## EXECUTIVE SUMMARY

This document presents the results of closure activities performed in support of clean closure of Hazardous Waste Management Unit 7 (HWMU-7) located at the Radford Army Ammunition Plant (Radford AAP, EPA ID No. VA1210020730) in Radford, Virginia. The closure activities were conducted in accordance with the Closure Plan Amendment for Hazardous Waste Management Unit 7 (Closure Plan Amendment), which was approved by the Virginia Department of Environmental Quality (VDEQ) in correspondence dated September 27, 2011, as part of the Class 3 Permit Modification for the ***Final Hazardous Waste Management Post-Closure Care Permit for Hazardous Waste Management Units (HWMUs) 5, 7, 10, and 16*** (Permit). This Closure Report documents the activities performed in support of clean closure of the residual material contained within the Unit as well as the underlying soil. In addition, the Closure Report includes an evaluation of groundwater monitoring data to determine the Unit's eligibility for clean closure for groundwater. With the attainment of clean closure for the residual material, soil, and groundwater, Radford AAP seeks to end post-closure care for HWMU-7.

The results of subsurface investigations conducted at HWMU-7 indicate that concentrations of inorganic hazardous constituents of concern (HCOC) detected in the residual material are less than their respective Facility-Wide Background concentrations. Furthermore, no organic HCOCs were detected in the residual material samples. Therefore, the residual material contained within HWMU-7 meets the requirements for clean closure as defined in the Closure Plan Amendment.

Concentrations of organic and inorganic HCOCs were detected in a limited number of samples collected from the clay liner and native soils underlying the Unit. In accordance with the Closure Plan Amendment, clean closure of the clay liner and native soils beneath HWMU-7 was demonstrated using a risk-based assessment as an alternative to the non-detection decontamination standard or the statistical comparison of soil samples to background levels. The results of the risk-based assessment indicate that the total cancer risk across all exposure pathways for the soils underlying the Unit for a residential adult is below the risk goal of total cumulative carcinogenic risk of $1 \times 10^{-4}$, and the risk from any individual carcinogen is below $1 \times 10^{-6}$. The total non-cancer hazard quotient across all exposure pathways in soil for a residential adult is below the risk goal of a total cumulative non-carcinogenic hazard index of 1.0. The total cancer risk across all exposure pathways in the soils for a residential child is below the risk goal of total cumulative carcinogenic risk of $1 \times 10^{-4}$; however, the risk from one individual carcinogen (Aroclor-1254 via ingestion) is greater than $1 \times 10^{-6}$. The total non-cancer hazard quotient across all exposure pathways in soil for a residential child is below the risk goal of a total cumulative non-carcinogenic hazard index of 1.0. However, data validation indicated that the Aroclor-1254 concentrations – which were only detected in samples collected during February 2004 – may be overestimated and inappropriate for use due to inadequate quality control data. Furthermore, based on the uncertainties inherent in this risk assessment, the total cumulative carcinogenic and non-carcinogenic risks were calculated using conservative assumptions that are highly protective. Therefore, the soils beneath the Unit meet the requirements for clean closure by risk-based assessment per the approved Closure Plan Amendment.

Based on the results of the clean closure evaluation, hazardous waste constituents are not present in groundwater at HWMU-7 at concentrations greater than their respective GPS or have

been demonstrated to be derived from a source other than the Unit to the satisfaction of the VDEQ. Therefore, HWMU-7 has not adversely affected groundwater at the site. As a result, Radford AAP has met the requirements in the approved Closure Plan Amendment for clean closure of groundwater.

The closure activities conducted in accordance with the Closure Plan Amendment indicate that the residual material, underlying soil, and groundwater at HWMU-7 meet the requirements for clean closure. Radford AAP will continue to monitor groundwater at HWMU-7 in accordance with the requirements of the Permit until certifications for clean closure of soil and groundwater at the Unit have been issued by the VDEQ. Radford AAP anticipates that certifications for clean closure of soil and groundwater will trigger the reduction of the post-closure care period and signify the completion of post-closure care, thereby terminating the post-closure care period for HWMU-7.

## 1.0 INTRODUCTION

Radford Army Ammunition Plant (Radford AAP; EPA ID No. VA1210020730) prepared this Closure Report for Hazardous Waste Management Unit 7 (HWMU-7) to document closure activities performed at the Unit in 2002 and 2004 in support of clean closure of the residual material within the Unit as well as the underlying soil. In addition, the Closure Report includes an evaluation of groundwater monitoring data to determine the Unit's eligibility for clean closure for groundwater. The Closure Report was prepared in accordance with the Closure Plan Amendment for HWMU-7, which was approved by the VDEQ in correspondence dated September 27, 2011, as part of the Class 3 Permit Modification for the *Final Hazardous Waste Management Post-Closure Care Permit for Hazardous Waste Management Units (HWMUs) 5, 7, 10, and 16* (Permit) and incorporated within Permit Attachment 1, Appendix C. A copy of the Closure Plan Amendment for HWMU-7 is included (on CD-ROM) in **Appendix A**. Copies of relevant project correspondence are included (on CD-ROM) in **Appendix B**.

