 Daily Quality Control

All radar traces and interpreted data sets should be accompanied by quality control data that indicate the level of quality of the data. Periodic replicate measurements should be made so that measurement precision can be established. Time and/or depth calibrations should be performed on a daily basis.

A calibration that yields significant changes in instrument parameters or travel time may indicate the need for repetition of data or increased density of travel time calibrations in the area of interest. Graphical data should be reviewed during the field activities to determine data quality, and whether the survey results appear to be consistent with geophysical knowledge of the site.

3.5 HEALTH AND SAFETY CONSIDERATIONS

All procedures for hazardous waste site entrance, traverse, and egress that apply to general field operations also apply to GPR surveys. The GPR survey consists of traversing the site on foot or in vehicles, and the extent of the activities results in considerable periods of time during which personnel are exposed to any adverse conditions that may exist. An appropriate level of protection against these risks must be planned and provided.

Hand-towed GPR systems involve physical activity (particularly on sloping or rough terrain) that is much more strenuous than when vehicle-mounted systems are used. Precautions must be taken against exposure to heat or cold in accordance with the type of activity that is planned. Extreme weather conditions will have an adverse effect on the time required to complete a survey, thereby increasing the duration of personal exposure to the elements and to hazardous site conditions.

3.6 POTENTIAL PROBLEMS AND LIMITATIONS

A wide-variety of problems may be encountered during GPR surveys. Problems can be expected to arise in the following areas:

3.6.1 Limitations Inherent to Geophysical Methods

A basic limitation of geophysical methods is that a given set of data cannot always be associated with a particular set of subsurface conditions. In general, surface geophysical measurements alone cannot provide a complete assessment of subsurface conditions. When appropriately integrated with other information from subsurface borings, borehole geophysics, etc., GPR can be an effective, accurate, and cost effective method of obtaining subsurface information.

Geophysics at Radford Army Ammunition Plant will, where coverage permits, integrate surface and down hole methods to develop more accurate and refined interpretations of subsurface conditions that possible with either type of method alone.

3.6.2 Planning and Execution

Rarely is a survey accomplished exactly according to the original plan. Site features not previously specified and other variations can occur that force changes in the details of the approach. However, the objectives of the survey, the general methodology, the amount and quality of data required, and the degree of data interpretation requested should remain unchanged. Project work scopes should be written with some degree of latitude to allow a change in plans whenever justified.

3.6.3 Material Properties Contrast

It may be difficult to identify a particular subsurface boundary or feature if the subsurface materials have an insufficient velocity contrast or gradual boundary.

3.6.4 Noise and Interferences

Measurements can be severely affected by both natural and man-made sources of interference. Sources of system noise that degrade the quality of radar traces include improper spacing of antennas above ground, improper cable placement, location of antennas too close to other system components, and facility instrument operation. Because reflections are obtained from any object with a dielectric constant differing from the surroundings, large masses of buried or surface rocks, metal, debris, wet soil, or aboveground structures can mask targets of interest. Some antennas are not shielded on top, and similar interfering reflections will be obtained from overhead objects such as trees, power lines, and buildings. The site personnel must recognize the limitations posed by these obstructions and take steps to minimize the interferences.

Topographic and geologic features can also interfere with acquisition of high-quality target detection data. Small depressions in the ground surface, the presence of boulders, clay lenses, and moist soil zones affect both the detectability of a target and determination of its depth from the travel time.

Sources of electromagnetic energy in the vicinity, such as radio or television transmitters or navigational radar antennas, can result in spurious signals in the radar traces. In some cases, these problems can be minimized by judicious selection of radar and/or data communications frequency and by scheduling the surveys during periods of transmission inactivity.

3.6.5 Weather Conditions

Because water is a good absorber of radar signals, wet weather has a very serious effect on the ability to perform GPR surveys. Physical difficulties in executing a survey over wet terrain also may be expected. The field activities should be planned, if possible, during periods when dry weather can be expected. Schedules for surveys should account for the probability that moist soil conditions will exist.

3.6.6 Technical Difficulties

Preventable difficulties include equipment malfunction or misapplication, poor operator training, and lack of applications experience. Other difficulties may arise because the geophysical characteristics of the site are not as initially conceptualized. Early recognition and response by technical management can minimize the effect of any problems. Interim, real-time scrutiny of the data by the site geophysicists is essential. The geophysicist must be responsive regarding equipment replacement, repair, or changes in personnel. The site manager and the site geologist should be cognizant of technical difficulties beyond the control of the field personnel and should recognize the need to change plans, change performers, or cancel a survey, as appropriate.

STANDARD OPERATING PROCEDURE 20.7
RESISTIVITY AND ELECTROMAGNETIC INDUCTION SURVEYS

1.0 PURPOSE

The purpose of this standard operating procedure (SOP) is to provide a general description and technical management guidance on the use of Resistivity and Electromagnetic Induction (Terrain Conductivity) Surveys.

2.0 MATERIALS

- Work Plans;
- Field Logbook;
- Site maps;
- Electromagnetic induction unit; and
- Personal protective equipment and clothing (PPE) per the site-specific health and safety plan.

3.0 PROCEDURE

3.1 DESCRIPTION OF METHODS

3.1.1 Theory and Principles of Operations

Resistivity. A resistivity survey measures the electrical resistivity of a geohydrologic section indirectly. A DC or low-frequency AC electrical current is injected into the ground through electrodes embedded in the ground surface. The flow of current within the subsurface produces an electric field with lines of equal potential perpendicular to the current flow. This potential field (voltage) is measured between a second pair of electrodes also embedded in the ground surface.

The actual resistivity is a complex function of the applied current, observed voltage, and the characteristics of the subsurface section that provide multiple current flow paths. The apparent subsurface resistivity can be calculated as a function of the applied current, the measured voltage, the separation of the electrodes, and the geometry of the current and potential electrode pairs. For the simplest electrode configuration in which all four electrodes are equally spaced in the order current-potential-current (i.e., the Wenner array) the apparent resistivity is given by the following equation:

$$a = \frac{2\pi AV}{I}$$

Where:
a = apparent resistivity in ohm-meters or ohm-feet,
V = the measured potential difference in volts, and
I = the applied current in amperes.

The calculations are similar for other electrode configurations except geometric factors other than 2 are used. Equipment operating manuals provide nomographs for determination of apparent resistivity from field measurements for all standard electrode configurations. These calculations are simple and can be performed on a hand-held calculator.

Of the many possible geometric configurations of current and potential electrodes, some of the most commonly used arrays are as follows:

- Linear array with electrodes in the order current-potential-potential-current. A Wenner array results if the spacing between each successive pair of electrodes is equal. For a Schlumberger array, the distance between the two potential electrodes is a small fraction of the distance between the two current electrodes.
- Linear array with electrodes in the order current-current-potential-potential. In this dipole-dipole configuration, the separation of the two current and the two potential electrodes is equal, with an equal or greater separation of the two dipole pairs.

Resistivity surveys may be conducted to determine either vertical or horizontal electrical anomalies. *Vertical electrical soundings* (VES) are made by symmetrically expanding a Wenner or Schlumberger array in line about a point, i.e., the electrode spacing is increased for successive readings. Measurements of potential and input current are made for each set of electrode spacings, and the apparent resistivity is calculated as described below. The resultant plot of spacing versus apparent resistivity is interpreted to yield the resistivity distribution with depth beneath the midpoint between the potential electrodes. However, the resistivity being measured is that of the materials beneath the entire array.

For *horizontal profiling*, apparent resistivity from a series of measurements is plotted as a function of the X- and Y-coordinates of the site. One or more of the following procedures accomplishes horizontal profiling:

- A series of VES profiles at several locations are compared;
- Measurements are made with fixed-electrode spacing along a line or over an area; and/or
- Dipole-dipole measurements are made with the current or potential dipole at a fixed location and the other dipole located at increasing distances along a line. This process provides a resistivity "cross-section" beneath the line.

The Wenner and Schlumberger configurations are most often used for vertical investigation, whereas the dipole-dipole configuration is most often used for lateral surveys.

Electromagnetic Induction (EM). In the Electromagnetic Induction (EM) method, the electrical conductivity of a geohydrologic section is measured by transmitting a high-frequency electromagnetic field into the earth, producing eddy currents that generate secondary electromagnetic fields that can be detected by a receiver. The eddy currents are induced in the earth by an aboveground transmitter coil, and the resulting secondary electromagnetic fields are coupled to an aboveground receiver coil. Thus, EM measurements do not require direct ground contact, as is the case for resistivity measurements, and surveys across a line or area may be performed quite rapidly.

EM instruments are calibrated to read subsurface conductivity directly in units of millimhos per meter, Where:

$$\textit{1,000}\ \text{milliohm per meter} = \frac{1}{\text{ohm-meter}}$$

This relation indicates that the conductivity obtained from EM measurements varies inversely with the resistivity measured using a resistivity survey. However, because the subsurface sections associated with the two methods are generally of different depth or cross-sectional area, there is not an exactly inverse relationship between conductivity and resistivity surveys.

The conductivity value obtained by an EM instrument depends on the combined effects of the number of soil and rock layers, their thicknesses and depths, and the inherent conductivities of the materials. The quantity

actually measured is an apparent conductivity of the earth volume between the ground surface and an effective penetration depth, which is defined as the depth at which variations in conductivity no longer have a significant effect on the measurement. The sampling depth is related to the spacing between the transmitter and receiver coils of the instrument, approximately as follows:

Sampling depth = 1.5 (coil spacing) (Vertical Dipole)
= 0.75 (coil spacing) (Horizontal Dipole)

Vertical profiling can be accomplished by multiple measurements about a point, with varying coil spacings. Horizontal profiling is performed by making measurements along traverses with fixed coil spacing.

3.1.2 Application

The measurement of a subsurface resistivity or conductivity at a hazardous waste site provides a valuable contribution to site characterization for the following reasons:

1. Conductivity (resistivity) is a function of the geohydrologic section and is overwhelmingly influenced by the presence of water. Therefore, conductivity (resistivity) can provide indirect evidence on the porosity and permeability of subsurface materials and the degree of saturation. These parameters, in turn, are directly related to subsurface lithology, and to the potential for infiltration/migration of contaminants from a source area.
2. Conductivity (resistivity) is influenced by the presence of dissolved electrolytes in soil or rock pore fluids. Contaminant plumes in the vadose (unsaturated) and saturated zones can be mapped if there is sufficient change in conductivity to be detected by EM or resistivity measurements.

   In general, contaminant plumes of inorganic wastes are most easily detected because conductivity may be increased by 1 to 3 orders of magnitude above background values. The limit of detection is a change from a background of 10% to 20%. Plumes of non-polar organic constituents from spills or leaking containers may be detected if sufficient soil moisture has been displaced to affect the ground conductivity to a measurable degree.
3. Conductivity (resistivity) can be used to detect the presence of buried wastes if the degree of saturation, containerization, or inherent electrical properties of the waste produces sufficient variation from the soil matrix. The degree of detail provided by typical surveys cannot distinguish the size, shape, or mass of sources except in a qualitative manner.

For these reasons, resistivity and conductivity surveys should be investigated as potentially appropriate site characterization tools when any of the following information is desirable:

- Detection and mapping of contaminant plumes; the rate of plume movement may also be deduced from measurements made over time;
- Estimates of depth, thickness, and resistivity of subsurface layers, depth to the water table, or probable geologic composition of a layer;
- Detection, mapping, and depths of burial pits, landfills, clay caps or lenses, or deposits of buried waste;
- Determination of locations for drilling to intercept contamination or to investigate aquifer properties; and
- Corroboration of limited chemical and geohydrologic data at a site.

In general, surface geophysical measurements alone cannot provide a complete assessment of subsurface conditions, When appropriately integrated with other investigative information from subsurface borings, borehole geophysics, etc., surface geophysical surveys can be an effective, accurate, and cost effective method of obtaining subsurface information. Geophysics at Radford Army Ammunition Plant will, where

coverage permits, integrate surface and down hole methods to develop more accurate and refined interpretations of subsurface conditions that possible with either type of method alone.

3.1.3 Instrumentation

Resistivity. The basic components of a field resistivity system are two current and two potential electrodes, electrical cables, centralized power unit (current source), and resistivity meter. Automated instrumentation is commonly used to conduct two or three-dimensional surveys. One such system is the Advanced Geosciences, Inc. (AGI) Sting/Swift system, which includes a central power unit, resistivity meter (Sting), control unit (Swift), and switched electrode cables for use with up to 254 electrodes. This AGI allows for automated measurements, complete control of the measurement array, programmable measurement cycles, large capacity storage of data with linkup to a personal computer. The Sting/Swift system allows for rapid collection of resistivity data and testing of arrays. Measurement ranges for the Sting/Swift system are 0.1 milliohm to 400kohms (resistance) and 0 to 500 volts full-scale auto ranging (volts).

Electromagnetic Induction (EM). Generally EM instruments are available in two forms:

1. Single-piece models operable by one person, with a fixed coil spacing 12 feet; these provide sampling depths on the order of 10 and 20 feet. The Geonics EM31DL is one example of this type of instrument.
2. Dual-coil models, operable by two persons, with variable coil spacing up to about 40 feet (sampling depth up to about 60 feet). The Geonics EM 34-3XL is an example of this type of instrument.

The 12-foot fixed coil and the dual coil apparatus are most commonly used in hazardous waste site investigations. In either case, an additional person to record data and identify measurement locations is highly desirable and more time efficient. The instruments are calibrated to read directly in conductivity units, and values are typically read and recorded on a data sheet. Some units have been modified to provide direct digital recording on magnetic tape.

3.2 DATA ACQUISITION

3.2.1 Field Procedures

Initial Operations. As with most geophysical surveys, conductivity or resistivity surveys involve the following initial steps:

- **Planning.** Known or assumed geohydrologic features of the site, potential source locations and migration characteristics of hazardous constituents, are used to select specific techniques and equipment to establish appropriate locations and depths for geophysical measurements (see Section 5.1.2). The level of detail necessary (data quality objectives) determines the amount of effort and, in simple terms, the required number and density of data points. As a minimum, the data quality will depend on the method and specific equipment selected and the supporting hardware and software capabilities.

  An "expert" system known as the Geophysics Advisor Expert System, developed by the Environmental Monitoring Systems Laboratory (EMSL) in Las Vegas, may be used as a planning tool to assist in selecting an appropriate geophysical method. This system prompts the user through a series of site-specific questions that will eventually rank various geophysical methods as to their feasibility at a specific site.

  Most of the details can be planned before site activities; however, some leeway must be accorded to the field procedures to account for variable site conditions and weather.

- **Site Layout.** One of the most labor-intensive and time-consuming aspects of the fieldwork involves layout of grids and surveying or careful measurement of locations to allow geophysical surveys to be accomplished in a systematic, documentable manner. Location coordinates of sufficient resolution to accomplish the objectives of the survey must uniquely identify every data point.

- **Array and Spacing Tests.** Select one area or line that typifies the site. Test different array types and spacing. Analyze the data to see if the results match induction or normal resistivity and drilling logs from nearby wells. Select the optimal array type and spacing configuration, and proceed with the survey. If induction or normal resistivity logs are not available for wells at or near the site, log these wells before executing the surface surveys.

Resistivity Measurements. Resistivity electrodes must be installed in the proper array and spacing at a particular site grid location (according to specific manufacturers directions). The cables connecting the electrodes to the current source and potentiometer are then attached, and the current flow is initiated. Voltage is measured directly on the potentiometer. The process is repeated at the next site grid location (for horizontal profiling) or with the next electrode spacing (for vertical electric soundings) as necessary for QC purposes.

General rules for electrode spacings are difficult to specify because of site-specific variation; depending on the site geohydrology and source characteristics. As a general rule of thumb, the maximum electrode spacing should be at least three to five times that of the maximum target depth.

Electromagnetic Induction Measurements. At a given site grid location, the specified orientation of the apparatus is established, i.e., with the axis of the coils either parallel or perpendicular to the direction of the survey line. The meter reading is recorded and the apparatus is moved to the next site grid location.

For the dual-coil method, both the intercoil spacing and coplanarity of the coils must be established before recording the data. Surveys are normally conducted with the coil axes horizontal and at right angles to the survey direction.

EM profiles can be accomplished in a continuous manner using vehicle-mounted equipment in conjunction with strip charts, magnetic tape recorders, or digital recorders. Location information must be appended by tic marks or voice-over and some means provided to reference written field logs in a consistent manner.

3.2.2 Data Format

General. Information obtained during a resistivity or EM survey should be presented according to a standard data format, using standardized data sheets with original field entries. As a minimum, the heading for each data sheet should contain the following information:

- Project, task, site, and location identification;
- Company or organization;
- Date (and time, if applicable);
- Operator's name and signature;
- Method/technique identification;
- Instrument make, model, serial number, and calibration date/frequency (if applicable);
- Test location (according to the survey plan);
- Electrode or coil type and configuration;
- Line or site grid location(s);
- Weather and site conditions and temperatures;
- Identity of relevant calibration and QC data; and

- Records of data for each sounding or profile on a single sheet, if possible;

Resistivity. Survey data should include, in a tabular format, the following information:

- Electrode location, per the survey plan;
- Electrode spacing, in feet or meters;
- Input current applied, in amperes; and
- Measured potential, in volts.

Electromagnetic Induction. Survey data should include, in a tabular format, the following information:

- Coil location, per the survey plan;
- Coil spacing;
- Coil configuration (unless specified in the heading); and
- Meter reading, in millimhos per meter.

Special precautions to systematize and preserve data will be required for data that are recorded continuously on strip charts, magnetic tape recorders, or digital recorders. Strip charts should be permanently affixed to the field logbook. The first original hard copy of output from magnetic tape should be treated similarly. Identifying header information must be recorded directly on the tape.

3.3 DATA INTERPRETATION

3.3.1 Resistivity Data

For each data point, the apparent resistivity is calculated according to the formula appropriate for the type of electrode array employed. For horizontal profiling, curves of apparent resistivity versus distance along a line defined by the site grid locations are plotted. These curves of lateral changes in resistivity at a given electrode spacing (therefore, at a given survey depth) provide a cross-section for interpretation of the anomalous subsurface features. Multiple parallel profile lines can be combined to produce an area map of apparent resistivity at a particular depth.

For vertical electrical soundings, the series of apparent resistivities are plotted versus corresponding electrode spacings on log-log graph paper. The curves can be compared qualitatively with known or suspected subsurface conditions or with idealized layer-models to determine layer thicknesses and depths. Computer processing is typically applied for analysis of complex data sets and inverse layer modeling.

3.3.2 Electromagnetic Induction Data

Corrections may be applied to EM data for accuracy and drift, variation in location from pre-established coordinates, topography, changes in scale, and non-linearities associated with high conductivity values. In all cases, such corrections must be fully supported by data originally recorded or annotated in the field. Profile data along traverses are obtained as plots of conductivity versus distance. As with resistivity profiling, parallel traverse data may be combined to provide conductivity contour maps of a site. Two or more profiles at different sampling depths, as well as sounding data at a given location, provide information on the relative conductivities of shallow and deeper layers. Contour plots may provide valuable information on the extent and direction of groundwater flow and contaminant transport.

Detailed comparison of EM sounding measurements with layer models of the site can be made. This type of interpretation has been used at sites with relatively simple, uniform geohydrology to determine overburden and bedrock spatial and depth relationships. In some cases, very detailed interpretations, including aquifer flow properties, location of permeable zones, and interaquifer transfer, are possible.

3.4 POTENTIAL PROBLEMS

Resistivity and EM surveys are geophysical methods that, although standardized and frequently applied, are subject to a wide variety of problems. Problems can be expected to arise in the following areas:

- **Planning and Execution.** Rarely is a survey accomplished exactly according to the original plan. Site features not previously specified and myriad other variations can occur that force changes in the details of the approach. However, the data quality objectives of the survey, the general methodology, the amount of data required, and the degree of data interpretation requested should remain unchanged. Project work scopes should be written with some degree of latitude to allow a change in plans whenever justified.
- **Noise and Interferences.** Measurements can be affected severely both by natural and man-made sources of electrical and electromagnetic noise. Nearby power lines, stray ground currents, and atmospheric discharges adversely affect both types of surveys. Large masses of buried metal, fences, railroad tracks and underground pipes or cables can strongly distort measurements and reduce instrument sensitivity to features of interest. These problems generally can be accounted for or overcome but must be recognized early in the survey so that appropriate avoidance measures can be implemented. Known or suspected sources of interference should be included in the initial planning for a project.
- **Weather Conditions**. It is possible to conduct the surveys under almost any conditions that permit traverse of the site. However, snow cover, standing water, heavy rainfall, or thoroughly saturated surface soils may severely restrict the ability to meet project objectives and schedules. Scheduling contingencies should be included whenever possible, especially during periods when inclement weather is expected.
- **Technical Difficulties.** Preventable difficulties include equipment malfunction or misapplication, poor operator training, and lack of applications experience. Other difficulties may arise because the geophysical response of the site is not as initially conceptualized. Early recognition and response by technical management can minimize the effect and severity of any problems. Interim, real-time scrutiny of the data by the site geophysicist is essential. The geophysicist must be responsive regarding equipment replacement, repair, or changes in personnel. The site manager and the site geologist should be cognizant of technical difficulties beyond the control of the field personnel and should recognize the need to change plans, field personnel, or cancel a survey, as appropriate.
- **Topographic Changes.** Significant changes in topography should be addressed when planning and making measurements.

3.5 QUALITY CONTROL

3.5.1 General

Geophysical surveys, including resistivity and conductivity surveys, are subject to misapplication, erroneous interpretations, and use of incomplete or inadequate data. All of these avoidable errors can severely affect both the cost of subsequent site investigations and the validity of the site characterization. This susceptibility to misuse and potential for negative effect demands an assurance that appropriate quality control measures have been implemented. Quality control aspects common to most types of geophysical field programs are as follows:

- Integrating surface-based results (indirect measurements) with well sampling results, drilling logs, and down hole (direct measurement) geophysical logs.

- Program management personnel with technical expertise in preparing statements of work; reviewing proposals, work plans, and reports; and supervising technical subcontracts and field-related programs.
- Insistence on a defined scope of work, clear specifications, and data validation procedures.
- Appropriate justification before rejection of data points from a data set. Field data sheets should contain all observed data and the conditions that could affect data validity.
- Field data should be recorded in permanent ink in a bound logbook with each page signed and dated by the operator. Original unaltered logbooks should be retained in the site file.
- Complete and clear understanding of manufacturer's operation manual for the particular apparatus being used.
- Properly calibrated instrument provides an added measure of data validity and permits correlation and comparison of the associated data with site features and geohydrologic characteristics not evident at the time of the field effort. Some geophysical survey objectives can be met by relative measurements across an area or with depth.
- An evaluation should be made of noise, interferences, and obstructions at a site. Such measurements, inferences, and explanations should be recorded in the field. These real-time quality control procedures aid field personnel in correction of noise sources over which they have control, in validating suspected external sources, and in early detection of problems that may jeopardize the survey objectives.

3.5.2 Resistivity Surveys

The resistivity apparatus consists of a current source and potentiometer, both of which must be calibrated at least twice a day, e.g., once at the beginning of the day and once at the end of the day.

The current source (source of the energy driving the system) is calibrated by placing an ammeter in series with the electrode cables. The reading obtained on the reference ammeter is then compared with the value read from the ammeter on the current source. The current source ammeter is then adjusted to the reading on the reference ammeter.

The potentiometer is the other apparatus that must be calibrated. This is normally accomplished by placing a precision resistor in series with the current load. A precision resistor is an electronic device that has a predetermined (as specified by the manufacturer) resistance to the electric current passing through the device, i.e., reduction in amperage. The potentiometer is then placed across the resistor. The potential measured should be equal to the product of the known resistance and the indicated current. Precision resistors can be purchased at most electronics supply stores.

All data sets should be accompanied by quality control data that indicate the level of quality of each individual data point. Periodically taking replicate measurements or re-running with the spacing and array configuration accomplishes this. These measurements should be averaged or statistically compared so that measurement precision can be estimated. Each data set should also be referenced to the most recent calibration. Data obtained before a calibration requiring significant changes in instrument controls is suspect. (NOTE: A significant change in instrument readings as a result of recalibration is interpreted as successive calibration values that vary by more than 10%).

Resistivities should be calculated and plotted during data acquisition to determine the overall quality of the data and whether the survey results are consistent with the site conceptualization. Data points representing discontinuities in the curves should be validated by repetition and, if necessary, a fine grid of measurements made to determine whether the anomaly represents a site feature of interest, a spurious reading, or an obstructive interference.

3.5.3 Electromagnetic Induction Surveys

Calibration. The manufacturer calibrates EM instruments over massive rock outcrops of known characteristic that are used as a geologic standard to measure the absolute conductivity over a uniform section of earth. The user should maintain the EM apparatus in calibration by noting drift in the readings at a stable "secondary standard" site. A secondary standard site is a location established in the field that is used to check the accuracy (calibration of the instrument and the drift precision of the instrument). A secondary standard site is a location used daily on large projects to check instrument accuracy, much the same way the manufacturer uses massive rock outcrops for precision and accuracy determination.

Unacceptable drift or erratic operation shall be corrected by replacement with an instrument in proper working order. Values that are obtained from measurements over the stable secondary standard site that vary by more than 10% to 15% are considered to be unacceptable drift, if environmental conditions remain somewhat constant (i.e., heavy precipitation can make measurements radically different).

All aspects of the daily quality control measures discussed for resistivity measurements apply also to EM measurements. Repeated periodic measurements (at least twice a day) should be made at one or more locations and orientations at the site to determine the precision of measurements and to detect instrument drift.

4.0 HEALTH AND SAFETY CONSIDERATIONS

All procedures for hazardous waste site entrance, traverse, and egress that apply to general field operations also apply to conduct of geophysical surveys. Resistivity and conductivity surveys depend on traverse of the site on foot or in vehicles, and there are extended periods during which personnel are subject to adverse environments at the site. In addition, resistivity measurements require implanting electrodes beneath the surface, which increases the risk of contact with toxic or hazardous agents. An appropriate level of protection against these risks must be provided during the surveys.

The geophysical methods discussed herein do not require extremely strenuous activity, and exposure to heat or cold is similar to that during other field activities. Extreme weather conditions will have adverse effects on the time required to obtain validated data, thereby increasing the duration of personal exposure to the elements and to hazardous site influences.

In resistivity surveys, substantial levels of electrical charges and voltage may be present across the current electrodes, and field procedures must be designed to ensure that no personnel are in contact with the electrodes when the current source is energized. The site-specific Health and Safety Plan must address emergency procedures in the event of electrical shock and possible loss of consciousness.

STANDARD OPERATING PROCEDURE 20.11
DRILLING METHODS AND PROCEDURES

1.0 SCOPE AND APPLICATION

The use of an appropriate drilling procedure is contingent upon the existing conditions at the project site. The purpose of this standard operating procedure (SOP) is to outline procedures for the various methods of soil and rock drilling identified in the Master Work Plan. In addition it provides procedures for using sampling devices commonly used during soil and rock drilling such as split-barrel sampling, thin walled tube sampling, direct push samplers, and rock coring. For a particular site investigation, the associated work plan addendum will identify the appropriate drilling method and method of sampling, along with proposed sampling depths and intervals and any special procedures or methods.

2.0 MATERIALS

The following types of materials are generally appropriate for drilling:

2.1 SPLIT-BARREL SAMPLING

- Split barrel sampler;
- Borehole logging materials per SOP 10.3 and sampling equipment and materials, as appropriate per SOP 30.1;
- Containers to manage investigation-derived material per SOP 70.1; and
- Decontamination supplies and equipment per SOP 80.1.

2.2 THIN WALLED TUBE SAMPLING

- Thin walled tubes;
- Sealing materials for sample such as sealing wax, metal disks, wood disks, tape, cheesecloth, caps, etc;
- Borehole logging materials per SOP 10.3 and sampling equipment and materials, as appropriate per SOP 30.1;
- Containers to manage investigation-derived material per SOP 70.1; and
- Decontamination supplies and equipment per SOP 80.1.

2.3 DIRECT PUSH SAMPLING

- Direct push unit with hydraulic ram, hammer, etc;
- Sample collection devices, associated equipment and expendable supplies such as sample liners, sample retainers, appropriate lubricants, etc;
- Hollow extension rods;
- Auxiliary tools for handling, assembling, and disassembling tools and samplers;
- Borehole logging materials per SOP 10.3 and sampling equipment and materials, as appropriate per SOP 30.1;
- Containers to manage investigation-derived material per SOP 70.1; and

- Decontamination supplies and equipment per SOP 80.1.

2.4 HOLLOW-STEM AUGER DRILLING

- Drill rig and associated equipment;
- Hollow stem auger assemblies for drilling to appropriate depth including auger heads, drive assembly, pilot assembly, and hollow-stem auger sections;
- Auxiliary devices such as wrenches, auger forks, hoisting hooks, swivels, and adaptors;
- Borehole logging materials per SOP 10.3 and sampling equipment and materials, as appropriate per SOP 30.1;
- Containers to manage investigation-derived material per SOP 70.1; and
- Decontamination supplies and equipment per SOP 80.1.

2.5 DIRECT AIR ROTARY DRILLING

- Drill rig with rotary table and Kelly or top-head drive unit;
- Drill rods, bits, and core barrels (as appropriate);
- Casing;
- Sampling devices and equipment, as appropriate;
- Air compressor and filters, pressure lines, discharge hose, swivel, dust collector, and air-cleaning device (cyclone separator);
- Auxiliary tools for handling, assembling, and disassembling tools and samplers;
- Borehole logging materials per SOP 10.3 and sampling equipment and materials, as appropriate per SOP 30.1;
- Containers to manage investigation-derived material per SOP 70.1; and
- Decontamination supplies and equipment per SOP 80.1.

2.6 DRILL-THROUGH CASING DRIVER

- Drill rig equipped with a mast-mounted, percussion driver;
- Casing, drill rods, and drill bits or hammers;
- Air compressor and filters, pressure lines, discharge hose, swivel, dust collector, and air-cleaning device (cyclone separator);
- Sampling devices and equipment, as appropriate;
- Auxiliary tools for handling, assembling, and disassembling tools and samplers;
- Welding equipment and materials for installation of casing;
- Borehole logging materials per SOP 10.3 and sampling equipment and materials, as appropriate per SOP 30.1;
- Containers to manage investigation-derived material per SOP 70.1; and
- Decontamination supplies and equipment per SOP 80.1.

2.7 DIRECT WATER-BASED ROTARY DRILLING

- Drill rig with derrick, rotary table and Kelly or top-head drive unit;
- Drill rods, bits, and core barrels (as appropriate);
- Casing;
- Water based drilling fluid, with approved additives as appropriate;
- Mud tub, suction hose, cyclone de-sander(s), drilling fluid circulation pump, pressure hose, and swivel;
- Auxiliary tools for handling, assembling, and disassembling tools and samplers;
- Borehole logging materials per SOP 10.3 and sampling equipment and materials, as appropriate per SOP 30.1;
- Containers to manage investigation-derived material per SOP 70.1; and
- Decontamination supplies and equipment per SOP 80.1.

2.8 DIRECT ROTARY WIRELINE-CASING ADVANCEMENT DRILLING

- Drill rig with either hollow spindle or top-head drive;
- Drill rods, coring or casing bits, overshot assembly, pilot bit, and core barrel;
- Water based drilling fluid, with approved additives as appropriate;
- Mud tub, suction hose, drilling fluid circulation pump, pressure hose, and swivel;
- Auxiliary tools for handling, assembling, and disassembling tools and samplers;
- Borehole logging materials per SOP 10.3 and sampling equipment and materials, as appropriate per SOP 30.1;
- Containers to manage investigation-derived material per SOP 70.1; and
- Decontamination supplies and equipment per SOP 80.1.

2.9 DIAMOND CORE DRILLING

- Direct rotary drill rig and associated equipment (see Sections 2.4, 2.5 or 2.6);
- Core barrels and core bits;
- Core lifters;
- Core boxes, engineers scale, permanent marking pen, and camera for photographing cores;
- Auxiliary tools for handling, assembling, and disassembling tools and samplers;
- Borehole logging materials per SOP 10.3 and sampling equipment and materials, as appropriate per SOP 30.1;
- Containers to manage investigation-derived material per SOP 70.1; and
- Decontamination supplies and equipment per SOP 80.1.

3.0 PROCEDURES

3.1 PENETRATION TEST AND SPLIT-BARREL SAMPLING OF SOILS

The following general procedure may be followed as outlined in ASTM Standard Test Method D 1586.

1. Advance the boring to the desired sampling depth using an appropriate drilling method (see sections below) and remove excessive cuttings from the borehole.
2. Attach the split-barrel sampler to the sampling rods and lower into the borehole. Do not allow the sampler to drop onto the soil to be sampled.
3. Position the hammer above and attach the anvil to the top of the drilling rods.
4. Rest the dead weight of the sampler, rods, anvil, and drive weight on the bottom of the boring and apply a seating blow. If excessive cuttings are encountered at the bottom of the borehole, remove the sampler and rods from borehole and remove the cuttings.
5. Mark the drill rods in three successive 6-inch increments so that the advance of the sampler can be observed.
6. Drive the sampler with blow from the 140 pound hammer and count the number of blows applied in each 6-inch increment until:
   a. Fifty (50) blows have been applied during one of the three 6-inch increments.
   b. A total of 100 blows have been applied.
   c. There is no observed advance of the sampler during the application of 10 successive blows of the hammer.
7. The sampler is advanced the complete 18-inches without the limiting blow counts occurring as described above.
8. Record the number of blows that is required to achieve each 6-inch increment of penetration or fraction of this increment on the boring.
   a. The first 6 inches is considered the seating driver.
   b. The sum of the second and third 6-inch penetration intervals is termed the “standard penetration resistance” or “N-value.”
   c. If the sampler is driven less than 18 inches as discussed in No. 6, then the number of blow for each partial increment will be recorded.
   d. For partial increments, the depth of penetration should be recorded to the nearest 1-inch on the boring log.
   e. If the sampler advances below the bottom of the boring under the weight of rods (static) and/or hammer, then this information will be recorded on the boring log.
9. The raising and dropping of the 140 pound hammer may be accomplished by:
   a. Using a trip, automatic, or semi-automatic hammer drop system that lifts the hammer and allows it to drop 30± 1 inches.
   b. Using a cathead shall be essentially free of rust, oil, or grease and have a diameter in the range of 6 to 10 inches. The cathead should be operated at a minimum speed of rotation of 100 revolutions per minute. No more than 2-1/4 rope turns on the cathead may be used when conducting the penetration test.

10. For each hammer blow, a 30-inch lift and drop shall be used.
11. After completing the penetration test, retrieve the sampler and open. Record the percent recovery or the length of sample recovered. Following the procedures outlined in SOP 30.1 when collecting environmental soil samples.
12. Borehole logging should be completed per SOP 10.3.
13. Split-barrel samples must be decontaminated before and after each use per the requirements of SOP 80.1.

3.2 THIN WALLED TUBE SAMPLING

The following general procedure may be followed for collection of relatively undisturbed, thin walled tube samples (e.g., Shelby tube) as outlined in ASTM Standard Practice D 1587.

1. Clean out the borehole to targeted sampling depth using most appropriate method, which avoids disturbing the material to be sampled. If groundwater is encountered, maintain the liquid level in the borehole at or above the groundwater level during sampling.
2. Place the sample tub so that its bottom rests on the bottom of the borehole.
3. Advance the sampler without rotation by a continuous relatively rapid motion.
4. Determine the length of the advance by the resistance and condition of the formation, the length of the advance should never exceed 5 to 10 diameters of the tube in sands and 10 to 15 diameters of the tube in clay.
5. When the formation is too hard for push type of sampling, the tube may be driven or the practice used for ring-lined barrel sampling may be used per ASTM Standard D 3550. When a sample is driven, the weight and fall of the hammer must be recorded along with the penetration achieved.
6. The maximum length of sample advance will be no longer than the sample-tube length minus an allowance for the sample head and a minimum of 3-inches for sludge-end cuttings.
7. Upon removal of the tube, measure the length of the sample in the tube. Remove the disturbed material in the upper end of the tube and re-measure the sample length.
8. Remove at least one-inch of material from the lower end of the tube for soil description and identification per SOP 10.3. Measure the overall sample length. Seal the lower end of the tube. If directed, the material from the end of the tube will not be removed for soil identification and description; in this case the tube will be sealed promptly.
9. Prepare sample labels and affix (or markings) on the tube.

3.3 DIRECT PUSH SOIL BORING

The following general procedures outlined in this section may be followed as described in ASTM Standard Test Method D 6282.

General considerations for this method include the following:

- A variety of direct push drive systems may be used to advance soil borings based on the intended sampling depths and subsurface conditions and include the following:

Shallower Depths and Less Difficult Conditions

- Percussive driving systems – use hydraulically operated hammers and mechanically operated hammers.
- Static push drive systems – use hydraulic rams to apply pressure and exert static pull (e.g., cone penetrometer systems).
- Vibratory/sonic systems – use a vibratory device, which is attached to the top of the sampler extension rods.

Greater Depths and More Difficult Conditions

- Sonic or resonance drilling systems – use a high power vibratory system to advance larger diameter single or dual tube systems.
- Rotary drilling equipment – use hydraulic system of drill rig for direct push.

- The equipment used for direct push must be capable of apply sufficient static force, or dynamic force, or both, to advance the sampler to the required depth of collection. Additionally, this equipment must have adequate retraction force to remove the sampler and extension/drive rods once the sample has been collected.
- Avoid using excessive down pressure when advancing the drilling tools/sampler. Excessive pressure may cause the direct push unit to offset from the boring location and may damage drilling tools and samplers.
- Sample liners should be compatible with the material being sampled and the type of analysis to be conducted on the sample. Sealing of liners for submittal to the laboratory for physical testing should be accomplished according to ASTM Standard D 4220 (Standard Practice for Preserving and Transporting Soil Samples).
- The general procedure for completing direct push soil borings is the following:
  1. Stabilize direct push unit and raise mast at desired location.
  2. Attach the hammer assembly to the drill head if not permanently attached. Attach the anvil assembly in the prescribed manner, slide the direct push unit the position over the borehole, and ready the tools for insertion.
  3. Inspect the direct push tools before and after use. Decontaminate all down hole tools before and after use per SOP 80.1.
  4. Inspect drive shoes for damaged cutting edges, dents or thread failures and these conditions could cause loss of sample recovery and slow the rate of advancement.
  5. Assemble samplers and install where required, install sample retainers where needed, and install and secure sampler pistons to ensure proper operation where needed (see Steps 14 through 20 for the various sampler assembly procedures, etc.).
  6. After sampler has been appropriately installed (see Steps 14 through 20 for installation procedures, etc.) advance the boring to the target sampling depth using an appropriate direct push technique, as identified above under general considerations.
  7. Collect the soil sample from the target sampling depth using one of the methods identified in Steps 14 through 20.
  8. Retrieve the sampler and appropriately process the soil sample as identified in Steps 14 through 20 below and in SOP 30.1.
  9. Log the borehole per the requirements of SOP 10.3.
  10. If collecting another soil sample, decontaminate the sampler for reuse per the requirements of SOP 80.1 or use another decontaminated sampler.

11. Appropriately manage investigation-derived material (discarded samples, decontamination fluids, etc.) per SOP 70.1.
12. Upon completion of the boring and collection of the desired soil samples, abandon the boring per the requirements of SOP 20.2.
13. The following single tube sampling systems (generally piston rod) may be used to collect soil samples (see Steps 14 through 16 below):
    a. Open Solid Barrel Sampler;
    b. Closed Solid Barrel Sampler (e.g. Geoprobe Macro-Core® Piston Rod Sampler); and
    c. Standard Split Barrel Sampler (see Section 3.1).
14. The following two tube sampling systems may be used to collect soil samples (see Steps 17 through 20 below):
    a. Split Barrel Sampler;
    b. Thin Wall Tubes;
    c. Thin Wall Tube Piston Sampler; and
    d. Open Solid Barrel Samplers.
15. Sampling with the single tube, open solid barrel sampler:
    a. Attach the required liner to the cutting shoe by insertion into the machined receptacle are or by sliding over the machined tube.
    b. Insert the liner and shoe into the solid barrel and attach the shoe.
    c. Attach the sampler head to the sampler barrel.
    d. Attach the sampler assembly to the drive rod and the drive head to the drive rod.
    e. Position the sampler assembly under the hammer anvil and advance the sampler assembly into the soil at a steady rate slow enough to allow the soil to be cut by the shoe and move up into the sample barrel.
    f. At the completion of the sampling interval, removal the sampler from the borehole. Remove the filled sampler liner from the barrel by unscrewing the shoe. Cap the liner for laboratory testing or split open for field processing (see SOP 30.1).
    g. Log the borehole per the requirements of SOP 10.3.
16. Sampling with the closed, solid barrel sampler (e.g., Macro-Core® sampler).
    a. Insert or attach the sample liner to the shoe and insert the assembly into the solid barrel sampler. Install the sample, retaining basket, if desired.
    b. Attach the latch coupling or sampler head to the sampler barrel, and attach the piston assembly with point and "O" rings if free water is present, to the latching mechanism.
    c. Insert the piston or packer into the liner to its proper position so that the point leads the sampler shoe. Set latch, charge packer, or install locking pin, and attach assembled sampler to drive rod.
    d. Add drive head and position under the hammer anvil. Apply down pressure, and hammer if needed, to penetrate the soil strata above the targeted sampling interval.
    e. When the sampling interval is reached, insert the piston latch release and recovery tool, removing the piston, or insert the locking pin removal/extension rods through the drive rods, turn counter clockwise, and remove the piston locking pin so the piston can float on top of the sample, or release any other piston holding device.
    f. Direct push or activate the hammer to advance the sampler the desired interval.

g. Retrieve the sampler from the borehole by removing the extension/drive rods. Remove the shoe, and withdraw the sample line with sample for processing (see SOP 30.1).

h. Clean and decontaminate the sampler, reload as described above and repeat the same procedure for collection of addition samples.

i. Log the borehole per the requirements of SOP 10.3.

17. Sampling with standard split barrel (split spoon) sampler generally consists of the following:

a. Attach the split barrel sampler to an extension rod or drill rod.

b. Using a mechanical or hydraulic hammer drive the ampler into the soil the desired interval. The maximum interval that should be driven is equal to the sample chamber length of the split barrel sampler, which is either 18-inches or 24-inches.

c. Retrieve the sampler from the borehole by removing the extension/drive rods.

d. Split the sampler open for field processing (see SOP 30.1).

e. Clean and decontaminate the sampler (SOP 80.1), re-attach and repeat the same procedure for collection of additional samples.

f. Log the borehole per the requirements of SOP 10.3.

18. Sampling with a two tube, split barrel sampler generally consists of the following:

a. Assemble the outer casing with the drive shoe on the bottom, attach the drive head to the top of the outer casing, and attach the sampler to the extension rods.

b. Connect the drive head to the top of the sampler extension rods, and insert the sampler assembly into the outer casing.

c. The cutting shoe of the sampler should contact the soil ahead of the outer casing to minimize sample disturbance.

d. The sample barrel should extend a minimum of 0.25 inches ahead of the outer casing.

e. Mark the outer casing to identify the required drive length, position the outer casing and sampler assembly under the drill head.

f. Move the drill head downward to apply pressure on the tool string. Advance the casing assembly into the soil at a steady rate, which is slow enough to allow the soil to be cut by the shoe and move up inside the sample barrel.

g. Occasional hammer action during the push may assist recovery.

h. If smooth push advancement is not possible because of subsurface conditions, use the hammer to advance the sampler.

i. Stop the application of pressure or hammering when target interval has been sampled. Move the drill head off the drive head. Attach a pulling device to the extension rods or position the hammer bail and retrieve the sampler from the borehole.

j. At the surface, remove the sampler from the extension rods and process the sample per Section 3.01 and SOP 30.1.

k. Log the borehole per the requirements of SOP 10.3.

19. Sampling with a two tube, thin wall tube sampler generally consists of the following:

a. Attach the tube to the tube head using removable screws.

b. Attach the tube assembly to the extension rods and position at the base of the outer casing shoe protruding a minimum of 0.25 inches to contact the soil ahead of the outer casing.

c. Advance the tube with or without the outer casing at a steady rate.

d. After completing the sampling interval, let the tube remain stationary for one minute. Rotate the tube slowly two revolutions to shear off the sample.

e. Remove the tube from the borehole and measure the recovery, and log the borehole per the requirements of SOP 10.3.

f. For field processing, extrude the sample from the tube sampler and process per SOP 30.1. Alternatively, the tube may be sealed and shipped to the laboratory.

20. Sampling with two tube, thin wall tube, piston sampler generally consists of the following:

a. Check the fixed piston sampling equipment for proper operation of the cone clamping assembly and the condition of the "O" rings.

b. Slide the thin wall tube over the piston, and attach it to the tube head. Position the piston at the sharpened end of the thin wall tube just above the sample relief bend.

c. Attach the tube assembly to the extension rods and lower the sampler into position through the outer casing. Install the actuator rods through the extension rod, and attach to the actuator rod in the sampler assembly.

d. Attach a holding ring to the top of the actuator rod string and hook the winch cable or other hook to the holding ring to hold the actuator rods in a fixed position.

e. Attach the pushing fork to the drill head/probe hammer and slowly apply downward pressure to the extension rods advancing the thin wall tube over the fixed piston into the soil for the length of the sampling interval.

f. After completing the sampling interval, let the tube remain stationary for one minute. Rotate the tube slowly one revolution to shear off the sample.

g. Remove the tube sampler from the borehole and measure the recovery, and log the borehole per the requirements of SOP 10.3.

h. For field processing, extrude the sample from the tube sampler and process per SOP 30.1.

21. Sampling with an two tube, open solid barrel sampler generally consists of the following:

a. This sampling technique may be used when soil conditions prevent advancement of a split barrel sampler or advancement of an outer casing.

b. The solid, single, or segmented barrel sampler requires the use of a liner.

c. Use sampler in advance of outer casing when this casing cannot be advanced.

d. Follow the procedures outlined for two tube, split barrel sampling.

3.4 HOLLOW-STEM AUGER DRILLING

The following general procedure may be followed as outlined in ASTM Standard Guide D 5784.

1. Stabilize drill rig and raise mast at desired location.
2. Attach an initial assembly of hollow-stem auger components (hollow stem auger, hollow auger head, center rod and pilot assembly, as appropriate) to the rotary drive of the drill rig.
3. Push the auger assembly below the ground surface and initiate rotation at a low velocity.
4. Decontamination of auger head may be necessary after this initial penetration if this surface soil is contaminated.
5. Continue drilling from the surface, usually at a rotary velocity of 50 to 100 rotations per minute to the depth where sampling or in-situ testing is required or until the drive assembly is within approximately 6 to 18 inches of the ground surface.
6. As appropriate, collect a soil sample from the required depth interval. The sample may be conducted by

a. Removing the pilot assembly, if used, and inserting and driving a sampler through the hollow stem auger of the auger column; or

b. Using a continuous sampling device within the lead auger section, where the sampler barrel fills with material as the auger is advanced.

7. Additional sections of hollow stems augers may be added to drill to a greater depth. After these auger sections are added, rotation of the hollow-stem auger assembly may be resumed.

8. When drilling through material suspected of being contaminated, the installation of single or multiple (nested) outer casings may be required to isolate zones suspected contamination (see SOP 20.1). Outer casings may be installed in a pre-drilled borehole or using a method in which casing is advanced at the same of drilling.

   Monitoring wells or piezometers may be installed using hollow-stem augers by:

   a. Drilling with or without sampling to the target depth.

   b. Removal of the pilot assembly, if used, and insertion of the monitoring well (or piezometer) assembly.

   c. The hollow stem auger column should be removed incrementally as the monitoring well (or piezometer) completion materials are placed (see SOP 20.1 for grouting).

9. If materials enter the bottom of the auger hollow stem during the removal of the pilot assembly, it should be removed with a drive sampler or other appropriate device.

10. If sampling or *in-situ* testing is not required during completion of the boring, the boring may be advanced with an expendable knock out plate or plug of an appropriate material instead of a pilot assembly.

11. Drill cuttings should be appropriately controlled and contained as IDM per SOP 70.1. It may be necessary to drill through a hole of sheet of plywood or similar material to prevent cuttings from contacting the ground surface.

12. The hollow-auger assembly and sampling devices must be decontaminated before and after each use per the methods specified in SOP 80.1.

13. Borehole logging should be completed per SOP 10.3.

14. Borehole abandonment, when required, should be conducted according to SOP 20.3.

3.5 DIRECT AIR ROTARY DRILLING

The following general procedure may be followed as outlined in ASTM Standard Guide D 5784.

1. Stabilize drill rig and raise mast at desired location. Appropriately position the cyclone separator and seal it to the ground surface considering the prevailing wind direction (exhaust).

2. Establish point for borehole measurements.

3. Attach an initial assembly of a bit, down hole hammer, or core barrel with a single section of drill rod, below the rotary table or top-head drive unit, with the bit placed below the top of the dust collector.

4. Activate the air compressor to circulate air through system.

5. Initiate rotation of bit.

6. Continue with air circulation and rotation of the drill-rod column to the depth where sampling or in-situ testing is required or until the length of the drill rod section limits further penetration.

7. Monitor air pressure during drilling operations. Maintain low air pressure at bit to prevent fracturing of surrounding material.

8. Stop rotation and lift the bit slightly off the bottom of the hole to facilitate removal of drill cuttings and continue air circulation until the drill cuttings are removed from the borehole annulus.

9. Open reaching a desired depth of sampling, stop the air circulation and rest bit on bottom of hole to determine the depth. Record the borehole depth and any resultant caving in. If borehole caving is apparent set a decontaminated casing to protect the boring.
10. When sampling, remove the drill rod column from the borehole or leave the drill rod assembly in place if the sampling can be performed through the hollow axis of the drill rods and bit.
11. Compare the sampling depth to clean-out depth by first resting the sampler on the bottom of the hole and compare that measurement with the clean-out depth measurement.
12. If bottom-hole contamination is apparent (indicated by comparison of sample depth to clean-out depth), it is recommended that the minimum depth below the sampler/bit be 18 inches for testing. Record the depth of sampling or in-situ testing and the depth below the sampler/bit.
13. The procedure described in Steps 8 through 12 should be conducted for each sampling or testing interval.
14. Drilling to a greater depth may be accomplished by attaching an additional drill rod section to the top of the previously advanced drill-rod column and resuming drilling operations as described above.
15. When drilling through material suspected of being contaminated, the installation of single or multiple (nested) outer casings may be required to isolate zones suspected contamination (see SOP 20.1 for grouting requirements). Outer casings may be installed in a pre-drilled borehole or using a method in which casing is advanced at the same of drilling.
16. Monitoring wells or piezometers may be installed by:
    a. Drilling with or without sampling to the target depth.
    b. Removal of the drill rod assembly and insertion of the monitoring well (or piezometer) assembly.
    c. Addition of monitoring well (or piezometer) completion materials (see SOP 20.1).
17. Drill cuttings should be appropriately controlled and contained as IDM per SOP 70.1.
18. The drill rod assembly, sampling devices, and other drilling equipment contacting potentially contaminated material must be decontaminated before and after each use per the methods specified in SOP 80.1.
19. Borehole logging should be completed per SOP 10.3.
20. Borehole abandonment, when required, should be conducted according to SOP 20.3

3.6 DRILL-THROUGH CASING DRILLING

The following general procedure may be followed as outlined in ASTM Standard Guide D 5872.

1. Stabilize drill rig and raise mast at desired location. Appropriately position the cyclone separator and seal it to the ground surface considering the prevailing wind direction (exhaust).
2. Establish point for borehole measurements.
3. Attach an initial assembly of a bit or down hole hammer with a single section of drill rod and casing to the top-head drive unit.
4. Activate the air compressor to circulate air through system.
5. Drilling may be accomplished by:
    a. Method 1- the casing will fall, or can be pushed downward behind the bit. To drill using Drive the casing first followed by drilling out the plug inside the casing.
    b. Method 2 - Advancing the casing and bit as a unit, with the drill bit or hammer, extending up to 12-inches below the casing.
    c. Method 3 - Under reaming method where bit or hammer pens a hole slightly larger than the casing so that Method 1, drive the casing first and drill out the plug in the casing by moving the bit or hammer beyond the casing and then withdrawing it into the casing. Air exiting the bit will

remove the cuttings up the hole. Separate cuttings from the return air with a cyclone separator or similar device.

6. To drill using Method 2, advance casing and bit as unit with the bit or hammer extending up to 12-inches beyond the casing depending on the conditions. While drilling, occasionally stop the casing advancement, retract the bit or hammer inside the casing to clear and maintain air circulation to clear cuttings.
7. To drill using Method 3, use a special down hole bit or hammer to open a hole slightly larger than the outside diameter of the casing so that the casing will fall or can be pushed downward immediately behind the bit. After advancing the casing, retract the radial dimension of the drill bit to facilitate removal of the down hole bit or hammer and drill tools inside the casing. Cuttings are removed from the borehole with the air that operates the bit or hammer and can be separated from the air with a cyclone separator or similar device.
8. Monitor air pressure during drilling operations. Maintain low air pressure at bit or hammer to prevent fracturing of surrounding material.
9. Continue air circulation and rotation of the drill rod column until drilling is completed to the target depth (for sampling, in-situ sampling, etc.) or until the length of the drill-rod section limits further penetration.
10. Stop rotation and lift bit or hammer slightly off the bottom of the hole to facilitate removal of drill cuttings and continue air circulation until the drill cuttings are removed from the borehole annulus.
11. After reaching a desired depth of sampling, stop the air circulation and rest the bit on bottom of hole to determine the depth. Record the borehole depth and any resultant caving in. If borehole caving is apparent set a decontaminated casing to protect the boring.
12. When sampling, remove the drill rod column from the borehole. Compare the sampling depth to clean-out depth by first resting the sampler on the bottom of the hole and compare that measurement with the clean-out depth measurement.
13. If bottom-hole contamination is apparent (indicated by comparison of sample depth to clean-out depth), it is recommended that the minimum depth below the sampler/bit be 18 inches for testing. Record the depth of sampling or in-situ testing and the depth below the sampler/bit.
14. The procedure described in Steps 11 through 14 should be conducted for each sampling or testing interval.
15. Drilling to a greater depth may be accomplished by attaching an additional drill rod section and casing section to the top of the previously advanced drill-rod column/casing and resuming drilling operations as described above.
16. Monitoring wells or piezometers may be installed by:
    a. Casing advancement in increments, with or without sampling to the target depth.
    b. Removal of the drill rods and the attached drill bit while the casing is temporarily left in place to support the borehole wall.
    c. Insertion of the monitoring well (or piezometer) assembly.
    d. Addition of monitoring well (or piezometer) completion materials (see SOP 20.1).
17. Drill cuttings should be appropriately controlled and contained as IDM per SOP 70.1.
18. The drill rod assembly, casing, sampling devices, and other drilling equipment contacting potentially contaminated material must be decontaminated before and after each use per the methods specified in SOP 80.1.
19. Borehole logging should be completed per SOP 10.3.
20. Borehole abandonment, when required, should be conducted according to SOP 20.3.

3.7 DIRECT WATER-BASED ROTARY DRILLING

The following general procedure may be followed as outlined in ASTM Standard Guide D 5783.

1. Stabilize drill rig and raise mast at desired location. Appropriately position the mud tub and install surface casing and seal at the ground surface.
2. Establish point for borehole measurements.
3. Attach an initial assembly of a bit or core barrel with a single section of drill rod, below the rotary table or top-head drive unit, with the bit placed with the top of the surface casing.
4. Activate the drilling-fluid circulation pump to circulate drill fluid through the system.
5. Initiate rotation of bit and apply axial force to bit.
6. Document drilling conditions and sequence (fluid loss, circulation pressures, depths of lost circulation, etc.) as described in SOP 10.3.
7. Continue with drill fluid circulation as rotation and axial force are applied to the bit until drilling to the depth
    a. Where sampling or in-situ testing is required;
    b. Until the length of the drill rod section limits further penetration; or
    c. Until core specimen has completely entered the core barrel (when coring) or blockage has occurred.
8. Stop rotation and the lift bit slightly off the bottom of the hole to facilitate removal of drill cuttings and continue fluid circulation until the drill cuttings are removed from the borehole annulus.
9. After reaching a desired depth of sampling, stop the fluid circulation and rest the bit on bottom of hole to determine the depth. Record the borehole depth and any resultant caving in. If borehole caving is apparent set a decontaminated casing to protect the boring.
10. When sampling, drill rod removal is not necessary if the sampling can be performed through the hollow axis of the drill rods and bit.
11. Compare the sampling depth to clean-out depth by first resting the sampler on the bottom of the hole and compare that measurement with the clean-out depth measurement.
12. If bottom-hole contamination is apparent (indicated by comparison of sample depth to clean-out depth), it is recommended that the minimum depth below the sampler/bit be 18 inches for testing. Record the depth of sampling or in-situ testing and the depth below the sampler/bit.
13. The procedure described in Steps 8 through 11 should be conducted for each sampling or testing interval.
14. Drilling to a greater depth may be accomplished by attaching an additional drill rod section to the top of the previously advanced drill-rod column and resuming drilling operations as described above.
15. When drilling through material suspected of being contaminated, the installation of single or multiple (nested) outer casings may be required to isolate zones suspected contamination (see SOP 20.1 for grouting requirements). Outer casings may be installed in a pre-drilled borehole or using a method in which casing is advanced at the same of drilling.
16. Monitoring wells or piezometers may be installed using hollow-stem augers by:
    a. Drilling with or without sampling to the target depth.
    b. Removal of the drill rod assembly and insertion of the monitoring well (or piezometer) assembly.
    c. Addition of monitoring well (or piezometer) completion materials (see SOP 20.1).
17. Drill cuttings and fluids should be appropriately controlled and contained as IDM per SOP 70.1.

18. The drill rod assembly, sampling devices, and other drilling equipment contacting potentially contaminated material must be decontaminated before and after each use per the methods specified in SOP 80.1.
19. Borehole logging should be completed per SOP 10.3.
20. Borehole abandonment, when required, should be conducted according to SOP 20.3.

3.8 DIRECT ROTARY WIRELINE CASING ADVANCEMENT DRILLING

The following general procedure may be followed as outlined in ASTM Standard Guide D 5876.

1. Stabilize drill rig and raise mast at desired location. Appropriately position the mud tub (for water based rotary) and install surface casing and seal at the ground surface.
2. Record the hole depth by knowing the length of the rod-bit assemblies and comparing its position relative to the established surface datum.
3. Attach an initial assembly of a lead drill rod and a bit or core barrel below the top-head drive unit, with the bit placed with the top of the surface casing.
4. Activate the drilling-fluid circulation pump to circulate drill fluid through the system.
5. Initiate rotation of bit and apply axial force to bit.
6. Document drilling conditions and sequence (fluid loss, circulation pressures, depths of lost circulation, down feed pressures etc.) as described in SOP 10.3.
7. In general, the pilot bit or core barrel can be inserted or removed at any time during the drilling process and the large inside diameter rods can act as a temporary casing for testing or installation of monitoring devices.
8. Continue with drill fluid circulation as rotation and axial force are applied to the bit until drilling to the depth
    a. Where sampling or in-situ testing is required;
    b. Until the length of the drill rod section limits further penetration; or
    c. Until core specimen has completely entered the core barrel (when coring) or blockage has occurred.
9. Stop rotation and lift the bit slightly off the bottom of the hole to facilitate removal of drill cuttings and continue fluid circulation until the drill cuttings are removed from the borehole annulus.
10. After reaching a desired depth of sampling, stop the fluid circulation and rest the bit on bottom of hole to determine the depth. Record the borehole depth and any resultant caving in. If borehole caving is apparent set a decontaminated casing to protect the boring.
11. When sampling, drill rod removal is not necessary if the sampling can be performed through the hollow axis of the drill rods and bit.
12. Compare the sampling depth to clean-out depth by first resting the sampler on the bottom of the hole and compare that measurement with the clean-out depth measurement.
13. If bottom-hole contamination is apparent (indicated by comparison of sample depth to clean-out depth), it may be necessary to further clean the hole by rotary recirculation.
14. Continuous sampling may be conducted with a soil core barrel or rock core barrel (see Section 1.7).
15. The pilot bit or core barrel may need to be removed during drilling such as when core barrels are full or there is evidence of core blocking. Before the drill string is reinserted, the depth of the boring should be rechecked to evaluate hole quality and determine whether casing may be required.

16. Water testing may be performed in consolidated deposits by pulling back on the drill rods and passing inflatable packer(s) with pressure fitting to test the open borehole wall (see ASTM Standards D 4630 and D 4631).
17. Drilling to a greater depth may be accomplished by attaching an additional drill rod section to the top of the previously advanced drill-rod column and resuming drilling operations as described above.
18. When drilling through material suspected of being contaminated, the installation of single or multiple (nested) outer casings might be required to isolate zones suspected contamination (see SOP 20.1 for grouting requirements). Outer casings may be installed in a pre-drilled borehole or using a method in which casing is advanced at the same of drilling.
19. Monitoring wells or piezometers may be installed by:
    a. Drilling with or without sampling to the target depth.
    b. Removal of the pilot bit or core barrel and insertion of the monitoring well (or piezometer) assembly.
    c. Addition of monitoring well (or piezometer) completion materials (see SOP 20.1).
20. Drill cuttings and fluids should be appropriately controlled and contained as IDM per SOP 70.1.
21. The drill rod assembly, sampling devices, and other drilling equipment contacting potentially contaminated material must be decontaminated before and after each use per the methods specified in SOP 80.1.
22. Borehole logging should be completed per SOP 10.3.
23. Borehole abandonment, when required, should be conducted according to SOP 20.3.

3.9 DIAMOND CORE DRILLING

The following general procedure may be followed as outlined in ASTM Standard Practice D 2113.

1. Use core-drilling procedures, such as the water-rotary drilling method outlined in Section 3.6.
2. Seat the casing on bedrock or firm formation to prevent raveling of the borehole and to prevent loss of drilling fluid. Level the formation that the casing will be seated on as needed.
3. Begin core drilling using an N-size double-tube, swivel-type core barrel or other approved size or type. Continue core drilling until core blockage occurs or until the net length of the core has been drilled.
4. Remove the core barrel from the borehole, and dis-assemble the core barrel as necessary to remove the core.
5. Reassemble the core barrel and return it to hole.
6. Continue core drilling.
7. Place the recovered core in the core box with the upper (surface) end of the core at the upper-left corner of the core box. Wrap soft or friable cores, etc. as needed or required. Use spacer blocks or slugs properly marked to indicate any noticeable gap in recovered core that might indicate a change or void in the formation. Fit fracture, bedded, or jointed pieces of core together as they naturally occurred.
8. The core within each completed box should be photographed after core surface has been cleaned or peeled, as appropriate, and wetted. Each photo should be in sharp focus and contain a legible scale in feet and tenths of feet (or metric if appropriate). The core should be oriented so that the top of the core is at the top of the photograph. A color chart should be included in the photograph frame as a check on photographic accuracy. The inside lid of the box should also be shown.
9. The inside of the box lid should be labeled at a minimum with the facility name, project name, boring number, box number, and core interval.

10. A preliminary field log of the core must be completed before the core box has been packed for transport (see SOP 10.3). Detailed logging may be conducted at a later time providing the core is appropriately handled and transported.
11. Four levels of sample protection may be used depending on character of the rock and the intended use of the rock core including:
    a. *Routine care* – for rock cored in 5 to 10 foot runs. Consists of placing in structurally sound boxes. Lay flat tubing may be used prior to placing the core.
    b. *Special care* – for rock samples to be tested that are potentially moisture sensitive, such as shale. This care consists of sealing with a tight fitting wrapping of plastic film and application of wax at the ends of the sample.
    c. *Critical care* – for rock samples that may be sensitive to shock and vibration and/or temperature. Protect by encasing each sample in cushioning material, such as sawdust, rubber, polystyrene, foam, etc. A minimum one-inch thick layer of cushioning material should be used. Thermally insulate samples that are potentially sensitive to changes in temperature.
    d. *Soil-Like care* – handle per ASTM Standard D 4220.
12. Drilling conditions and sequence (fluid loss, circulation pressures, depths of lost circulation, down feed pressures, core blockage etc.) should be documented on the boring log as described in SOP 10.3.
13. Drill cuttings and fluids should be appropriately controlled and contained as investigation-derived material per SOP 70.1.
14. The drill rod assembly, sampling devices, and other drilling equipment contacting potentially contaminated material must be decontaminated before and after each use per the methods specified in SOP 80.1.
15. Borehole logging should be completed per SOP 10.3.
16. Borehole abandonment, when required, should be conducted according to SOP 20.3.

4.0 MAINTENANCE

Not applicable.

5.0 PRECAUTIONS

Refer to site-specific health and safety plan included in work plan addenda.

STANDARD OPERATING PROCEDURE 30.1
SOIL SAMPLING

1.0 SCOPE AND APPLICATION

The purpose of this standard operating procedure (SOP) is to delineate protocols for sampling surface and subsurface soils.

2.0 MATERIALS

- Stainless steel scoop, spoon, trowel, knife, spatula, (as needed);
- Split-spoon, Shelby tube, or core barrel sampler;
- Hand auger or push tube sampler;
- Drill rig and associated equipment (subsurface soil);
- Stainless steel bowls;
- Photoionization detector or other appropriate instrument as specified in site-specific health and safety plan;
- Sampling equipment for collection of volatile organic samples;
- Appropriate sample containers;
- Appropriate sample labels and packaging material;
- Personal protective equipment and clothing (PPE) per site-specific health and safety plan; and
- Decontamination equipment and supplies (SOP 80.1).

3.0 PROCEDURE

3.1 DOCUMENTATION

Soil sampling information should be recorded in the field logbooks as described in SOPs 10.1 and 10.2.

3.2 SURFICIAL SOIL SAMPLES

The targeted depths for surficial soil samples (surface and near surface) will be specified in the work plan addenda developed for site-specific investigations.

1. All monitoring equipment should be appropriately calibrated before beginning sampling according to the requirements of the work plan addenda and SOP 90.1 or 90.2.
2. All sampling equipment should be appropriately decontaminated before and after use according to the requirements of the work plan addendum and SOP 80.1.
3. Use a spade, shovel, or trowel or other equipment (manufactured from material, which is compatible with the soil to be sampled) to remove any overburden material present (including vegetative mat) to the level specified for sampling.
4. Measure and record the depth at which the sample will be collected with an engineers scale or tape.

5. Remove the thin layer that was in contact with the overburden removal equipment using a clean stainless steel scoop or equivalent and discard it.
6. Begin sampling with the acquisition of any discrete sample(s) for analysis of volatile organic compounds (VOCs), with as little disturbance as possible. VOC samples will not be composited or homogenized.
7. When a sample will not be collected with a core type of sampler (push tube, split spoon, etc.), the sample for VOC analysis will be collected from freshly exposed soil. The method of collection will follow the procedures specified in SOP 30.8 (Methanol Preservation Method) or 30.9 (En Core® Method) based on the requirements of the work plan addenda.
8. Field screen the sample with properly calibrated photoionization detector (PID) or other appropriate instrument. Cut a cross-sectional slice from the core or center of the sample and insert the monitoring instrument(s). Based on the screening results, collect the VOC fraction, as applicable.
9. Collect a suitable volume of sample from the targeted depth with a clean stainless steel scoop (or similar equipment), push tube sampler, or bucket auger.
10. For core type of samplers, rough trimming of the sampling location surface should be considered if the sampling surface is not fresh or other waste, different soil strata, or vegetation may contaminate it. Surface layers can be removed using a clean stainless steel, spatula, scoop, or knife. Samples collected with a bucket auger or core type of sampler should be logged per the requirements of SOP 10.3.
11. If homogenization or compositing of the sampling location is not appropriate for the remaining parameters, the sample should be directly placed into appropriate sample containers with a stainless steel spoon or equivalent.
12. If homogenization of the sample location is appropriate or compositing of different locations is desired, transfer the sample to a stainless steel bowl for mixing. The sample should be thoroughly mixed with a clean stainless steel spoon, scoop, trowel, or spatula and then placed in appropriate sample containers per the requirements for containers and preservation specified in work plan addenda. Secure the cap of each container tightly.
13. Appropriately, label the samples (SOP 50.1), complete the chain-of-custody (SOP 10.4), and package the samples for shipping (SOP 50.2).
14. Return any remaining unused soil to the original sample location. If necessary, add clean sand to bring the subsampling areas back to original grade. Replace the vegetative mat over the disturbed areas.

3.3 SUBSURFACE SAMPLES

All sampling equipment should be appropriately decontaminated before and after use according to the requirements of the work plan addendum and SOP 80.1.

1. All monitoring equipment should be appropriately calibrated before sampling according to the requirement of the work plan addendum and SOP 90.1 or SOP 90.2.
2. All sampling equipment should be appropriately decontaminated before and after use according to the requirements of the work plan addendum and SOP 80.1.
3. Collect split-spoon; core barrel, Shelby tube, sonic core or other similar samples during drilling.
4. Upon opening sampler or extruding sample, immediately screen soil for VOCs using a PID or appropriate instrument. If sampling for VOCs, determine the area of highest concentration; use a

stainless steel knife, trowel, or lab spatula to cut the sample; and screen for VOCs with monitoring instrument(s).

5. Log the sample on the boring log before extracting from the sampler per the requirements of SOP 10.3.
6. Any required VOC samples will be collected first followed by the other parameters. VOC samples will not be composited or homogenized and will be collected from the area exhibiting the highest screening level. The method of VOC sample collection will follow the procedures specified in SOP 30.8 (Methanol Preservation Method) or 30.9 (En Core® Method) based on the requirements of the work plan addenda.
7. Field screen the sample with properly calibrated photoionization detector (PID) or other appropriate instrument. Cut a cross-sectional slice from the core or center of the sample and insert the monitoring instrument(s). Based on the screening results, collect the VOC fraction, as applicable.
8. Rough trimming of the sampling location surface should be considered if the sampling surface is not fresh or other waste, different soil strata, or vegetation may contaminate it. Surface layers can be removed using a clean stainless steel, spatula, scoop, or knife.
9. If homogenization or compositing of the sampling location is not appropriate for other parameters, the sample should be directly placed into appropriate sample containers with a stainless steel spoon or equivalent.
10. If homogenization of the sample location is appropriate or compositing of different locations is desired, transfer the sample to a stainless steel bowl for mixing. The sample should be thoroughly mixed with a clean stainless steel spoon, scoop, trowel, or spatula and placed in appropriate sample containers per the requirements for containers and preservation specified in work plan addenda. Secure the cap of each container tightly.

15. Appropriately, label the samples (SOP 50.1), complete the chain-of-custody (SOP 10.4), and package the samples for shipping (SOP 50.2).
16. Discard any remaining sample into the drums used for collection of cuttings.
17. Abandon borings according to procedures outlined in SOP 20.3.

3.4 INVESTIGATION-DERIVED MATERIAL

Investigation-derived material will be managed in accordance with procedures defined in the work plan addenda for the site being investigated and SOP 70.1.

NOTES: If sample recoveries are poor, it may be necessary to composite samples before placing them in jars. In this case, the procedure will be the same except that two split-spoon samples (or other types of samples) will be mixed together. The boring log should clearly state that the samples have been composited, which samples were composited, and why the compositing was done. In addition, VOC fraction should be collected from the first sampling device.

When specified, samples taken for geotechnical analysis (e.g., percent moisture, density, porosity, and grain size) will be undisturbed samples, such as those collected using a thin-walled (Shelby tube) sampler, sonic core sampler, etc.

4.0 MAINTENANCE

Not applicable.

5.0 PRECAUTIONS

Refer to the site-specific health and safety plan.

Soil samples will not include vegetative matter, rocks, or pebbles unless the latter are part of the overall soil matrix.

STANDARD OPERATING PROCEDURE 30.2
GROUNDWATER SAMPLING

1.0 SCOPE AND APPLICATION

The purpose of this standard operating procedure (SOP) is to delineate protocols for the collection of groundwater samples from monitoring wells.

2.0 MATERIALS

- Work Plans;
- Field logbooks and field parameter forms;
- Plastic sheeting;
- Decontamination equipment and supplies (SOP 80.1);
- Variable-speed, low-flow submersible pump with safety drop cable;
- Nylon stay-ties;
- Generator;
- Dedicated Teflon tubing or Teflon lined polyethylene tubing;
- Flow-through-cell and probes for measuring pH, temperature, specific conductance, oxidation/reduction potential, dissolved oxygen, and turbidity (SOP 40.1);
- Electronic water-level indicator;
- Appropriate sample bottles, labels, chain-of-custody forms, and sample shipping supplies etc;
- Cooler with ice;
- Silicone tubing;
- 0.45-micron disposable filters (as appropriate).
- Personal protective equipment and clothing (PPE) per site-specific health and safety plan;
- Photoionization detector (PID) or other appropriate monitoring instrument per the site-specific health and safety plan; and
- Appropriate containers for investigation-derived material.

3.0 PROCEDURE

3.1 DOCUMENTATION

Groundwater sampling information should be recorded in the field logbooks as described in SOPs 10.1 and 10.2.

The following are general rules for the field parameter logbook for groundwater, as described in SOP 10.2:

- Only information for one site or installation per logbook. The same book maybe used for more than one sampling event.

- The first five pages will be reserved for index, general notes, etc. Sign and date each entry.
- Fill in the forms.
- Duplicate copies, index pages, and calibration sheets remain intact.

3.2 OVERVIEW OF SAMPLING TECHNIQUES

In general, two different techniques may be used to sample groundwater from monitoring wells at Radford Army Ammunition Plant (RFAAP):

- Low flow purging and sampling (Type I); and
- Conventional purging and low-flow sampling (Type II).

These two sampling techniques are intended to address the different groundwater conditions that may be encountered at RFAAP.

The Type I sampling technique will be used in the following situations:

- In wells where only one discrete water-producing zone is encountered;
- In wells with no discrete water bearing zone and a low yield (generally < 0.5 liters per minute); and
- In wells sampled during seasonal low groundwater conditions with greatly reduced yield.

The Type II sampling technique will be used in the following situations:

- In a well with potential or documented multiple flow zones and where individual flow zones will not be evaluated;
- In moderately producing wells (> 0.5 liters per minute) where no discrete flow zones were documented during drilling; and
- In wells sampled during seasonal high groundwater conditions with enhanced yield (and potentially additional flow zones).

Groundwater samples should be collected no sooner than 14 days after well development. Information from the boring logs, well completion records, and well development records should be reviewed before sampling a well to determine the most appropriate sampling technique. Pertinent information for each well to be sampled includes:

- Well construction;
- Depth and nature of water producing zones;
- Sustainable pumping rate of the well to be sampled;
- Well recharge characteristics; and
- Baseline turbidity.

Because of the heterogeneous nature of the fracture and solution-enhanced fractured bedrock at RFAAP, monitoring well purging and sampling techniques will need to be flexible. This flexibility is necessary to obtain representative samples that meet the data quality objectives (DQOs) specified in site-specific work plan addenda.

In general, when using the pumps specified in the following sections, situate any gasoline-powered generator on level ground approximately 15 ft downwind from the well. All generator maintenance (oil and fueling) is

to be performed off site. If the hose(s) and/or power cord of the pump is not on a reel, place the pump with its hose and power cord on the plastic sheeting downhill from the well.

3.3 TYPE I SAMPLING PROCEDURES

Type I low flow purging and sampling procedures include the following:

- The work area outside the well will be prepared by placing plastic sheeting on the ground around the well casing to avoid cross-contamination.
- All equipment used to purge and sample the wells will be thoroughly decontaminated before and after use according to the requirements of the work plan addenda and SOP 80.1.
- All equipment to be used for monitoring water quality parameters will be calibrated before beginning purging according to the requirements of the work plan addenda and SOP 40.1.
- Note the condition of the well and well head.
- Monitor the headspace of the well with a photoionization detector as the well cap is removed.
- Measure and record the depth to water with an electronic water level indicator. The measurement of well depth will not be taken until after sampling is completed so that potential re-suspension of any settled solids at the bottom of the well is avoided.
- Well depth at the time of purging will be obtained from well construction and existing data.
- Slowly lower a clean, stainless steel, adjustable flow rate, submersible pump and dedicated Teflon or Teflon-lined polyethylene tubing to the desired depth. As the pump is slowly lowered into the well, secure the safety drop cable, tubing, and electrical lines to each other using nylon stay-ties.
- For wells with very low sustainable pumping rates ($\leq$ 0.5 liters per minute), the pump should be set in the middle of the saturated screen section of the well or middle of the water column for open wells. The pump should be set 12 hours prior to purging so that the depth to water equilibrates and sediments disturbed during pump placement have time to settle.
- For wells with sustainable pumping rates (> 0.5 liters per minute), the pumps will be set at a desired depth prior to purging, allowing for the depth to water to equilibrate before sampling. The desired depth will be specified in work plan addenda based on site-specific conditions and DQOs.
- Connect the pump tubing to an in-line flow-through cell(s) and connect the multi-parameter probe to the cell(s). The end of the tubing exiting the in-line flow-through cell should be placed to discharge into an appropriate container(s) to collect purge water.
- Immediately prior to purging, the depth to water will be measured and record. Start pumping the water at a rate of 100 to 400 milliliters per minute. Avoid surging. The pumping rate should cause minimal drawdown (less than 0.2 ft). Water level measurements should be collected continuously to document stabilization of the water level. Pumping rates should, if needed, be reduced to the minimal capabilities of the pump to avoid dewatering the screen interval and ensure stabilization of indicator parameters.
- During purging, water quality indicator parameters will be monitored at the in-line flow-through cell(s) every 3 to 5 minutes. The parameters to be monitored include pH, specific conductance, oxidation/reduction potential (Eh), dissolved oxygen, and turbidity.
- Continue purging until stabilization of indicator parameters is achieved. Stabilization is defined as three consecutive readings that are within the following criteria:
  - $\pm$ 0.1 for pH;

- ±3% for specific conductance;
- ±10 mV for oxidation/reduction potential (Eh); and
- ±10% for turbidity and dissolved oxygen.

- If the parameters have stabilized, but the turbidity is not in the range of 5 to 10 NTU, then both filtered and unfiltered samples should be collected for any metals analysis. Filter metal samples should be collected with an in-line filter using a high capacity 0.45-micron particulate filter. This filter should be pre-rinsed according to the manufacturer's instructions.
- Once purging is completed, reduce the pumping rate to its lowest steady rate and disconnect the tubing from the in-line flow-though cell(s).
- Collect groundwater samples directly from the end of the tubing into clean containers provided by the laboratory. The container requirements and preservatives for groundwater samples are specified in work plan addenda. Allowing the pump discharge to flow gently down the inside of the container with minimal turbulence should fill all sample containers. Volatile organic compound (VOC) and gas sensitive parameter samples should be collected first followed by other parameters.
- In general, samples should be collected and containerized in the order of the volatilization sensitivity of the parameters. A preferred collection order for some common parameters is VOCs, extractable organics, metals, cyanide, sulfate and chloride, turbidity, and nitrate and ammonia. The parameters to be collected at any well location are site-specific and are specified in work plan addenda.
- Appropriately, label the samples (SOP 50.1), complete the chain-of-custody (SOP 10.4), and package the samples for shipping (SOP 50.2).
- After the sample collection is complete; remove the pump, tubing, and associated lines. Note: sample tubing will be dedicated to each well.
- Measure and record the total depth of the well.
- Secure the well be replacing and locking the lid.

3.4 TYPE II SAMPLING PROCEDURES

- The work area outside the well will be prepared by placing plastic sheeting on the ground around the well casing to avoid cross-contamination.
- All equipment used to purge and sample the wells will be thoroughly decontaminated before and after use according to the requirements of the work plan addenda and SOP 80.1.
- All equipment to be used for monitoring water quality parameters will be calibrated before beginning purging according to the requirements of the work plan addenda and SOP 40.1.
- Note the condition of the well and well head.
- Monitor the headspace of the well with a photoionization detector as the well cap is removed.
- Measure and record the depth to water with an electronic water level indicator. The measurement of well depth will not be taken until after sampling is completed so that potential re-suspension of any settled solids at the bottom of the well is avoided.
- Well depth at the time of purging will be obtained from well construction and existing data.
- Calculate the standing water column in the well by subtracting the depth to water from the total depth of the well as recorded during completion of the well.

- From the water depth, well diameter, sand pack length, etc., calculate the equivalent volume (1 EV) of water in the well.

  1 EV = volume in casing + volume in saturated sand pack. Therefore; if the water table lies below the top of the sand pack, use the following equation:

  $1\ EV = (pR_w^2h_w) + (0.30p(R_s^2-R_w^2)h_w) * (0.0043)$

  If the water table lies above the top of the sand pack use this equation:

  $1\ EV = [(pR_w^2h_w) + (0.30p(R_s^2-R_w^2)h_s)] * (0.0043)$

  Where: R_s = radius of sand pack in inches
  R_w = radius of well casing in inches
  h_s = height of sand pack in inches
  h_w = water depth in inches
  0.0043 gal/in^3
  Assumed filter pack porosity = 30%

Tables and graphs showing equivalent volumes for typical well constructions are available.

- Slowly lower a clean, stainless steel, adjustable flow rate, submersible pump and dedicated Teflon or Teflon-lined polyethylene tubing to the middle of the saturated screen interval or water column in an open borehole. As the pump is slowly lowered into the well, secure the safety drop cable, tubing, and electrical lines to each other using nylon stay-ties.
- Connect the pump tubing to an in-line flow-through cell(s) and connect the multi-parameter probe to the cell(s). The end of the tubing exiting the in-line flow-through cell should be placed to discharge into an appropriate container to collect purge water.
- Start purging the well at the minimally achievable pumping rate. Gradually increase the pumping rate to achieve the maximum flow rate of the pump or the maximum sustainable flow rate that does not draw down the static water level to a point below the top of the first water bearing zone, whichever is achieved first.
- During purging, water level measurements should be collected periodically to verify water levels in the well.
- During purging, water quality indicator parameters will be monitored at the in-line flow-through cell(s) every 3 to 5 minutes. The parameters to be monitored include pH, specific conductance, oxidation/reduction potential (Eh), dissolved oxygen, and turbidity.
- Note when each indicator parameter stabilizes. Stabilization is defined as three consecutive readings that are within the following criteria:
  - ± 0.1 for pH;
  - ±3% for specific conductance;
  - ±10 mV for oxidation/reduction potential (Eh); and
  - ±10% for turbidity and dissolved oxygen.
- Three calculated eVs of water in the will be purged prior to sampling. It will be documented if stabilization of the indicator parameters has not occurred after three calculated well volumes have been removed and sampling procedures begin.
- If the turbidity is not in the range of 5 to 10 NTU when purging has been completed, then both filtered and unfiltered samples should be collected for any metals analysis. Filter metal samples

should be collected with an in-line filter using a high capacity 0.45-micron particulate filter. This filter should be pre-rinsed according to the manufacturer's instructions.

- Once purging is completed, reduce the pumping rate to its lowest steady rate and disconnect the tubing from the in-line flow-though cell(s).
- Collect groundwater samples directly from the end of the tubing into clean containers provided by the laboratory. The container requirements and preservatives for groundwater samples are specified in work plan addenda. Allowing the pump discharge to flow gently down the inside of the container with minimal turbulence should fill all sample containers. Volatile organic compound (VOC) and gas sensitive parameter samples should be collected first followed by other parameters.
- Appropriately, label the samples (SOP 50.1), complete the chain-of-custody (SOP 10.4), and package the samples for shipping (SOP 50.2).
- After the sample collection is complete, remove the pump, tubing, and associated lines. Note: sample tubing will be dedicated to each well.
- Measure and record the total depth of the well.
- Secure the well be replacing and locking the lid.

3.5 INVESTIGATION-DERIVED MATERIAL

Investigation-derived material will be managed in accordance with procedures defined in the work plan addendum for the site being investigated and SOP 70.1.

4.0 MAINTENANCE

Refer to manufacturer's requirements for maintenance of pumps and generators.

5.0 PRECAUTIONS

Refer to the site-specific health and safety plan.

STANDARD OPERATING PROCEDURE 30.4
SEDIMENT SAMPLING WITH SCOOP OR TUBE SAMPLER

1.0 SCOPE AND APPLICATION

The purpose of this standard operating procedure (SOP) is to delineate protocols for obtaining representative sediments sampling using a scoop or hand corer.

Sediments include solid matter derived from rocks or biological materials that are suspended in, or settled from, water. This procedure can be applied to the collection of sediment samples from areas of deposition such as streams, rivers, ditches, lakes, ponds, and lagoons.

SOP 30.5 describes two methods of grab sampling (Ekman and Ponar) that are suitable for sampling surface or deep sediments. SOP 30.12 describes a method of sampling deep sediments by using a Vibracore sampler.

2.0 MATERIALS

- Work Plans;
- Field logbooks;
- Photoionization detector (PID) or other appropriate monitoring instruments as specified in site-specific health and safety plan;
- Appropriate sample bottles, labels, chain-of-custody forms, and sample shipping supplies etc;
- Stainless steel bowls;
- Stainless steel or polytetrafluoroethylene (PTFE) scoops, trowels, spoons, and knives;
- Hand core sediment sampler, liners (optional) and extensions;
- Hand auger with buckets, rods, and T-handles;
- Rubber boots/waders;
- Decontamination equipment and supplies (SOP 80.1);
- Plastic sheeting;
- Utility knife;
- Boat or other stable work platform, and personal flotation devices, as applicable; and
- Personal protective equipment and clothing (PPE) as specified in site-specific health and safety plan.

3.0 PROCEDURE

The water content of the sediment may vary greatly. Likewise, the sediments themselves may range from very soft to dense. It may be necessary to use a variety of equipment to obtain the required samples, even at a single site.

3.1 CONSIDERATIONS

Factors that determine the type of sediment water sampler used are primarily related to project objectives of surficial versus subsurface samples, site constraints of the water depth, sampling and sediment conditions, and cost-effectiveness of the sampler.

The most appropriate method(s) of sample collection and the appropriate depths of sampling (sampling strategies) will be specified in the work plan addendum based on site-specific conditions and data quality objectives (DQOs).

3.2 DOCUMENTATION

Sediment sampling information should be recorded in the field logbooks as described in SOPs 10.1 and 10.2. This information should include a description of the water body characteristics (size, depth, flow, etc.) and nature of sediments.

Sampling locations should be marked on a site map. Describe each location and place a numbered stake above the visible high water mark on the bank closest to the sampling location and/or mark adjacent trees with surveyor's flagging. The descriptions must be adequate to allow the sampling station to be relocated at some future date by someone other than the original sampling crew.

3.3 SAMPLE LOCATION AND TIMING

Sampling should proceed from downstream locations to upstream locations so that disturbance related to sampling does not affect the samples collected upstream. In addition, if surface water samples are to be collected at the same locations as the sediment samples, the surface water samples must be collected first.
Sampling should be conducting using appropriate sampling devices that minimize disturbance and sample washing as the sample is retrieved through the liquid column.

In general, sediment samples should be collected and containerized in the order of the volatilization sensitivity of the parameters. A preferred collection order for some common parameters is volatile organic compounds (VOCs), extractable organics, metals, cyanide, sulfate and chloride, turbidity, and nitrate and ammonia. The parameters to be collected at any location are site-specific and are specified in work plan addenda.

3.4 LOCATION

For all samples, mark the sampling location on a site map. Photograph (optional, recommended) and describe each location, and place a numbered stake above the visible high water mark on the bank closest to the sampling location. The photographs and description must be adequate to allow the sampling station to be relocated at some future date.