## 1.1 PURPOSE AND OBJECTIVE

The purpose of the Closure Report is to document the activities that were performed to demonstrate that HWMU-7 does not contain characteristically hazardous wastes and does not contain hazardous constituents at concentrations that pose a risk to human health and the environment. Accordingly, the objective of this report is to evaluate whether the previous closure activities were successful and that the Unit no longer meets the definition of a hazardous waste unit. Therefore, post-closure monitoring at the Unit is no longer warranted.

This Closure Report provides documentation of the procedures and data gathering efforts conducted to attain clean closure for HWMU-7 in accordance with the Virginia Hazardous Waste Management Regulations (VHWMR), 9 VAC 20-60-12, et seq., and with the requirements of the Resource Conservation and Recovery Act (RCRA) as presented in Title 40 of the Code of Federal Regulations (CFR). With the attainment of clean closure for soil and groundwater, Radford AAP seeks to end the post-closure care period for HWMU-7.

## 1.2 UNIT DESCRIPTION

HWMU-7 is a former unlined holding and neutralization basin located on the floodplain of the New River. The location of HWMU-7 is 37°11'12" N latitude and 80°33'15" W longitude, and is shown on the site location map included as **Figure 1**. A Site Plan for HWMU-7 is illustrated in **Figure 2**. Intermittent drainages are located to the north and south of the Unit, and the New River is located approximately 225 feet to the west of the Unit.

When HWMU-7 was in operation, the impoundment measured approximately 90 feet wide by 160 feet long by 12 feet deep (side slope at 2:1). The resulting maximum capacity of the Unit was 566,131 gallons (75,685 cubic feet or 2,803 cubic yards).

The closed HWMU-7 consists of a mound measuring approximately 90 feet wide by 160 feet long by 7 feet high, with a bottom elevation of approximately 1,711.1 feet above msl and a top elevation of approximately 1,718.3 feet above msl. Based on the results of the 2002 and 2004 closure activities (subsurface investigations), it appears that HWMU-7 is capped with a composite liner consisting of (from top to bottom):

- Vegetative cover.
- 1 foot to 1.5 feet of topsoil.
- 1.25 feet to 2 feet of clay.
- 0.5 foot to 1.5 feet of sand (drainage layer; $10^{-3}$ cm/sec permeability).
- 30-mil PVC membrane liner.

The 30-mil PVC membrane liner is underlain by the neutralized residual material. The residual material in turn is underlain by a clay liner ranging in thickness from 1.75 feet to 3 feet throughout most of the Unit. At the northern end of the Unit, the neutralized residual material is underlain by native soils.

## 1.3 UNIT HISTORY

### 1.3.1 Operational History

HWMU-7 was put into operation in 1972. During operation, influent into HWMU-7 included spills, runoff, and wash down waters from the Acid Tank Farms in the Oleum Plant Area; waste sulfuric acid and caustics from oleum production; and waste caustic mixed with acidic water for neutralization. The wastes were characteristically hazardous as corrosive (EPA I.D. No. D002). The acidic waste waters were both nitric ($NO_3$) and sulfuric ($SO_4$) in origin with a pH ranging from 1.5 to 1.6 and a dominant constituent of mixed acids. The waste caustics were also corrosive in characteristic (pH >12.5), resulting in an EPA designation of D002. The dominant constituent of the caustic wastes was sodium hydroxide. The relative abundance of both waste streams was less than 1 percent. As the primary function of the Unit was to neutralize high and low pH influents, the Unit could be interpreted to meet the criteria of a T31 – Neutralization Treatment Unit under the RCRA Treatment, Storage, and Disposal (TSD) Handling Codes designation system.

During a hydrographic survey conducted in December 1984, the thickness of accumulated sediments (primarily residues of lime precipitation) in HWMU-7 was measured at approximately five feet. According to Radford AAP personnel, no waste stream from the NC-line was ever discharged to HWMU-7. Therefore, no reactive wastes were likely present in HWMU-7. According to EP toxicity analyses conducted on the lagoon influent water and sediment, several heavy metals were detected in low concentrations (i.e., nonhazardous). The pH of the lagoon water was 11.4 when the analysis was conducted, which was also classified as nonhazardous. However, as the pH of the lagoon's influent was known to fluctuate (below 2.0 and above 12.5), the wastewater was classified as a corrosive substance. The results of the EP toxicity analyses conducted on the lagoon water and sediment are presented below. The samples collected from the lagoon water and sediment indicate that heavy metals were not present at concentrations that would classify the wastes as hazardous.

| EP Toxicity Parameter | Lagoon Water Concentration | Sediment Concentration |
|---|---|---|
| pH | 11.4 s.u. | NA |
| Arsenic | ND | ND |
| Barium | ND | 0.33 mg/l |
| Cadmium | 0.016 mg/l | 0.027 mg/l |
| Chromium | ND | 0.73 mg/l |
| Lead | ND | 0.58 mg/l |
| Mercury | ND | ND |
| Selenium | ND | ND |
| Silver | ND | 0.027 mg/l |

ND: Non-detect.