3.5 GENERAL PROCEDURES

1. All sampling equipment should be appropriately decontaminated before and after use according to the requirements of work plan addenda and SOP 80.1.
2. Spread new plastic sheeting on the ground at each sampling location to prevent cross-contamination. If sample access is restricted, use appropriate vessel or another stable working platform adjacent to the area to be sampled.
3. Document sample location and conditions appropriately in the field logbooks and on site maps.
4. Collect surface water sample as described in the work plan addenda and SOP 30.3, as necessary.
5. Collect sediment sample using the appropriate sampling device as described in the following sections.

3.6 SCOOP OR TROWEL METHOD

The scoop or trowel method is a very accurate procedure for collecting representative samples, but is limited to sampling exposed sediments or sediments in surface water less than 6-inches deep, with nominal flow.

1. Insert scoop or trowel into material and remove sample.
2. Begin sampling with the acquisition of any discrete sample(s) for analysis of volatile organic compounds (VOCs), with as little disturbance as possible. VOC samples will not be composited or homogenized.
3. The method of collection for VOC samples will follow the procedures specified in SOP 30.8 (Methanol Preservation Method) or 30.9 (En Core® Method) based on the requirements of the work plan addenda and sampling conditions.
4. Field screen the sample with properly calibrated photoionization detector (PID) or other appropriate instrument. Based on the screening results collect the VOC fraction, as applicable.
5. If homogenization or compositing of the sampling location is not appropriate for the remaining parameters, the sample should be directly placed into appropriate sample containers with a stainless steel spoon or equivalent.
6. If homogenization of the sample location is appropriate or compositing of different locations is desired, transfer the sample to a stainless steel bowl for mixing. The sample should be thoroughly mixed with a clean stainless steel spoon, scoop, trowel, or spatula and then placed in appropriate sample containers. Secure the cap of each container tightly. Sample container requirements are specified in work plan addenda.
7. Appropriately, label and package the samples according to the requirements specified in SOPs 50.1 and 50.2, respectively, and with any additional sample handling requirements specified in work plan addenda.

3.7 TUBE SAMPLER

Tube samplers are a simple and direct method for obtaining sediment samples. The tube sampler is forced into the sediment and then withdrawn and the sample collected. Non-cohesive sediments may limit the effectiveness of this type of sampler.

1. Ensure that the corers and (optional) liners are properly cleaned.
2. Gradually force the corer into the sediment.
3. Carefully retrieve the tube sampler.
4. Remove the sediment core from the tube sampler and place core on a clean working surface.
5. Begin sampling with the acquisition of any discrete sample(s) for analysis of VOCs, with as little disturbance as possible. VOC samples will not be composited or homogenized.
6. The method of collection for VOC samples will follow the procedures specified in SOP 30.8 (Methanol Preservation Method) or 30.9 (En Core® Method) based on the requirements of the work plan addenda and sampling conditions.
7. Field screen the sample with properly calibrated photoionization detector (PID) or other appropriate instrument. Based on the screening results collect the VOC fraction, as applicable.

8. If homogenization or compositing of the sampling location is not appropriate for the remaining parameters, the sample should be directly placed into appropriate sample containers with a stainless steel spoon or equivalent.
9. If homogenization of the sample location is appropriate or compositing of different locations is desired, transfer the sample to a stainless steel bowl for mixing. The sample should be thoroughly mixed with a clean stainless steel spoon, scoop, trowel, or spatula and then placed in appropriate sample containers. Secure the cap of each container tightly. Sample container requirements are specified in work plan addenda.
10. Appropriately, label and package the samples according to the requirements specified in SOPs 50.1 and 50.2, respectively, and with any additional sample handling requirements specified in work plan addenda.

3.8 HAND AUGER AND TUBE SAMPLER

In general, the use of a hand auger and tube sampler will allow for sampling deeper sediments than possible with the tube sampling method described in Section 3.7. A potential disadvantage of using this method is that it limited to use for water bodies of limited depth and hand augers may not be an effective method for penetrating soft sediments since the borehole may collapse prior to sampling.

1. Attach the auger bucket to a drill rod extension and attach the T-handle to the drill rod.
2. Begin drilling with the auger. Periodically remove accumulated sediment from the bucket.
3. After reaching the desired depth, slowly and carefully remove the auger from the boring.
4. Remove the auger bucket from the drill rod(s) and replace with a clean thin-wall tube sampler.
5. Remove the sediment core from the tube sampler and place core on a clean working surface.
6. Carefully lower the tube sampler down the borehole and gradually force it into the sediment, avoiding scraping the borehole sides.
7. Carefully retrieve the tube sampler and unscrew the drill rod(s).
8. Begin sampling with the acquisition of any discrete sample(s) for analysis of VOCs, with as little disturbance as possible. VOC samples will not be composited or homogenized.
9. The method of collection for VOC samples will follow the procedures specified in SOP 30.8 (Methanol Preservation Method) or 30.9 (En Core® Method) based on the requirements of the work plan addenda and sampling conditions.
10. Field screen the sample with properly calibrated photoionization detector (PID) or other appropriate instrument. Based on the screening results collect the VOC fraction, as applicable.
11. If homogenization or compositing of the sampling location is not appropriate for the remaining parameters, the sample should be directly placed into appropriate sample containers with a stainless steel spoon or equivalent.
12. Appropriately, label and package the samples according to the requirements specified in SOPs 50.1 and 50.2, respectively, and with any additional sample handling requirements specified in work plan addenda.

3.9 INVESTIGATION-DERIVED MATERIAL

Investigation-derived material will be managed in accordance with procedures defined in the work plan addenda for the site being investigated and SOP 70.1.

4.0 MAINTENANCE

Not applicable.

5.0 PRECAUTIONS

Refer to the site-specific health and safety plan.

STANDARD OPERATING PROCEDURE 30.7
SAMPLING STRATEGIES

1.0 SCOPE AND APPLICATION

The purpose of this standard operating procedure (SOP) is to delineate sampling strategies for sampling various media.

2.0 MATERIALS

- Historical site data;
- Site topography;
- Soil types; and
- Sampled media.

3.0 PROCEDURE

The primary goal of any investigation is to collect samples representative of existing site conditions. Statistics are generally used to ensure samples are as representative as possible. Sampling plans may employ more than one approach to ensure project data quality objectives are adequately addressed. A comparison of sampling strategies is presented in Table 1.

3.1 CLASSICAL STATISTICAL SAMPLING

Classical statistical sampling strategies are appropriately applied to either sites where the source of contamination is known or small sites where the entire area is remediated as one unit. Primary limitations of this sampling approach include (1) inability to address media variability; (2) inadequate characterization of heterogenous sites; and (3) inadequate characterization of sites with unknown contamination characteristics.

3.1.1 Simple Random Sampling

Simple random sampling is generally more costly than other approaches because of the number of samples required for site characterization. This approach is generally used when minimal site information is available and visible signs of contamination are not evident and includes the following features:

- Sampling locations are chosen using random chance probabilities.
- This strategy is most effective when the number of sampling points is large.

3.1.2 Stratified Random Sampling

This sampling approach is a modification to simple random sampling. This approach is suited for large site investigations that encompass a variety of soil types, topographic features, and/or land uses. By dividing the site into homogenous sampling strata based on background and historical data, individual random sampling techniques are applied across the site. Data acquired from each stratum can be used to determine the mean or total contaminant levels and provide these advantages:

- Increased sampling precision results due to sample point grouping and application of random sampling approach.
- Control of variances associated with contamination, location, and topography.

3.1.3 Systematic Grid

The most common statistical sampling strategy is termed either systematic grid or systematic random sampling. This approach is used when a large site must be sampled to characterize the nature and extent of contamination.

Samples are collected at predetermined intervals within a grid pattern according to the following approach:

- Select the first sampling point randomly; remaining sampling points are positioned systematically from the first point.
- Determine the grid design: one or two-dimensional. One-dimensional sample grids may be used for sampling along simple man-made features. Two-dimensional grid systems are ideal for most soil applications.
- Determine the grid type: square or triangular. Sampling is usually performed at each grid-line intersection. Other strategies include sampling within a grid center or obtaining composite samples within a grid.
- Each stratum is sampled based on using the simple random sampling approach but determined using a systematic approach.

3.1.4 Hot-Spot Sampling

Hot spots are small, localized areas of media characterized by high contaminant concentrations. Hot-spot detection is generally performed using a statistical sampling grid. The following factors should be addressed:

- Grid spacing and geometry. The efficiency of hot-spot searches is improved by using a triangular grid. An inverse relationship exists between detection and grid point spacing, e.g., the probability of hot-spot detection is increased as the spacing between grid points is decreased.
- Hot-spot shape/size. The larger the hot spot, the higher the probability of detection. Narrow or semi-circular patterns located between grid sampling locations may not be detected.
- False-negative probability. Estimate the false negative (β-error) associated with hot-spot analysis.

3.1.5 Geostatistical Approach

Geostatistics describe regional variability in sampling and analysis by identifying ranges of correlation or zones of influence. The general two-stage approach includes the following:

- Conducting a sampling survey to collect data defining representative sampling areas.
- Defining the shape, size, and orientation of the systematic grid used in the final sampling event.

3.2 NON-STATISTICAL SAMPLING

3.2.1 Biased Sampling

Specific, known sources of site contamination may be evaluated using biased sampling. Locations are chosen based on existing information.

3.2.2 Judgmental Sampling

This sampling approach entails the subjective selection of sampling locations that appear to be representative of average conditions. Because this method is highly biased, it is suggested that a measure of precision be included through the collection of multiple samples.

4.0 MAINTENANCE

Not applicable.

TABLE 1
SAMPLING STRATEGIES

SAMPLING STRATEGY	DESCRIPTION	APPLICATION	LIMITATIONS
Classical Statistical Sampling Strategies			
Simple Random Sampling	Representative sampling locations are chosen using the theory of random chance probabilities.	Sites where background information is not available and no visible signs of contamination are present.	May not be cost-effective because samples may be located too close together. Does not take into account spatial variability of media.
Stratified Random Sampling	Site is divided into several sampling areas (strata) based on background or site survey information.	Large sites characterized by a number of soil types, topographic features, past/present uses, or manufacturing storage areas.	Often more cost-effective than random sampling. More difficult to implement in the field and analyze results. Does not take into account spatial variability of media.
Systematic Grid Sampling	Most common statistical strategy; involves collecting samples at predetermined, regular intervals within a grid pattern.	Best strategy for minimizing bias and providing complete site coverage. Can be used effectively at sites where no background information exists. Ensures that samples will not be taken too close together.	Does not take into account spatial variability of media.
Hot-Spot Sampling	Systematic grid sampling strategy tailored to search for hot spots.	Sites where background information or site survey data indicate that hot spots may exist.	Does not take into account spatial variability of media. Tradeoffs between number of samples, chance of missing a hot spot, and hot spot size/shape must be weighed carefully.
Geostatistical Approach	Representative sampling locations are chosen based on spatial variability of media. Resulting data are analyzed using kriging, which creates contour maps of the contaminant concentrations and the precision of concentration estimates.	More appropriate than other statistical sampling strategies because it takes into account spatial variability of media. Especially applicable to sites where presence of contamination is unknown.	Previous investigation data must be available and such data must be shown to have a spatial relationship.
Non-Statistical Sampling Strategies			
Biased Sampling	Sampling locations are chosen based on available information.	Sites with known contamination sources.	Contaminated areas can be overlooked if background information or visual signs of contamination do not indicate them. Best used if combined with a statistical approach, depending on the project objectives.
Judgmental Sampling	An individual subjectively selects sampling locations that appear to be representative of average conditions.	Homogenous, well-defined sites.	Not usually recommended due to bias imposed by individual, especially for final investigations.

STANDARD OPERATING PROCEDURE 30.9
COLLECTION OF SOIL SAMPLES BY USEPA SW 846 METHOD 5035 USING DISPOSABLE SAMPLERS

1.0 SCOPE AND APPLICATION

This standard operating procedure (SOP) outlines the recommended protocol and equipment for collection of representative soil samples to monitor potential volatile organic contamination in soil samples.

This method of sampling is appropriate for surface or subsurface soils contaminated with low to high levels of volatile organic compounds (VOCs). This sampling procedure may be used in conjunction with any appropriate determinative gas chromatographic procedure, including, but not necessarily limited to, SW-846 Method 8015, 8021, and 8260.

2.0 MATERIALS

- Work Plans;
- Field Logbook;
- Photoionization Detector (PID) or other monitoring instrument(s) per site-specific health and safety plan;
- Personal protective equipment and clothing per site-specific health and safety plan;
- Soil sampling equipment, as applicable (SOP 30.1);
- Disposable sampler;
- T-handle and/or Extrusion Tool; and
- Decontamination equipment and supplies (SOP 80.1).

3.0 PROCEDURE

3.1 METHOD SUMMARY

Disposable samplers are sent to the field to be used to collect soil samples. Three samplers must be filled for each soil sampling location, two for the low-level method (sodium bisulfate preservation) and one for the high level method (methanol preservation). After sample collection, disposable samplers are immediately shipped back to the laboratory for preservation (adding soil sample into methanol and sodium bisulfate solution). The ratio of volume of methanol to weight of soil is 1:1 as specified in SW-846 Method 5035 (Section 2.2.2). The amount of preservative in the solution corresponds to approximately 0.2g of preservative for each 1 g of sample. Enough sodium bisulfate should be present to ensure a sample pH of $\leq$2.

If quality assurance/quality control (QA/QC) samples are needed, seven samplers will be needed for the original, matrix spike, and matrix spike duplicate analysis. Soil samples are collected in the field using the disposable samplers, sealed and returned to the laboratory. A separate aliquot of soil is collected in a 125-mL container for dry weight determination.

3.2 SAMPLE CONTAINERS, PRESERVATION, HANDLING AND STORAGE

After sample collection, the disposable samplers must be cooled to and maintained at 4°C. The contents of the samplers will be analyzed using EPA methods 8015, 8021, and/or 8260. The **disposable** sampler is a single use device. It cannot be cleaned and/or reused.

Disposable samplers have a 48 hour holding time from sample collection to sample preparation in the laboratory. Return the samplers to the laboratory immediately after sampling.

3.3 SAMPLE PROCEDURES

Before sampling, the disposable sampler should be prepared as follows:

1. Unpack the cooler/sampling kit received from the laboratory. Disposable samplers are packed in sealed aluminized bags. These should be over packed in plastic zip lock bags. A T-Handle will also be needed to collect samples with the disposable sampler.
2. Hold coring body and push plunger rod down until small 0-ring rests against tabs. This will assure that plunger moves freely.
3. Depress locking lever on the sampler T-Handle (or other extraction device). Place coring body, plungers end first, into the open end of the T-Handle, aligning the two slots on the coring body with the two locking pins in the T-Handle. Twist the coring body clockwise to lock the pins in the slots. Check to ensure the sampler is locked in place. Sampler is ready for use.

The following procedure should be followed when using a disposable sampler to sample for VOCs in soil:

1. After the soil-sampling device (split spoon, corer, etc.) is opened, the sampling process should be completed in a minimum amount of time with the least amount of disruption.
2. Visual inspection and soil screening should be conducted after the sampler is opened and a fresh surface is exposed to the atmosphere. Soil screening should be conducted with an appropriate instrument (PID or FID).
3. Rough trimming of the sampling location surface should be considered if the sampling surface is not fresh or other waste, different soil strata, or vegetation may contaminate it. Surface layers can be removed using a clean stainless steel, spatula, scoop, or knife.
4. Orient the T-Handle with the T-up and the coring body down. This positions the plunger bottom flush with bottom of coring body (ensure that plunger bottom is in position). Using T-Handle, push sampler into soil until the coring body is completely full taking care not to trap air behind the sampler. When full, the small o-ring will be centered in the T-Handle viewing hole. Remove sampler from soil. Wipe excess soil from coring body exterior with a clean disposable paper towel.
5. Cap coring body while it is still on the T-Handle. ***Push*** cap over flat area of ridge ***and twist*** to lock cap in place. ***Cap must be seated to seal sampler.***
6. Remove the capped sampler by depressing locking lever on T-Handle while twisting and pulling sampler from T-Handle.
7. Lock plunger by rotating extended plunger rod fully counterclockwise until wings rest firmly against tabs.
8. Fill the 125-mL wide mouth jar for the non-preserved portion of the sample to be used for a moisture determination. These may be in a cardboard box. Retain all packaging to return the samples.
9. The disposable sampler should collect approximately 5 grams of soil (not necessary to weigh in the field). After a sample has been collected and capped, tear off the identification tag found at the bottom of the label on the aluminized bag. This tag is added to the sampler on the cap used to seal the sampler.

10. Place the sampler back in the aluminized bag and seal the top (a zip-lock seal). Make sure all the appropriate information is on the label. Record the sampler ID number on the chain-of-custody. Make sure each sampler and 125-mL container is labeled with the same location identification. The sampler should be placed inside the plastic zip-lock bags.

11. Place the 125-mL wide mouth jars in the cooler with the sampler on top. These should be sandwiched between bags of ice to maintain the correct temperature. If sent with the jars and samplers, a temperature bottle (used to evaluate the temperature on receipt) should be placed in the middle of the jars. The sample temperature should be 4ºC during shipment.

12. Ship the samples so that they will be received within 24 hours of sampling. The laboratory must receive the sampler within 40 hours of the collection so that they can be correctly preserved.

3.4 QUALITY ASSURANCE/QUALITY CONTROL (QA/QC)

1. All data must be documented on chain-of-custody forms, field data sheets and in the field logbook.

2. An equipment blank is a QA/QC sample that will determine potential contamination from sampling equipment used to collect and transfer samples from the point of collection to the sample container. An equipment blank is performed by pouring demonstrated analyte free water from one sample container, over a sampler, and into a separate set of identical sample containers. The equipment blank is optional when sampling with the methanol preservation technique. It may be required on a site-specific basis if elevated analytical results are suspected to be due to cross contamination from sampling equipment.

3. A trip blank is a QA/QC sample, which will determine additional sources of contamination that may potentially influence the samples. The sources of the contamination may be from the laboratory, sample containers, or during shipment. The laboratory prepares a trip blank at the same time and in the same manner as the sample containers. The trip blank must accompany the sample containers to the field and back to the laboratory along with the collected samples for analysis. It must remain sealed at all times until it is analyzed at the laboratory. The frequency of collection for the trip blank must be at a rate of one per sample shipment.

3.5 LIMITATIONS IN SAMPLING

This sampling protocol will not be applicable to all solid environmental matrices, such as those that cannot be cored including non-cohesive granular material, gravel, or hard dry clay. In this case, the procedure for collecting VOC samples using Methanol Preservation should be used (see SOP 30.8).

4.0 MAINTENANCE

Not applicable.

5.0 PRECAUTIONS

None.

6.0 REFERENCES

STANDARD OPERATING PROCEDURE 40.1
MULTIPARAMETER WATER QUALITY MONITORING INSTRUMENT

1.0 SCOPE AND APPLICATION

The purpose of this standard operating procedure (SOP) is to delineate protocols for field operation with the multiparameter water quality logging system (data transmitter and visual display). This system can monitor up to eleven basic parameters, including dissolved oxygen, percent saturation, temperature, pH, specific conductance, resistivity, salinity, total dissolved solids, redox, level, and depth.

2.0 MATERIALS

- Visual display;
- Data transmitter;
- Underwater cables; and
- Field logbooks.

3.0 PROCEDURE

3.1 CALIBRATION

Calibration will be performed in the field daily before use according to manufacturer's specifications. The following parameters are calibrated to the following standards:

- Temperature—none required;
- Specific conductance—KCl or seawater standards;
- pH—pH 7 buffer plus a slope buffer;
- Dissolved oxygen—saturated air or saturated water;
- Redox—quinhydrone or transfer;
- Depth—set zero in air;
- Level—set zero in air; and
- Salinity—uses calibration for specific conductance.

3.2 OPERATION

1. Attach the cable to the transmitter.
2. Connect the other end of the cable to the display.
3. Press the On/Off key on the display panel. Allow a few seconds for the transmitter to start sending data to the display screen.
4. Calibrate the transmitter.
5. Deploy the sensor into a minimum of 4 in. of water.
6. Write data values from the display screen in the appropriate field logbook.

7. Retrieve sensor and clean the transmitter to prevent cross-contamination.
8. Move to the next sampling location. If travel time is great, turn off display by pressing On/Off key. Check condition of probes after each deployment.
9. Disconnect the transmitter when finished sampling for the day.

4.0 MAINTENANCE

Maintain according to specific manufacturer's specifications.

5.0 PRECAUTIONS

- Check condition of probes frequently between sampling; and
- Do not force pins into the connectors; note the keying sequence.

6.0 REFERENCES

Manufacturer's Handbook.

STANDARD OPERATING PROCEDURE 40.2
WATER LEVEL AND WELL-DEPTH MEASUREMENTS

1.0 SCOPE AND APPLICATION

The purpose of this standard operating procedure (SOP) is to delineate protocols for measuring water level and well depth. This procedure is applicable to the sampling of monitoring wells and must be performed before any activities that may disturb the water level, such as purging or aquifer testing.

2.0 MATERIALS

- Work Plans;
- Well construction diagrams;
- Field logbook;
- Photoionization detector (PID) or other monitoring instruments per site-specific health and safety plan;
- Decontamination equipment and supplies (SOP 80.1);
- Electric water level indicator (dipmeter) with cable measured at 0.01 ft increments;
- Oil-water interface probe (if non-aqueous phase liquid (NAPLs) are suspected to be present); and
- Plastic sheeting.

3.0 PROCEDURE

3.1 PRELIMINARY STEPS

1. Locate the well and verify its position on the site map. Record whether positive identification was obtained, including the well number and any identifying marks or codes contained on the well casing or protective casing. Gain access to the top of the well casing.
2. Locate the permanent reference mark at the top of the casing. This reference point will be scribed, notched, or otherwise noted on the top of the casing. If no such marks are present, measure to the top of the highest point of the well casing and so note this fact in field logbook. Determine from the records and record in the notebook the elevation of this point.
3. Record any observations and remarks regarding the completion characteristics and well condition, such as evidence of cracked casing or surface seals, security of the well (locked cap), and evidence of tampering.
4. Keep all equipment and supplies protected from gross contamination; use clean plastic sheeting. Keep the water level indicator probe in its protective case when not in use.

3.2 OPERATION

1. Sample the air in the well head for gross organic vapors by lifting the well cap only high enough for an organic vapor meter (PID or FID) probe to be entered into the well casing. This will indicate the presence of gross volatile contaminants as well as indicating potential sampler exposure.

2. Remove cap. Allow well to vent for 60–90 seconds. Resample headspace. Record both readings. If the second reading is lower than the first, use the second reading to determining whether respiratory protection will be required during subsequent water level and well depth determinations and sampling.
3. Note that all headspace sampling must be performed at arm's length and from the upwind side of the well if possible.
4. If NAPL contamination is suspected, use an interface probe to determine the existence and thickness of NAPLs.
    - Open the probe housing, turn the probe on, and test the alarm. Slowly lower the probe into the well until the alarm sounds. A continuous alarm indicates a NAPL, while an intermittent alarm indicates water. If a NAPL is detected, record the initial level (first alarm). Mark the spot by grasping the cable with the thumb and forefingers at the top of the casing. If a mark is present on the casing, use the mark as the reference point. If no mark is present, use the highest point on the casing as the reference point. Withdraw the cable sufficiently to record the depth.
    - Continue to slowly lower the probe until it passes into the water phase. Slowly retract the probe until the NAPL alarm sounds and record that level in the manner as described above.
    - Record the thickness of the LNAPL (see Section 3.3.1).
    - Continue to slowly lower the interface probe through the water column to check for the presence of DNAPL.
    - Measure and record the thickness of the DNAPL layer (if any) as described above.
    - Slowly raise the interface probe, recording the depth to each interface as the probe is withdrawn. If there is a discrepancy in depths, clean the probe sensors and re-check the depths.
    - NOTE: Air-liquid interface depth is more reliable if probe is lowered into liquid. NAPL-water depths are more accurate if probe is moved from water into NAPL.
    - Always lower and raise interface probe slowly to prevent undue mixing of media.
    - Always perform NAPL check in wells installed in areas with suspected NAPL contamination. Always perform NAPL check if headspace test reveals presence of volatiles. Always perform NAPL check the first time a well is sampled. If a well has been sampled previously and no NAPLs were present and none of the proceeding conditions are met, the NAPL check may be omitted.
5. If no NAPL is present, use an electronic water level detector as follows.
    - Remove the water level indicator probe from the case, turn on the sounder, and test check the battery and sensitivity scale by pushing the red button. Adjust the sensitivity scale until you can hear the buzzer.
    - Slowly lower the probe and cable into the well, allowing the cable reel to unwind. Continue lowering until the meter buzzes. Very slowly, raise and lower the probe until the point is reached where the meter just buzzes. Marking the spot by grasping the cable with the thumb and forefingers at the top of the casing. If a mark is present on the casing, use the mark as the reference point. If no mark is present, use the highest point on the casing as the reference point. Withdraw the cable and record the depth.
6. To measure the well depth, lower electric water level indicator probe or tape until slack is noted. Very slowly raise and lower the cable until the exact bottom of the well is "felt." Measure (cable) or read the length (tape) and record the depth.

7. Note that if the electric water level indicator is used to determine depth of well, the offset distance between the tip of the probe and the electrode must be added to the reading to determine actual depth.
8. Withdraw the probe or tape.
9. Decontaminate the probe(s) and cable(s), in accordance with SOP 80.1.

3.3 DATA RECORDING AND MANIPULATION

Record the following information in the field logbook and appropriate sampling forms:

- Date and time;
- Weather;
- Method of measurement;
- Casing elevation;
- NAPL surface elevation = casing elevation - depth to NAPL;
- Apparent measured LNAPL thickness = depth to bottom of NAPL - depth to top of NAPL;
- Water level elevation = casing elevation - depth to water; and
- Well bottom elevation = casing elevation - depth to bottom (or read directly from tape).

4.0 CALIBRATION

No calibration is required. Ensure operability of electric water level indicator by testing sounder before use.

5.0 PRECAUTIONS

- Depending upon the device used, correction factors may be required for some measurements;
- Check instrument batteries before each use; and
- Exercise care not to break the seals at the top of the electric water level indicator probe.

STANDARD OPERATING PROCEDURE 50.1
SAMPLE LABELS

1.0 SCOPE AND APPLICATION

Every sample will have a sample label uniquely identifying the sampling point and analysis parameters. The purpose of this standard operating procedure (SOP) is to delineate protocols for the use of sample labels. An example label is included as Figure 50.1-A. Other formats with similar levels of detail are acceptable.

2.0 MATERIALS

- Sample label; and
- Indelible marker.

3.0 PROCEDURE

The use of preprinted sample labels is encouraged and should be requested from the analytical support laboratory during planning activities.

As each sample is collected, fill out a sample label ensuring the following information has been collected:

- Project name;
- Sample ID: enter the SWMU number and other pertinent information concerning where the sample was taken. This information should be included in site-specific work plan addenda;
- Date of sample collection;
- Time of sample collection;
- Initials of sampler(s);
- Analyses to be performed (NOTE: Due to number of analytes, details of analysis should be arranged with lab *a priori*); and
- Preservatives (water samples only).

Double-check the label information to make sure it is correct. Detach the label, remove the backing and apply the label to the sample container. Cover the label with clear tape, ensuring that the tape completely encircles the container.

4.0 MAINTENANCE

Not applicable.

5.0 PRECAUTIONS

None.

STANDARD OPERATING PROCEDURE 50.2
SAMPLE PACKAGING

1.0 SCOPE AND APPLICATION

The purpose of this standard operating procedure (SOP) is to delineate protocols for the packing and shipping of samples to the laboratory for analysis.

2.0 MATERIALS

- Waterproof coolers (hard plastic or metal);
- Metal cans with friction-seal lids (e.g., paint cans);
- Chain-of-custody forms;
- Chain-of-custody seals (optional);
- Packing material;
- Sample documentation;
- Ice;
- Plastic garbage bags;
- Clear Tape;
- Zip-top plastic bags; and
- Temperature blanks provided by laboratory for each shipment.

3.0 PROCEDURE

1. Check cap tightness and verify that clear tape covers label and encircles container.
2. Wrap sample container in bubble wrap or closed cell foam sheets. Samples may be enclosed in a secondary container consisting of a clear zip-top plastic bag. Sample containers must be positioned upright and in such a manner that they will not touch during shipment.
3. Place several layers of bubble wrap, or at least 1 in. of vermiculite on the bottom of the cooler. Line cooler with open garbage bag, place all the samples upright inside the garbage bag and tie.
4. Double bag and seal loose ice to prevent melting ice from soaking the packing material. Place the ice outside the garbage bags containing the samples.
5. Pack shipping containers with packing material (closed-cell foam, vermiculite, or bubble wrap). Place this packing material around the sample bottles or metal cans to avoid breakage during shipment.
6. A temperature blank (provided by laboratory) will be included in each shipping container to monitor the internal temperature. Samples should be cooled to 4 degrees C on ice immediately after sampling.
7. Enclose all sample documentation (i.e., Field Parameter Forms, Chain-of-Custody forms) in a waterproof plastic bag and tape the bag to the underside of the cooler lid. If more than one cooler is being used, each cooler will have its own documentation. Add the total number of shipping containers included in each shipment on the chain-of-custody form.

8. Seal the coolers with signed and dated custody seals so that if the cooler were opened, the custody seal would be broken. Place clear tape over the custody seal to prevent damage to the seal.
9. Tape the cooler shut with packing tape over the hinges and place tape over the cooler drain.
10. Ship all samples via overnight delivery on the same day they are collected if possible.

4.0 MAINTENANCE

Not applicable.

5.0 PRECAUTIONS

5.1 PERMISSIBLE PACKAGING MATERIALS

- Non-absorbent
  - — Bubble wrap; and
  - — Closed cell foam packing sheets.
- Absorbent
  - — Vermiculite.

5.2 NON-PERMISSIBLE PACKAGING MATERIALS

- Paper;
- Wood shavings (excelsior); and
- Cornstarch "peanuts."

STANDARD OPERATING PROCEDURE 70.1
INVESTIGATION-DERIVED MATERIAL

1.0 SCOPE AND APPLICATION

Management of investigation-derived material (IDM) minimizes the potential for the spread of waste material onsite or offsite through investigation activities. The purpose of this standard operating procedure (SOP) is to provide general guidelines for appropriate management of potentially contaminated materials derived from the field investigations. Specific procedures related to the transportation and disposal of hazardous waste are beyond the scope of this SOP.

2.0 INTRODUCTION

Investigation derived material (IDM) consists of waste materials that are known or suspected to be contaminated with waste substances through the actions of sample collection or personnel and equipment decontamination. These materials include decontamination solutions, disposable equipment, drill cuttings and fluids, and water from groundwater monitoring well development and purging. To the extent possible, the site manager will attempt to minimize the generation of these materials through careful design of decontamination schemes and groundwater sampling programs. Testing conducted on soil and water investigation-derived material will show if they are also hazardous wastes as defined by RCRA. This will determine the proper handling and ultimate disposal requirements.

The criteria for designating a substance as hazardous waste according to RCRA are provided in 40 CFR 261.3. If IDM meet these criteria, RCRA requirements will be followed for packaging, labeling, transporting, storing, and record keeping as described in 40 CFR 262.34. Those materials that are judged potentially to meet the criteria for a regulated solid or hazardous waste will be placed in DOT-approved 55-gallon steel drums or another type of DOT approved container; based on waste characteristics and volume.

Investigation-derived material will be appropriately placed in containers, labeled, and tested to determine disposal options in accordance with RCRA regulations and Virginia Hazardous Waste Management Regulations.

3.0 INVESTIGATION-DERIVED MATERIAL MANAGEMENT

Procedures that minimize potential for the spread of waste material include minimizing the volume of material generated, material segregation, appropriate storage, and disposal according to RCRA requirements.

3.1 WASTE MINIMIZATION

In the development of work plan addenda, each aspect of the investigation will be reviewed to identify areas where excess waste generation can be eliminated. General procedures that will eliminate waste include avoidance of unnecessary exposure of materials to hazardous material and coordination of sampling schedules to avoid repetitious purging of wells and use of sampling equipment.

3.2 WASTE SEGREGATION

Waste accumulation and management procedures to be used depend upon the type of material generated. For this reason, IDM described below are segregated into separate 55-gallon storage drums or other appropriate DOT containers. Waste materials that are known to be free of potential hazardous waste contamination (such as broken sample bottles or equipment containers and wrappings) must be collected separately for disposal to municipal systems. Large plastic garbage or "lawn and leaf" bags are useful for collecting this trash. Even "clean" sample bottles or Tyvek should be disposed of with care. Although they are not legally a problem, if

they are discovered by the public they may cause concern. Therefore, items that are known to be free from contamination but are also known to represent "hazardous or toxic waste" to the public must not be disposed of in any public trash receptacle, such as found at your hotel or park.

3.2.1 Decontamination Solutions

Solutions considered investigation-derived materials range from detergents, organic solvents, and acids used to decontaminate small hand samplers to steam-cleaning rinsate used to wash drill rigs and other large equipment. These solutions are to be placed in 55-gallon drums with bolt-sealed lids or other appropriate DOT approved containers. Residual liquid IDM from decontamination pads will be removed and appropriately placed in container(s) at the end of each field day.

3.2.2 Soil Cuttings and Drilling Muds

Soil cuttings are solid to semi-solid soils generated during trenching activities or drilling for the collection of subsurface soil samples or the installation of monitoring wells. Depending on the type of drilling, drilling fluids known as "muds" may be used to remove soil cuttings. Drilling fluids flushed from the borehole must be directed into a settling section of a mud pit. This allows reuse of the decanted fluids after removal of the settled sediments. Drill cuttings, whether generated with or without drilling fluids, are to be removed with a flat-bottomed shovel and placed in 55-gallon drums with bolt-sealed lids or other appropriate DOT containers, as conditions or volume of IDM dictate.

3.2.3 Well Development and Purge Water

Well development and purge water is removed from monitoring wells to repair damage to the aquifer following well installation, obtain characteristic aquifer groundwater samples, or measure aquifer hydraulic properties. The volume of groundwater to be generated will determine the appropriate container to be used for accumulation of IDM.

For well development and purging, 55-gallon drums are typically an efficient container for accumulation. When larger volumes of water are removed from wells, such as when pumping tests are conducted, the use of large-volume portable tanks such as "Baker Tanks" should be considered for IDM accumulation.

Analytical data for groundwater samples associated with the well development and purge water will be used to assist in characterizing IDM and evaluating disposal options.

3.2.4 Personal Protective Equipment and Disposable Sampling Equipment

Personal protective equipment and clothing (PPE) may include such items as Tyvek coveralls, gloves, booties, and APR cartridges. Disposable sampling equipment may include such items as plastic sheeting, bailers, disposable filters, disposable tubing and paper towels. PPE and disposable sampling equipment that have or may have contacted contaminated media (soil, water, etc.) will be segregated and placed in 55-gallon drums separate from soil and water IDM. Disposition of this type of IDM will be determined by the results of IDM testing of the media in which the PPE and sampling equipment contacted.

3.3 MATERIAL ACCUMULATION

The IDM in containers must be placed in an appropriate designated RCRA container accumulation area at RFAAP, where it is permissible to accumulate such waste. IDM placed into a designated 90-day accumulation area will be properly sealed, labeled and covered. All drums will be placed on pallets.

A secure and controlled waste staging area will be designated by the installation prior the commencement of field sampling activities. Per the facility's requirements as a RCRA large quantity generator, waste accumulation cannot exceed 90 days for materials presumed or shown to be RCRA-designated hazardous wastes; waste which is known not to be RCRA-designated waste should be promptly disposed to municipal waste systems or appropriate facility.

3.3.1 IDM Accumulation Containers

Containers will be DOT-approved (DOT 17H 18/16GA OH unlined) open-head steel drums or other DOT approved container, as appropriate.

Container lids should lift completely off and be secured by a bolt ring (for drum). Order enough containers to accumulate all streams of expected IDM including soil, PPE and disposable sampling equipment, decontamination water, purge water, etc.

Solid and liquid waste streams will not be mixed in a container. PPE and expendable sampling equipment will be segregated from other IDM and placed in different containers than soil. Containers inside containers are not permitted. PPE must be placed directly in a drum not in a plastic bag.

Pallets are often required to allow transport of filled drums to the staging area with a forklift. Normal pallets are 3×4 ft and will hold two to three 55-gallon drums depending on the filled weight. If pallets are required for drum transport or storage, field personnel are responsible for ensuring that the empty drums are placed on pallets before they are filled and that the lids are sealed on with the bolt-tighten ring after the drums are filled. Because the weight of one drum can exceed 500 lbs, under no circumstances should personnel attempt to move the drums by hand.

3.3.2 Container Labeling

Each container that is used to accumulate IDM will be appropriately labeled at the time of accumulation and assigned a unique identification number for tracking purposes. The following information will be written in permanent marker on a drum label affixed on the exterior side at a location at least two-thirds of the way up from the bottom of the drum.

- Facility name.
- Accumulation start date and completion date.
- Site identifier information (SWMU, boring, well, etc.).
- Description of IDM.
- Drum ID No.

4.0 MATERIAL CHARACTERIZATION AND DISPOSAL

IDM will be characterized and tested to determine whether it is a hazardous waste as defined by 40 CFR Part 261 and to determine what disposal options exist in accordance with RCRA regulations and the Virginia Hazardous Waste Management Regulations (VHWMR).

In general, IDM will be considered a hazardous waste if it contains a listed hazardous waste or if the IDM exhibits a characteristic of hazardous waste.

Work plan addenda will identify the appropriate characterization and testing program for IDM based on the following:

- Site-specific conditions related to chemicals of concern, etc.
- The nature and quantity of expected IDM to be generated during site-specific investigations.
- Applicable Federal, State, and local regulations, such as RCRA, VHWMR regulations and policies and procedures, and Army Regulation 200-1.
- RFAAP specific requirements and policies for IDM characterization and disposal at the time of the investigation.

In general, appropriate USEPA SW 846 Test Methods for Evaluating Solid Waste will be used for testing IDM and will be specified in work plan addenda. Other appropriate test methods may be specified by RFAAP in addition to SW 846 Methods that are specific to installation operations, the site of interest (percent explosive content, reactivity, etc.), or requirements for disposal at RFAAP water treatment facilities or publicly owned treatment works.

Responsibility for the final disposal of IDM will be determined before field activities are begun and will be described in work plan addenda. Off-site disposal of IDM will be coordinated with RFAAP (generator) to ensure appropriate disposition. The contractor will coordinate IDM transportation and disposal activities for RFAAP (generator).

At the direction of RFAAP, appropriate waste manifests will be prepared by the USACE contractor or Alliant Techsystems subcontractor for transportation and disposal. Alliant Techsystems or other appropriate RFAAP entity will be listed as the generator and an appointed representative from RFAAP will review and sign the manifest for offsite disposal.

RFAAP will make the final decision on the selection of the transporter, storage, and disposal facility (TSDFs) or recycling facility. RFAAP will provide the contractor a listing of previously used TSDFs for priority consideration. Proposed facilities that are not included on the listing are required to provide a copy of the TSDFs most recent state or federal inspection to the installation. Waste characterization and testing results will be submitted to RFAAP (generator) for review and approval before final disposition of the material.

Hazardous waste: Prior to final disposition, a hazardous waste manifest will be furnished by the TSDF to accompany transport to the disposal facility. Following final disposition, a certificate of disposal will be furnished by the disposal facility. Copies of the manifests and certificates of disposal are to be provided to RFAAP and retained on file by the contractor or subcontractor.

4.0 PRECAUTIONS

- Because the weight of one drum can exceed 500 lbs, under no circumstances should personnel attempt to move drums by hand.
- Refer to the site-specific health and safety plan when managing IDM.

5.0 REFERENCES

Safety Rules for Contractors and Subcontractors, (As Updated). Alliant Techsystems, Incorporated, Radford Army Ammunition Plant.

STANDARD OPERATING PROCEDURE 80.1
DECONTAMINATION

1.0 SCOPE AND APPLICATION

Before leaving the site, all personnel or equipment involved in intrusive sampling or having entered a hazardous waste site during intrusive sampling must be thoroughly decontaminated to prevent adverse health effects and minimize the spread of contamination. Equipment must be decontaminated between sites to preclude cross-contamination. Decontamination water will be free of contaminants as evidenced through either chemical analyses or certificates of analysis. This standard operating procedure (SOP) describes general decontamination requirements for site personnel and sampling equipment. Decontamination procedures for contaminants requiring a more stringent procedure, e.g., dioxins/furans, will be included in site-specific addenda.

2.0 MATERIALS

- Plastic sheeting, buckets or tubs, pressure sprayer, rinse bottles, and brushes;
- U.S. Army Corps of Engineers or installation approved decontamination water source;
- Deionized ultra-filtered, HPLC-grade organic free water (DIUF);
- Non-phosphate laboratory detergent;
- Nitric Acid, 0.1 Normal (N) solution;
- Pesticide-grade solvent, Methanol;
- Aluminum foil;
- Paper towels;
- Plastic garbage bags; and
- Appropriate containers for management of investigation-derived material (IDM).

3.0 PROCEDURE

3.1 SAMPLE BOTTLES

At the completion of each sampling activity the exterior surfaces of the sample bottles must be decontaminated as follows:

- Be sure that the bottle lids are on tight.
- Wipe the outside of the bottle with a paper towel to remove gross contamination.

3.2 PERSONNEL DECONTAMINATION

Review the site-specific health and safety plan for the appropriate decontamination procedures.

3.3 EQUIPMENT DECONTAMINATION

3.3.1 Drilling Rigs

Drilling rigs and associated equipment, such as augers, drill casing, rods, samplers, tools, recirculation tank, and water tank (inside and out), will be decontaminated before site entry, after over-the-road mobilization and

immediately upon departure from a site after drilling a hole. Supplementary cleaning will be performed before site entry. There is a likelihood that contamination has accumulated on tires and as spatter or dust en route from one site to the next.

1. Place contaminated equipment in an enclosure designed to contain all decontamination residues (water, sludge, etc.).
2. Steam-clean equipment until all dirt, mud, grease, asphaltic, bituminous, or other encrusting coating materials (with the exception of manufacturer-applied paint) has been removed.
3. Water used will be taken from an approved source.
4. When cross-contamination from metals is a concern, rinse sampling components such as split spoons, geo-punch stems, and augers with nitric acid, 0.1N.
5. Rinse with DIUF water.
6. When semi-volatile and non-volatile organics may be present, rinse the sampling components with pesticide-grade solvent methanol.
7. Double rinse the sampling components with DIUF water.
8. Decontamination residues and fluids will be appropriately managed as IDM per work plan addenda and SOP 80.1.

3.3.2 Well Casing and Screen

Prior to use, well casing and screen materials will be decontaminated. This activity will be performed in the leak proof, decontamination pad, which will be constructed prior to commencement of the field investigation. The decontamination process will include:

- Steam cleaning with approved source water.
- Rinse with DUIF water.
- Air-dry on plastic sheeting.
- Wrap in plastic sheeting to prevent contamination during storage/transit.

3.3.3 Non Dedicated Submersible Pumps Used for Purging and Sampling

1. Scrub the exterior of the pump to remove gross (visible) contamination using appropriate brushes, approved water, and non-phosphate detergent (steam cleaning may be substituted for detergent scrub).
2. Pump an appropriate amount of laboratory detergent solution (minimum 10 gallons) to purge and clean the interior of the pump.
3. Rinse by pumping no less than 10 gallons of approved water to rinse.
4. Rinse the pump exterior with approved decontamination water.
5. When cross-contamination from metals is a concern, rinse the pump exterior with approved nitric acid 0.1N solution.
6. Rinse the pump exterior with DIUF water.
7. When semi-volatile and non-volatile organics may be present, rinse the pump exterior with pesticide-grade solvent methanol.
8. Double rinse the pump exterior with DIUF water.

9. Air-dry on aluminum foil or clean plastic sheeting.
10. Wrap pump in aluminum foil or clean plastic sheeting, or store in a clean, dedicated PVC or PTFE storage container.
11. Solutions and residuals generated from decontamination activities will be managed appropriately as IDM per work plan addenda and SOP 80.1.

3.3.4 Sample Equipment and Measuring Water Level Devices

1. Scrub the equipment to remove gross (visible) contamination using appropriate brush (es), approved water, and non-phosphate detergent.
2. Rinse with approved source water.
3. When cross-contamination from metals is a concern, rinse the sampling equipment with approved nitric acid 0.1N solution.
4. Rinse equipment with DIUF water.
5. When semi-volatile and non-volatile organics may be present, rinse the sampling equipment with pesticide-grade solvent methanol.
6. Double rinse the sampling equipment with DIUF water.
7. Air-dry on aluminum foil or clean plastic sheeting.
8. Wrap in aluminum foil, clean plastic sheeting, or zip top bag or store in a clean, dedicated PVC or PTFE storage container.
9. Solutions and residuals generated from decontamination activities will be managed appropriately as IDM per work plan addenda and SOP 80.1.

3.3.5 Other Sampling and Measurement Probes

Temperature, pH, conductivity, Redox, and dissolved oxygen probes will be decontaminated according to manufacturer's specifications. If no such specifications exist, remove gross contamination and triple-rinse probe with DIUF water.

4.0 PRECAUTIONS

- Manage IDM appropriately according to the requirements specified in work plan addenda.
- Follow appropriate procedures as specified in the site-specific health and safety plan.

USACE. 2001. Requirements for the Preparation of Sampling and Analysis Plans. EM 200-1-3. 1 February.

STANDARD OPERATING PROCEDURE 90.1
PHOTOIONIZATION DETECTOR (HNu Model PI–101 and HW–101)

1.0 SCOPE AND APPLICATION

The purpose of this standard operating procedure (SOP) is to delineate protocols for field operations with a photoionization detector (HNu Systems Model PI–101 or HW–101). The photoionization detector (PID) detects total ionizables; hence it is used to monitor both organic and inorganic vapors and gases to determine relative concentrations of air contaminants. This information is used to establish level of protection and other control measures such as action levels. The PID cannot effectively detect compounds having ionization potentials above the photon energy level of the lamp used; therefore, methane, which has an ionization potential of 12.98 eV, is undetectable by PIDs because the lamps produce 9.5, 10.2, or 11.7 eV.

Use of brand names in this SOP is in not intended as an endorsement or mandate that a given brand be used. Alternate equivalent brands of detectors, sensors, meters, etc., are acceptable. If alternate equipment is to be used, the contractor shall provide applicable and comparable SOPs for its maintenance and calibration.

2.0 MATERIALS

- HNu Systems Model PI–101 or HW–101 survey probe with 9.5, 10.2, or 11.7 eV lamp;
- Lead-acid gel-cell battery;
- Calibration gas (e.g., isobutylene, 101ppm) with regulator;
- Tygon tubing;
- Tedlar bag (optional);
- Instrument logbook; and
- Field logbook.

3.0 PROCEDURE

These procedures are to be followed when using the HNu in the field.

3.1 STARTUP

1. Before attaching the probe, check the function switch on the control panel to ensure that it is in the off position. Attach the probe by plugging it into the interface on the top of the readout module.
2. Turn the function switch to the battery check position. The needle on the meter should read within or above the green battery arc on the scale; if not, recharge the battery. If the red indicator light comes on, the battery needs recharging or service may be indicated.
3. Turn the function switch to any range setting. Listen for the hum of the fan motor. Check meter function by holding a solvent-based marker pen near the sample intake. If there is no needle deflection, look briefly into the end of the probe (no more than 1 or 2 sec) to see if the lamp is on; if it is on, it will give a purple glow. Do not stare into the probe any longer than 2 sec. Long-term exposure to UV light can damage the eyes. (See further information in Section 5.)
4. To zero the instrument, turn the function switch to the standby position and rotate the zero adjustment until the meter reads zero. A calibration gas is not needed since this is an electronic zero adjustment. If the span adjustment setting is changed after the zero is set, the zero should be rechecked and adjusted if

necessary. Allow the instrument to warm up for 3–5 min to ensure that the zero reading is stable. If necessary, readjust the zero.

3.2 OPERATIONAL CHECK

Follow the startup procedure in Section 3.1.

With the instrument set on the 0–20 range, hold a solvent-based marker near the probe tip. If the meter deflects upscale, the instrument is working.

3.3 FIELD CALIBRATION PROCEDURE

1. Follow the startup procedures in Section 3.1 and the operational check in Section 3.2.
2. Set the function switch to the range setting for the concentration of the calibration gas.
3. Attach a regulator HNu P/N 101-351 or equivalent (flow = 200 to 300 ml/min) to a disposable cylinder of isobutylene (HNu 101-351 or equivalent). Connect the regulator to the probe of the HNu with a piece of clean Tygon tubing. Turn on the valve of the regulator.
4. After 5 sec, adjust the span dial until the meter reading equals the benzene concentration of the calibration gas used, corrected to its equivalence, which should be marked on the canister (Isobutylene ~0.7X benzene).
5. Record in the field log the instrument ID No., serial No., initial and final span settings, date, time, location, concentration and type of calibration gas used, and the signature of the person who calibrated the instrument.
6. If the HNu does not function or calibrate properly, the project equipment manager is to be notified as soon as possible. Under no circumstances is work requiring monitoring with a PI–101 or HW–101 to be done with a malfunctioning instrument.

3.4 CALIBRATION TO A GAS OTHER THAN ISOBUTYLENE

The HNu may be calibrated to any certified calibration gas. However, after calibration, all subsequent instrument readings will be relative to the calibration gas used. General procedures include the following:

1. Calibrate according to procedure 3.3.
2. Partially fill and flush one-to-two times a gas bag (Tedlar recommended) with the certified National Institute of Standards and Technology (NIST) (formerly NBS) traceable calibration gas. Then fill the bag with 1 to 3L of the calibration gas. If the gas is toxic, this must be done in a fume hood.
3. Feed the calibration gas into the probe with the range set for the value of the gas. After 5 sec, adjust the span control until the meter reads the value of the calibration gas.
4. Record the results of the calibration on the calibration/maintenance log and attach a new calibration sticker (if available) or correct the existing sticker to reflect the new calibration data. All subsequent readings will be relative to the new calibration gas.

3.5 OPERATION

1. Follow the startup procedure, operational check, and calibration check (refer to Section 3.1).
2. Set the function switch to the appropriate range. If the concentration of gas vapors is unknown, set the function switch to 0-20 ppm range. Adjust if necessary.
3. Prevent exposing the HNu to excessive moisture, dirt, or contaminant while monitoring the work activity as specified in the Site Health and Safety Plan.

4. When the activity is completed, or at the end of the day, carefully clean the outside of the HNu with a damp disposable towel to remove all visible dirt. Return the HNu to a secure area and place on charge. Charge after each use; the lead acid batteries cannot be ruined by over charging.
5. With the exception of the probe's inlet and exhaust, the HNu can be wrapped in clear plastic to prevent it from becoming contaminated and to prevent water from getting inside in the event of precipitation. If the instrument becomes contaminated, make sure to take necessary steps to decontaminate it. Call the Equipment Administrator if necessary; under no circumstances should an instrument be returned from the field in a contaminated condition.

4.0 MAINTENANCE

Calibration/maintenance logs are to be filled in completely whenever a PI-101 or HW-101 receives servicing. This is true of both contractor-owned and rental instruments.

The equipment manager should be called to arrange for a fresh instrument when necessary. The contractor's equipment facility is responsible for arranging all repairs that cannot be performed by the project equipment manager.

4.1 ROUTINE SERVICE

The PID's performance is affected by a number of factors. These include but are not limited to the decay of the UV lamp output over time and the accumulation of dust and other particulate material and contaminates on the lamp and in the ion chamber. Because of these factors, the PID should not be left in the field for a period of more than 2 weeks before being replaced with a fresh instrument. If a site is going to be inactive for a period of more than a week, all monitoring instruments are to be returned to the project equipment manager or his trained designee for servicing and/or reassignment. The following procedures are to be performed at the designated intervals for routine service.

Procedure	Frequency
Operational check	Before use and at instrument return
Field calibration	Before use and at instrument return
Full calibration	Bi-weekly (return instrument to equipment manager for replacement with a fresh unit)
Clean UV lamp and	Bi-weekly or as needed ion chamber
Replace UV Lamp	As needed

4.1.1 UV Lamp and Ion Chamber Cleaning

During periods of analyzer operation, dust and other foreign materials are drawn into the probe forming deposits on the surface of the UV lamp and in the ion chamber. This condition is indicated by meter readings that are low, erratic, unstable, non-repeatable, or drifting and show apparent moisture sensitivity. These deposits interfere with the ionization process and cause erroneous readings. Check for this condition regularly to ensure that the HNu is functioning properly. If the instrument is malfunctioning, call your equipment manager to arrange to have a fresh replacement.

4.1.2 Lamp eV Change

If different applications for the analyzer would require different eV lamps, separate probes, each with its own eV lamp, must be used. A single readout assembly will serve for any of the probes (9.5, 10.2, and 11.7 eV). A change in probe will require resetting of the zero control and recalibrating the instrument. The 11.7 eV

lamp will detect more compounds than either of the two lower eV lamps. However, the 11.7 eV probe needs more frequent calibration; it burns out much faster than the lower eV lamps.

5.0 PRECAUTIONS

- The HNu PI–101 and HW–101 are designed to sample air or vapors only. *Do not allow any liquids or low boiling vapors to get into the probe or meter assembly.*
- High concentrations of any gas can cause erroneous readings. High humidity can also cause the instrument readings to vary significantly from the actual concentration of gases or vapors present. This is true even through the HNu cannot react to water vapor.
- High humidity, dust, and exposure to concentrations of low boiling vapors will contaminate the ion chamber, causing a steady decrease in sensitivity.
- Continued exposure to ultraviolet light generated by the light source can be harmful to eyesight. If a visual check of the UV lamp is performed *do not look at the light source from a distance closer than 6 inches with unprotected eyes.* Use eye protection (UV-blocking sunglasses or safety glasses). Only look briefly—never more than about 2 sec.
- Place the instrument on charge after each use; the lead batteries cannot be ruined by over charging.
- If at any time the instrument does not check out or calibrate properly in the field, the equipment manager is to be notified immediately and a replacement obtained for the malfunctioning instrument. Under no circumstances should fieldwork requiring continuous air monitoring for organic vapors and/or gases be done with a malfunctioning Hnu or without a HNu or an approved comparable instrument.

Log of Borehole 18SB3

Sheet 1 of 1

Date(s) Drilled	**August 12, 2009**	Logged By	**Rhoda Willis**	Reviewed By	**Tina Devine**
Drilling Method	**Direct Push Technology**	Drilling Contractor		Total Depth of Borehole	**8.0 feet**
Drill Rig Type	**Track-mounted Drill Rig**	Drill Bit Size/Type	**NA**	Ground Surface Elevation	**Not Available**
Groundwater Level(s)	**Groundwater was not encountered.**	Sampling Method	**4' Macrocore sampler with disposable acetate liner**	Hammer Data	**Continuous hydraulic pressure**
Borehole Backfill	**Unknown**	Comments			

Elevation, feet	Downhole Depth, feet	SAMPLES Type	SAMPLES Number	SAMPLES Recovery (feet)	SAMPLES PID (ppm)	Graphic Log	Lithologic Log (USCS Code)	MATERIAL DESCRIPTION	FIELD NOTES
	0							Grass surface over, 5YR 3/4 dark reddish brown, SILT, moist, (soft), non-plastic, no odor.	Soil sample 18SB3A was collected from 0-1 ft. bgs.
	2		1	4.0	0				
	4				0		ML	At 3.5 ft bgs becomes 7.5YR 6/6 reddish yellow SILT with trace sand and clay, (medium stiff).	
	6		2	4.0					Soil sample 18SB3B was collected from 5-7 ft. bgs.
	8							Boring terminated at 8.0 ft. bgs. August 12, 2009.

SWMU 51 GEOLOGIC CROSS SECTION (LINE 8 – LINE 8')

B.1 INTRODUCTION

SWMU 51 is located in the southeast section of the Horseshoe Area and adjacent to SWMU 30. Background information indicates that the site consists of a 20x200-ft trench that has been filled to grade, and is weed and grass covered. An unknown quantity of TNT neutralization sludge from the treatment of red water was disposed in this unlined trench in the 1970s, and an estimated 10 tons of red water ash was reportedly disposed in the trench from 1968 to 1972 (Dames & Moore, 1992). The trench is reported to be centrally located between two-adjacent trenches that are part of SWMU 30.

Surface geophysical surveys using two-dimensional resistivity profiling, seismic refraction tomography, and EM-31/34 terrain-conductivity mapping were performed at SWMU 51 during the time period of August through September 2002. Additional downhole seismic velocity measurements were collected in four monitoring wells adjacent SWMU 51 to help guide the seismic interpretations, and downhole electrical logging was collected by USACE New England District personnel to help constrain the resistivity models.

B.2 OBJECTIVE

The primary objective of the SWMU 51 surveys was to provide both the lateral and vertical extent of the former trench used for the TNT neutralization sludge disposal. Information obtained by the geophysical surveys will be used to develop the CSM and focus the proposed sampling activities to assess the nature and extent of TNT neutralized sludge disposed at SWMU 51.

B.3 TECHNICAL APPROACH

Site conditions are critical in assessing what geophysical techniques are appropriate for an investigation. SWMU 51 is underlain by carbonate rock (limestone and dolomite) that in places is structurally complex (folded and faulted) and contains clastic interbeds and tectonic breccias. Overburden sediments range from 0 to 60+ feet in thickness, and in landfill areas, the overburden may contain a considerable thickness (>10-ft) of red water ash, as well as other debris associated with dump activities.

Two-dimensional electrical resistivity imaging (2D-ERI), seismic refraction profiling/tomography, electromagnetic (EM) terrain-conductivity mapping are applicable techniques that can map changes in the electrical (2D-ERI and EM) and acoustic (seismic) characteristics of the underlying soil and rock. **Appendix B-2** describes in more detail the theory and operation of these methods.

In general, the underlying rock should have a higher seismic-velocity than the overburden sediment, and should be readily distinguishable on the resulting tomographic sections. A decrease in seismic velocity will occur where the rock is fractured (weak zones), less competent, or dominated by void and cavity development.

The electrical response of the rock is more complex and depends on the type of strata present and the electrical properties of the pore fluid. Higher electrical-resistivity should occur if carbonate rock is present, though the presence of an electrically conductive pore-fluid, or a significant clay fraction, could alternately yield lower-resistivities than expected. Air-filled fractures and voids would likely increase the electrical resistivity.

The trench work within the overburden sediment is expected to produce a zone of slightly lower seismic-velocity and lower electrical resistivity. In addition, the presence of waste material and degradation products may also lower the electrical response in the vicinity of the trench. Metallic debris deposited within the trench will also have a significant electromagnetic response during the EM surveys.

B.4 GEOPHYSICAL SURVEYS

Geophysical surveys for SWMU 51 consisted of 3 seismic-refraction profiles, 4 two-dimensional resistivity (2D-ERI) profiles, and one EM grid **(Figure B-1)**. Also shown on Figure 1 are the locations of the main boundary fence for SWMU 30, the interior fence outlining the TNT sludge disposal trench, and the areal coverage provided by the EM grid (~33 ft major survey lines are shown). Two of the profiles (L-2 and L-3) were collected parallel to the long axis of the trench, and the other two profiles (L-1 and L-4) were collected perpendicular to the long axis.

B.4.1 Geophysical Profiling (Seismic and Resistivity)

Both seismic and two-dimensional resistivity data (2D-ERI) were collected along profiles L-1, L-2, and L-4, and only a resistivity survey was conducted along Profile L-3. Each profile was extended beyond the fence boundaries in order to verify whether or not the fenced area truly marks the limits of the TNT sludge disposal trench. Profile L-4 was also extended further to the west and outside the limits SWMU 30 fence to allow contrasting presumed natural conditions with the geophysical response within SWMUs 30 and 51.

Resistivity data were collected using both Schlumberger and dipole-dipole array surveys (see **Appendix B-3** for further explanation). Use of both array types allows discerning whether observed anomalies are modeling or data collection artifacts, and more credence is given to the results where models constructed from both array types show similar features.

The seismic data were processed using both refractor-layer (earth-layer) and tomographic models. Earth-layer models provide discreet boundaries between horizontal zones (layers) of different seismic velocity, and are limited to a single velocity per model layer. Tomographic models do not have this restriction, and attempt to show both horizontal and vertical changes in velocity. The tomographic cross-section was developed using several different velocity models including the earth-layer solution. Modeling generally resolved into similar solutions, of which one is shown for each profile.

The resistivity and seismic results are presented as color-contoured cross-sectional models with magenta-to-blue colors representing lower values, and red-to-white colors higher values. The same color-contour scheme is used throughout for all four profiles to allow a direct comparison of anomaly magnitudes. For each profile, three model panels are shown, with the upper two panels representing the dipole-dipole and Schlumberger array results, and the bottom panel the seismic refraction results. The seismic model for Profile L-2 is used as comparison with the resistivity data collected on Profile L-3. Also shown on each panel, are the intersecting points of cross-lines, the refractor-layer seismic model (orange trace lines), and the relative position of the SWMU 51 fence (magenta rectangle near ground surface labeled as the “SWMU 51 fenced area”).

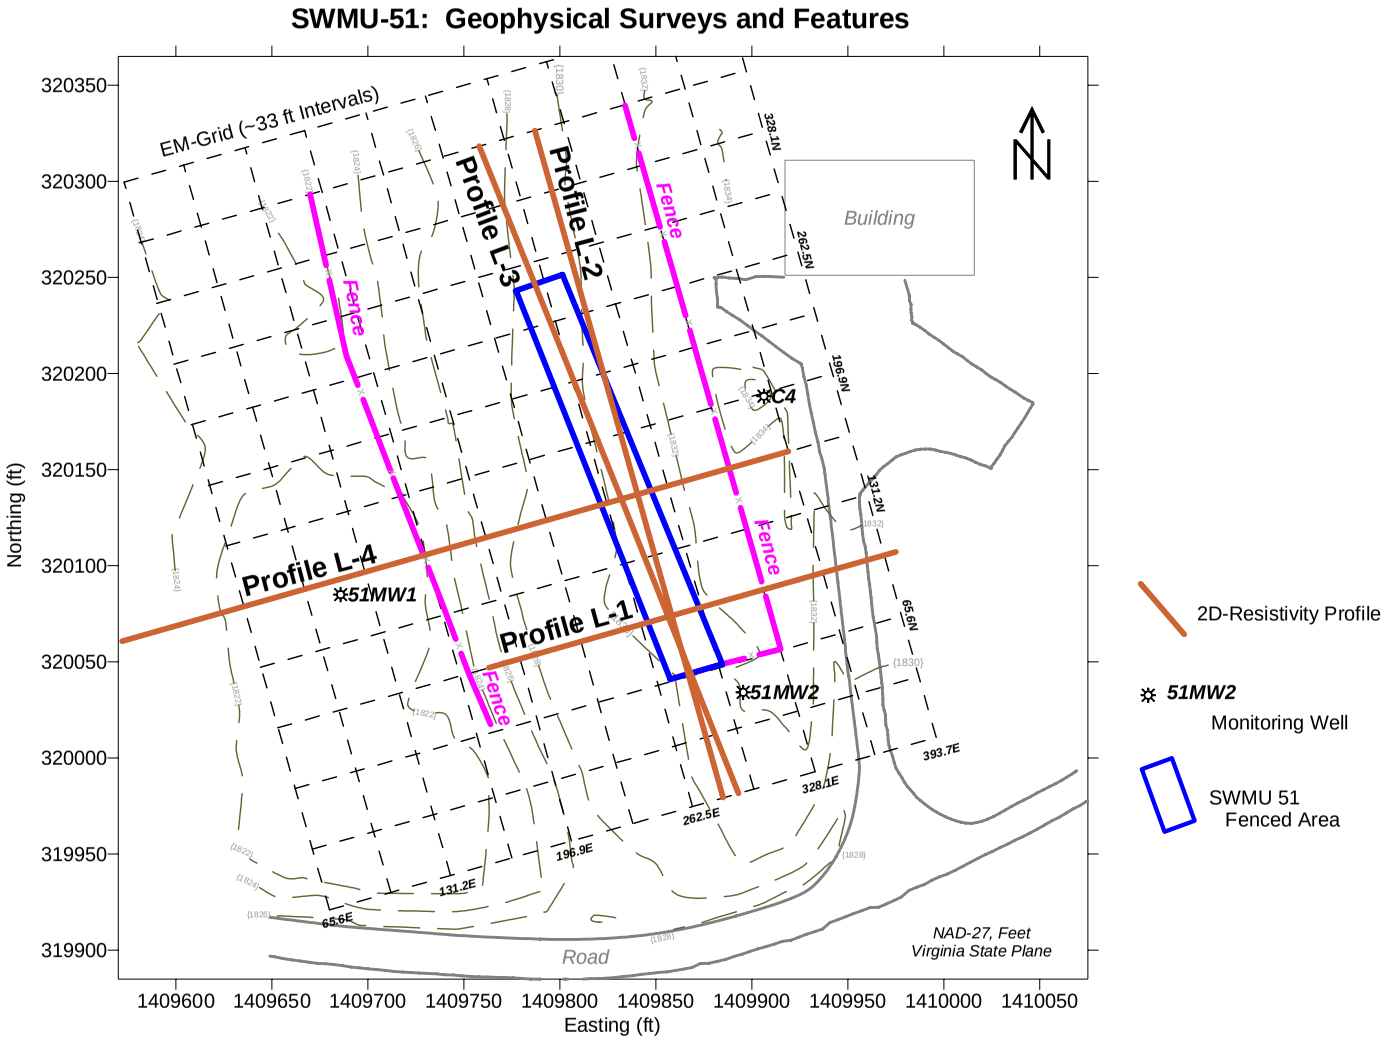

Figure B-1. Base Map for SWMU 51.

Profile L-1

Profile L-1 was acquired along a WSW-ENE transect near the southern end of the SWMU 51 area, along a line perpendicular to the long axis of the TNT trench (**Figure B-1**). Both 2D-ERI and seismic surveys were collect on this profile. The resistivity survey used an electrode spacing of 6.56 ft (2 m) and a total of 28 electrodes, and the seismic profile used a single array of 48 geophones spaced at a 3.28ft (1 m) interval. The resulting geophysical models are shown in **Figure B-2**.

A distinct zone of low-resistivity (<80 ohm-m) is present on the 2D-ERI models (upper 2 panels) of **Figure B-2**. The lateral extent of this low-resistivity zone coincides roughly with the area bounded by the SWMU 51 fence (264X to 292X on the profile). Low-resistivities within this zone are tentatively interpreted as waste and/or waste byproduct resulting from activities at SWMU 51. Depth to top of this low-resistivity zone ranges from 5 to 7 ft below ground surface (bgs), with the shallower depth-to-top near the western and eastern edges of this feature. The base of the low-resistivity occurs at approximately 16 ft bgs, giving 9-11 ft in total thickness.

Material of higher resistivity caps the low-resistivity zone, and is interpreted to correlate with the blocky (cobbles) rubble observed on the ground surface during data collection. Note also that a zone of low-to-moderate resistivity (100-300 ohm-m) occurs in the upper 10 ft of the subsurface in the approximate position of one of the SWMU 30 trenches (profile coordinates 212-250X).

The short length of the resistivity profile was not able to resolve the overburden-bedrock interface. The bedrock surface is approximately 1,780 ft in elevation near well 51MW2, and ~1,782 ft beneath well 51MW1.

A three-layer solution was used to construct the earth-layer model for Profile L-1 using seismic velocities of 400, 700, and 2,000 m/s. The tomographic solution yielded a slightly different set of average velocities (550, 970, 1,550 m/s) for the same range of depths on the earth layer model.

The uppermost refractor surface indicates a broader area of lower velocity material than that indicated by the SWMU 51 fenced area (and corresponding resistivity anomaly). This surface deepens to approximately 15 ft bgs immediately west of the SWMU 51 fence. The tomography model also depicts a zone of low seismic velocity (stippled pattern of velocity less than 450 m/s). The low-velocity zone, however, is much broader than the resistivity anomaly (and location marked by the fence), and extends in depth to approximately the top of the low-resistivity anomaly (base of cap material). The most likely interpretation is that this low-velocity zone is a result of backfilling and capping, and not representative of the waste material within the trench.

The lowermost refractor surface likely corresponds to an interface above the bedrock surface. Note that well 51MW2 (50 ft to the south) places the bedrock approximately 8-to-10 ft deeper than this refractor. The highest velocities observed on tomographic model for Profile L-1 are significantly lower (1,800 m/s versus 2,400-2,700 m/s) than seismic velocities observed for the bedrock on the other three profiles.

Profile L-2

Profile L-2 was collected along a transect sub-parallel to the long axis of the SWMU 51 fenced area, along the 278E axis line of the EM grid **(Figure B-1)**. Both 2D-ERI and seismic

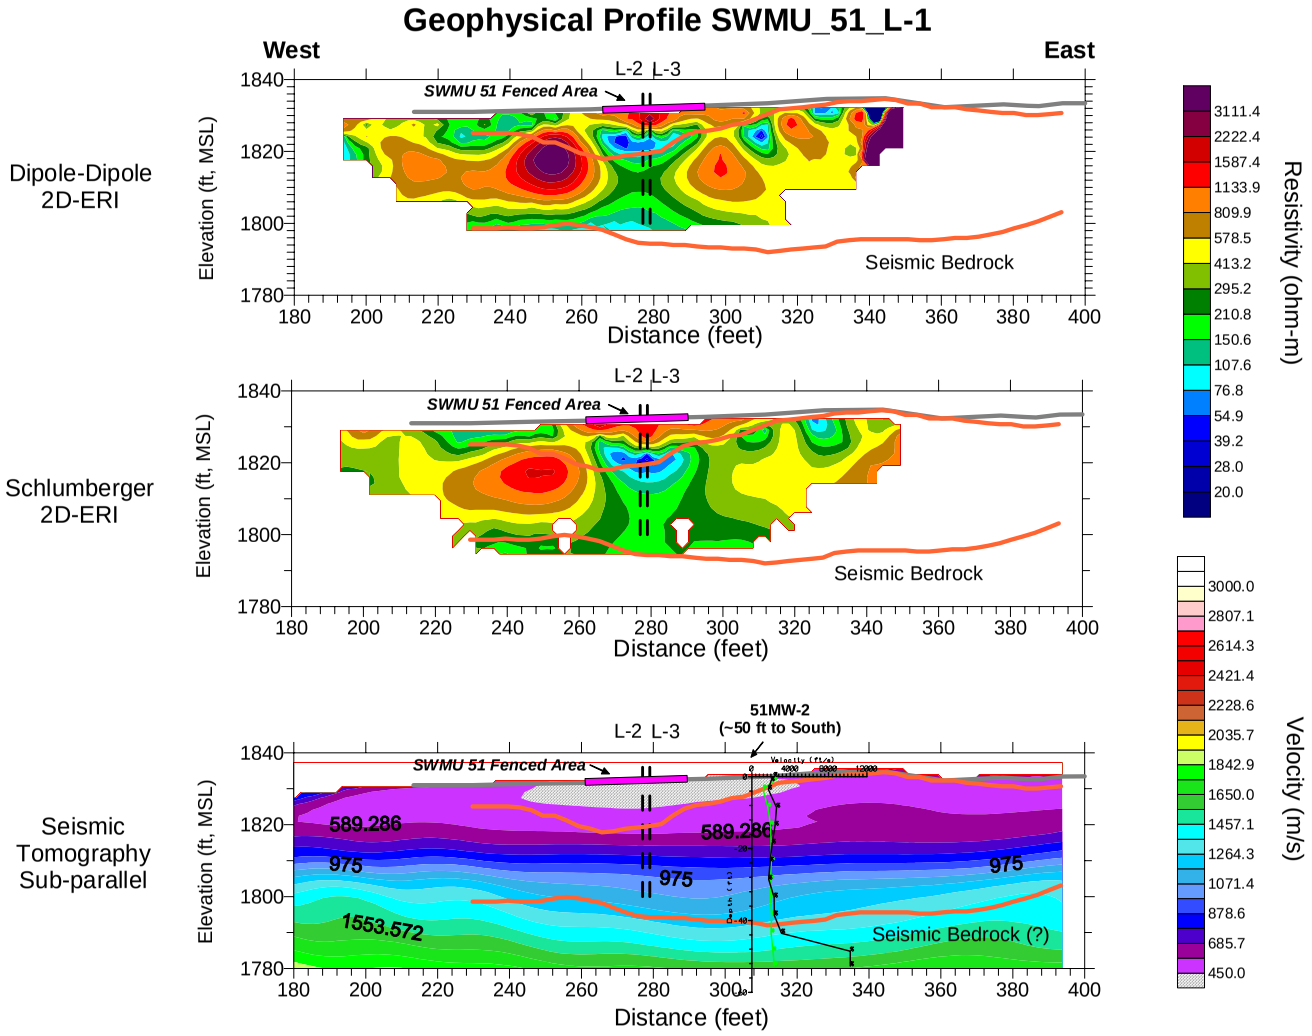

Figure B-2. Geophysical Results for Profile L-1

data were collected. The resistivity survey used an electrode spacing of 13.12 ft (4 m) and a total of 28 electrodes. The seismic profile used two adjacent spreads of 48 geophones spaced at a 3.28 ft (1 m) interval. The resulting geophysical models are shown in **Figure B-3**.

Both resistivity models (upper two panels, **Figure B-3**) show a zone of low-resistivity (<80 ohm-m) extending from 100X to 205X. The electrical response of this zone is interpreted to be caused by the waste and/or waste byproduct based on its position relative to the SWMU 51 fence area (note that Profile L-2 exits the fence enclosure approximately three-quarters the length of the N-S fence length) and similarity to responses observed on the other three profiles. The top of this feature ranges from 6-9 ft bgs and the base from 16 to 21 ft bgs, with a general deepening towards the north. The Schlumberger model (middle panel) does not provide a sharp boundary for the base of this anomaly, but instead models a zone of intermediate resistivity (100-300 ohm-m) immediately beneath the suspected location of the trench.

A three-layer model was used to construct the earth-layer solution for Profile L-2. Layer velocities are higher than that indicated for L-1, and are (top to bottom) 521, 1,046, and 3,035 m/s. The resulting tomographic solution yielded overburden velocities consistent with the earth-layer model, but with a lower bedrock velocity (2,421 m/s).

The uppermost refractor surface exhibits a slight depression in the vicinity of the trench, but the tomographic solution models this interface as a horizontal surface. A distinct zone of low velocity (<450 m/s, stippled area), with a thickness of 5-6 ft, is modeled over the southern two-thirds of the resistivity defined trench location. The upper refractor surface appears to approximate the base of the low-resistivity anomaly within the central part of the profile (150X), but is more likely corresponding to natural changes in subsurface conditions. As with the L-1 Profile, the L-2 seismic data cannot be used to resolve the waste thickness within the SWMU 51 trench.

The top of bedrock, as defined by the earth-layer model, is interpreted as a relatively flat surface ranging approximately 55-60 ft in depth, and with a slight rise to 50 ft bgs near profile coordinate 80X. The corresponding tomographic model images the bedrock as a horizontal surface at approximately 60 ft in depth. A slight decrease in velocity is observed in the bedrock between profile coordinates 50X and 90X.

Profile L-3

Profile L-3 was collected along the long axis of the SWMU 51 fenced area, extending approximately 66 ft to the south of the fenced area and 70 ft to the north. Only resistivity data were collected using 56 electrodes at a spacing of 6.56 ft (2m), which provided a line length of 360.9 ft (110 m). It was hoped that the finer electrode spacing and co-linearity with the trench's long axis would yield a better definition of the trench boundaries. The resulting dipole-dipole and Schlumberger array models are shown in **Figure B-4** (upper two panels), and the seismic model results for Profile L-2 (lower panel) are shown for comparison.

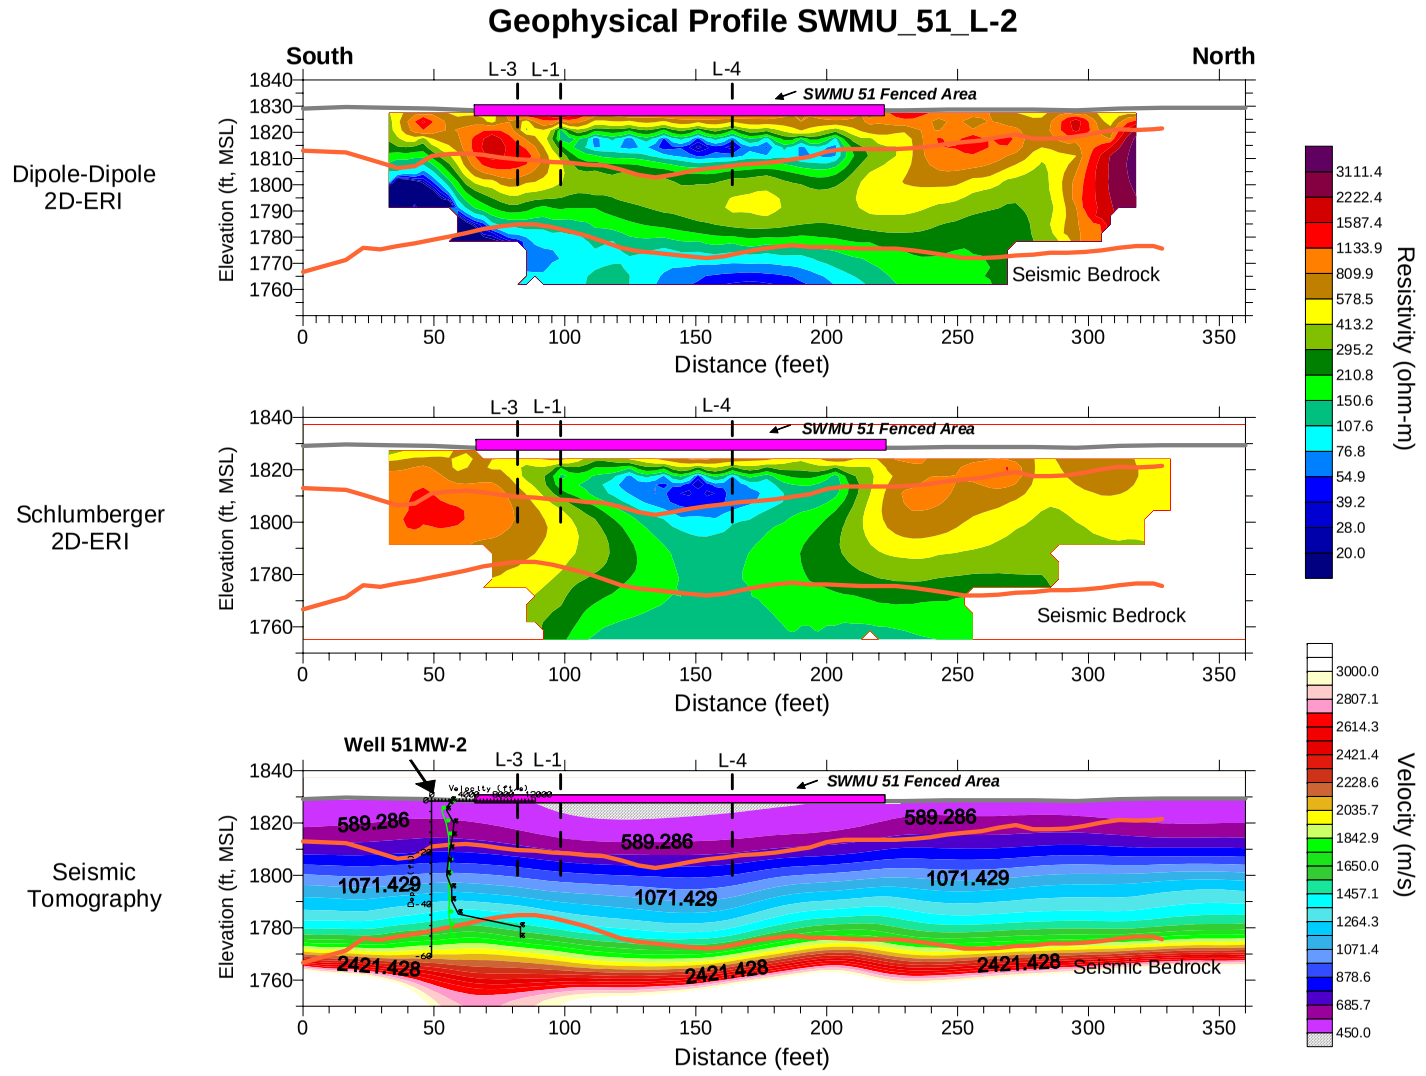

Figure B-3. Geophysical Results for Profile L-2

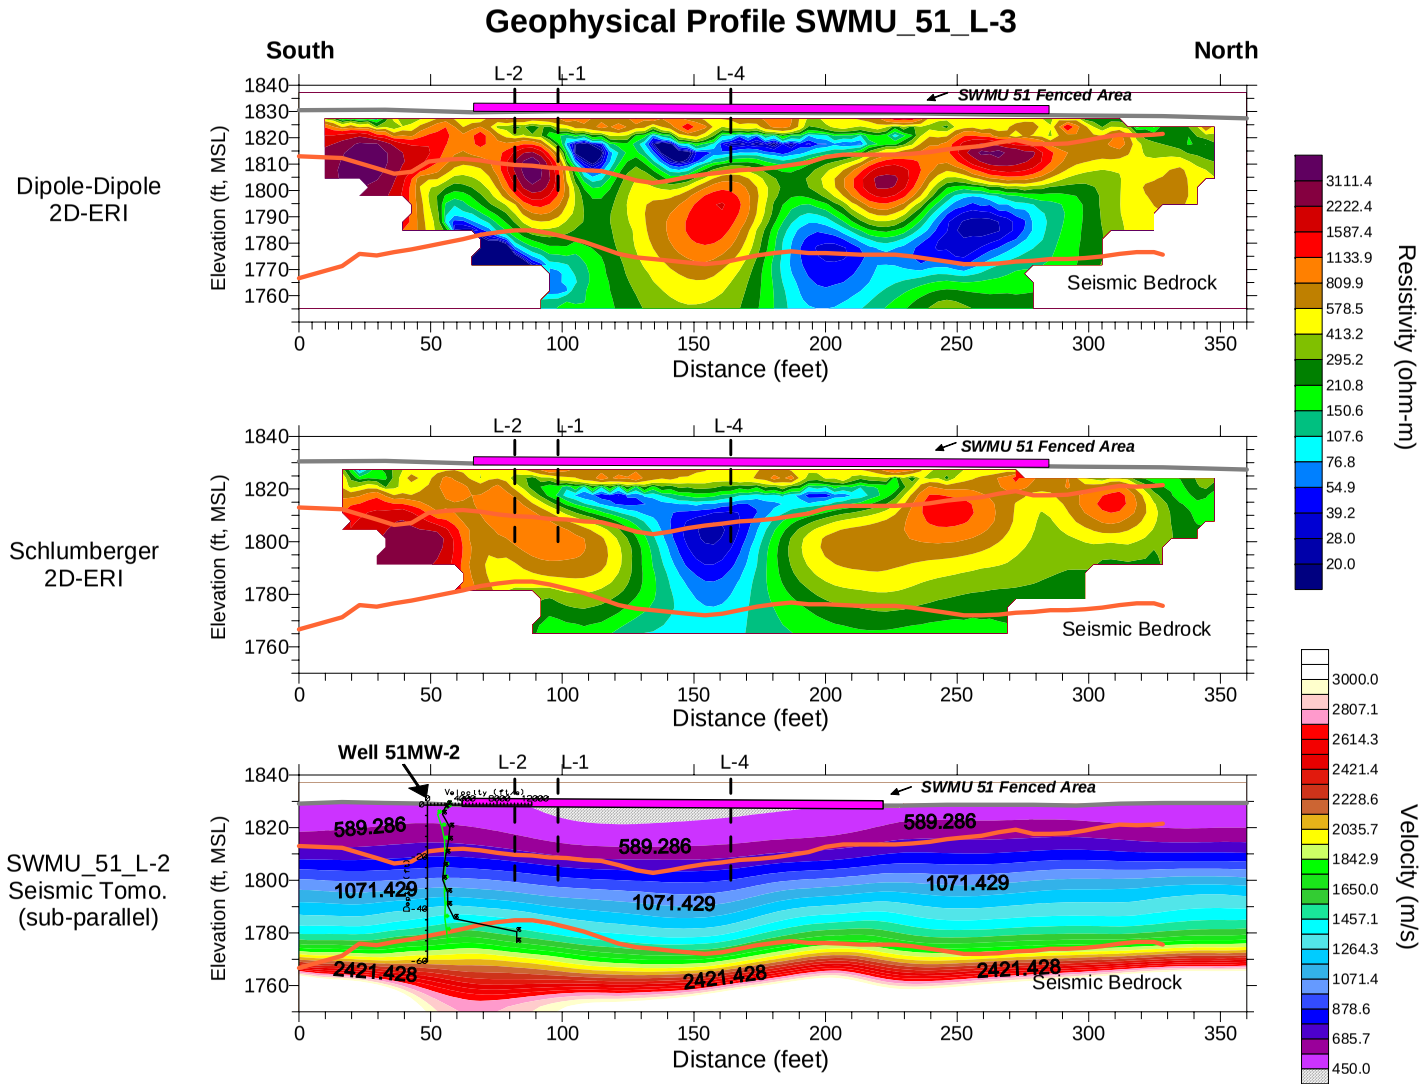

Figure B-4. Geophysical Results for Profile L-3

The resistivity models depict a zone of low-resistivity (<80 ohm-m) between profile coordinates 90X to 225X, with a depth to top ranging from 7-to-9 ft bgs and depth-to-base from 15-to-25 ft (average is approximately 18 ft bgs). Following interpretations for Profiles L-1 and L-2, this low-resistivity zone is probably the electrical response of the waste and/or waste byproduct. The dipole-dipole model indicates less lateral continuity in the trench, exhibiting a break in the low-resistivity near profile coordinate 120X. This low-resistivity zone extends to its greatest depth immediately adjacent to this break. The Schlumberger model does not resolve the base of this anomaly in the central part of the profile, although the upper refractor of the L-2 seismic model appears to mimic the base of the low-resistivity zone.

Other zones of low-resistivity are modeled by the dipole-dipole data near the southern end and northern third of the SWMU 51 fenced area. The Schlumberger model does not image these same features suggesting that they are most likely modeling artifacts.

Profile L-4

Profile L-4 was collected on a line perpendicular to the long axis of the trench along EM grid axis 164N. The profile was extended to the west so that well 51MW1 could be used to help guide the interpretation, and so the electrical and seismic character of the "undisturbed" area west of SWMU 30 could be used as a contrast. The resistivity data were collected with 56 electrodes at a spacing of 6.56 ft (2 m), providing a profile length of approximately 360 ft. Two adjacent spreads of 48 geophones, spaced at 3.28 ft (1m) intervals, were used for seismic data collection. The resulting geophysical models are shown in **Figure B-5**.

A distinct, low-resistivity anomaly (<80 ohm-m) is centered beneath the SWMU 51 fenced area, located between profile coordinates 265X and 280X. The depth-to-top of this anomaly is approximately 7 ft, and the depth-to-bottom, though not fully resolved, is estimated at approximately 20 ft. This depth estimate is based on the Schlumberger model at the point where the upper seismic refractor crosses the base of the low-resistivity anomaly. Note that unlike the results for the other three profiles, the dipole-dipole array did not resolve the base of the low-resistivity zone.

Two other zones of low-resistivity are present at depth to the west of the SWMU 51 fenced area. The zone of low-resistivity occurring between coordinates 170X and 200X is interpreted to correlate with the SWMU 30 trenches. The source for the furthest west zone of low-resistivity is not known, but may be due to the general decrease in resistivity observed near the overburden-bedrock interface.

The seismic model for Profile L-4 (bottom panel **Figure B-5**) shows a relatively flat bedrock surface, and a broad area of lower velocity underlying SWMU 30 and SWMU 51. A three-layer solution was required for the earth-layer model, using velocities of 500, 800, and 2,550 m/s. The tomographic model yielded similar velocities (550, 878, and 2,421 m/s) for equivalent depth ranges. A zone of low-velocity (<450 m/s) is modeled by the tomographic solution as a broad swale underlying the SWMU 51 fenced area. The base of this low-velocity zone corresponds with the top of the low-resistivity anomaly, suggesting that this is related to the cap and/or backfill material.

B.4.2 EM-31 and EM-34 Conductivity Surveys

Electromagnetic (EM) surveys were performed in the grid area shown on **Figure B-1** with the objective of mapping the lateral extent of the SWMU 51 trench, and to determine

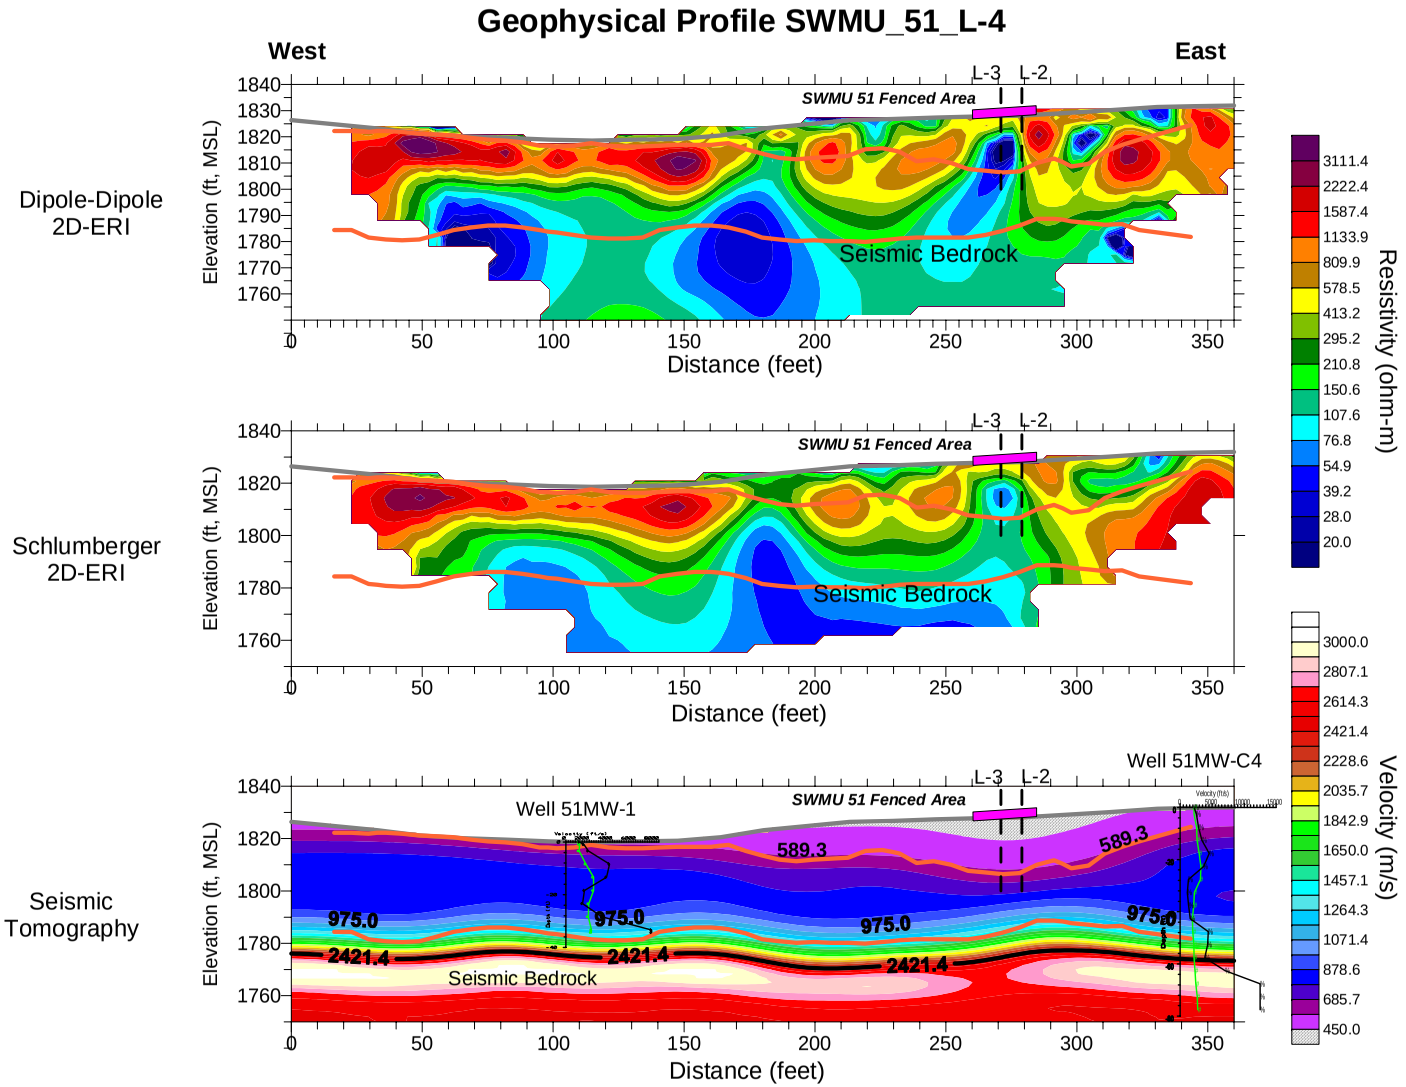

Figure B-5. Geophysical Results for Profile L-4

whether a significant quantity of metallic debris has been buried. It was expected that the activities involved in the construction of and disposal within the trench would alter the subsurface electrical properties, yielding a distinguishable anomalous area associated with the trench. Prior to performing the surveys, the barbed wire fence enclosure surrounding SWMU 51 was removed to the extent practicable, with only the corner fence posts and possibly some rusted fencing material within the vegetation at the site remaining in place.

Both the EM-31 and EM-34 terrain-conductivity meters were used to collect EM measurements at SWMU 51 (see **Appendix B-3** for a further description). EM-31 measurements were collected along profiles spaced at 8 ft (2.5 m) in the approximate north-south direction and along profiles spaced at 33 ft (10 m) in the approximate east-west direction. Both quad-phase (electrical-conductivity) and inphase (percent metals) data were collected with the EM-31. EM-34 surveys were collected along profiles spaced at 33 ft (10 m) in the approximate north-south direction, and along 66 ft (20 m) spaced profiles in the approximate east-west direction (except for profiles along 164E and 328.1E, which were excluded to reduce interference from the SWMU 30 fence lines). The EM-34 collects only quad-phase (electrical conductivity) data.

EM measurements reflect a weighted average with greater weight given to shallower depths. The EM-31 was operated in the vertical dipole mode, and 80% of the measured response correlates with the upper 10 ft (3 m) of subsurface material, with the peak response occurring in the 1.6 to 8.2 ft (0.5-2.5 m) depth range. The EM-34 meter was operated in the horizontal dipole mode using a coil spacing of 66 ft (20 m), which resulted in 80% of the response (also peak response) coming from the upper 33 ft (10 m) of subsurface material.

Figure B-6 shows the conductivity anomaly map constructed from the EM-31 survey. Red-to-white colors indicate areas of relatively higher electrical conductivity, whereas blue-to-magenta colors areas of lower conductivity. The locations of the 4 geophysical profiles are shown as heavy brown lines, and the interpreted area of the trench (from 2D ERI profiles) as a crosshatched region. Site features including roads, fences, wells, and ground-surface topography are also shown. Some of the EM-31 data were not included in construction of the map due to their proximity to the fence lines. Natural or background conditions are inferred on **Figure B-6** for the western side of the grid (west of the fence line) where conductivity values range from 5-to-7 mS/m.

The high conductivity anomalies (>12 mS/m) located to the west of Profile L-3, and north of Profile L-1 (grid area: 99N-to-396N; 164E-to-260E), are most likely related to one or more of the SWMU 30 disposal trenches. Another zone of high conductivity parallels the easternmost fence line, and may be related to another SWMU 30 trench. Profile data collected within 10 ft of this easternmost fence were excluded from the plot, and thus the observed anomalous character cannot fully be due to the fence. Note that the original description of SWMU 51 cites that the neutralization sludge trench lies between two adjacent SWMU 30 trenches, supporting this interpretation of the EM-31 plot.

Inspection of the EM-31 anomaly map reveals a slight increase in conductivity within the southern two-thirds of the SWMU 51 fenced area. This increase, related to changes in electrical properties within the upper 10 ft (3 m) at the site, is approximately 1-2 mS/m higher than background levels, and is roughly coincident with the trench area defined by the resistivity profiles. All four resistivity profiles indicate an electrically conductive zone from 5-9 ft bgs, which is near the practicable depth limits of the EM-31 instrument.

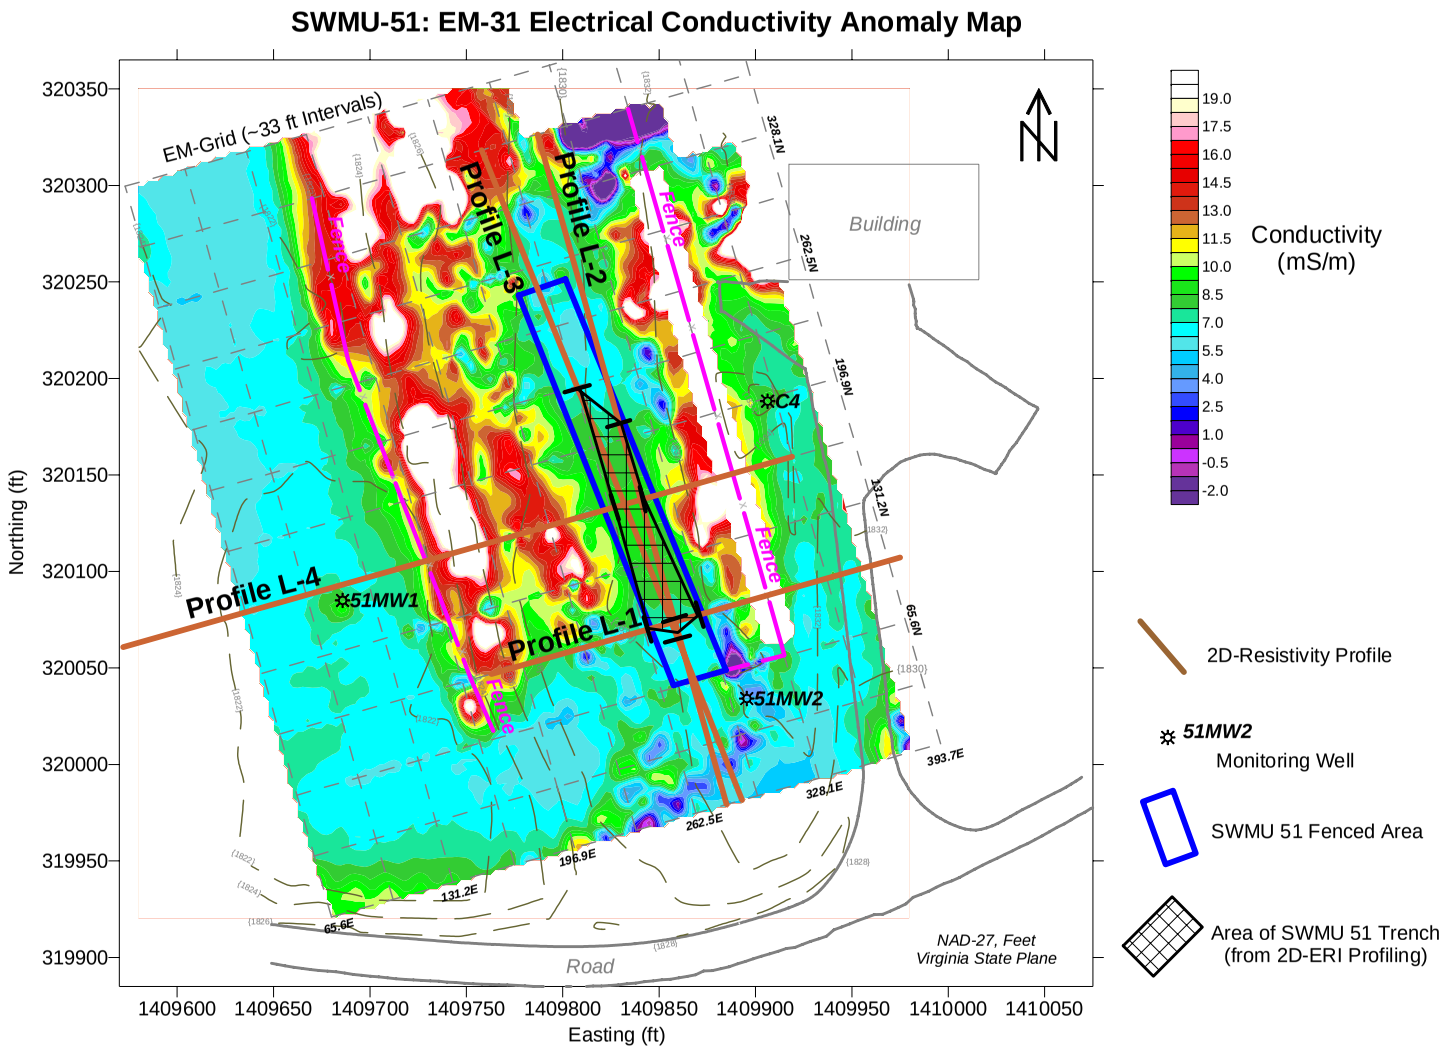

Figure B-6. EM-31 Conductivity Anomaly Map

In-phase (metals) data were collected concurrently with the EM-31 conductivity data, and the resulting anomaly map is shown in **Figure B-7**. No metal response is indicated in the areas west, south, and east of the SWMU 30 fence (outer fence lines). No metal (other than a couple fence posts at the inner fence corners) was detected within the fenced boundary of SWMU 51 (blue outlined rectangle). Metal related anomalies associated with other site activities were detected to the west, north, and east of SWMU 51 corresponding with anomalous areas shown on the conductivity plot **(Figure B-6)**.

The EM-34 conductivity anomaly map is shown in **Figure B-8** using the same color scale as that used in **Figure B-6** (EM-31 conductivity). The relatively higher "background" conductivity (8-10 mS/m vs. 5-7 mS/m) is interpreted to result from the EM-34 sampling to a greater depth, and thus including presumably wetter soils in the measurement (depth to bedrock is great enough to have little impact on the EM measurements).

An area of increase in conductivity (~4 mS/m) is observed within the southern two-thirds of the SWMU 51 fenced area. This relative high area is in the approximate location as a conductivity increase observed in the EM-31 data, though of greater relative magnitude. Therefore, it is likely that the conductive material (possibly the waste itself or leached material) delineated by the EM surveys extend to depths greater than 10 ft (~3 m). The north-south extent of this anomaly is less than the areal coverage indicated by the 2D-ERI profiles (crosshatched polygon). Other areas of high-conductivity, the grid area between 164E-260E, 99N-230N, and those north of grid 250N are most likely related to the trenches of SWMU 30.

B.5 SUMMARY

Seismic refraction profiling, two-dimensional electrical-resistivity imaging (2D-ERI), and electromagnetic terrain-conductivity surveying were conducted at SWMU 51 in order to delineate the boundaries of the disposal trench. The geophysical data suggest that the SWMU 51 related trenching and disposal is contained within the current SWMU 51 fence, and restricted to the southern two-thirds of the fenced area.

Seismic refraction tomography mapped a low-velocity zone interpreted to be due to the capping or backfilled material, but did not map the base of the trench. Earth-layer models constructed for the profiles indicate an intra-overburden increase in velocity, which occurs near the base of the trenching, and may indicate a maximum boundary for trenching. No significant structural features were indicated for the bedrock, and top-of-bedrock was mapped as a relatively horizontal surface.

2D-ERI profiling modeled a zone of low-resistivity (<80 ohm-m) underlying the SWMU 51 fenced area. The source for the low-resistivity is interpreted to be either the waste or waste byproducts (leachate or leached material). Depth-to-top of this low-resistivity zone ranged from 5-9 ft bgs, and averaged 6-7 ft bgs. Therefore it is argued that the waste material deposited in the SWMU 51 trench is at least 5 ft bgs.

Depth to the true base of waste is the issue. The resistivity data indicate a range of 15-to-25 ft bgs for the base, though it is possible that a downward migration of leachate (or leached material) has increased thickness of the low-resistivity zone, thus overstating the thickness of the waste. At best, the base of the low-resistivity zone can serve as an upper boundary for estimating the thickness of the waste material.

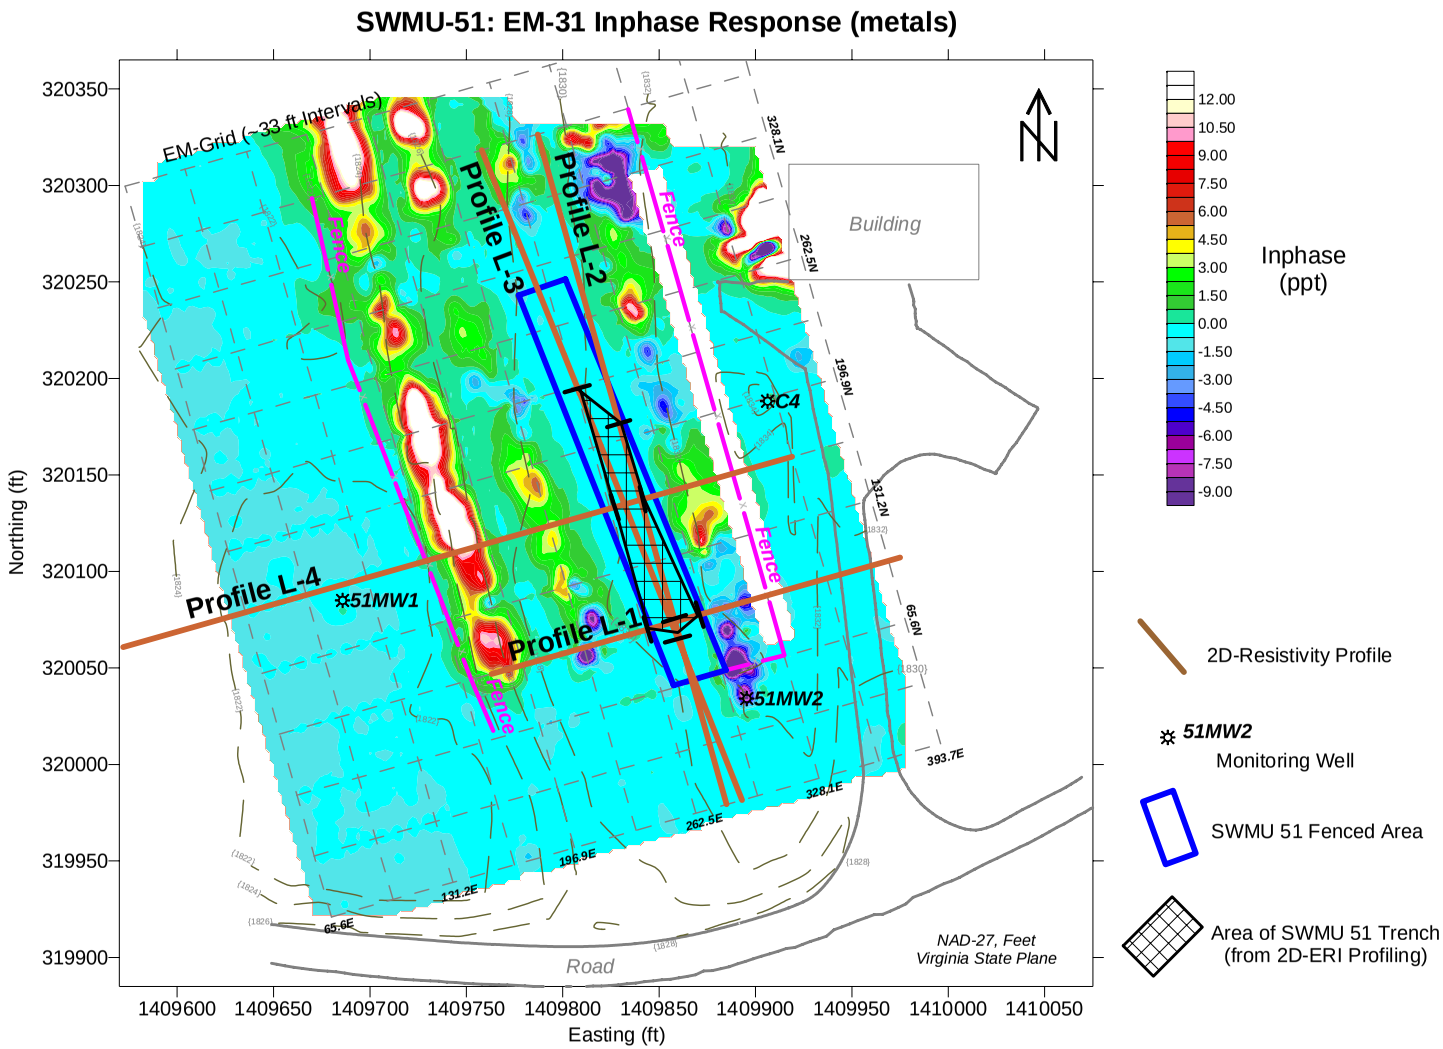

Figure B-7. EM-31 Inphase Response (Metals) Anomaly Map

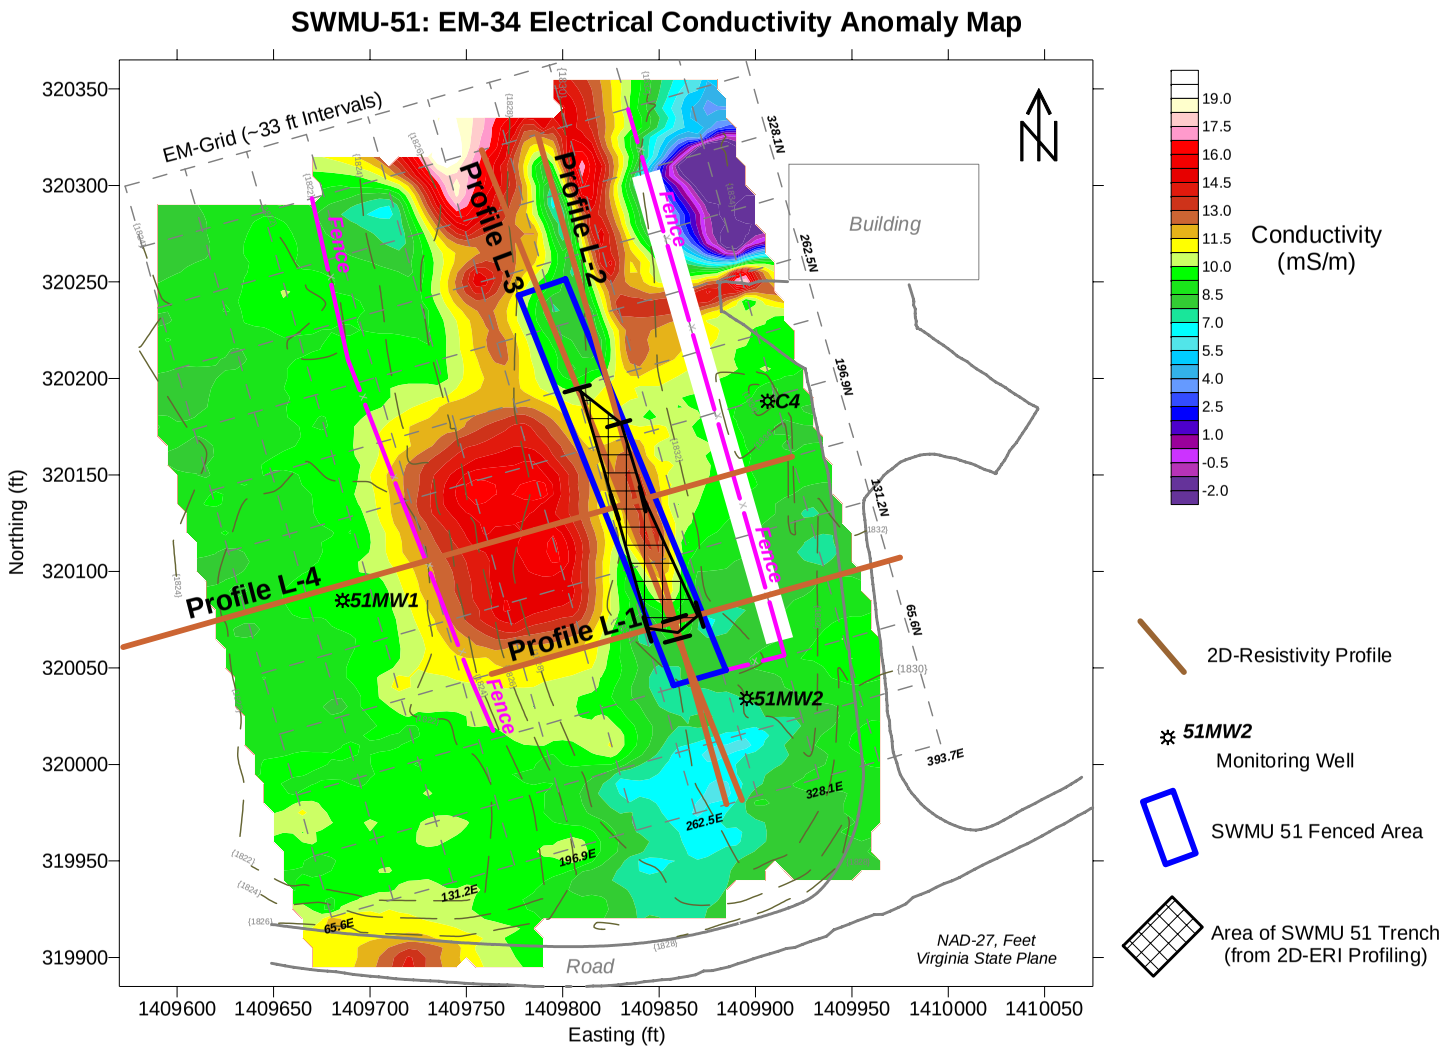

Figure B-8. EM-34 Conductivity Anomaly Map

Electromagnetic surveys using the EM-31 and EM-34 instruments mapped a zone of increased electrical-conductivity (decreased resistivity) within the southern two-thirds of the SWMU 51 fenced area. A 1-2 mS/m increase was measured by the EM-31, and suggests that the top of the anomalous region must be within the upper 10 ft (3 m) of the subsurface. The EM-34 instrument yielded a greater electromagnetic response than the EM-31, indicating that the source of this electrically conductivity zone (low-resistivity) extends below 10 ft (~3 m in depth). The anomalous area mapped by the EM-34 is approximately two-thirds that indicated by the 2D-ERI profiles.

The volume of waste is estimated as follows:

- The maximum areal extent of the trench defined by the 2D-ERI data is approximately 2,300 square feet (115 ft x 20 ft). The minimum areal extent can be estimated from the EM-34 conductivity anomaly map, and is 1,800 square feet (90 ft x 20 ft).
- Depth to top of the low-resistivity (electrically conductive) zone ranges from 5-9 ft, and averages 6-7 ft. Depth to bottom ranges from 15-25 ft, with an average of approximately 18 ft. The range in thickness is 6-20 ft, and averages approximately 11 ft.
- Using the average thickness (indicated on the 2D-ERI sections) and the areal extent, a volume range of 19,800 (11 ft x 90 ft x 20 ft) to 25,300 (11 ft x 115 ft x 20 ft) cubic ft or 733 to 937 cubic yards is calculated.

GEOPHYSICAL METHODS

2D Electrical Resistivity Imaging

Two-dimensional electrical resistivity imaging (2D-ERI) measures horizontal and vertical variations in the electrical-resistance of the subsurface. For RFAAP, the underlying carbonate rock was expected to be of higher-electrical resistivity than the overburden sediment. The electrical response of the rock is probably more complex, depending on the type of strata present and the electrical properties of the pore fluid. Higher electrical-resistivity should occur if carbonate rock is present, though the presence of an electrically conductive pore-fluid, or a significant clay fraction, could alternately yield lower-resistivities than expected. In addition, weak or fractured zones within the carbonate rock should display changes in electrical character, from either an increase in resistivity for air-filled regions, to a decrease in resistivity for clayey intervals. The trench work within the overburden sediment is expected to produce a zone of lower electrical resistivity. In addition, the presence of waste material and degradation products may also lower the electrical response in the vicinity of the trench.

The Advanced Geosciences, Inc. (AGI) Sting/Swift™ system is an automatic multi-electrode system and earth resistivity meter that acquires data by passing an electric current between two electrodes and measuring the potential difference (voltage) between two separate electrodes. The measured voltage is a factor of the resistance of the earth material and the geometry of the electrode array. Resistivity, an intrinsic property of the earth, is then calculated using the measured voltage, the electric current strength, and a geometric factor for the electrode array. The calculated resistivity value is actually an "apparent-resistivity" because it includes the resistances of all the material that the electrical current passes through. A modeling procedure is then used to convert the measured apparent-resistivity data into earth-layer resistivity sections.

The electrodes used to measure the voltage difference are arranged in various geometries called arrays, and the calculated apparent-resistivity value is interpreted to represent a depth point at the center of an individual array. Depth of measurement is related to width of electrode separation, with greater electrode separation resulting in greater depths of penetration. Classically, two different techniques are used to determine the electrical resistivity of earth materials. In vertical electrical sounding (VES), electrodes are expanded about the center of an array to generate a layered electrical section at a single point (vertical profile). The lateral profiling technique uses an array with a fixed electrode separation, which is marched along a line to image lateral variations at a constant depth.

Two-dimensional electrical-resistivity imaging (2D-ERI) combines VES and lateral profiling into a single survey without the time-consuming process of constantly moving electrodes and reconnecting cables. In 2D-ERI a single cable connects a linear array of electrodes, which are turned on and off using a preprogrammed sequence via a controller box. The raw apparent-resistivity data are typically displayed as a pseudosection where the lateral position of the measurement point is placed at the center of the corresponding electrode array, and the depth of the measurement increases with increasing electrode spacing. Apparent-resistivity pseudosections are useful for performing quality-control checks and for examining whether manmade objects have impacted the data set.

Apparent-resistivity pseudosections are converted, through a process termed inversion, into an electrical-resistivity cross-section showing true earth-layer resistivities. RES2DINV (Loke,

1996), a commercially available program, was used to perform the two-dimensional inversion modeling. During the inversion, the subsurface is divided into a number of blocks equal to or less than the number of measurement points. A smoothness-constrained, least-squares inversion routine is used to estimate the resistivity value of each block, and finite-element or finite-difference forward modeling is used to calculate the resulting pseudosection. The model is iteratively corrected until an apparent-resistivity pseudosection calculated from the model converges with the measured apparent-resistivity pseudosection. A root-mean-square (RMS) error calculation of the difference between the two apparent-resistivity pseudosections is used as a measure of the degree of fit for the model. Maximum convergence often occurs within 3 to 5 iterations, after which RMS values do not change significantly and the model may start to become unstable.

Electromagnetic Terrain-Conductivity Surveying

Electromagnetic-induction instruments (EM-31 and EM-34) are used to measure the electrical conductivity of the near surface, and can also be used to locate buried metallic objects. A transmitter coil is used to induce an electrical current into the ground, and the receiver coil measures the strength of the secondary magnetic field generated by these currents. Two components of the secondary magnetic field are recorded: 1) the quadrature-phase component which is used to measure the ground conductivity, and 2) the inphase component which is used for metallic detection due to its extreme sensitivity to large metallic objects (Geonics Ltd., 1991). The electrical conductivity of the ground is nearly linearly proportional to strength of the quadrature-phase component and is given in units of milli-siemens per meter (mS/m). The inphase measurement is the ratio of the secondary magnetic field to the primary field, and is expressed in parts per thousands (ppt).

The coils can be oriented in either a vertical dipole or horizontal dipole configuration. For the vertical dipole case, the axes of the coils are oriented perpendicular to the ground surface, and for the horizontal dipole, the axes are parallel to the ground surface. For both cases, the coils are maintained in a coplanar state. The vertical dipole orientation is generally preferred over the horizontal dipole because it provides for a greater investigative depth and is less sensitive to near surface variations.

The separation between the transmitter and receiver coils is the primary component that determines the depth of penetration. **Table B-1** lists the depth of investigation for different coil orientations and separations for the Geonics EM-31 and EM-34 meters. The “Practical Depth” is roughly the depth at which 80% of the instrument response has occurred, and the “Effective Depth Range” is the where the instrument’s overall response is the greatest. Thus, layers within the “Effective Depth Range” contribute most to the measured conductivity. The bolded numbers are for configurations used in this study.

Table B-1
Effective Penetration Depth of the EM-31 and EM-34 Instruments

Instrument	Coil Orientation	Practical Depth	Effective Depth Range
EM-31 (3.3 m)	Horizontal Dipole	5.5 ft (1.7 m)	0-5.5 ft (0-1.7 m)
	Vertical Dipole	10 ft (3 m)	1.6-8.2 ft (0.5-2.5 m)
EM-34 (20 m)	Horizontal Dipole	33 ft (10 m)	0-33 ft (0-10 m)
	Vertical Dipole	59 ft (18 m)	10-49 ft (3-15 m)

Conductivity values obtained in EM surveying represent weighted mean values of all the layer conductivities from the ground surface to the maximum depth that is sensed by the EM instrument (McNeill, 1980). If the underlying rock or sediment is uniform, the measured conductivity value will be the true conductivity. The amount of contribution to the measured conductivity from a single layer depends on its conductivity, depth, and thickness. In general, deeper layers contribute less to the final value than do near-surface layers, as do layers outside the effective depth range.

Geonics EM-31. The EM-31 transmitter and receiver coils are housed in a 3.5m long sensor boom, and a single person can operate the instrument (Geonics, 1991). A nominal depth of investigation of 18-ft (5.5-m) is realized when measurements are made using the vertical-dipole mode. Measurements are collected at ½ second intervals, and the quadrature and inphase components are collected simultaneously. This allows discrimination between anomalies sourced by buried metallic objects from those that are either lithologically or hydrologically controlled. Additional information consisting of the profile position, starting, and ending points, as well as fiducial mark locations along the profile, were recorded with an OMNI 720 data logger (Polycorder). This information is then downloaded to a personal computer for processing and display.

Geonics EM-34. The EM-34 is a two-person operable instrument that can measure terrain conductivities to depths of 150-ft (Geonics, 1991). Data were collected at approximately 1 sample per two-feet, and fiducial marker points are recorded at 20-to-50-ft intervals to help mitigate measurement point location errors due to uneven walking speeds. A Polycorder data logger is used to record the line geometry and profile data, which are downloaded to a personal computer for processing and display.

Seismic Refraction Tomography

Seismic refraction provides acoustic velocity and layer depth information (Redpath, 1973). The refraction method generally depends on an increase in seismic-wave velocity (speed of sound through earth material) with depth, though the newer tomographic codes presently available have the capability of handling a velocity inversion (zones of lower seismic velocity underlying zones of higher velocity). Both a tomographic model and an earth-layer (refractor) cross-section are planned as processing outputs from the refraction profiling. The commercially available SeisOpt2D code will be used to construct the tomographic model, and the SIPT software package was used to generate the earth-layer cross-section.

In the refraction method, the seismic energy (or wave) bends (refracts) at interfaces between layers of different velocities. In the special case where the seismic wave has been refracted parallel to the interface, the seismic energy travels along this interface, generating a head wave

that returns to the surface. A linear array of acoustic receivers (geophones) is used to record the travel-time of the first returning seismic signal. This information is plotted on a time-distance graph; for the case of plane layer geometry, the time-distance plot will show distinct linear segments for each layer where the inverse of the slope of a segment is equivalent to the apparent seismic velocity for a particular layer.

A multi-channel, engineering seismograph was used to record the seismic refraction information, and either a 500-lb weight drop (EWG) or a 16-lb. sledgehammer were used as the energy source. Geophones (seismic-receivers) were spaced at a 3.28-ft (1-m) interval during surveying. Shot points were acquired at every fifth geophone position, which allows input to the tomographic modeling software.

The processing sequence for the refraction data consists of:

- Picking first arrival times of return energy for each shot;
- Assigning the array-geometric to the first arrival data;
- Inverting the first-arrival information for velocity and depth using the SIPT algorithm (delay-time method); and
- Constructing a tomographic model of the first-arrival information using the either the SeisOpt2D code available from Optim Software, or the GeoCT-II code from GeoTomo.

The SIPT method takes advantage of the reverse-spread geometry and far offset shot points of the survey to compute depths to interfaces below each geophone. The algorithm employs the delay-time method of Pakiser and Black (1957) to calculate depth and position of refraction horizons. The generated refraction model is further refined using a ray-tracing algorithm which overcomes difficulties associated with dipping or undulating horizons.

The SeisOpt2D software achieves a globally optimized, velocity model using only first arrival travel time data and array geometry as input. SeisOpt2D requires no prior assumptions of subsurface structure, or any other subjective data, as input. A controlled Monte-Carlo inversion method is employed where the derived models are conditionally accepted or rejected based on a probability criterion. The criterion allows the algorithm to escape from non-unique, local, travel time minima to achieve a unique, globally optimized model of subsurface velocity structure. The algorithm makes no assumptions on the orientation of the subsurface velocity gradient, and can therefore reveal vertical structures and strong lateral gradients, if present.

The GeoCT-II inversion code also uses the geometry and first-arrival information as a starting point to apply a nonlinear continuum inversion in order to achieve a velocity-depth model. This package also allows providing a priori constraints such as known velocities from downhole surveys, and using earth-layer models as starting points.

Vertical Seismic Profiling

Vertical seismic profiles (check shots) are used to measure the in-situ velocity of the underlying sediment and rock, and these data provide confirmatory velocity information for the refraction models. The general configuration for recording the downhole seismic data consists of a three-component geophone, implementing 40Hz receiver elements. The downhole geophone is moved in 5-ft increments within the borehole (5-ft receiver spacing). A sledgehammer is used as the energy source, and is placed at offsets up to 15-ft from the borehole. Three additional geophones are placed on the surface at offsets up to 20-ft from the borehole, and are required to resolve any shot-timing variations that occur when using impact sources. Data are recorded at a 0.1 ms

interval (10,000 samples per second), which is required so that very small changes in arrival time (up to 0.2 milli-seconds) can be detected. The small arrival time changes are due to the presence of fast-velocity limestones and dolomites and correspond to a seismic wave traveling from 10,000 to 25,000-ft/s (yields arrival-time changes of 0.2 to 0.5milliseconds over a 5 foot interval).

Data processing consisted of the following:

- Pick first arrival energy for the downhole and reference geophones;
- Sort the arrival-time data by depth point;
- Compute and apply shot-timing corrections using the arrival time picks obtained from the reference geophones;
- Compute the average velocity to a receiver station using the straight-line distance from the shot to the receiver and the corrected arrival time;
- Convert to vertical travel-time using the depth point for the receiver and the computed average velocities; and
- Compute interval velocities using least squares line-fitting algorithm to estimate the slope (inverse of velocity) between measurement points. The least-squares operator has the advantage of smoothing over small time-picking errors.
- Where available, the data are correlated with the lithologic information and other available borehole geophysical data.

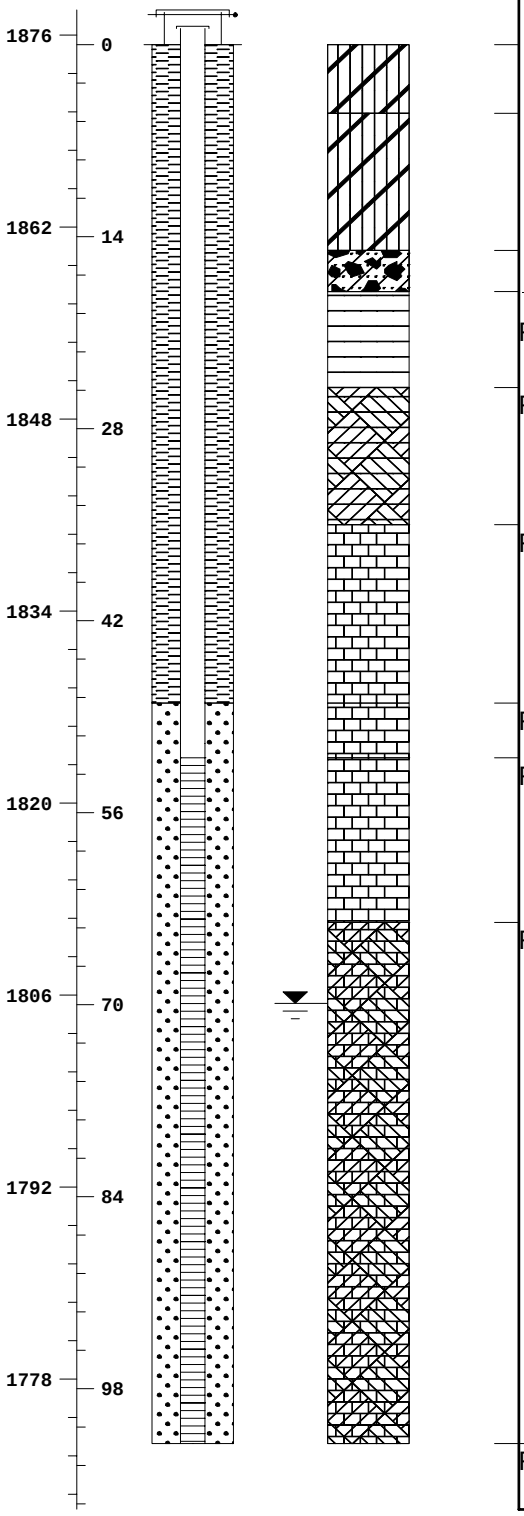
DRILL HOLE LOG
DRILL HOLE NO.: LFMW01

PROJECT: WPA 019 Groundwater Investigation
CLIENT/OWNER: RFAAP
HOLE LOCATION: RFAAP Radford, VA
DRILLER: Bedford Well Drilling
DRILL RIG: T3 Air Rotary
DEPTH TO WATER: 69.9
HOLE DIAMETER: 6 Inch

PROJECT NO.: 123461
DATE: 8/10/07
TOC ELEV.: 1877.9
GS ELEV.: 1875.3
LOGGED BY: J. Choynowski
HOLE NO.: LFMW01



ELEVATION / DEPTH	USCS	DESCRIPTION	Sample Number	Recovery	Water Content
		4" Protective case.			
0	CL-ML	Dark brown clay and silt, little(+) gravel. 2" PVC well pipe.			
5	CL-ML	Yellowish brown clay & silt.			
15	GC-SC	Yellowish brown clay w/ gravel, little(-) silt, some(+) coarse to medium sand.			
18	ROCK	Pale brown shale.			
25	ROCK	Pale brown shale & dolostone.			
35	ROCK	Pale brown limestone			
48	ROCK	Top of sand filter layer.			
52	ROCK	Top of well screen, 0.010" slot.			
64	ROCK	Alternating layers of Limestone and dolostone.			
102	ROCK	Bottom of screen and well.

Table 4-2
Legend

12	J	Shading and black font indicate an industrial RBC exceedance.
12	J	Bold outline indicates a residential RBC exceedance.
12	**J**	Bold, underlined font indicates a background exceedance.
12	*12*	Shading in the MDL/MRL columns indicates the MDL exceeds a criterion.

RBCs for non-Carcinogenic compounds have been recalculated to an HI of 0.1.
The pyrene RBCs were used for acenaphthylene, benzo(g,h,i)perylene and phenanthrene.
Inorganic results below background UTLs are not indicated as exceedances on the table.
RBC = Risk-Based Concentration (October 2007).
RBC values in table are for the more conservative chromium VI.
RBC values for chromium III are 150,000 (ind) and 12,000 (res), which were not exceeded.
Lead screening values from Technical Review Workgroup for Lead: Guidance Document (April 1999).
mg/kg = milligrams per kilogram (parts per million).
ng/kg = nanograms per kilogram (parts per trillion).
µg/kg = micrograms per kilogram (parts per billion).
NA = not applicable.
NT = analyte not tested.

LQ = Lab Data Qualifiers

B = (organics) Blank contamination. Value detected in sample and associated blank.
A (Dioxins) = B = (metals) Value <MRL and >MDL and is considered estimated.
E (metals) = Reported value is estimated because of the presence of interferences.
EMPC (Dioxins) = The ion-abundance ratio between the two characteristic PCDD/PCDF ions was outside accepted ranges. The detected PCDD/PCDF was reported as an estimated maximum possible concentration (EMPC).
J = (organics) Value <MRL and >MDL and is considered estimated.
U = Analyte not-detected at the method reporting limit.
X = (dioxins) Ion abundance ratio outside acceptable range. Value reported is EMPC.

VQ = Validation Data Qualifiers:

B = blank contamination. Value detected in sample and associated blank.
J = estimated concentration
K = estimated concentration bias high
L = estimated concentration bias low
N = presumptive evidence for tentatively identified compounds using a library search
U = analyte not detected
UJ = estimated concentration non-detect
UL = estimated concentration non-detect bias low

ATS International Project No. P09-10

October 2nd, 2009

Table of Contents

List of Figures

Executive Summary

ATS International, Inc. (ATS) was retained by URS Group, Inc. (URS) to conduct a geophysical investigation in the vicinities of SWMU-30 and SWMU-79 on the Radford Army Ammunition Plant (RAAP) near Radford, Virginia. The purpose of the study was to use geophysical methods to identify the lateral and vertical extents of buried asbestos waste material known to exist in several trenches. The tasks involved in this study included:

1. Establishment of a survey grid approximately 200 feet wide by 550 long.
2. Collection, processing, and interpretation of electromagnetic induction (EM) data.
3. Collection, processing, and interpretation of electrical resistivity data.
4. Collection, processing, and interpretation of ground penetrating radar (GPR) data.
5. Preparation of this document detailing our methods and findings.

The purpose of the EM survey was to evaluate lateral changes in EM distribution that may indicate the presence of fill materials. Strong, localized contrasts in conductivity may indicate the presence of buried materials that differ from the natural materials. The resistivity imaging survey was conducted to collect cross-sectional resistivity data over areas of anomalous EM for the purpose of corroborating the EM data and delineating the vertical extents of fill materials. The purpose of the GPR survey was to corroborate the EM and resistivity data and to provide additional vertical imaging of high resolution.

Both the quadrature and in-phase components of the EM data revealed several distinct linear zones of high EM response across the study area. The additional linear EM anomalies are interpreted as the locations of additional former disposal trenches.

The resistivity lines placed through the anomalous EM zones display distinct low-resistivity zones in the shallow subsurface immediately coincident with the zones of anomalous EM response. These zones range from approximately 13 to 30 feet in width and approximately 10 to 17 feet in depth, which is consistent with historical reporting for the trenches.

Processed into map view, the GPR data did not reveal the laterally extensive anomalies in the expected vicinity of the trenches as did the EM and resistivity data. However, trough-like GPR anomalies were observed in several of the in cross-sections in vicinities which coincide with the locations of anomalies in the EM and resistivity data. The GPR data confirm that the EM and resistivity provide reliable estimations of the lateral extent of the trenches, but the resistivity is likely to provide a more reliable estimation of the depth of the waste. Based on the resistivity results the waste is estimated to be approximately 10 to 17 feet in thickness.

The EM and resistivity data clearly reveal the lateral and vertical extents of those former disposal trenches, as well as the extents of the additional trenches to the west of SWMU (SSA) 30 and SWMU (SSA) 79.

1. Introduction

ATS International, Inc. (ATS) was retained by URS Group, Inc. (URS) to conduct a geophysical investigation in the vicinities of SWMU-30 and SWMU-79 on the Radford Army Ammunition Plant (RAAP) near Radford, Virginia. The purpose of the study was to use geophysical methods to identify the lateral and vertical extents of buried asbestos waste material known to exist in several trenches. The trenches are reported to have been approximately 15 feet wide and 15 feet deep. The study area is located in the southeast section of the "Horseshoe Area" of the RAAP. The aerial photograph in Figure 1 depicts SWMU-30 and SWMU-79 in 1986 as open disposal trenches.

The tasks involved in this study included:

1) Establishment of a survey grid approximately 200 feet wide by 550 long.

2) Collection, processing, and interpretation of electromagnetic induction (EM) data.

3) Collection, processing, and interpretation of electrical resistivity data.

4) Collection, processing, and interpretation of ground penetrating radar (GPR) data.

5) Preparation of this document detailing our methods and findings.

The purpose of the EM survey was to evaluate lateral changes in EM distribution that may indicate the presence of fill materials. Strong, localized contrasts in conductivity may indicate the presence of buried materials that differ from the natural materials. The resistivity imaging survey was conducted to collect cross-sectional resistivity data over areas of anomalous EM for the purpose of corroborating the EM data and delineating the vertical extents of fill materials. The purpose of the GPR survey was to corroborate the EM and resistivity data and to provide additional vertical imaging of high resolution.

The remainder of this document is divided into sections discussing delineation of the study area (Section 2); principles, methods, and results of the EM Survey (Section 3); principles, methods, and results of the resistivity survey (Section 4); and principles, methods, and results of the GPR survey (Section 5). Section 6 provides a summary of results and conclusions drawn from the geophysical investigation. References cited in this report are provided in Section 7.

2. Study Area

The study area was defined by URS personnel prior to initiation of this study as a rectangular area measuring approximately 200 feet by 550 feet, with the long axis oriented in a northwest-southeast direction (Figure 2). Colored ground flags were placed along the outer margins of the

grid in the direction of the long axis in increments of 10 feet. This grid provided the framework for both the EM and GPR grid data collection.

3. EM Survey

3.1. Principles of EM

EM investigation utilizes a low frequency transmitter to induce electrical current into the subsurface. The induced current creates secondary electromagnetic fields which are measured by the EM device. The amplitude and phase of these secondary fields are related to the electrical properties of the subsurface material, and therefore a measurement of the secondary fields is a measure of how well the subsurface materials conduct electric current.

The EM device measures the quadrature and in-phase components of the electromagnetic fields generated by the instrument's transmitter. The quadrature component of the EM data reveals apparent terrain conductivity in units of milliSiemens per meter (mS/m), which is a weighted average of the conductivity through the depth of measurement beneath the instrument. High magnitude responses, either positive or negative, indicate high bulk conductivity in the materials under the instrument.

The in-phase component of the EM data is the ratio of the secondary to primary magnetic field, and is presented in parts per thousand (ppt). The in-phase component is more sensitive to the presence of highly conductive material, especially shallow metal objects, and is generally considered the metal-detection mode of the EM investigation. It is important to note that an EM response in the in-phase component does not conclusively indicate the presence of metallic objects, only that it is the mode that is most sensitive to metals. It is also important to note that the size, depth of burial, and degree of corrosion of a metal object are all factors which affect the in-phase response (Jordan and Constantini, 1995).

The conductivity of subsurface materials is a function of their physical properties, namely porosity, permeability and the nature of the fluid within the pores. Landfill materials tend to have an abundance of pore space that holds moisture, and the materials themselves tend to increase the ionic strength of the pore water. Both of these factors work to increase the electrical conductivity, and thus landfill materials are usually readily distinguished from the surrounding native soils.

3.2. EM Field Methods

The instrument used for this investigation was the Geonics EM-31 Short terrain conductivity meter. The unit consists of a portable control module attached to a transmitter coil and a receiver coil. The transmitter and receiver coils are spaced approximately 1.8 meters (6 feet) apart, which

allows for an effective depth of exploration of approximately four meters (13 feet) under ideal conditions.

EM surveys are usually conducted along traverses through the area of interest with measurements taken at fixed distances or at a fixed time interval along the traverse. By conducting sub-parallel traverses, substantial lateral coverage can be obtained. The data can then be contoured to evaluate the spatial distribution of the measured conductivity values.

For this study, traverses were conducted in parallel lines spaced approximately 10 feet apart, and oriented in a northeast-southwest direction (Figure 3). The EM data were collected with a continuous time-stamp log, with measurements taken at 1-second intervals, while a concurrent time-stamped global positioning system (GPS) track log was also collected. The time-stamped data from the GPS track log provide the spatial locations for each of the individual EM measurements, so that contours of the spatial distribution of the EM measurements across the grid can be generated.

3.3. EM Results

The contoured results of the quadrature component of the EM survey reveal background apparent conductivity values between approximately 0 to 20 milliSiemens per meter (mS/m) across much of study area (Figure 4). Several distinct linear zones of higher conductivity values (20 to 135 mS/m) extend through the entire study area from southeast to northwest. The easternmost of these linear anomalies is coincident with the trench location as observed in the aerial photograph in Figure 1. As such, this linear anomaly is interpreted as the location of that former trench. The additional elongated anomalous zones are interpreted as additional disposal trenches not depicted in the aerial photograph in Figure 1. These zones are illustrated in Figure 4 by a dashed white line.

A zone of high conductivity values trending northeast in the northernmost portion of the study area is the result of the metal fence present in that area.

The contours of the in-phase component of the EM data are consistent with the quadrature component, revealing similar anomalies across the study area (Figure 5).

The quadrature and in-phase components of the EM data reveal several linear anomalies extending across the full length of the study area. The location and extent of the easternmost of these anomalies is coincident with the location of the asbestos disposal trench as seen in the 1986 aerial photograph, and as such, that anomaly is interpreted as the location of that former trench. The EM data also suggest the presence of two to three additional trenches to the west of that observed in the aerial photograph.

4. Resistivity Imaging

To evaluate the vertical extent of potential fill material at the site, resistivity imaging techniques were employed. Resistivity imaging provides cross-sectional images of the resistance to electric current. Electrical resistivity is a fundamental parameter of the material that describes how easily the material can transmit electrical current. High values of resistivity imply that the material is very resistant to the flow of electricity; low values of resistivity imply that the material transmits electrical current very easily.

The primary factors affecting the resistivity of earth materials are porosity, water saturation, clay content, and ionic strength of the pore water. In general, the minerals making up soils and rock do not readily conduct electric current and thus most of the current flow takes place through the material's pore water. The relatively high levels of pore water in soils and other unconsolidated materials tend to give low resistivity values for the shallow subsurface. Where the levels of pore water in soils and other unconsolidated materials are low, resistivity values tend to be high in the shallow subsurface.

4.1. Principles of Resistivity

Experiments by George Ohm in the early 19th century revealed the empirical relationship between the current flowing through a material and the potential required to drive that current. This relationship is described by:

$$V = IR$$

where V is voltage in volts, I is the current in amperes, and R is the proportionality constant. Rearranging the equation to:

$$\frac{V}{I} = R$$

gives resistance with the units of volts divided by amperes, or ohms.

The resistance of a material is dependent not only on the property of the material but also the geometry of the material. Specifically, a longer travel path for the current or smaller cross-sectional area would cause the resistance to increase. The geometry-independent property used to quantify the flow of electric current through a material is resistivity, given by:

$$\rho = \frac{RA}{L}$$

where ρ is the resistivity, R is the resistance, A is the cross-sectional area through which the current flows, and L is the length of the current flow path. With all length units expressed as meters, the units associated with resistivity are ohm-meters.

Resistivity surveys are conducted by inducing an electric current into the ground between two electrodes, and measuring the potential at other electrodes. Numerous configurations of electrode placement are commonly employed, each with unique data characteristics. The configuration utilized for this study was the dipole-dipole array. For the dipole-dipole array, a current is applied to two adjacent electrodes positioned a predetermined distance apart (distance *a*). The voltage across two other electrodes is measured simultaneously with the applied current. The two sets of electrodes are always spaced distance *a* apart and the distance between the current and voltage electrodes is always a multiple of *a* ($n \bullet a$). To obtain apparent resistivity values, the voltage and current measurements are input into the following formula for dipole-dipole surveys:

$$\rho = 2\pi(n+1)\cdot(n+2)\cdot a\cdot\frac{V}{I}$$

4.2. Field Methods

Seven resistivity lines were positioned across the study area based on the results of the EM survey. Lines 1 through 6 were oriented southwest-northeast perpendicular to the interpreted trenches, and Line 7 was oriented northwest-southeast along the axis of the easternmost former trench as interpreted from the Quadrature component of the EM data (Figure 6).

Lines 1 through 6 employed a spacing of 2 meters (6.56 feet) between electrodes, using a total of 28 electrodes. Line 7 employed a spacing of 3 meters (10 feet) between electrodes, with a total of 56 electrodes. The electrodes were assigned a unique identifier consisting of the line number followed by a dash and the electrode number. For example, the first electrode on Line 1 is 1-1, the first electrode on Line 2 is 2-1, etc. Wire stake flags were placed in the ground at the location of every fifth electrode and labeled with the electrode number for future reference. Locations of the resistivity lines were plotted with GPS and referenced to the study area grid.

Field data were collected using a SuperSting R8 IP® multi-electrode resistivity system manufactured by Advanced Geosciences Inc. Data were collected using the dipole-dipole array with a current of up to 200 milliamps. For each electrode configuration in the array, measurements were repeated a minimum of two times or until the error between measurements was less than or equal to five percent.

Measurements were initiated at one end of the resistivity line and incrementally moved through the electrodes until readings had been taken at every position along the line. The value of *n* was then increased to add additional resistivity readings at greater depths in the subsurface.

4.3. Inversion Modeling

The resistivity measurements on a section are called apparent resistivities. They may differ from the true resistivities in the subsurface because the measured data may be affected by passage through non-homogeneous materials and the distance of travel through the media. Apparent resistivity measurements must be processed to model the distribution of resistivities for the site-specific geology. Therefore, linear inversion techniques were applied to the data using

RES2DINV inversion modeling software (Geotomo Software, 2006). Linear inversion modeling fits the measured data in the resistivity section to an earth model that may represent the actual resistivities in the section. The inversion modeling is completed by calculating apparent resistivity from the earth model for comparison to the measured data. If the comparison is within reasonable limits, the earth model can be accepted as an approximation of subsurface conditions. Details of the inversion process may be found in Lines and Treitel (1984), Loke and Barker (1995), and Loke and Barker (1996). The inverted resistivity section is the image used for interpretation of geologic conditions.

4.4. Resistivity Results

Each of the resistivity lines reveal distinct zones of low resistivity in the immediate vicinities where they cross the various linear EM anomalies, as depicted in Figure 6. As such, these resistivity anomalies are interpreted as the former trenches. The vertical thickness of these low-resistivity zones ranges from approximately 10 to 17 feet. However, it should be noted that buried waste materials often lower the resistivities of the natural materials beneath, such that the apparent vertical thickness of buried waste may be greater that the actual thickness.

5. Ground Penetrating Radar

5.1. Principles of GPR

Ground penetrating radar (GPR) operates by transmitting pulses of high frequency radio waves (microwave electromagnetic energy) into the ground through a transducer or antenna. The main parameter which controls the subsurface response is the dielectric constant of the material. The transmitted energy is reflected when a radar pulse strikes a boundary where there is an abrupt change in dielectric constant (Davis and Annan, 1989). A second antenna receives the reflected waves and stores them in the digital control unit. Subsurface objects are expressed as hyperbolic reflections similar to an inverted “U” shape.

The depth of penetration is determined primarily by the electrical conductivity of the materials and the frequency of the GPR transmitter. The depth of investigation tends to be greater in low conductivity materials such as concrete, dry sand, or granitic rocks. Clays, shale, and other high conductivity materials attenuate or absorb GPR signals, greatly decreasing the depth of penetration. In general, low frequency signals penetrate deeper but have a poorer resolution than high frequency signals. Areas containing large amounts of metallic material reflect the majority of the GPR signal, preventing signal penetration beneath those materials.

5.2. GPR Field Methods

For this study, a 250 MHz GPR instrument was used. To corroborate the EM and resistivity data, GPR data were collected over a majority of the study area where accessible to the GPR instrument. Data were collected in a grid measuring 60 feet by 510 feet, in traverses spaced 10 feet apart. Traverses were collected in a northeast-southwest orientation so as to cross the former trenches in a perpendicular direction (Figure 10).

Several of the GPR cross-sections reveal trough-like anomalies in the vicinities of the former trenches as depicted in the resistivity data. The three most prominent examples of these are illustrated in Figure 12. The sections presented are from GPR traverses 6, 25 and 28, which coincide with resistivity lines 1, 3 and 4. The trough-like features observed in the GPR cross-sections are delineated in Figure 11 by a dotted black line. In order to correlate the GPR data to the resistivity data, the delineations of these features were superimposed onto the resistivity sections. The lateral locations of these anomalies immediately coincide with the trough-like low resistivity anomalies. However, the maximum discernible depth of these anomalies in the GPR data is approximately five feet. This is likely again the result of attenuation of the GPR signal.

6. Conclusions

Both the quadrature and in-phase components of the EM data revealed several distinct linear zones of high EM response across the study area. One of these anomalies occurs in the immediate vicinity of the former disposal trench as observed in the 1986 aerial photograph. The additional linear EM anomalies occur in a repeating fashion just west of the trench depicted in the aerial photograph, and bear near-identical geophysical signatures. As such, the additional linear EM anomalies are interpreted as the locations of additional former disposal trenches.

The resistivity lines placed through the anomalous EM zones display distinct low-resistivity zones in the shallow subsurface immediately coincident with the zones of anomalous EM response. These zones range from approximately 13 to 30 feet in width and approximately 10 to 17 feet in depth, which is consistent with historical reporting for the trenches.

The GPR data were greatly attenuated by the presence of clayey soils. Processed into map view, the GPR data did not reveal the laterally extensive anomalies in the expected vicinity of the trenches as did the EM and resistivity data. However, trough-like GPR anomalies were observed in several of the in cross-sections in vicinities which coincide with the locations of anomalies in the EM and resistivity data. The maximum discernible depth of these anomalies in the GPR data is approximately five feet, much shallower than both the historical knowledge of the trenches and that which is observed in the resistivity imaging. The GPR data confirm that the EM and resistivity provide reliable estimations of the lateral extent of the trenches, but the resistivity is likely to provide a more reliable estimation of the depth of the waste. Based on the resistivity results the waste is estimated to be approximately 10 to 17 feet in thickness.

The EM and resistivity data, when interpreted together and combined with aerial photography of the site when the disposal trenches SWMU (SSA) 30 and SWMU (SSA) 79 were open, clearly reveal the lateral and vertical extents of those former disposal trenches, as well as the extents of the additional trenches to the west of SWMU (SSA) 30 and SWMU (SSA) 79. The lateral extent of the interpreted buried materials is delineated in Figure 12 by a solid red line.

USEPA..... U.S. Environmental Protection Agency

1.0 INTRODUCTION

The purpose of this appendix is to present and describe development of exposure assessment models for the receptors presented in the Screening Level Ecological Risk Assessments (SLERAs) for SSA 18, SSAs 30 and 79, SSA 60, and SSA 77. The following sections provide a summary of parameters used in the models and a detailed description of the direct contact and dose rate modeling approachs used in the SLERAs. The complete SLERAs for SSA 18, SSAs 30 and 79, SSA 60, and SSA 77 are presented in Appendices F.2, F.3, F.4, and F.5, respectively.

2.0 MODEL PARAMETERS

The direct contact and dose rate models include parameters relating to receptor-specific exposure, chemical of potential concern (COPC) toxicity, and bioaccumulation rates. The following sections describe the estimation of these parameters and major assumptions of parameterization.

2.1 TOXICITY REFERENCE VALUES

MDCs for detected chemicals in soil are used as the preliminary exposure estimate to evaluate a conservative risk scenario for the direct contact pathway to soil invertebrates. Other potentially complete exposure pathways to soil invertebrate and microbial communities include direct ingestion of soil and biota. Due to insufficient information to quantify these pathways, likely secondary to the direct contact/absorption pathway, their omission should not substantially alter the risk characterization.

To evaluate the preliminary exposure estimates, the Toxicity Reference Values (TRVs) that were protective of terrestrial plants and soil invertebrate/microbial communities, were selected from a review of toxicological benchmarks for soil. TRVs for direct contact of soil to invertebrates/microbes and soil to plants were determined from the following guidance:

- USEPA Ecological Soil Screening Level (ECO-SSL): soil invertebrate and plant;
- Oak Ridge National Laboratory (ORNL): plant, microbial community, earthworm values (Efroymson *et al*. 1997a, Efroymson *et al*. 1997b, Efroymson *et al*. 1997c); and
- USEPA Region III Biological Technical Assistance Group (BTAG) soil screening values (USEPA 1995), BTAG freshwater screening benchmarks (USEPA 2006a), and BTAG freshwater sediment screening levels (USEPA 2006b)

Selected screening levels and sources are reported on Tables F.2-5 (SSA 18), F.3-5 (SSAs 30 and 79), F.4-5 (SSA 60), and F.5-5 (SSA 77) for terrestrial plants and Tables F.2-7 (SSA 18), F.3-7 (SSAs 30 and 79), F.4-7 (SSA 60), and F.5-7 (SSA 77) for soil invertebrates and microbial communities.

2.2 RECEPTOR-SPECIFIC EXPOSURE PARAMETERS

Wildlife receptors selected to characterize exposure include:

- Herbivorous mammals: Meadow Vole (*Microtus pennsylvanicus*);
- Invertivorous mammals: Short-tailed Shrew (*Blarina brevicauda*);
- Invertivorous birds: American Robin (*Turdus migratorius*);
- Carnivorous birds: Red-tailed Hawk (*Buteo jamaicensis*); and
- Carnivorous mammals: Red Fox (*Vulpes vulpes*).

Exposure parameters used to derive TRV-based substrate concentrations for each receptor include body weight (kg), food ingestion rate (kg dry weight/day), dietary fraction, incidental substrate ingestion rate (kg dry weight/day), and area use factor. Both preliminary and refinement level exposure parameters are presented in Tables F.2-9 (SSA 18), F.3-9 (SSAs 30 and 79), F.4-9 (SSA 60), and F.5-9 (SSA 77).

2.3 LITERATURE-BASED NOAEL AND LOAEL VALUES

The dose-response relationships for chemicals of potential concern are expressed as NOAELs and LOAELs for wildlife receptors, which are defined as a daily ingested amount (mg/kg body weight-day) that is associated with a specified effect. This process involves the determination of a "test species dose" for a critical endpoint from a particular experimental combination of exposure concentration, exposure duration, test species, and chemical. Endpoints may be based on growth, reproductive, developmental, and survival effects. Such effects are important because they may affect the abundance or reproductive success of receptor populations. The test-species dose from the selected study is then modified using extrapolation and uncertainty factors (EFs and UFs).

For this evaluation, EFs and UFs are used to modify laboratory study results, based on the methodology of Sample et al. (1996). This process involves the determination of a "test species dose" for a critical endpoint from a particular experimental combination of exposure concentration, exposure duration, test species, and chemical. The test-species dose from the selected study is then modified to account for the various extrapolations and uncertainties inherent in applying results from a controlled setting to an ecologically relevant setting, as in:

$$\text{NOAEL or LOAEL} = \frac{\text{Test-Species Dose}}{\text{Duration UF} \times \text{Endpoint UF}} \times \text{Body-Weight EF}$$

EFs and UFs are based on: (1) the duration of exposure, (2) the endpoint measured, and (3) differences in body weights among test and receptor species (Calabrese and Baldwin 1993, Ford et al. 1992, Opresko et al. 1994, Sample et al. 1996, USEPA 1996, Wentsel et al. 1994). EFs and UFs derivation and use is described in the following subsections. The use of surrogate chemical data is also discussed. NOAEL and LOAELs for COPCs are summarized in Tables F.2-10 (SSA 18), F.3-10 (SSAs 30 and 79), F.4-10 (SSA 60), and F.5-10 (SSA 77).

2.3.1 The Test-Species Dose

Critical toxicological values are identified from carefully qualified primary and secondary literature references. The selection of particular studies and endpoints used for the derivation of NOAELs and LOAELs is based on the evaluation of the applicable studies and the dose-response data contained therein. In cases where preferred toxicological endpoints are not available, other toxicity values are used, but additional uncertainty factors may be incorporated. All toxicological values chosen for NOAEL and LOAEL derivation are presented on a mg chemical per kg body weight per day (mg/kg BW-day) basis. These units allow comparisons among organisms of different body sizes (Sample et al. 1996).

2.3.2 Duration Uncertainty Factors

Exposure durations of interest include (1) chronic, (2) subchronic, and (3) acute. Chronic studies occur over the lifetime or a majority of the lifespan of the test organism, generally longer than one year for mammals and 10 weeks for birds. Additionally, studies in which the test organism is dosed during a critical life stage (e.g., gestation) are included with chronic duration studies. Subchronic studies include exposures of two weeks to one year in duration that do not occur during a critical life stage. Acute studies typically have exposures of less than two weeks. NOAELs and LOAELs are usually reported from chronic and subchronic studies, with acute studies often reporting LD_{50} levels (LD_{50}; doses corresponding to the overt expression of a serious adverse effect such as mortality in 50% of test animals). Test-species doses from chronic studies are used preferentially over data from acute and subchronic studies. In cases where chronic data are not available as test-species doses, studies involving less-than-chronic exposures are used to in NOAEL and LOAEL derivation with the addition of a duration uncertainty factor.

For this study, duration uncertainty factors are applied according to USACHPPM 2000:

- Subchronic NOAEL to Chronic NOAEL: 10
- Subchronic LOAEL to Chronic NOAEL: 20
- Subchronic LOAEL to Chronic LOAEL: 4
- Acute NOAEL to Chronic NOAEL: 30
- Acute LOAEL to Chronic NOAEL: 50
- Acute LOAEL to Chronic LOAEL: 10

2.3.3 Endpoint Uncertainty Factors

Additional UFs are used to account for uncertainties in extrapolation between effect- and no-effect levels. Specifically, a NOAEL test-species dose may be estimated from a LOAEL (or LD_{50}) value, or a LOAEL may be estimated from a LD_{50}.

Extrapolation from a LOAEL or LD_{50t} to a NOAEL: Consistent with USACHPPM 2000, a UF of 10 is used with chronic LOAEL values to estimate the chronic NOAEL, which is considered conservative (Sample et al. 1996, USEPA 1996). When a LOAEL value is not available, a LD_{50} is used, although chronic NOAELs may range from 1/10 to 1/10,000 of the corresponding acute LD_{50} value (Opresko et al. 1994). For this report, an uncertainty factor of 100 is used to estimate a NOAEL value from a LD_{50} value (USACHPPM 2000).

Extrapolation from an LD_{50} to a LOAEL: Consistent with USACHPPM 2000, an UF of 20 is used conservatively to estimate a LOAEL value from a LD_{50} value (USACHPPM 2000).

2.3.4 Body-Weight Extrapolation Factor

This extrapolation is accomplished using a body weight-scaling factor to account for differences in body size (Sample et al. 1996). Numerous studies have shown that many physiological functions such as metabolic rates and responses to chemicals are a function of body size for mammals. Smaller mammals have higher metabolic rates and are usually more resistant to chemicals because of more rapid rates of detoxification. It has been shown that the best measure of body size is one based on body surface-area, which can be expressed in terms of body weight raised to a fractional power (Opresko et al. 1994, Sample et al. 1996, USEPA 1980). Dosimetric differences between the mammalian test species and wildlife receptors are accounted for using:

$$\mathrm{NOAEL}_w = \mathrm{NOAEL}_t \times \left(\frac{\mathrm{BW}_t}{\mathrm{BW}_w} \right)^{0.25}$$

where:

$NOAEL_w$	= NOAEL for the mammalian wildlife receptor (mg/kg BW-day)
$NOAEL_t$	= NOAEL for the mammalian test species (mg/kg BW-day)
BW_t	= Test species body weight (kg)
BW_w	= Wildlife receptor body weight (kg)

Scaling factors may not be appropriate for avian interspecies extrapolations. Information has shown that adjustment factors based on body size for interspecies extrapolation among avian species range from 0.63 to 1.55 (Sample et al. 1996). Therefore, a body-weight extrapolation factor is not used to derive avian NOAELs and LOAELs.

Mammalian wildlife receptor body weights are presented on Tables F.2-9 (SSA 18), F.3-9 (SSAs 30 and 79), F.4-9 (SSA 60), and F.5-9 (SSA 77) and laboratory test species body weights are presented on Tables F.2-10 (SSA 18), F.3-10 (SSAs 30 and 79), F.4-10 (SSA 60), and F.5-10 (SSA 77).

2.4 BIOACCUMULATION FACTORS

Bioaccumulation factors (BAFs) provide quantitative indicators of the tendency for a chemical to partition into terrestrial organisms, relative to the concentrations present in terrestrial exposure media. Exposure-point concentrations of chemicals in terrestrial prey (soil invertebrates and small mammals) and terrestrial plants are estimated using BAFs derived from the literature. The derivation of BAFs is described for organic and inorganic chemicals in the following subsections.

2.4.1 Terrestrial Plants

Exposure-point concentrations of chemicals in terrestrial plants are estimated using soil-to-plant bioaccumulation factors (uptake factors for plants, UF_{plant}) derived from the literature. UF_{plant} values are used to estimate wet-weight chemical concentrations in terrestrial plants using the same equation for invertebrates and a dry weight to wet weight conversion factor assuming plants are 80% water (Salisbury and Ross 1992). The uptake factors for plants are presented on Tables F.2-11 (SSA 18), F.3-11 (SSAs 30 and 79), F.4-11 (SSA 60), and F.5-11 (SSA 77).

Organic Chemicals: Organic chemicals may enter the plant by partitioning from contaminated soil to the roots and then translocating throughout the plant via the xylem tissue. Most bioaccumulative, lipophilic organic chemicals partition to the epidermis of the root or adhere to soil particles and are not drawn into the inner root or xylem (Paterson et al. 1990). Uptake factors for estimating concentrations of organic chemicals in plant tissues are derived from the following equation:

$$UF_{plant} = 10^{[1.588-(0.578\times \log K_{ow})]}$$

where:

UF_{plant} = Plant uptake factor (kg soil, dry weight / kg plant, dry weight)

$\log K_{ow}$ = Logarithm of the octanol:water partition coefficient

This relationship is based on a linear regression of bioaccumulation factors for 29 organic chemicals (Travis and Arms 1988). The correlation coefficient for the regression is 0.73, indicating that a majority of the variability in bioaccumulation is explained by the log K_{ow}. UF_{plant} values are derived for organic chemicals using this equation.

Inorganic Chemicals: Concentrations of inorganic chemicals in plant tissues are estimated based on generalized soil-to-plant transfer coefficients reported in a literature review. The soil-to-plant transfer factors for inorganic chemicals are equivalent to UF_{plant} values for organic chemicals and represent the ratio of the dry weight concentrations in plant tissue to the dry weight concentration of the element in root-zone soils. Bechtel-Jacobs 1998 C_p regression equation: $C_p = e^{(slope*\ln(Cs) - intercept)}$

2.4.2 Terrestrial Prey

Organic Chemicals: BAFs for estimating concentrations of organic chemicals in prey tissues are derived from linear regression equations presented in Travis and Arms (1998) and Beyer and Stafford (1993). The dry weight to wet weight (DW:WW) conversion factor is 0.2 for soil invertebrates (kg soil invertebrate dry weight per soil invertebrate wet weight; assumes invertebrates are 80% water), based on data reported in USEPA (1993). No DW:WW conversion factor was applied for small mammals. The BAF values used in to estimate concentrations of organic chemicals in soil invertebrates and small mammals are shown in Tables F.2-12 and F.2-13 (SSA 18), F.3-12 and F.3-13 (SSAs 30 and 79), F.4-12 and F.4-13 (SSA 60), and F.5-12 and F.5-13 (SSA 77).

Inorganic Chemicals: Inorganic bioaccumulation factors for terrestrial prey (Tables F.2-13, F.3-13, F.4-13, and F.5-13) are wet-weight-based and are used to predict concentrations in invertebrates and small mammals according to:

$$BAF_{si} = C_{si} / C_{soil}$$

where:

BAF_{si} = Soil invertebrate uptake factor for inorganic chemicals

C_{si} = Chemical concentration predicted in soil invertebrates (mg chemical / kg soil invertebrate, dry weight)

C_{soil} = Concentration of inorganic chemical in soil (mg chemical / kg soil, dry weight)

3.0 DIRECT CONTACT APPROACH

3.1 PRELIMINARY DIRECT CONTACT TOXICITY EVALUATION

Risk is assessed by comparing the preliminary exposure estimate (maximum detected concetration - MDC) of each detected chemical to the established TRV (detailed in Section 2.1). The preliminary risk is characterized in terms of a hazard quotient (HQ), which is expressed as:

HQ = MDC/TRV

where:

HQ = Hazard Quotient for the contaminant (unitless)
MDC = Maximum Detected Concentration for contaminant (mg/kg)
TRV = Screening Level for contaminant (mg/kg)

3.2 REFINED DIRECT CONTACT TOXICITY EVALUATION

For the refined evaluation, risk is assessed by comparing the exposure point concentration (EPC) of each detected chemical to the TRV. Due to the number of samples at the sites, a 95%UCL was not calculated; therefore, a refinement of the direct contact pathway was not conducted.

An HQ of less than 1 indicates no or negligible risk. The potential for risk increases as the HQ increases above unity. However, this result should be considered in the context of other characteristics of the exposure area.

Results of the direct contact toxicity evaluation for SSA 18 are presented in Tables F.2-6 (terrestrial plants) and F.2-8 (soil and microbial communities), SSAs 30 and 79 results are presented in Tables F.3-6 (terrestrial plants) and F.3-8 (soil and microbial communities), SSA 60 results are presented in Tables F.4-6 (terrestrial plants) and F.4-8 (soil and microbial communities), and SSA 77 results are presented in Tables F.5-6 (terrestrial plants) and F.5-8 (soil and microbial communities).

4.0 DOSE RATE MODELING APPROACH

A simplified food web model is utilized to calculate TRVs for each chemical and wildlife receptor. TRVs quantify COPC concentrations in exposure media that may result in no observable adverse effects or low observable adverse effects. The NOAEL corresponds to the greatest exposure associated with no observed adverse effects on growth, reproduction, or survival. The LOAEL corresponds to the smallest exposure associated with observed adverse effects on growth, reproduction or survival. TRVs developed by dose rate models are used to evaluate ecological effects associated with COPEC concentrations in exposure media.

4.1 PRELIMINARY DOSE RATE MODEL

Preliminary risk characterization for wildlife receptors uses the conservative preliminary exposure estimate and ecological effects evaluation to characterize risk to potential terrestrial receptors.

The simplified food web model considers the ingestion of prey, the incidental ingestion of media, and the primary routes of exposure to wildlife receptors. Chemical concentrations in prey are expressed as a function of chemical concentrations in exposure media using BAFs for terrestrial prey items. Other important parameters in the model include receptor body weight and an estimate of receptor use. As shown in the equation below, literature-derived NOAEL and LOAEL values are input into the model as the ADD variable to calculate the concentration in exposure media (C_{TRV}) that would result in a dose equivalent to a NOAEL or LOAEL.

$$C_{TRV} = \frac{ADD \cdot BW}{(IR_{food} \ (BAF_{food} \cdot DF) + IR_s)AF}$$

where:

C_{TRV} = NOAEL or LOAEL-based screening level (mg chemical/kg soil)

ADD = NOAEL or LOAEL (mg COPC/kg body weight-day)

BW = Minimum Body Weight of the receptor (kg)

IR_{food} = Maximum Ingestion Rate of food (kg food ingested per day, dry weight)

BAF_{food} = BAF of most contaminated dietary component used, specific to prey type and COPC (ratio of mg of COPC/kg fauna, wet weight to mg COPC/ kg substrate, dry weight)

DF = Dietary Fraction (most contaminated dietary component assumed to be 100% of diet)

IR_s = Maximum Incidental Ingestion Rate of soil (kg substrate ingested per day, dry weight)

AF = 100% Area Use Factor

Preliminary receptor parameters for SSA 18, SSAs 30 and 79, SSA 60, and SSA 77 are presented on Tables F.2-9, F.3-9, F.4-9, and F.5-9 respectively. The resulting risk is characterized in terms of an HQ and is presented for wildlife receptors in Appendix F.2 and summarized in Table F.2-24 for SSA 18, in Appendix F.3 and summarized in Table F.3-24 for SSAs 30 and 79, in Appendix F.4 and summarized in Table F.4-24 for SSA 60, and in Appendix F.5 and summarized in Table F.5-24 for SSA 77.

4.2 REFINED EXPOSURE ESTIMATE AND RISK CHARACTERIZATION

The refined exposure and risk characterization, Step 3a of the ecological risk assessment guidance (ERAGS), reviews and refines the conservative assumptions used in the risk calculation (USEPA 1997). In Step 3a, conservative assumptions used in the preliminary exposure and risk characterization are replaced with more environmentally realistic assumptions to evaluate risk posed by COPECs identified in the preliminary risk characterization. The addition of Step 3a focuses the outcome of the ecological screening, streamlines the review process and functions as the initial basis for ecological risk management decision-making at each site.

4.3 REFINED DOSE RATE MODEL

This step replaces the conservative assumptions used in the preliminary exposure estimate and ecological effects evaluation with more environmentally realistic assumptions including the use of average body weight, average food and substrate ingestion rates, and the use of realistic area use factor, resulting in a more realistic estimate of potential risk. Due to the number of samples at the sites, a 95% UCL was not calculated for the sites and the MDC was used as the EPC for the refinement.

$$C_{TRV} = \frac{ADD \cdot BW}{(IR_{food} \sum (BAF_{food} \cdot DF) + IR_s)AF}$$

where:

C_{TRV} = NOAEL or LOAEL-based screening level (mg chemical/kg soil)

ADD = NOAEL or LOAEL (mg COPC/kg body weight-day)

BW = Average Body Weight of the receptor (kg)

IR_{food} = Average Ingestion Rate of food (kg food ingested per day, dry weight)

BAF_{food} = BAF of dietary component used, specific to prey type and COPC (ratio of mg of COPC/kg fauna, wet weight to mg COPC/ kg substrate, dry weight)

DF = Dietary Fraction

IR_s = Average Incidental Ingestion Rate of soil (kg substrate ingested per day, dry weight)

$AF_{refined}$ = Refined Area Use Factor (detailed below)

In the refined model, a realistic area use factor ($AF_{refined}$) was used to calculate the ratio of the site area to the average home range of the receptor:

$AF_{refined}$ = Study Area/Home Range Area

Other receptor parameters in the refined model remain conservative. The conservative assumptions are summarized as follows:

- Receptors assimilate 100% of COPECs detected in the food and soil; and
- Receptors forage in the site area 100% of the time.

Refined receptor parameters for SSA 18, SSAs 30 and 79, SSA 60, and SSA 77 are presented on Tables F.2-9, F.3-9, F.4-9, and F.5-9, respectively. The resulting risk is characterized in terms of an HQ and is presented for wildlife receptors in Appendix F.2 and summarized in Table F.2-24 for SSA 18, in Appendix F.3 and summarized in Table F.3-24 for SSAs 30 and 79, in Appendix F.4 and summarized in Table F.4-24 for SSA 60, and in Appendix F.5 and summarized in Table F.5-24 for SSA 77.

4.4 EXAMPLE C_{TRV} EQUATION CALCULATION – PRELIMINARY AND REFINED

The following example C_{TRV} equation details the arsenic NOAEL-based screening level (SL) calculated for the short-tailed shrew at SSAs 30 and 79 (Tables F.3-16 and F.3-17) and resulting HQs:

Preliminary

- ADD = 0.15 mg/kg bw-day (NOAEL)
- BW = 0.0125 kg (minimum body weight)
- IR_{food} = 0.003 kg dw/day (maximum ingestion rate)
- BAF_{food} = 1.1 (for the most contaminated dietary component in this case plant)
- DF = 1 (100% most contaminated dietary component in this case 100% plants)
- IR_{soil} = 0.00039 kg dw/day (maximum soil ingestion rate)
- AF = 1 (default used)

$$C_{TRV} = \frac{ADD \cdot BW}{(IR_{food} \ (BAF_{food} \cdot DF) + IR_s)AF} = \frac{0.15 \cdot 0.0125}{(0.003\,(1.1 \cdot 1) + 0.00039) \cdot 1} = \textbf{5.1E-01 mg/kg}$$

NOAEL HQ = MDC (mg/kg)/NOAEL-based SL (mg/kg) = $\frac{3.3}{5.1E-01}$ = **6.5E+00**

Refined

- ADD = 0.15 mg/kg bw-day
- BW = 0.015 kg
- IR_{food} = 0.002 kg dw/day
- BAF_{plant} = 0.038
- BAF_{inv} = 0.17
- DF_{plant} = 0.14
- DF_{inv} = 0.86
- IR_{soil} = 0.00026 kg dw/day
- $AF_{refined}$ = 1

$$C_{TRV} = \frac{ADD \cdot BW}{(IR_{food} \sum (BAF_{food} \cdot DF_{food}) + IR_s)AF}$$

$$= \frac{0.15 \cdot 0.015}{(0.002\,(0.038 \cdot 0.14 + 0.17 \cdot 0.86) + 0.00026) \cdot 0.31} = \textbf{4.0+00 mg/kg}$$

NOAEL HQ = MDC (mg/kg)/NOAEL-based SL (mg/kg) = $\frac{3.3}{4.0E+00}$ = **8.3E-01**

Tables F.2-24, F.3-24, F.4-24, and F.5-24 provide a summary of preliminary and refined HQs developed for terrestrial receptors at SSA 18, SSAs 30 and 79, SSA 60, and SSA 77, respectively.

5.0 SUMMARY

Receptor-specific exposure parameters are obtained from life history studies found in the literature. Important receptor-specific exposure parameters input into the model include: body weight, food ingestion rate, diet composition, incidental substrate ingestion rate, and area use factor.

The dose-response relationships for chemicals of potential interest are expressed as NOAELs and LOAELs for wildlife receptors, which are defined as a daily ingested amount (mg COPC/kg body weight-day) that is associated with a specified growth, reproductive, developmental, or survival effect. Extrapolation and uncertainty factors are applied to literature-based toxicological endpoints to account for differences in a controlled laboratory setting and an ecologically relevant setting. Extrapolation and uncertainty factors are based on: (1) the duration of exposure, (2) the endpoint measured, and (3) differences in body weights among test and receptor species.

Bioaccumulation accumulation factors provide quantitative indicators of the tendency for a chemical to partition into organisms, relative to the concentrations present in exposure media. Exposure-point concentrations of chemicals in terrestrial prey (soil invertebrates and small mammals) are estimated using several BAFs derived from the literature.

COPC concentrations in prey and media, receptor-specific exposure parameters, literature-based NOAEL and LOAEL values, and bioaccumulation factors are used in the model to calculate the concentration in exposure media (C_{TRV}) that would result in a dose equivalent to a NOAEL or LOAEL. The dose rate modeling approach is used to evaluate the potential mobility of COPCs through varying trophic associations.

AUF = Area Use Factor

[1]Wildlife Exposure Factors Handbook. U.S. Environmental Protection Agency (EPA). 1993. Office of Research and Development. 2 Volumes. EPA/600/R93/187a&b. December.
[2] Estimated food intake rate (kg [dw]/day) calculated as follows:
FI ((kg/day) = 0.0687 $Wt.^{0.882}$ for mammals (red fox and short-tailed shrew)
FI ((g/day) = 0.577 $Wt.^{0.727}$ for herbivores (meadow vole)
FI ((g/day) = 0.301 $Wt.^{0.751}$ for non-passerine birds (red-tailed hawk)
FI ((g/day) = 0.398 $Wt.^{0.850}$ for passerine birds (american robin)
[3]Estimating Exposure to Terrestrial Wildlife to Contaminants. Sample and Sutter. 1994. ES/ER/TM-125.
The soil ingestion rate for the american robin set equal to 38% of the american woodcock value (0.34*10.4%=4%), based on a robin diet of 38% invertbrates.

Notes:
CAS = Chemical Abstract Service
TRV = Toxic Reference Value
NOAEL = No observable adverse effects level
LOAEL = Lowest observable adverse effects level
mg/kg = Milligram Per Kilogram
bw/d = Body Weight Per Day
kg = kilogram
PAH = Polynuclear Aromatic Hydrocarbon
PCB = Polychlorinated Biphenyl
USACE = U.S. Army Corps of Engineers
ORNL = Oak Ridge National Laboratory
NOAEL and LOAEL values were derived from acute values by applying an uncertainty factor of 150.
LD_{50} = Lethal Dose for 50% of test organisms

Notes:

CAS = Chemical Abstract Services
C_s = Chemical Concentration in Soil
C_e = Chemical Concentration in Earthworm (dry weight)
K_{ow} = Chemical octanol-water coefficient
MDC = Maximum Detected Concentration
K_{oc} = Chemical water to soil partitioning coefficient
K_{ww} = Chemical worm to soil partitioning coefficient
foc = fraction organic content in soil (0.002 from physical samples)
[1] = BAFs for chemical using Ce regression equation calculated by as follows: BAF = C_e/C_s

Notes:

CAS = Chemical Abstract Services

C_{TRV}= NOAEL-based screening level (mg chemical/kg soi)

ADD = NOAEL or LOAEL (mg chemical/kg body weight-day) from Table F.2-10

BW = Minimum Body Weigth of Receptor (kg)

IR_{food} = Maximum Ingestion Rate for Food

BAF_{food} = Bioaccumulation factor (Most contaminated dietary component BSAF used)

DF = Dietary fraction (Most contaminated dietary component assumed to be 100% of diet)

IRs = Incidental Ingestion Rate of soil (kg soil ingested per day, dry weight)

AF = 100% Area Use Factor

NOAEL = No observable adverse effects level

LOAEL = Lowest observable adverse effects level

mg/kg = Milligram Per Kilogram

bw - day = Body Weight - Day

HQ = Hazard Quotient

TRV = Toxicity Reference Value

Meadow Vole Specific Data from Table F.2-9

BW=	0.017	kg
IR_{food} =	0.010	kg dw/day
BAF_{food}=	Chem Specific	unitless
IR_{soil} =	0.00024	kg dw/day
AF =	1	unitless

[a] = The following equation was used to calculate screening levels:

$$C_{TRV} = \frac{ADD \cdot BW}{(IR_{food}(BAF_{food} \cdot DF) + IR_s)AF}$$

See Appendix F.1 for an example C_{TRV} calculation.

NOAEL HQ = Maximum Detected Concentration/Calculated NOAEL-Based Concentration

LOAEL HQ = Maximum Detected Concentration/Calculated LOAEL-Based Concentration

Table F.2-15
SSA 18 - Refined Wildlife Risk Characterization - Meadow Vole
Screening Level Ecological Risk Assessment
SSP Report for SSAs 18, 72, 30, 79, 60, and 77
Radford Army Ammunition Plant, Radford, Virginia

Notes:

CAS = Chemical Abstract Services

C_{TRV}= NOAEL-based screening level (mg chemical/kg soi)

ADD = NOAEL or LOAEL (mg chemical/kg body weight-day) from Table F.2-10

BW = Average Body Weigth of Receptor (kg)

IR_{food} = Average Ingestion Rate for Food

BAF_{food} = Bioaccumulation factor, specific to prey type and chemical

DF = Dietary fraction

IRs = Incidental Ingestion Rate of soil (kg soil ingested per day, dry weight)

AF = Area Use Factor

NOAEL = No observable adverse effects level

LOAEL = Lowest observable adverse effects level

mg/kg = Milligram Per Kilogram

bw - day = Body Weight - Day

HQ = Hazard Quotient

TRV = Toxicity Reference Value

BDL = Below Detection Limit

EPC = Exposure Point Concentration

* = Due to the number of samples at the site, the EPC defaults to the MDC (maximum detected concentration)

[a] = The following equation was used to calculate screening levels:

$$C_{TRV} = \frac{ADD \cdot BW}{(IR_{food} \sum (BAF_{food} \cdot DF) + (IR_s)) \cdot AF}$$

See Appendix F.1 for an example C_{TRV} calculation.

NOAEL HQ = EPC/Calculated NOAEL-Based Screening Level

LOAEL HQ = EPC/Calculated LOAEL-Based Screening Level

Meadow Vole Specific Data from Table F.2-9

BW=	0.037	kg
IR_{food} =	0.008	kg dw/day
BAF_{food}=	Chem Specific	unitless
DF_{plants} =	1.00	unitless
IR_{soil} =	0.00019	kg dw/day
AF =	1	unitless

Notes:

CAS = Chemical Abstract Services

C_{TRV}= NOAEL-based screening level (mg chemical/kg soil)

ADD = NOAEL or LOAEL (mg chemical/kg body weight-day) from Table F.2-10

BW = Minimum Body Weigth of Receptor (kg)

IR_{food} = Maximum Ingestion Rate for Food

BAF_{food} = Bioaccumulation factor (Most contaminated dietary component BSAF used)

DF = Dietary fraction (Most contaminated dietary component assumed to be 100% of diet)

IRs = Incidental Ingestion Rate of soil (kg soil ingested per day, dry weight)

AF = 100% Area Use Factor

NOAEL = No observable adverse effects level

LOAEL = Lowest observable adverse effects level

mg/kg = Milligram Per Kilogram

bw - day = Body Weight - Day

HQ = Hazard Quotient

TRV = Toxicity Reference Value

Short-tailed Shrew Specific Data from Table F.2-9

BW=	0.0125	kg
IR_{food} =	0.003	kg dw/day
BAF_{food}=	Chem Specific	unitless
IR_{soil} =	0.00039	kg dw/day
AF =	1	unitless

[a] = The following equation was used to calculate soil screening levels:

$$C_{TRV} = \frac{ADD \cdot BW}{(IR_{food}(BAF_{food} \cdot DF) + IR_s)AF}$$

See Appendix F.1 for an example C_{TRV} calculation.

NOAEL HQ = Maximum Detected Concentration/Calculated NOAEL-Based Screening Level

LOAEL HQ = Maximum Detected Concentration/Calculated LOAEL-Based Screening Level

Table F.2-17
SSA 18 - Refined Wildlife Risk Characterization - Short-tailed Shrew
Screening Level Ecological Risk Assessment
SSP Report for SSAs 18, 72, 30, 79, 60, and 77

Notes:

CAS = Chemical Abstract Services

C_{TRV}= NOAEL-based screening level (mg chemical/kg soil)

ADD = NOAEL or LOAEL (mg chemical/kg body weight-day) from Table F.2-10

BW = Average Body Weigth of Receptor (kg)

IR_{food} = Average Ingestion Rate for Food

BAF_{food} = Bioaccumulation factor, specific to prey type and chemical

DF = Dietary fraction

IRs = Incidental Ingestion Rate of soil (kg soil ingested per day, dry weight)

AF = Area Use Factor

NOAEL = No observable adverse effects level

LOAEL = Lowest observable adverse effects level

mg/kg = Milligram Per Kilogram

bw - day = Body Weight - Day

HQ = Hazard Quotient

TRV = Toxicity Reference Value

BDL = Below Detection Limit

EPC = Exposure Point Concentration

* = Due to the number of samples at the site, the EPC defaults to the MDC (maximum detected concentration)

[a] = The following equation was used to calculate soil screening levels:

$$C_{TRV} = \frac{ADD \cdot BW}{(IR_{food} \sum (BAF_{food} \cdot DF) + (IR_s)) \cdot AF}$$

See Appendix F.1 for an example C_{TRV} calculation.

NOAEL HQ = EPC/Calculated NOAEL-Based Screening Level

LOAEL HQ = EPC/Calculated LOAEL-Based Screening Level

Short-tailed Shrew Specific Data from Table F.2-9

BW = Average Body Weigth of Receptor (kg)

IR_{food} = Average Ingestion Rate for Food

BAF_{food} = Bioaccumulation factor, specific to prey type and chemical

DF = Dietary fraction

IRs = Incidental Ingestion Rate of soil (kg soil ingested per day, dry weight)

AF = Area Use Factor

NOAEL = No observable adverse effects level

LOAEL = Lowest observable adverse effects level

mg/kg = Milligram Per Kilogram

bw - day = Body Weight - Day

HQ = Hazard Quotient

TRV = Toxicity Reference Value

BDL = Below Detection Limit

EPC = Exposure Point Concentration

* = Due to the number of samples at the site, the EPC defaults to the MDC (maximum detected concentration)

[a] = The following equation was used to calculate screening levels:

$$C_{TRV} = \frac{ADD \cdot BW}{(IR_{food} \sum (BAF_{food} \cdot DF) + (IR_s)) \cdot AF}$$

See Appendix F.1 for an example C_{TRV} calculation.

NOAEL HQ = EPC/Calculated NOAEL-Based Screening Level

LOAEL HQ = EPC/Calculated LOAEL-Based Screening Level

Red FoxSpecific Data from Table F.2-9

AUF = Area Use Factor

[1]Wildlife Exposure Factors Handbook. U.S. Environmental Protection Agency (EPA). 1993. Office of Research and Development. 2 Volumes. EPA/600/R93/187a&b. December.
[2] Estimated food intake rate (kg [dw]/day) calculated as follows:
FI ((kg/day) = 0.0687 $Wt.^{0.882}$ for mammals (red fox and short-tailed shrew)
FI ((g/day) = 0.577 $Wt.^{0.727}$ for herbivores (meadow vole)
FI ((g/day) = 0.301 $Wt.^{0.751}$ for non-passerine birds (red-tailed hawk)
FI ((g/day) = 0.398 $Wt.^{0.850}$ for passerine birds (american robin)
[3]Estimating Exposure to Terrestrial Wildlife to Contaminants. Sample and Sutter. 1994. ES/ER/TM-125.
The soil ingestion rate for the american robin set equal to 38% of the american woodcock value (0.34*10.4%=4%), based on a robin diet of 38% invertbrates.

Notes:
CAS = Chemical Abstract Service
TRV = Toxic Reference Value
NOAEL = No observable adverse effects level
LOAEL = Lowest observable adverse effects level
mg/kg = Milligram Per Kilogram
bw/d = Body Weight Per Day
kg = kilogram
PAH = Polynuclear Aromatic Hydrocarbon
PCB = Polychlorinated Biphenyl
USACE = U.S. Army Corps of Engineers
ORNL = Oak Ridge National Laboratory
NOAEL and LOAEL values were derived from acute values by applying an uncertainty factor of 150.
LD_{50} = Lethal Dose for 50% of test organisms

Notes:
CAS = Chemical Abstract Services
BAF = Bioaccumulation Factor
K_{ow} = Chemical octanol-water coefficient
NC = Not Calculated
C_s = Chemical Concentration in Soil
C_p = Chemical Concentration in Plant Matter (dry weight)
[1] = BAFs for chemical using Cp regression equation calculated by as follows: BAF = C_p/C_s
MDC = Maximum Detected Concentration

Notes:

CAS = Chemical Abstract Services
C_s = Chemical Concentration in Soil
C_e = Chemical Concentration in Earthworm (dry weight)
K_{ow} = Chemical octanol-water coefficient
MDC = Maximum Detected Concentration
K_{oc} = Chemical water to soil partitioning coefficient
K_{ww} = Chemical worm to soil partitioning coefficient
foc = fraction organic content in soil (0.0085 from physical sample)
[1] = BAFs for chemical using Ce regression equation calculated by as follows: BAF = C_e/C_s

Jager Model: As presented in USEPA 2005, Guidance for Developing Ecological Screening Levels, Appendix 4-1, Table 5.
BAF = K_{ww}(L/kg worm dw)/K_d (L/kg soil dw)
K_{ww} (dry weight) = 10^(0.87*logK_{ow} - 2.0) / 0.16
Wet weight to dry weight assuming 16% solids
$K_d = f_{oc} * K_{oc}$
foc = 0.0085 from site specific physical soil data
Note: The maximum Kow utilized for the preliminary calculation and the Selected Kow utilized for the refined calculation.

Notes:

CAS = Chemical Abstract Services
C_{TRV}= NOAEL-based screening level (mg chemical/kg soi)
ADD = NOAEL or LOAEL (mg chemical/kg body weight-day) from Table F.3-10
BW = Minimum Body Weigth of Receptor (kg)
IR_{food} = Maximum Ingestion Rate for Food
BAF_{food} = Bioaccumulation factor (Most contaminated dietary component BSAF used)
DF = Dietary fraction (Most contaminated dietary component assumed to be 100% of diet)
IRs = Incidental Ingestion Rate of soil (kg soil ingested per day, dry weight)
AF = 100% Area Use Factor
NOAEL = No observable adverse effects level
LOAEL = Lowest observable adverse effects level
mg/kg = Milligram Per Kilogram
bw - day = Body Weight - Day
HQ = Hazard Quotient
TRV = Toxicity Reference Value

Meadow Vole Specific Data from Table F.3-9

BW=	0.017	kg
IR_{food} =	0.010	kg dw/day
BAF_{food}=	Chem Specific	unitless
IR_{soil} =	0.00024	kg dw/day
AF =	1	unitless

[a] = The following equation was used to calculate screening levels:

$$C_{TRV} = \frac{ADD \cdot BW}{(IR_{food}(BAF_{food} \cdot DF) + IR_s)AF}$$

See Appendix F.1 for an example C_{TRV} calculation.

NOAEL HQ = Maximum Detected Concentration/Calculated NOAEL-Based Concentration
LOAEL HQ = Maximum Detected Concentration/Calculated LOAEL-Based Concentration

Notes:

CAS = Chemical Abstract Services

C_{TRV}= NOAEL-based screening level (mg chemical/kg soi)

ADD = NOAEL or LOAEL (mg chemical/kg body weight-day) from Table F.3-10

BW = Average Body Weigth of Receptor (kg)

IR_{food} = Average Ingestion Rate for Food

BAF_{food} = Bioaccumulation factor, specific to prey type and chemical

DF = Dietary fraction

IRs = Incidental Ingestion Rate of soil (kg soil ingested per day, dry weight)

AF = Area Use Factor

NOAEL = No observable adverse effects level

LOAEL = Lowest observable adverse effects level

mg/kg = Milligram Per Kilogram

bw - day = Body Weight - Day

HQ = Hazard Quotient

TRV = Toxicity Reference Value

BDL = Below Detection Limit

EPC = Exposure Point Concentration

* = Due to the number of samples at the site, the EPC defaults to the MDC (maximum detected concentration)

[a] = The following equation was used to calculate screening levels:

$$C_{TRV} = \frac{ADD \cdot BW}{(IR_{food} \sum (BAF_{food} \cdot DF) + (IR_s)) \cdot AF}$$

See Appendix F.1 for an example C_{TRV} calculation.

NOAEL HQ = EPC/Calculated NOAEL-Based Screening Level

LOAEL HQ = EPC/Calculated LOAEL-Based Screening Level

Meadow Vole Specific Data from Table F.3-9

BW=	0.037	kg
IR_{food} =	0.008	kg dw/day
BAF_{food}=	Chem Specific	unitless
DF_{plants} =	1.00	unitless
IR_{soil} =	0.00019	kg dw/day
AF =	1	unitless

Notes:

CAS = Chemical Abstract Services

C_{TRV}= NOAEL-based screening level (mg chemical/kg soil)

ADD = NOAEL or LOAEL (mg chemical/kg body weight-day) from Table F.3-10

BW = Minimum Body Weigth of Receptor (kg)

IR_{food} = Maximum Ingestion Rate for Food

BAF_{food} = Bioaccumulation factor (Most contaminated dietary component BSAF used)

DF = Dietary fraction (Most contaminated dietary component assumed to be 100% of diet)

IRs = Incidental Ingestion Rate of soil (kg soil ingested per day, dry weight)

AF = 100% Area Use Factor

NOAEL = No observable adverse effects level

LOAEL = Lowest observable adverse effects level

mg/kg = Milligram Per Kilogram

bw - day = Body Weight - Day

HQ = Hazard Quotient

TRV = Toxicity Reference Value

Short-tailed Shrew Specific Data from Table F.3-9

BW=	0.0125	kg
IR_{food} =	0.003	kg dw/day
BAF_{food}=	Chem Specific	unitless
IR_{soil} =	0.00039	kg dw/day
AF =	1	unitless

[a] = The following equation was used to calculate soil screening levels:

$$C_{TRV} = \frac{ADD \cdot BW}{(IR_{food}(BAF_{food} \cdot DF) + IR_s)AF}$$

See Appendix F.1 for an example C_{TRV} calculation.

NOAEL HQ = Maximum Detected Concentration/Calculated NOAEL-Based Screening Level

LOAEL HQ = Maximum Detected Concentration/Calculated LOAEL-Based Screening Level

Notes:

CAS = Chemical Abstract Services
C_{TRV}= NOAEL-based screening level (mg chemical/kg soil)
ADD = NOAEL or LOAEL (mg chemical/kg body weight-day) from Table F.3-10
BW = Minimum Body Weigth of Receptor (kg)
IR_{food} = Maximum Ingestion Rate for Food
BAF_{food} = Bioaccumulation factor (Most contaminated dietary component BSAF used)
DF = Dietary fraction (Most contaminated dietary component assumed to be 100% of diet)
IRs = Incidental Ingestion Rate of soil (kg soil ingested per day, dry weight)
AF = 100% Area Use Factor
NOAEL = No observable adverse effects level
LOAEL = Lowest observable adverse effects level
mg/kg = Milligram Per Kilogram
bw - day = Body Weight - Day
HQ = Hazard Quotient
TRV = Toxicity Reference Value

Red FoxSpecific Data from Table F.3-9

BW=	2.9500	kg
IR_{food} =	0.342	kg dw/day
BAF_{food}=	Chem Specific	unitless
IR_{soil} =	0.00960	kg dw/day
AF =	1	unitless

[a] = The following equation was used to calculate screening levels:

$$C_{TRV} = \frac{ADD \cdot BW}{(IR_{food}(BAF_{food} \cdot DF) + IR_s)AF}$$

See Appendix F.1 for an example C_{TRV} calculation.

NOAEL HQ = Maximum Detected Concentration/Calculated NOAEL-Based Screening Level
LOAEL HQ = Maximum Detected Concentration/Calculated LOAEL-Based Screening Level

Notes:

CAS = Chemical Abstract Services

C_{TRV}= NOAEL-based screening level (mg chemical/kg soil)

ADD = NOAEL or LOAEL (mg chemical/kg body weight-day) from Table F.3-10

BW_i = Minimum Body Weigth of Receptor (kg)

IR_{food} = Maximum Ingestion Rate for Food

BAF_{food} = Bioaccumulation factor (Most contaminated dietary component BSAF used)

DF = Dietary fraction (Most contaminated dietary component assumed to be 100% of diet)

IRs = Incidental Ingestion Rate of soil (kg soil ingested per day, dry weight)

AF = 100% Area Use Factor

NOAEL = No observable adverse effects level

LOAEL = Lowest observable adverse effects level

mg/kg = Milligram Per Kilogram

bw - day = Body Weight - Day

HQ = Hazard Quotient

TRV = Toxicity Reference Value

Red-tailed Hawk Specific Data from Table F.3-9

BW=	0.957	kg
IR_{food} =	0.063	kg dw/day
BAF_{food}=	Chem Specific	unitless
DF_{mam} =	1.00	unitless
IR_{soil} =	0.00	kg dw/day
AF =	1	unitless

[a] = The following equation was used to calculate screenning levels:

$$C_{TRV} = \frac{ADD \cdot BW}{(IR_{food}(BAF_{food} \cdot DF) + IR_s)AF}$$

See Appendix F.1 for an example C_{TRV} calculation.

NOAEL HQ = Maximum Detected Concentration/Calculated NOAEL-Based Concentration

LOAEL HQ = Maximum Detected Concentration/Calculated LOAEL-Based Concentration

Table F.3-23
SSAs 30 and 79 - Refined Wildlife Risk Characterization - Red-tailed Hawk
Screening Level Ecological Risk Assessment
SSP Report for SSAs 18, 72, 30, 79, 60, and 77

Notes:

CAS = Chemical Abstract Services

C_{TRV}= NOAEL-based screening level (mg chemical/kg soil)

ADD = NOAEL or LOAEL (mg chemical/kg body weight-day) from Table F.3-10

BW = Average Body Weigth of Receptor (kg)

IR_{food} = Average Ingestion Rate for Food

BAF_{food} = Bioaccumulation factor, specific to prey type and chemical

DF = Dietary fraction

IRs = Incidental Ingestion Rate of soil (kg soil ingested per day, dry weight)

AF = Area Use Factor

NOAEL = No observable adverse effects level

LOAEL = Lowest observable adverse effects level

mg/kg = Milligram Per Kilogram

bw - day = Body Weight - Day

HQ = Hazard Quotient

TRV = Toxicity Reference Value

BDL = Below Detection Limit

EPC = Exposure Point Concentration

* = Due to the number of samples at the site, the EPC defaults to the MDC (maximum detected concentration)

[a] = The following equation was used to calculate screening levels:

$$C_{TRV} = \frac{ADD \cdot BW}{(IR_{food} \sum (BAF_{food} \cdot DF) + (IR_s)) \cdot AF}$$

See Appendix F.1 for an example C_{TRV} calculation.

NOAEL HQ = EPC/Calculated NOAEL-Based Screening Level

LOAEL HQ = EPC/Calculated LOAEL-Based Screening Level

Red-tailed Hawk Specific Data from Table F.3-9

BW=	1.134	kg
IR_{food} =	0.059	kg dw/day
BAF_{food}=	Chem Specific	unitless
DF_{mam} =	1.00	unitless
IR_{soil} =	0.0	kg dw/day
AF =	0.0026	unitless

Notes:
kg = Kilogram
kg dw/day = Kilogram Dry-weight per Day
L/day = Liter per Day
ha = Hectares
AUF = Area Use Factor

[1]Wildlife Exposure Factors Handbook. U.S. Environmental Protection Agency (EPA). 1993. Office of Research and Development. 2 Volumes. EPA/600/R93/187a&b. December.
[2] Estimated food intake rate (kg [dw]/day) calculated as follows:
FI ((kg/day) = 0.0687 $Wt.^{0.882}$ for mammals (red fox and short-tailed shrew)
FI ((g/day) = 0.577 $Wt.^{0.727}$ for herbivores (meadow vole)
FI ((g/day) = 0.301 $Wt.^{0.751}$ for non-passerine birds (red-tailed hawk)
FI ((g/day) = 0.398 $Wt.^{0.850}$ for passerine birds (american robin)
[3]Estimating Exposure to Terrestrial Wildlife to Contaminants. Sample and Sutter. 1994. ES/ER/TM-125.
The soil ingestion rate for the american robin set equal to 38% of the american woodcock value (0.34*10.4%=4%), based on a robin diet of 38% invertbrates.

Notes:
CAS = Chemical Abstract Service
TRV = Toxic Reference Value
NOAEL = No observable adverse effects level
LOAEL = Lowest observable adverse effects level
mg/kg = Milligram Per Kilogram
bw/d = Body Weight Per Day
kg = kilogram
PAH = Polynuclear Aromatic Hydrocarbon
PCB = Polychlorinated Biphenyl
USACE = U.S. Army Corps of Engineers
ORNL = Oak Ridge National Laboratory
NOAEL and LOAEL values were derived from acute values by applying an uncertainty factor of 150.
LD_{50} = Lethal Dose for 50% of test organisms

Sample et al. 1998: Sample, B.E., Beauchamp, J.J., Efroymson, R.A., Sutter, G.W., Ashwood, T.L., February 1998. Development and Validation of Bioaccumulation Models for Earthworms.

Jager Model: As presented in USEPA 2005, Guidance for Developing Ecological Screening Levels, Appendix 4-1, Table 5.

BAF = K_{ww}(L/kg worm dw)/K_d (L/kg soil dw)

K_{ww} (dry weight) = 10^(0.87*logK_{ow} - 2.0) / 0.16

Wet weight to dry weight assuming 16% solids

$K_d = f_{oc} * K_{oc}$

foc = 0.00096 from site specific physical soil data

Note: The maximum Kow utilized for the preliminary calculation and the Selected Kow utilized for the refined calculation.

Notes:

CAS = Chemical Abstract Services

C_s = Chemical Concentration in Soil

C_d = Chemical Concentration in Prey (assumed to be 100% earthworms (dry weight))

C_m = Chemical Concentration in Mammal (dry weight)

K_{ow} = Chemical octanol to water partitioning coefficient

[1] = BAFs for chemical using Ce regression equation calculated by as follows: $BAF = C_m/C_s$

MDC = Maximum Detected Concentration

Notes:

CAS = Chemical Abstract Services

C_{TRV}= NOAEL-based screening level (mg chemical/kg soi)

ADD = NOAEL or LOAEL (mg chemical/kg body weight-day) from Table F.4-10

BW = Minimum Body Weigth of Receptor (kg)

IR_{food} = Maximum Ingestion Rate for Food

BAF_{food} = Bioaccumulation factor (Most contaminated dietary component BSAF used)

DF = Dietary fraction (Most contaminated dietary component assumed to be 100% of diet)

IRs = Incidental Ingestion Rate of soil (kg soil ingested per day, dry weight)

AF = 100% Area Use Factor

NOAEL = No observable adverse effects level

LOAEL = Lowest observable adverse effects level

mg/kg = Milligram Per Kilogram

bw - day = Body Weight - Day

HQ = Hazard Quotient

TRV = Toxicity Reference Value

Meadow Vole Specific Data from Table F.4-9

BW=	0.017	kg
IR_{food} =	0.010	kg dw/day
BAF_{food}=	Chem Specific	unitless
IR_{soil} =	0.00024	kg dw/day
AF =	1	unitless

[a] = The following equation was used to calculate screening levels:

$$C_{TRV} = \frac{ADD \cdot BW}{(IR_{food}(BAF_{food} \cdot DF) + IR_s)AF}$$

See Appendix F.1 for an example C_{TRV} calculation.

NOAEL HQ = Maximum Detected Concentration/Calculated NOAEL-Based Concentration

LOAEL HQ = Maximum Detected Concentration/Calculated LOAEL-Based Concentration

Table F.4-15

Notes:

CAS = Chemical Abstract Services

C_{TRV}= NOAEL-based screening level (mg chemical/kg soi)

ADD = NOAEL or LOAEL (mg chemical/kg body weight-day) from Table F.4-10

BW = Average Body Weigth of Receptor (kg)

IR_{food} = Average Ingestion Rate for Food

BAF_{food} = Bioaccumulation factor, specific to prey type and chemical

DF = Dietary fraction

IRs = Incidental Ingestion Rate of soil (kg soil ingested per day, dry weight)

AF = Area Use Factor

NOAEL = No observable adverse effects level

LOAEL = Lowest observable adverse effects level

mg/kg = Milligram Per Kilogram

bw - day = Body Weight - Day

HQ = Hazard Quotient

TRV = Toxicity Reference Value

BDL = Below Detection Limit

EPC = Exposure Point Concentration

* = Due to the number of samples at the site, the EPC defaults to the MDC (maximum detected concentration)

[a] = The following equation was used to calculate screening levels:

$$C_{TRV} = \frac{ADD \cdot BW}{(IR_{food} \sum (BAF_{food} \cdot DF) + (IR_s)) \cdot AF}$$

See Appendix F.1 for an example C_{TRV} calculation.

NOAEL HQ = EPC/Calculated NOAEL-Based Screening Level

LOAEL HQ = EPC/Calculated LOAEL-Based Screening Level

Meadow Vole Specific Data from Table F.4-9

BW=	0.037	kg
IR_{food} =	0.008	kg dw/day
BAF_{food}=	Chem Specific	unitless
DF_{plants} =	1.00	unitless
IR_{soil} =	0.00019	kg dw/day
AF =	1	unitless

Notes:

CAS = Chemical Abstract Services

C_{TRV}= NOAEL-based screening level (mg chemical/kg soil)

ADD = NOAEL or LOAEL (mg chemical/kg body weight-day) from Table F.4-10

BW = Minimum Body Weigth of Receptor (kg)

IR_{food} = Maximum Ingestion Rate for Food

BAF_{food} = Bioaccumulation factor (Most contaminated dietary component BSAF used)

DF = Dietary fraction (Most contaminated dietary component assumed to be 100% of diet)

IRs = Incidental Ingestion Rate of soil (kg soil ingested per day, dry weight)

AF = 100% Area Use Factor

NOAEL = No observable adverse effects level

LOAEL = Lowest observable adverse effects level

mg/kg = Milligram Per Kilogram

bw - day = Body Weight - Day

HQ = Hazard Quotient

TRV = Toxicity Reference Value

Short-tailed Shrew Specific Data from Table F.4-9

BW=	0.0125	kg
IR_{food} =	0.003	kg dw/day
BAF_{food}=	Chem Specific	unitless
IR_{soil} =	0.00039	kg dw/day
AF =	1	unitless

[a] = The following equation was used to calculate soil screening levels:

$$C_{TRV} = \frac{ADD \cdot BW}{(IR_{food}(BAF_{food} \cdot DF) + IR_s)AF}$$

See Appendix F.1 for an example C_{TRV} calculation.

NOAEL HQ = Maximum Detected Concentration/Calculated NOAEL-Based Screening Level

LOAEL HQ = Maximum Detected Concentration/Calculated LOAEL-Based Screening Level

Notes:

CAS = Chemical Abstract Services

C_{TRV}= NOAEL-based screening level (mg chemical/kg soil)

ADD = NOAEL or LOAEL (mg chemical/kg body weight-day) from Table F.4-10

BW = Average Body Weigth of Receptor (kg)

IR_{food} = Average Ingestion Rate for Food

BAF_{food} = Bioaccumulation factor, specific to prey type and chemical

DF = Dietary fraction

IRs = Incidental Ingestion Rate of soil (kg soil ingested per day, dry weight)

AF = Area Use Factor

NOAEL = No observable adverse effects level

LOAEL = Lowest observable adverse effects level

mg/kg = Milligram Per Kilogram

bw - day = Body Weight - Day

HQ = Hazard Quotient

TRV = Toxicity Reference Value

BDL = Below Detection Limit

EPC = Exposure Point Concentration

* = Due to the number of samples at the site, the EPC defaults to the MDC (maximum detected concentration)

[a] = The following equation was used to calculate screening levels:

$$C_{TRV} = \frac{ADD \cdot BW}{(IR_{food} \sum (BAF_{food} \cdot DF) + (IR_s)) \cdot AF}$$

See Appendix F.1 for an example C_{TRV} calculation.

NOAEL HQ = EPC/Calculated NOAEL-Based Screening Level

LOAEL HQ = EPC/Calculated LOAEL-Based Screening Level

Red FoxSpecific Data from Table F.4-9

BW=	4.5300	kg
IR_{food} =	0.238	kg dw/day
BAF_{food}=	Chem Specific	unitless
DF_{plants} =	0.17	unitless
DF_{inv} =	0.04	unitless
DF_{mam} =	0.79	unitless
IR_{soil} =	0.00670	kg dw/day
AF =	0.0063	unitless

Notes:

CAS = Chemical Abstract Services
C_{TRV}= NOAEL-based screening level (mg chemical/kg soil)
ADD = NOAEL or LOAEL (mg chemical/kg body weight-day) from Table F.4-10
BW = Minimum Body Weigth of Receptor (kg)
IR_{food} = Maximum Ingestion Rate for Food
BAF_{food} = Bioaccumulation factor (Most contaminated dietary component BSAF used)
DF = Dietary fraction (Most contaminated dietary component assumed to be 100% of diet)
IRs = Incidental Ingestion Rate of soil (kg soil ingested per day, dry weight)
AF = 100% Area Use Factor
NOAEL = No observable adverse effects level
LOAEL = Lowest observable adverse effects level
mg/kg = Milligram Per Kilogram
bw - day = Body Weight - Day
HQ = Hazard Quotient
TRV = Toxicity Reference Value

American Robin Specific Data from Table F.4-9

BW=	0.0635	kg
IR_{food} =	0.020	kg dw/day
BAF_{food}=	Chem Specific	unitless
IR_{soil} =	0.00100	kg dw/day
AF =	1	unitless

[a] = The following equation was used to calculate soil screening levels:

$$C_{TRV} = \frac{ADD \cdot BW}{(IR_{food}(BAF_{food} \cdot DF) + IR_s)AF}$$

See Appendix F.1 for an example C_{TRV} calculation.

NOAEL HQ = Maximum Detected Concentration/Calculated NOAEL-Based Concentration
LOAEL HQ = Maximum Detected Concentration/Calculated LOAEL-Based Concentration

Notes:

CAS = Chemical Abstract Services
C_{TRV}= NOAEL-based screening level (mg chemical/kg soil)
ADD = NOAEL or LOAEL (mg chemical/kg body weight-day) from Table F.4-10
BW_i = Minimum Body Weigth of Receptor (kg)
IR_{food} = Maximum Ingestion Rate for Food
BAF_{food} = Bioaccumulation factor (Most contaminated dietary component BSAF used)
DF = Dietary fraction (Most contaminated dietary component assumed to be 100% of diet)
IRs = Incidental Ingestion Rate of soil (kg soil ingested per day, dry weight)
AF = 100% Area Use Factor
NOAEL = No observable adverse effects level
LOAEL = Lowest observable adverse effects level
mg/kg = Milligram Per Kilogram
bw - day = Body Weight - Day
HQ = Hazard Quotient
TRV = Toxicity Reference Value

Red-tailed Hawk Specific Data from Table F.4-9

BW=	0.957	kg
IR_{food} =	0.063	kg dw/day
BAF_{food}=	Chem Specific	unitless
DF_{mam} =	1.00	unitless
IR_{soil} =	0.00	kg dw/day
AF =	1	unitless

[a] = The following equation was used to calculate screenning levels:

$$C_{TRV} = \frac{ADD \cdot BW}{(IR_{food}(BAF_{food} \cdot DF) + IR_s)AF}$$

See Appendix F.1 for an example C_{TRV} calculation.

NOAEL HQ = Maximum Detected Concentration/Calculated NOAEL-Based Concentration
LOAEL HQ = Maximum Detected Concentration/Calculated LOAEL-Based Concentration

Table F.4-23
SSA 60 - Refined Wildlife Risk Characterization - Red-tailed Hawk
Screening Level Ecological Risk Assessment
SSP Report for SSAs 18, 72, 30, 79, 60, and 77
Radford Army Ammunition Plant, Radford, Virginia

PARAMETER	CAS #	NOAEL (mg/kg bw-day)	LOAEL (mg/kg bw-day)	Refined Assessment

Notes:

CAS = Chemical Abstract Services

C_{TRV}= NOAEL-based screening level (mg chemical/kg soil)

ADD = NOAEL or LOAEL (mg chemical/kg body weight-day) from Table F.4-10

BW = Average Body Weigth of Receptor (kg)

IR_{food} = Average Ingestion Rate for Food

BAF_{food} = Bioaccumulation factor, specific to prey type and chemical

DF = Dietary fraction

IRs = Incidental Ingestion Rate of soil (kg soil ingested per day, dry weight)

AF = Area Use Factor

NOAEL = No observable adverse effects level

LOAEL = Lowest observable adverse effects level

mg/kg = Milligram Per Kilogram

bw - day = Body Weight - Day

HQ = Hazard Quotient

TRV = Toxicity Reference Value

BDL = Below Detection Limit

EPC = Exposure Point Concentration

* = Due to the number of samples at the site, the EPC defaults to the MDC (maximum detected concentration)

[a] = The following equation was used to calculate screening levels:

$$C_{TRV} = \frac{ADD \cdot BW}{(IR_{food} \sum (BAF_{food} \cdot DF) + (IR_s)) \cdot AF}$$

See Appendix F.1 for an example C_{TRV} calculation.

NOAEL HQ = EPC/Calculated NOAEL-Based Screening Level

LOAEL HQ = EPC/Calculated LOAEL-Based Screening Level

Red-tailed Hawk Specific Data from Table F.4-9

BW=	1.134	kg
IR_{food} =	0.059	kg dw/day
BAF_{food}=	Chem Specific	unitless
DF_{mam} =	1.00	unitless
IR_{soil} =	0.0	kg dw/day
AF =	0.0024	unitless

Notes:
CAS = Chemical Abstracts Service
pg/g = Picogram per Gram
LQ = Laboratory Qualifier
VQ = Validation Qualifier
r = Reason Code

Data Qualifiers:
E = Concentration exceeded the upper level of the calibration range of the instrument for that specific analysis.
J = Analyte present. Reported value may not be accurate or precise.
L = Analyte present. Reported value may be biased low. Actual value is expected to be higher.
d = MS/MSD or LCS/LCSD RPD imprecision.
m = Internal standard failure.
q = Concentration exceeded the linear range.

-- = No Value Available

Total 2,3,7,8-TCDD Equivalents are calculated by summing the detected concentration times the TEF for each chemical. Non-detects, R-flagged data, and B-flagged data are excluded from summed total.

Notes:
kg = Kilogram
kg dw/day = Kilogram Dry-weight per Day
L/day = Liter per Day
ha = Hectares
AUF = Area Use Factor

[1]Wildlife Exposure Factors Handbook. U.S. Environmental Protection Agency (EPA). 1993. Office of Research and Development. 2 Volumes. EPA/600/R93/187a&b. December.
[2] Estimated food intake rate (kg [dw]/day) calculated as follows:
FI ((kg/day) = 0.0687 $Wt.^{0.882}$ for mammals (red fox and short-tailed shrew)
FI ((g/day) = 0.577 $Wt.^{0.727}$ for herbivores (meadow vole)
FI ((g/day) = 0.301 $Wt.^{0.751}$ for non-passerine birds (red-tailed hawk)
FI ((g/day) = 0.398 $Wt.^{0.850}$ for passerine birds (american robin)
[3]Estimating Exposure to Terrestrial Wildlife to Contaminants. Sample and Sutter. 1994. ES/ER/TM-125.
The soil ingestion rate for the american robin set equal to 38% of the american woodcock value (0.34*10.4%=4%), based on a robin diet of 38% invertbrates.

Notes:

CAS = Chemical Abstract Service
TRV = Toxic Reference Value
NOAEL = No observable adverse effects level
LOAEL = Lowest observable adverse effects level
mg/kg = Milligram Per Kilogram
bw/d = Body Weight Per Day
kg = kilogram
PAH = Polynuclear Aromatic Hydrocarbon
PCB = Polychlorinated Biphenyl
USACE = U.S. Army Corps of Engineers
ORNL = Oak Ridge National Laboratory
NOAEL and LOAEL values were derived from acute values by applying an uncertainty factor of 150.
LD_{50} = Lethal Dose for 50% of test organisms

Notes:

CAS = Chemical Abstract Services
BAF = Bioaccumulation Factor
K_{ow} = Chemical octanol-water coefficient
NC = Not Calculated
C_s = Chemical Concentration in Soil
C_p = Chemical Concentration in Plant Matter (dry weight)
[1] = BAFs for chemical using Cp regression equation calculated by as follows: $BAF = C_p/C_s$
MDC = Maximum Detected Concentration

Notes:

CAS = Chemical Abstract Services

C_s = Chemical Concentration in Soil

C_e = Chemical Concentration in Earthworm (dry weight)

K_{ow} = Chemical octanol-water coefficient

MDC = Maximum Detected Concentration

K_{oc} = Chemical water to soil partitioning coefficient

K_{ww} = Chemical worm to soil partitioning coefficient

foc = fraction organic content in soil (0.00178 from physical samples)

[1] = BAFs for chemical using Ce regression equation calculated by as follows: BAF = C_e/C_s

Sample et al. 1998: Sample, B.E., Beauchamp, J.J., Efroymson, R.A., Sutter, G.W., Ashwood, T.L., February 1998. Development and Validation of Bioaccumulation Models for Earthworms.

Jager Model: As presented in USEPA 2005, Guidance for Developing Ecological Screening Levels, Appendix 4-1, Table 5.

BAF = K_{ww}(L/kg worm dw)/K_d (L/kg soil dw)

K_{ww} (dry weight) = 10^(0.87*logK_{ow} - 2.0) / 0.16

Wet weight to dry weight assuming 16% solids

$K_d = f_{oc} * K_{oc}$

foc = 0.00178 from site specific physical soil data

Note: The maximum Kow utilized for the preliminary calculation and the Selected Kow utilized for the refined calculation.

Notes:

CAS = Chemical Abstract Services

C_{TRV}= NOAEL-based screening level (mg chemical/kg soi)

ADD = NOAEL or LOAEL (mg chemical/kg body weight-day) from Table F.5-10

BW = Minimum Body Weigth of Receptor (kg)

IR_{food} = Maximum Ingestion Rate for Food

BAF_{food} = Bioaccumulation factor (Most contaminated dietary component BSAF used)

DF = Dietary fraction (Most contaminated dietary component assumed to be 100% of diet)

IRs = Incidental Ingestion Rate of soil (kg soil ingested per day, dry weight)

AF = 100% Area Use Factor

NOAEL = No observable adverse effects level

LOAEL = Lowest observable adverse effects level

mg/kg = Milligram Per Kilogram

bw - day = Body Weight - Day

HQ = Hazard Quotient

TRV = Toxicity Reference Value

Meadow Vole Specific Data from Table F.5-9

BW=	0.017	kg
IR_{food} =	0.010	kg dw/day
BAF_{food}=	Chem Specific	unitless
IR_{soil} =	0.00024	kg dw/day
AF =	1	unitless

[a] = The following equation was used to calculate screening levels:

$$C_{TRV} = \frac{ADD \cdot BW}{(IR_{food}(BAF_{food} \cdot DF) + IR_s)AF}$$

See Appendix F.1 for an example C_{TRV} calculation.

NOAEL HQ = Maximum Detected Concentration/Calculated NOAEL-Based Concentration

LOAEL HQ = Maximum Detected Concentration/Calculated LOAEL-Based Concentration

Notes:

CAS = Chemical Abstract Services

C_{TRV}= NOAEL-based screening level (mg chemical/kg soi)

ADD = NOAEL or LOAEL (mg chemical/kg body weight-day) from Table F.5-10

BW = Average Body Weigth of Receptor (kg)

IR_{food} = Average Ingestion Rate for Food

BAF_{food} = Bioaccumulation factor, specific to prey type and chemical

DF = Dietary fraction

IRs = Incidental Ingestion Rate of soil (kg soil ingested per day, dry weight)

AF = Area Use Factor

NOAEL = No observable adverse effects level

LOAEL = Lowest observable adverse effects level

mg/kg = Milligram Per Kilogram

bw - day = Body Weight - Day

HQ = Hazard Quotient

TRV = Toxicity Reference Value

BDL = Below Detection Limit

EPC = Exposure Point Concentration

* = Due to the number of samples at the site, the EPC defaults to the MDC (maximum detected concentration)

[a] = The following equation was used to calculate screening levels:

$$C_{TRV} = \frac{ADD \cdot BW}{(IR_{food} \sum (BAF_{food} \cdot DF) + (IR_s)) \cdot AF}$$

See Appendix F.1 for an example C_{TRV} calculation.

NOAEL HQ = EPC/Calculated NOAEL-Based Screening Level

LOAEL HQ = EPC/Calculated LOAEL-Based Screening Level

Meadow Vole Specific Data from Table F.5-9

BW=	0.037	kg
IR_{food} =	0.008	kg dw/day
BAF_{food}=	Chem Specific	unitless
DF_{plants} =	1.00	unitless
IR_{soil} =	0.00019	kg dw/day
AF =	1	unitless

Notes:

CAS = Chemical Abstract Services
C_{TRV}= NOAEL-based screening level (mg chemical/kg soil)
ADD = NOAEL or LOAEL (mg chemical/kg body weight-day) from Table F.5-10
BW = Average Body Weigth of Receptor (kg)
IR_{food} = Average Ingestion Rate for Food
BAF_{food} = Bioaccumulation factor, specific to prey type and chemical
DF = Dietary fraction
IRs = Incidental Ingestion Rate of soil (kg soil ingested per day, dry weight)
AF = Area Use Factor
NOAEL = No observable adverse effects level
LOAEL = Lowest observable adverse effects level
mg/kg = Milligram Per Kilogram
bw - day = Body Weight - Day
HQ = Hazard Quotient
TRV = Toxicity Reference Value
BDL = Below Detection Limit
EPC = Exposure Point Concentration
* = Due to the number of samples at the site, the EPC defaults to the MDC (maximum detected concentration)

Short-tailed Shrew Specific Data from Table F.5-9

BW=	0.015	kg
IR_{food} =	0.002	kg dw/day
BAF_{food}=	Chem Specific	unitless
DF_{plants} =	0.14	unitless
DF_{inv} =	0.86	unitless
IR_{soil} =	0.00026	kg dw/day
AF =	0.260	unitless

[a] = The following equation was used to calculate soil screening levels:

$$C_{TRV} = \frac{ADD \cdot BW}{(IR_{food} \sum (BAF_{food} \cdot DF) + (IR_s)) \cdot AF}$$

See Appendix F.1 for an example C_{TRV} calculation.

NOAEL HQ = EPC/Calculated NOAEL-Based Screening Level
LOAEL HQ = EPC/Calculated LOAEL-Based Screening Level

Notes:

CAS = Chemical Abstract Services
C_{TRV}= NOAEL-based screening level (mg chemical/kg soil)
ADD = NOAEL or LOAEL (mg chemical/kg body weight-day) from Table F.5-10
BW = Minimum Body Weigth of Receptor (kg)
IR_{food} = Maximum Ingestion Rate for Food
BAF_{food} = Bioaccumulation factor (Most contaminated dietary component BSAF used)
DF = Dietary fraction (Most contaminated dietary component assumed to be 100% of diet)
IRs = Incidental Ingestion Rate of soil (kg soil ingested per day, dry weight)
AF = 100% Area Use Factor
NOAEL = No observable adverse effects level
LOAEL = Lowest observable adverse effects level
mg/kg = Milligram Per Kilogram
bw - day = Body Weight - Day
HQ = Hazard Quotient
TRV = Toxicity Reference Value

Red FoxSpecific Data from Table F.5-9

BW=	2.9500	kg
IR_{food} =	0.342	kg dw/day
BAF_{food}=	Chem Specific	unitless
IR_{soil} =	0.00960	kg dw/day
AF =	1	unitless

[a] = The following equation was used to calculate screening levels:

$$C_{TRV} = \frac{ADD \cdot BW}{(IR_{food}(BAF_{food} \cdot DF) + IR_s)AF}$$

See Appendix F.1 for an example C_{TRV} calculation.

NOAEL HQ = Maximum Detected Concentration/Calculated NOAEL-Based Screening Level
LOAEL HQ = Maximum Detected Concentration/Calculated LOAEL-Based Screening Level

Notes:

CAS = Chemical Abstract Services

C_{TRV}= NOAEL-based screening level (mg chemical/kg soil)

ADD = NOAEL or LOAEL (mg chemical/kg body weight-day) from Table F.5-10

BW = Average Body Weigth of Receptor (kg)

IR_{food} = Average Ingestion Rate for Food

BAF_{food} = Bioaccumulation factor, specific to prey type and chemical

DF = Dietary fraction

IRs = Incidental Ingestion Rate of soil (kg soil ingested per day, dry weight)

AF = Area Use Factor

NOAEL = No observable adverse effects level

LOAEL = Lowest observable adverse effects level

mg/kg = Milligram Per Kilogram

bw - day = Body Weight - Day

HQ = Hazard Quotient

TRV = Toxicity Reference Value

BDL = Below Detection Limit

EPC = Exposure Point Concentration

* = Due to the number of samples at the site, the EPC defaults to the MDC (maximum detected concentration)

[a] = The following equation was used to calculate screening levels:

$$C_{TRV} = \frac{ADD \cdot BW}{(IR_{food} \sum (BAF_{food} \cdot DF) + (IR_s)) \cdot AF}$$

See Appendix F.1 for an example C_{TRV} calculation.

NOAEL HQ = EPC/Calculated NOAEL-Based Screening Level

LOAEL HQ = EPC/Calculated LOAEL-Based Screening Level

Red FoxSpecific Data from Table F.5-9

BW=	4.5300	kg
IR_{food} =	0.238	kg dw/day
BAF_{food}=	Chem Specific	unitless
DF_{plants} =	0.17	unitless
DF_{inv} =	0.04	unitless
DF_{mam} =	0.79	unitless
IR_{soil} =	0.00670	kg dw/day
AF =	0.0011	unitless

Notes:

CAS = Chemical Abstract Services

C_{TRV}= NOAEL-based screening level (mg chemical/kg soil)

ADD = NOAEL or LOAEL (mg chemical/kg body weight-day) from Table F.5-10

BW = Minimum Body Weigth of Receptor (kg)

IR_{food} = Maximum Ingestion Rate for Food

BAF_{food} = Bioaccumulation factor (Most contaminated dietary component BSAF used)

DF = Dietary fraction (Most contaminated dietary component assumed to be 100% of diet)

IRs = Incidental Ingestion Rate of soil (kg soil ingested per day, dry weight)

AF = 100% Area Use Factor

NOAEL = No observable adverse effects level

LOAEL = Lowest observable adverse effects level

mg/kg = Milligram Per Kilogram

bw - day = Body Weight - Day

HQ = Hazard Quotient

TRV = Toxicity Reference Value

American Robin Specific Data from Table F.5-9

BW=	0.0635	kg
IR_{food} =	0.020	kg dw/day
BAF_{food}=	Chem Specific	unitless
IR_{soil} =	0.00100	kg dw/day
AF =	1	unitless

[a] = The following equation was used to calculate soil screening levels:

$$C_{TRV} = \frac{ADD \cdot BW}{(IR_{food}(BAF_{food} \cdot DF) + IR_s)AF}$$

See Appendix F.1 for an example C_{TRV} calculation.

NOAEL HQ = Maximum Detected Concentration/Calculated NOAEL-Based Concentration

LOAEL HQ = Maximum Detected Concentration/Calculated LOAEL-Based Concentration

Notes:

CAS = Chemical Abstract Services
C_{TRV}= NOAEL-based screening level (mg chemical/kg soil)
ADD = NOAEL or LOAEL (mg chemical/kg body weight-day) from Table F.5-10
BW_s = Minimum Body Weigth of Receptor (kg)
IR_{food} = Maximum Ingestion Rate for Food
BAF_{food} = Bioaccumulation factor (Most contaminated dietary component BSAF used)
DF = Dietary fraction (Most contaminated dietary component assumed to be 100% of diet)
IRs = Incidental Ingestion Rate of soil (kg soil ingested per day, dry weight)
AF = 100% Area Use Factor
NOAEL = No observable adverse effects level
LOAEL = Lowest observable adverse effects level
mg/kg = Milligram Per Kilogram
bw - day = Body Weight - Day
HQ = Hazard Quotient
TRV = Toxicity Reference Value

Red-tailed Hawk Specific Data from Table F.5-9

BW=	0.957	kg
IR_{food} =	0.063	kg dw/day
BAF_{food}=	Chem Specific	unitless
DF_{mam} =	1.00	unitless
IR_{soil} =	0.00	kg dw/day
AF =	1	unitless

[a] = The following equation was used to calculate screenning levels:

$$C_{TRV} = \frac{ADD \cdot BW}{(IR_{food}(BAF_{food} \cdot DF) + IR_s)AF}$$

See Appendix F.1 for an example C_{TRV} calculation.

NOAEL HQ = Maximum Detected Concentration/Calculated NOAEL-Based Concentration
LOAEL HQ = Maximum Detected Concentration/Calculated LOAEL-Based Concentration

Notes:

CAS = Chemical Abstract Services

C_{TRV}= NOAEL-based screening level (mg chemical/kg soil)

ADD = NOAEL or LOAEL (mg chemical/kg body weight-day) from Table F.5-10

BW = Average Body Weigth of Receptor (kg)

IR_{food} = Average Ingestion Rate for Food

BAF_{food} = Bioaccumulation factor, specific to prey type and chemical

DF = Dietary fraction

IRs = Incidental Ingestion Rate of soil (kg soil ingested per day, dry weight)

AF = Area Use Factor

NOAEL = No observable adverse effects level

LOAEL = Lowest observable adverse effects level

mg/kg = Milligram Per Kilogram

bw - day = Body Weight - Day

HQ = Hazard Quotient

TRV = Toxicity Reference Value

BDL = Below Detection Limit

EPC = Exposure Point Concentration

* = Due to the number of samples at the site, the EPC defaults to the MDC (maximum detected concentration)

[a] = The following equation was used to calculate screening levels:

$$C_{TRV} = \frac{ADD \cdot BW}{(IR_{food} \sum (BAF_{food} \cdot DF) + (IR_s)) \cdot AF}$$

See Appendix F.1 for an example C_{TRV} calculation.

NOAEL HQ = EPC/Calculated NOAEL-Based Screening Level

LOAEL HQ = EPC/Calculated LOAEL-Based Screening Level

Red-tailed Hawk Specific Data from Table F.5-9

BW=	1.134	kg
IR_{food} =	0.059	kg dw/day
BAF_{food}=	Chem Specific	unitless
DF_{mam} =	1.00	unitless
IR_{soil} =	0.0	kg dw/day
AF =	0.0004	unitless

DATA QUALITY OBJECTIVES

THIS PAGE LEFT INTENTIONALLY BLANK

TABLE G.1-1
DATA USABILITY WORKSHEET
SITE: SSAs 18, 72, 30, 79, 60, and 77
MEDIUM: Soil

Activity	Comment
Field Sampling	
Discuss sampling problems and field conditions that affect data usability.	There were no problems identified during field sampling that affected data usability.
Are samples representative of receptor exposure for this medium (e.g., sample depth, grab vs. composite, filtered vs. unfiltered, low flow, etc.)?	Yes. Samples are representative of receptor exposure. Surface soil samples and subsurface soil samples were collected from discrete intervals.
Assess the effect of field QC results on data usability.	Field duplicate samples were collected at the rate of 1 per 10 soil samples. The average concentration of the soil sample and its duplicate sample were used in the risk assessments. Equipment rinsate blank samples were collected at the rate of 1 per 20 soil samples. Low-level detections at concentrations below the laboratory reporting limit were reported in one or more of the equipment blank samples for selected metals, pesticides, VOCs, SVOCs, and explosives (Table G.1-1.1). No significant impact on data usability resulted from these detections. Matrix spike (MS)/matrix spike duplicate (MSD) samples were at the rate of 1 per 20 soil samples. No significant impact on data usability was identified based on the matrix spike results.
Summarize the effect of field sampling issues on the risk assessment, if applicable.	No significant sampling issues were noted. Sections 4.0 through 8.0 of the SSP Report discuss the uncertainty analysis for the human health and ecological risk assessments for sampling and analysis.
Analytical Techniques	
Were the analytical methods appropriate for quantitative risk assessment?	Yes. Low-level SW-846 analytical methods were used for soil analysis in accordance with the MWP and WPA 028. Soil samples were analyzed for VOCs by SW-846 Method 8260B, SVOCs by SW-846 Method 8270C, explosives by SW-846 Methods 8330 and 8332, pesticides by SW-846 Method 8081A, PCBs by SW-846 Method 8082, metals by SW-846 Methods 6010B, 6020, 7471A, and 9012A, dioxin/furans by SW-846 8290, and asbestos by CARB Method 435.
Were detection limits adequate?	Low-level SW-846 Methods were used. The detection limits were adequate for screening against adjusted RSLs as noted in Tables G.1-1.2 through G.1-1.6. As discussed in the uncertainties in Sections 4.0 through 8.0, the lack of sensitivity could lead to an underestimation of risk at the site.

TABLE G.1-1
DATA USABILITY WORKSHEET
SITE: SSAs 18, 72, 30, 79, 60, and 77
MEDIUM: Soil

Activity	Comment
Summarize the effect of analytical technique issues on risk assessment, if applicable.	There were no analytical technical issues which significantly affected the risk assessments. Sections 4.0 through 8.0 of the SSP Report discuss the uncertainty analysis for the human health and ecological risk assessments for sampling and analysis.
Data Quality Objectives	
Precision – How were duplicates handled?	Field duplicate samples were collected at the rate of 1 per 10 soil samples. The average concentration of the soil sample and its duplicate sample were used in the risk assessments.
Accuracy – How were split samples handled?	Split samples were not collected.
Representativeness – Indicate any problems associated with data representativeness (e.g., trip blank or rinsate blank contamination, COC problems, etc.).	No significant issues regarding data representativeness were noted.
Completeness – Indicate any problems associated with data completeness (e.g., incorrect sample analysis, incomplete sample records, problems with field procedures, etc.).	No significant issues regarding completeness of the data were noted. The overall completeness goal of 90±2% for field activities was exceeded for analytical analysis and field data collection.
Comparability – Indicate any problems associated with data comparability.	No significant issues regarding comparability of the data were noted.
Were the DQOs specified in the QAPP satisfied?	Yes, the DQOs specified in the QAPP were satisfied.
Summarize the effect of DQO issues on the risk assessment, if applicable.	Not applicable.
Data Validation and Interpretation	
What are the data validation requirements for this region?	EPA Region III modifications to the National Functional Guidelines for Data Validation.
What method or guidance was used to validate the data?	EPA Region III National Functional Guidelines for Data Validation.
Was the data validation method consistent with regional guidance? Discuss any discrepancies.	Yes, there were no discrepancies.
Were all data qualifiers defined? Discuss those which were not.	Yes, they were defined in the guidance document, data validation reports included in Appendix G.2 of the SSP Report, and in the data tables included in Sections 4.0 through 8.0 of the SSP Report.
Which qualifiers represent usable data?	B, E, J, K, L, U, UJ, UL
Which qualifiers represent unusable data?	R

TABLE G.1-1
DATA USABILITY WORKSHEET
SITE: SSAs 18, 72, 30, 79, 60, and 77
MEDIUM: Soil

Activity	Comment
How are tentatively identified compounds handled?	Detected tentatively identified compounds are qualified NJ. These compounds are not used in the risk assessments.
Summarize the effect of data validation and interpretation issues on the risk assessment, if applicable.	Sections 4.0 through 8.0 of the SSP Report discuss uncertainties associated with qualified data.
Additional notes:	None.

Notes:

CAS = Chemical Abstracts Service
µg/L = Microgram Per Liter
TAL = Target Analyte List
TCL = Target Compound List
VOC = Volatile Organic Compound
SVOC = Semi-volatile Organic Compound
MDL = Method Detection Limit
RL = Reporting Limit
LQ = Laboratory Qualifier
VQ = Validation Qualifier
r = Reason Code

Data Qualifiers

B = Analyte found in associated blank as well as in the sample.
J = Analyte present. Reported value may not be accurate or precise.
,J = Estimated value. The result is less than the reporting limit, but greater than the method detection limit.
L = Analyte present. Reported value may be biased low. Actual value is expected to be higher.
U = The compound was analyzed for but not detected. The reporting limit will be adjusted to reflect any dilution, and for soil, the percent moisture.
UL = Not detected, quantitation limit is probably higher.
c = Calibration failure.
g = Dual column confirmation imprecision.
l = MS/MSD recovery failure.
o = Calibration blank contamination.
p = Preparation blank contamination.
z = Method blank and/or storage blank contamination.

Notes:

CAS = Chemical Abstracts Service
mg/kg = Milligram Per Kilogram
ug/kg = Microgram Per Kilogram
TAL = Target Analyte List
TCL = Target Compound List
PCB = Polychlorinated Biphenyl
VOC = Volatile Organic Compound
SVOC = Semi-volatile Organic Compound
PETN = Pentaerythritol Tetranitrate
MDL = Method Detection Limit
RSL = Regional Screening Level (RSL) from April 2009 RSL Table
Adjusted RSLs = a Hazard Quotient (HQ) of 0.1 applied to non-carcinogens
-- = No Screening Level Available
R-RSL = Residential RSL
SL = Screening Level

Y = MDL exceeds screening level
N = MDL does not exceed screening level
NS = No screening level available

[1] = Chlordane RSL value was used
[2] = Alpha-BHC RSL value was used
[3] = Endosulfan RSL value was used
[4] = Endrin RSL value was used
[5] = Noncarcinogenic RSL value for Aroclor 1254 was used
[6] = 1,3-Dichloropropene RSL value was used
[7] = Noncarcinogenic RSL value for 2,4,6-Trichlorophenol was used
[8] = 3-Methylphenol RSL value was used
[9] = Pyrene RSL value was used
[10] = Noncarcinogenic RSL value for Hexachlorobutadiene was used
[11] = Noncarcinogenic RSL value for Hexachloroethane was used
[12] = Noncarcinogenic RSl value for 2,4,6-Trinitrotoluene was used
[13] = Noncarcinogenic RSL value for 4-Nitrotoluene was used

Notes:

CAS = Chemical Abstracts Service
mg/kg = Milligram Per Kilogram
ug/kg = Microgram Per Kilogram
TAL = Target Analyte List
TCL = Target Compound List
PCB = Polychlorinated Biphenyl
VOC = Volatile Organic Compound
SVOC = Semi-volatile Organic Compound
PETN = Pentaerythritol Tetranitrate
MDL = Method Detection Limit
RSL = Regional Screening Level (RSL) from April 2009 RSL Table
Adjusted RSLs = a Hazard Quotient (HQ) of 0.1 applied to non-carcinogens
-- = No Screening Level Available
R-RSL = Residential RSL
SL = Screening Level

Y = MDL exceeds screening level
N = MDL does not exceed screening level
NS = No screening level available

[1] = Chlordane RSL value was used
[2] = Alpha-BHC RSL value was used
[3] = Endosulfan RSL value was used
[4] = Endrin RSL value was used
[5] = Noncarcinogenic RSL value for Aroclor 1254 was used
[6] = 1,3-Dichloropropene RSL value was used
[7] = Noncarcinogenic RSL value for 2,4,6-Trichlorophenol was used
[8] = 3-Methylphenol RSL value was used
[9] = Pyrene RSL value was used
[10] = Noncarcinogenic RSL value for Hexachlorobutadiene was used
[11] = Noncarcinogenic RSL value for Hexachloroethane was used
[12] = Noncarcinogenic RSl value for 2,4,6-Trinitrotoluene was used
[13] = Noncarcinogenic RSL value for 4-Nitrotoluene was used

Notes:

CAS = Chemical Abstracts Service
mg/kg = Milligram Per Kilogram
ug/kg = Microgram Per Kilogram
TAL = Target Analyte List
TCL = Target Compound List
PCB = Polychlorinated Biphenyl
VOC = Volatile Organic Compound
SVOC = Semi-volatile Organic Compound
PETN = Pentaerythritol Tetranitrate
MDL = Method Detection Limit
RSL = Regional Screening Level (RSL) from April 2009 RSL Table
Adjusted RSLs = a Hazard Quotient (HQ) of 0.1 applied to non-carcinogens
-- = No Screening Level Available
R-RSL = Residential RSL
SL = Screening Level

Y = MDL exceeds screening level
N = MDL does not exceed screening level
NS = No screening level available

[1] = Mercuric Chloride RSL value was used
[2] = Chlordane RSL value was used
[3] = Alpha-BHC RSL value was used
[4] = Endosulfan RSL value was used
[5] = Endrin RSL value was used
[6] = Noncarcinogenic RSL value for Aroclor 1254 was used
[7] = 1,3-Dichloropropene RSL value was used
[8] = Noncarcinogenic RSL value for 2,4,6-Trichlorophenol was used
[9] = 3-Methylphenol RSL value was used
[10] = Pyrene RSL value was used
[11] = Noncarcinogenic RSL value for Hexachlorobutadiene was used
[12] = Noncarcinogenic RSL value for Hexachloroethane was used
[13] = Noncarcinogenic RSl value for 2,4,6-Trinitrotoluene was used
[14] = Noncarcinogenic RSL value for 4-Nitrotoluene was used

Notes:

CAS = Chemical Abstracts Service
mg/kg = Milligram Per Kilogram
ug/kg = Microgram Per Kilogram
TAL = Target Analyte List
TCL = Target Compound List
PCB = Polychlorinated Biphenyl
VOC = Volatile Organic Compound
SVOC = Semi-volatile Organic Compound
PETN = Pentaerythritol Tetranitrate
MDL = Method Detection Limit
RSL = Regional Screening Level (RSL) from April 2009 RSL Table
Adjusted RSLs = a Hazard Quotient (HQ) of 0.1 applied to non-carcinogens
-- = No Screening Level Available
R-RSL = Residential RSL
SL = Screening Level

Y = MDL exceeds screening level
N = MDL does not exceed screening level
NS = No screening level available

[1] = Chlordane RSL value was used
[2] = Alpha-BHC RSL value was used
[3] = Endosulfan RSL value was used
[4] = Endrin RSL value was used
[5] = Noncarcinogenic RSL value for Aroclor 1254 was used
[6] = 1,3-Dichloropropene RSL value was used
[7] = Noncarcinogenic RSL value for 2,4,6-Trichlorophenol was used
[8] = 3-Methylphenol RSL value was used
[9] = Pyrene RSL value was used
[10] = Noncarcinogenic RSL value for Hexachlorobutadiene was used
[11] = Noncarcinogenic RSL value for Hexachloroethane was used
[12] = Noncarcinogenic RSl value for 2,4,6-Trinitrotoluene was used
[13] = Noncarcinogenic RSL value for 4-Nitrotoluene was used

TABLE G.1-2
DATA USABILITY WORKSHEET
SITE: SSAs 18, 72, 30, 79, 30, and 77
MEDIUM: Groundwater

Activity	Comment
Field Sampling	
Discuss sampling problems and field conditions that affect data usability.	There were no problems identified during field sampling that affected data usability.
Are samples representative of receptor exposure for this medium (e.g., sample depth, grab vs. composite, filtered vs. unfiltered, low flow, etc.)?	Yes. Low-flow groundwater sampling techniques were used to collect the samples representative of groundwater quality.
Assess the effect of field QC results on data usability.	Field duplicate samples were collected at the rate of 1 per 10 groundwater samples. The average concentration of the groundwater sample and its duplicate sample were used in the risk assessments. Equipment rinsate blank samples were collected at the rate of 1 per 20 groundwater samples. Asbestos was not detected in the equipment blank (Table G.1-2). No impact on data usability resulted from this sample. Matrix spike (MS)/matrix spike duplicate (MSD) samples were at the rate of 1 per 20 groundwater samples. No significant impact on data usability was identified based on the matrix spike results.
Summarize the effect of field sampling issues on the risk assessment, if applicable.	No significant sampling issues were noted. Section 6.0 of the SSP Report discusses the uncertainty analysis for the human health risk assessment for sampling and analysis.
Analytical Techniques	
Were the analytical methods appropriate for quantitative risk assessment?	Yes. EPA analytical methods were used for groundwater analysis in accordance with the MWP and WPA 028. Groundwater samples were analyzed for Asbestos by EPA Method 100.2.
Were detection limits adequate?	Not applicable.
Summarize the effect of analytical technique issues on risk assessment, if applicable.	There were no analytical technical issues which significantly affected the risk assessments. Section 6.0 of the SSP Report discusses the uncertainty analysis for the human health risk assessment for sampling and analysis.
Data Quality Objectives	
Precision – How were duplicates handled?	Field duplicate samples were collected at the rate of 1 per 10 groundwater samples. The average concentration of the groundwater sample and its duplicate sample were used in the risk assessment.
Accuracy – How were split samples handled?	Split samples were not collected.

TABLE G.1-2
DATA USABILITY WORKSHEET
SITE: SSAs 18, 72, 30, 79, 30, and 77
MEDIUM: Groundwater

Activity	Comment
Representativeness – Indicate any problems associated with data representativeness (e.g., trip blank or rinsate blank contamination, COC problems, etc.).	No significant issues regarding data representativeness were noted.
Completeness – Indicate any problems associated with data completeness (e.g., incorrect sample analysis, incomplete sample records, problems with field procedures, etc.).	No significant issues regarding completeness of the data were noted. The overall completeness goal of 90±2% for field activities was exceeded for analytical analysis and field data collection.
Comparability – Indicate any problems associated with data comparability.	No significant issues regarding comparability of the data were noted.
Were the DQOs specified in the QAPP satisfied?	Yes, the DQOs specified in the QAPP were satisfied.
Summarize the effect of DQO issues on the risk assessment, if applicable.	Not applicable.
Data Validation and Interpretation	
What are the data validation requirements for this region?	EPA Region III modifications to the National Functional Guidelines for Data Validation.
What method or guidance was used to validate the data?	EPA Region III National Functional Guidelines for Data Validation.
Was the data validation method consistent with regional guidance? Discuss any discrepancies.	Yes, there were no discrepancies.
Were all data qualifiers defined? Discuss those which were not.	Yes, they were defined in the guidance document, data validation reports included in Appendix G.2 of the SSP Report, and in the data tables included in Section 6.0 of the SSP Report.
Which qualifiers represent usable data?	B, J, L, U
Which qualifiers represent unusable data?	R
How are tentatively identified compounds handled?	Detected tentatively identified compounds are qualified NJ. These compounds are not used in the risk assessment.
Summarize the effect of data validation and interpretation issues on the risk assessment, if applicable.	Section 6.0 of the SSP Report discusses uncertainties associated with qualified data.
Additional notes:	None.

Table G.1-2
Detected Analytes in Groundwater Field Blanks
SSP Report for SSAs 18, 72, 30, 79, 60, and 77
Radford Army Ammunition Plant, Radford, Virginia

Sample ID Sample Date	Units	EQBK-1 11/11/2009		MDL	RL
		Result	LQ, VQ, r		
Asbestos					
Asbestos	MFL	<0.72	U	0.20	0.72

Notes
MFL = Million Fibers per Liter
MDL = Method Detection Limit
RL = Reporting Limit
LQ = Laboratory Qualifier
VQ = Validation Qualifier
r = Reason Code

Data Qualifiers
U = The compound was analyzed for but not detected. The reporting limit will be adjusted to reflect any dilution, and for soil, the percent moisture.

DATA VALIDATION REPORT - Level III Review

SDG No.:	**SSP0809**	**Fraction:**	**VOC, SVOC, Pesticides, PCB, Explosives, TAL Inorganics, & TOC**
Laboratory:	**TriMatrix**	**Project:**	**Radford SSP**
Reviewer:	**Andrea Sansom**	**Date:**	**October 12, 2009**

This report presents the findings of a review of the referenced data. The report consists of this summary, copies of data reports with data qualifying flags applied (as required), the completed data validation checklist, supporting documentation, and an explanation of the data qualifying flags employed. The review performed is based on the USEPA Region III Modifications to the National Functional Guidelines for Organic and Inorganic Data Review as pertains to the specifics of the analytical methods employed and provisions of the approved project-specific QAPP.

Major Anomalies: For the semi-volatile organic compound analyses (SVOC), the laboratory control spikes displayed the following anomalies:

Batch	Analyte	Laboratory Control Spike (%)	Laboratory Control Spike Duplicate (%)	Control Limits (%)	Relative Percent Difference	Control Limit (%)
0909484	Benzo(a)pyrene	110	**111**	55-110	0.7	30
	Caprolactam	**22**	**15**	25-135	**39**	
	Carbazole	**137**	**135**	50-115	2	
	Dibenzofuran	**107**	104	55-105	3	
	2,4-Dichlorophenol	**106**	100	50-105	6	
	Hexachloroethane	**102**	91	30-95	11	
	2-Methylnaphthalene	**114**	105	45-105	8	
	Naphthalene	**102**	93	40-100	9	
	Pentachlorophenol	**117**	115	40-115	2	
0909647	Benzaldehyde	**4**	not applicable	50-150	-	-

The associated field sample results were non-detect for benzaldehyde and caprolactam; these results were flagged R,l. The other associated field sample results were non-detect while the laboratory control spikes displayed a positive bias; therefore, no further data qualifying action was taken. The matrix spike pair performed on field sample 77SB1A displayed the following major percent recovery anomalies:

Analyte	Matrix Spike (%)	Matrix Spike Duplicate (%)	Control Limits	RPD	Control Limit	Previously Qualified
2,4-Dinitrophenol	53	**0**	15-130	**200**	30	
3,3'-Dichlorobenzidine	**0**	**0**	10-130	0		UJ,i
4-Chloroaniline	**5**	**6**	10-95	21		
4-Nitrophenol	**0**	**0**	015-140	0		
Benzaldehyde	**0**	**0**	50-150	0		R,l

These compounds were qualified R,m in the associated soil samples, unless previously qualified for a similar laboratory control spike anomaly.

Minor Anomalies: For the volatile organic compound analyses (VOC) analyses, blanks displayed the following positive detections:

Type	Identification	Analyte	Result	Units
Batch Blank	0909550-BLK1	1,2,3-Trichlorobenzene	2.4	µg/kg
		1,2,4-Trichlorobenzene	3.8	
		2-Hexanone	1.6	
		Acetone	11	
		Methylene Chloride	1.4	
	0909550-BLK2	1,2,3-Trichlorobenzene	2.2	
		1,2,4-Trichlorobenzene	3.6	
		2-Hexanone	2.4	
	0909853-BLK1	Methylene Chloride	24	
EQBK-1	0908185-10	Acetone	4.2	µg/L
Trip Blank	0908185-11		4.5	

Positive associated field sample results less than five times (ten times for acetone and methylene chloride) the method blank detections were flagged B,z. The initial calibration 9H12016 and 9H21009 displayed correlations less than the control limit of 0.995 for 1,2-dibromo-3-chloropropane at 0.994 and 1,2-dibromoethane at 0.992, respectively. Since the associated field sample results were non-detect, no data qualifying action was taken. The continuing calibrations displayed the following percent differences (%Ds) greater than the control limit (i.e., 20%):

Date	Time	Analyte	%D	Bias
08/20/09	1609	trans-1,3-Dichloropropene	22.3	-
		Isopropylbenzene	22.7	+

The associated field sample result for trans-1,3-dichloropropene was non-detect and was flagged UJ,c. The associated field sample result was non-detect for isopropylbenzene while the continuing calibration displayed a positive bias; no data qualifying action was required. The neat analysis of field sample 60SE1 displayed an internal standard area count less than the lower control limit of 50% for 1,4-dichlorobenzene-d_4 at 37%. The associated field sample results quantified from this internal standard were non-detect and were flagged UJ,i. The neat analysis of field sample 60SE1 displayed a surrogate percent recovery less than the lower control limit of 85% for 4-bromofluorobenzene at 76%. Positive associated field sample results were flagged J,s while non-detect results were flagged UJ,s, unless previously qualified for an internal standard anomaly. Sample 60SE1 was re-analyzed at a medium dilution with acceptable surrogate percent recoveries and internal standard area counts. The data reviewer has manually indicated the data for use on the result forms. The matrix spike pair performed on 77SB1A displayed the following percent recoveries or relative percent difference (RPD) outside the control limits:

Analyte	Matrix Spike (%)	Matrix Spike Duplicate (%)	Lower Control Limit (%)	RPD	Control Limit (%)
1,2,3-Trichlorobenzene	**53**	76	60	**35**	30
1,2,4-Trichlorobenzene	**52**	71	65	**31**	

Since the matrix spike duplicate displayed acceptable percent recoveries, no data qualifying action was taken.

For the SVOC analyses, blanks displayed the following positive detections:

Type	Identification	Analyte	Result	Units
Batch Blank	0909484-BLK1	Butyl Benzyl Phthalate	0.090	µg/L
		Diethyl Phthalate	0.050	
		Di-n-butyl Phthalate	0.35	
	0909647-BLK1	Bis(2-ethylhexyl) Phthalate	7.3	µg/kg
EQBK-1	0908185-10	Acetophenone	0.081	µg/L
		Bis(2-ethylhexyl) Phthalate	0.30	
		Butyl Benzyl Phthalate	0.39	
		Diethyl Phthalate	0.081	
		Di-n-butyl Phthalate	0.71	

Positive associated field sample results less than five times (ten times for phthalates) the method blank detections were flagged B,z. The equipment blank detections for butyl benzyl phthalate, diethylphthalate, and di-n-butylphthalate were flagged B due to method blank detections and no further data qualifying action was taken. The associated positive field sample results less than ten times the equipment blank detection for bis(2-ethylhexyl)phthalate were previously flagged for a method blank detection and no further data qualifying action was taken. The associated field sample results were non-detect for acetophenone and no data qualifying action was required. The continuing calibration check analyzed on 8/21/09 at 1438 displayed a percent difference greater than the control limit of 20% with a negative bias for 2,4-dinitrophenol at 20.4%. The associated field sample results were non-detect and were flagged UJ,c. The neat analyses of field samples 60SS1, 60SE1, 60SE2, 77SB1A, and 77SB3A displayed internal standard area counts less than the lower control limit of 50% for chrysene-d_{12} and perylene-d_{12}. The positive associated field sample results quantified from these internal standards were flagged J,i while non-detects were flagged UJ,i, unless previously flagged for a blank detection or matrix spike anomaly. These samples were re-analyzed at various dilutions with acceptable internal standard area counts. The data reviewer has manually indicated the data for use on the result forms. The matrix spike pair performed on field sample 77SB1A displayed the following percent recoveries and relative percent differences outside the laboratory generated control limits:

Analyte	Matrix Spike (%)	Matrix Spike Duplicate (%)	Control Limits	RPD	Control Limit
2,4-Dinitrotoluene	112	**147**	50-115	25	30
4,6-Dinitro-2-methylphenol	76	35	30-135	**73**	
4-Bromophenyl Phenyl Ether	**120**	**117**	45-115	3	
4-Nitroaniline	**31**	**27**	35-115	16	
Benzo(a)anthracene	**111**	99	50-110	10	
Benzo(b)fluoranthene	**134**	**118**	45-115	11	
Bis(2-ethylhexyl) Phthalate	**160**	**261**	45-125	**41**	
Butyl Benzyl Phthalate	**136**	**131**	50-125	4	
Diethyl Phthalate	**47**	75	50-115	10	
Di-n-butyl Phthalate	**128**	**395**	55-110	**84**	
Di-n-octyl Phthalate	126	**132**	40-130	5	
Hexachlorocyclopentadiene	59	37	10-113	**46**	
Phenanthrene	**117**	**132**	50-110	12	
Pyrene	**146**	**131**	45-125	9	

The parent sample result for 4-nitroaniline was non-detect and was flagged UL,m. The parent sample result for diethylphthalate was positive and was flagged L,m. The parent sample results were non-detect for 4,6-dinitro-2-methylphenol and hexachlorocyclo-pentadiene while the matrix spike pair displayed only relative percent difference anomalies; thus, no data qualifying action was deemed necessary. Positive field sample results for the remaining anomalous compounds were flagged K,m, unless previously flagged for an internal standard anomaly.

For the pesticide analyses, the equipment blank displayed positive detections for gamma-BHC at 0.0022 µg/L and heptachlor epoxide at 0.0016 µg/L. Positive associated field samples results were less than five times the blank concentration and were flagged B,x. The continuing calibrations displayed the following percent differences greater than the control limit of 15%:

Date	Time	Column	Analyte	Percent Difference	Bias
8/25/09	1437	2	gamma-Chlordane	71.0	+
8/26/09	1739	1	Toxaphene	65.4	+
		2		38.3	
	2316	1	4,4'-DDT	16.6	-
			Methoxychlor	18.8	
8/27/09	1915		Toxaphene	20.0	+
8/28/09	1012		Methoxychlor	16.1	-
	1050		Toxaphene	20.6	+
8/30/09	1803			19.2	-
		2		16.5	
8/31/09	0441		Endrin	17.4	+
	0518	1	Toxaphene	15.6	-
		2		18.7	

Positive field sample results associated with positive bias anomalies were flagged J,c. No data qualifying action was required for non-detect results reported from the passing column when the second analytical column displayed an anomaly of either bias. When both columns displayed a negative bias, the associated field sample results were non-detect and were flagged UJ,c. The separate toxaphene continuing calibrations displayed surrogate percent difference anomalies. Since the surrogates displayed acceptable percent differences in the single peak pesticide continuing calibrations, no data qualifying action was deemed necessary. The aqueous laboratory control spike for batch 0909501 displayed a percent recovery greater than the upper control limit of 125% on column 2 for beta-BHC at 134%. The associated field sample result was non-detect, thus, no data qualifying action was taken. The matrix spike pair conducting on field sample 77SB1A for batch 0909442 displayed the following anomalies:

Analyte	Matrix Spike (%)		Matrix Spike Duplicate (%)		Control Limits (%)
	Column 1	Column 2	Column 1	Column 2	
4,4'-DDE	116	**130**	103	**138**	70-125
4,4'-DDT	**206**	**366**	**191**	**388**	45-140
Dieldrin	90	**59**	81	**41**	65-125
Toxaphene	**296**	**208**	**162**	**163**	40-150

Toxaphene also displayed a relative percent difference greater than the control limit of 30% on column 1 at 59%. Since the parent sample results were non-detect for toxaphene and 4,4'-DDT, no data qualifying action was deemed necessary. The parent sample results for 4,4'-DDE and dieldrin were reported from column 1 that displayed passing matrix spike percent recoveries, thus, no data qualifying action was taken. Several positive results displayed relative percent differences greater than the control limit of 40% between the dual column concentrations. These results were flagged J,g, unless previously flagged for a blank detection or continuing calibration anomaly.

For the PCB analyses, the matrix spikes performed on field sample 77SB1A displayed percent recoveries less than the lower control limit of 60% for Aroclor-1260 on column one (58%/53%) and on column two (53%/51%). The parent sample was positive for two Aroclors and these results were flagged L,m while the non-detect parent sample results were flagged UL,m. Several positive results displayed relative percent differences greater than the control limit of 40% between the dual column concentrations. These results were flagged J,g.

For the explosives analyses, the following continuing calibrations displayed percent differences greater than the control limit (i.e., 15%):

Date	Time	Analyte	%D	Bias
08/23/09	0308	Tetryl	17.1	-
08/24/09	1019	4-Amino-2,6-dinitrotoluene	16.1	
		HMX	15.4	
	1640	Tetryl	15.5	
	2056		15.3	
08/25/09	1017	4-Amino-2,6-dinitrotoluene	15.6	
	1514	HMX	15.1	

Since the associated field sample results were non-detect while the continuing calibrations displayed a negative bias, the associated field sample results were flagged UJ,c. The continuing calibrations also displayed percent differences greater than the control limit of 15% with a negative bias for the surrogate 4-nitroaniline. Since all the field samples and batch quality control samples displayed acceptable surrogate percent recoveries, no data qualifying action was taken.

For the inorganic analyses, the method blanks displayed the following detections:

Date	Time	Identification	Analyte	Result	Units
08/17/09	1014	9H17031-CCB1	Silver	0.000034	mg/L
	1026	9H17031-CCB2		0.000028	
			Thallium	0.000013	
	1104	9H17031-CCB3	Selenium	0.00011	
	1142	9H17031-CCB4		-0.00013	
	1217	9H17031-CCB5	Silver	0.000035	
08/18/09	0949	0909448-BLK1	Calcium	15	mg/kg

	0910	EQBK-1	Iron	13	
	0923	9H20016-CCB3	Aluminum	-31	

The associated field sample results for silver, thallium, arsenic, calcium, zinc, and iron were greater than five times the blank concentrations, thus, no data qualifying action was required. The positive field sample results less than five times the blank concentrations for antimony were flagged B,o. The associated field sample results for aluminum and selenium were non-detect and were flagged UL,o. The associated positive field sample results for cobalt and selenium that were less than five times the absolute value of the negative blank detections were flagged L,o. The equipment blank EQBK-1 displayed the following detections:

Analyte	Result	Units
Iron	13	µg/L
Barium	0.34	
Chromium	0.76	
Cobalt	0.063	
Manganese	0.65	
Zinc	11	

The associated field sample results were positive and greater than five times the blank concentrations; no data qualifying action was required. The 6020 sequence 9H17031 analyzed on 08/17/09 displayed a positive detection greater than the reporting limit for the unspiked element nickel. Since the samples were not analyzed for interfering elements during this analysis, the presence of interfering elements at concentrations approximate to the ICS was evaluated and confirmed in the 6010 raw data. The field sample results were positive for nickel at concentrations greater than five times the value reported in the ICS, thus no data qualifying action was taken. The matrix spike pair performed on field sample 77SB1A displayed the following anomalies:

Analyte	Matrix Spike (%)	Matrix Spike Duplicate (%)	Control Limits	RPD	Control Limit
Barium	102	**157**	80-120	10	20
Calcium	86	**428**		**25**	
Mercury	**121**	**56**		16	
Nickel	**67**	**62**		3	
Selenium	**79**	**79**		0.2	
Vanadium	**76**	**71**		2	

The associated field sample results were positive for barium and calcium; these results were flagged K,m. The associated field sample results were positive for nickel, selenium, and vanadium; these results were flagged L,m, unless previously flagged for a blank detection. Positive associated field sample results for mercury were flagged J,m. The field duplicate pair conducted on parent sample 60SS4 displayed a relative percent difference greater than the control limit of 35% for copper at 54.9%. The associated field duplicate sample results were positive and were flagged J,f.

Correctable Anomalies: Due to laboratory capability limitations, the sample summary forms displayed an analytical date of 8/19/09 even though Aroclor 1262 and 1268 were manually noted as not being a match on raw data collected during the analysis conducted from 8/20/09 through 8/21/09 and positive Aroclor 1254 results were reported from data collected during the analysis conducted from 8/20/09 through 8/21/09 after a five point initial calibration for Aroclor 1254.

Comments: The samples are dried prior to metals digestion; the results are not adjusted for percent solids. In addition, the preparation volumes do not adjust the MDL/MRL until a greater than 6% difference in the default amount and actual amount is observed. Due to the abundance of target compounds, most of the samples were analyzed at dilutions for several metal analytes. Therefore, the reporting limits for these constituents were elevated. No anomalies were encountered if a given fraction was not mentioned. Except for data flagged "R", data are usable as qualified for their intended purpose based on the data reviewed.

534-52-1	4,6-Dinitro-2-methylphenol	1	220	220	27	U
51-28-5	2,4-Dinitrophenol	1	440	440	140	U R,M
121-14-2	2,4-Dinitrotoluene	1	220	220	25	U
606-20-2	2,6-Dinitrotoluene	1	220	220	3.0	U
117-84-0	Di-n-octyl Phthalate	1	220	220	7.0	U
117-81-7	Bis(2-ethylhexyl) Phthalate	1	26	220	6.1	J B,J
206-44-0	Fluoranthene	1	22	22	1.0	U
86-73-7	Fluorene	1	44	44	9.1	U

ORGANIC ANALYSIS DATA SHEET
USEPA-8270C

77SB4B

Laboratory: TriMatrix Laboratories, Inc. SDG: SSP0809

Client: URS Corporation Project: RFAAP SSP at Six Sites

Matrix: Soil Laboratory ID: 0908185-09 File ID: 0908185-09.D

Sampled: 08/11/09 15:30 Prepared: 08/18/09 07:41 Analyzed: 08/21/09 19:48

Solids: 75.68 Preparation: 3550B Sonication Extract Initial/Final: 30 g / 1 mL

QC Batch: 0909647 Sequence: 9H24008 Calibration: 9H18007 Instrument: 308

CAS No.	Analyte	Dilution	CONC. (ug/kg dry)	MRL	MDL	Q
118-74-1	Hexachlorobenzene	1	220	220	5.6	U
87-68-3	Hexachlorobutadiene	1	220	220	4.5	U
77-47-4	Hexachlorocyclopentadiene	1	220	220	2.7	U
67-72-1	Hexachloroethane	1	220	220	3.3	U
193-39-5	Indeno(1,2,3-cd)pyrene	1	89	89	4.8	U
78-59-1	Isophorone	1	220	220	8.2	U
91-57-6	2-Methylnaphthalene	1	220	220	0.60	U
95-48-7	2-Methylphenol	1	220	220	6.3	U
106-44-5	4-Methylphenol	1	220	220	5.9	U
91-20-3	Naphthalene	1	22	22	2.7	U