### 1.3.2 Unit Closure and Post-Closure Care

Radford AAP ceased operation of HWMU-7 in 1986 and closed the Unit in 1989 in accordance with the VDEQ-approved Closure Plan dated May 1988. At the time of closure, HWMU-7 was drained of all waters, the residual material was treated in-place with flyash and cement kiln dust to achieve a target pH range of 6.3 and 10.5, and the basin was filled with the residual material and stone and capped. No waste has been processed through HWMU-7 since it was closed. A copy of the May 1988 Closure Plan and the certification of closure are included in the Closure Plan Amendment (on CD-ROM) in **Appendix A**.

The May 1988 Closure Plan (**Appendix A**) documents the closure performance standards, environmental assessment of closure methods, and justifications of in-place closure that were used for HWMUs 5, 7, and 16. The four major sections of the May 1988 Closure Plan are discussed below:

**Waste Characterization/Maximum Waste Inventory** – Includes physical descriptions of HWMUs 5, 7, and 16, along with detailed descriptions of each Unit's functions.

**Construction Procedure** – Details basic closure construction procedures and the methods by which wastes and contaminated soils were handled during closure construction. Additional specific or unique information regarding site preparation, demolition cleanup, soil treatment, soil sampling and soil sample analysis is included.

**Soil Treatment** – Includes special instructions for soil treatment prior to and during closure. Presents the two objectives of the soil treatment program: 1) to neutralize acidic sediments and soils, and 2) to solidify soft subsoils for greater manageability. The objectives were accomplished by using pH as a guide for acidity and by testing compressive strength. Also describes procedures including but not limited to: cover system analysis, drain installation, backfill, grading, drainage control, performance evaluation, and certification of closure.

**Post-Closure Care and Groundwater Monitoring** – Presents basic procedures for groundwater monitoring, inspections, maintenance, and contingency activities for the

Units. Also includes engineering specifications for construction procedures, standards to be used, testing requirements, construction submittals, materials to be used, quality controls, unsatisfactory materials, and specific special construction instructions.

Certifications of closure for HWMUs 5, 7, and 16 were submitted to the VDEQ in letters dated October 26, 1989 and January 4, 1990. Following closure, Radford AAP monitored HWMU-7 in accordance with the post-closure care and groundwater monitoring procedures specified in the May 1988 Closure Plan. HWMU-7 was classified as an interim status Unit until the VDEQ issued the ***Post-Closure Permit for Hazardous Waste Management Unit 7*** (issued October 30, 1999; effective date November 30, 1999); the VDEQ subsequently revised the ***Post-Closure Permit***, and issued the ***Final Hazardous Waste Post-Closure Permit for HWMUs 5, 7, 10, and 16*** (Permit) on October 4, 2002. Since 1999, Radford AAP has performed quarterly monitoring of HWMU-7 in accordance with the post-closure care and groundwater monitoring procedures specified in the ***Post-Closure Permits***, as appropriate. In correspondence dated June 14, 2007, the VDEQ modified the Permit to change the groundwater monitoring frequency from quarterly to semiannual.

## 2.0 CLOSURE PERFORMANCE STANDARDS

HWMU-7 is a closed hazardous waste surface impoundment. The Closure Performance Standards, as presented in 40 CFR 264.111, specify that the owner/operator of a hazardous waste surface impoundment must close the Unit in a manner that:

(a) Minimizes the need for further maintenance; and

(b) Controls, minimizes or eliminates, to the extent necessary to protect human health and the environment, post-closure escape of hazardous waste, hazardous constituents, leachate, contaminated run-off, or hazardous waste decomposition products to the ground or surface waters or to the atmosphere; and

(c) Complies with the closure requirements of this subpart, including but not limited to the requirements of 40 CFR 264.228.

In 1989, HWMU-7 was closed in accordance with the closure requirements of 40 CFR 264.111 and 264.228. The Unit was closed with residual material left in-place as detailed in the VDEQ-approved Closure Plan dated May 1988. The Closure Plan Amendment documented procedures to achieve clean closure for HWMU-7 thereby ending the post-closure care period for the Unit. Such a process is allowed by 40 CFR 264.117(a)(2), which states:

> "…any time during the post-closure period for a particular unit, the Director may, in accordance with the permit modification procedures in parts 124 and 270:
> (i) Shorten the post-closure care period applicable to the hazardous waste management unit…if he finds that the reduced period is sufficient to protect human health and the environment (e.g., leachate or groundwater monitoring results, characteristics of the hazardous wastes, application of advanced technology, or alternative disposal, treatment, or re-use techniques indicate that the hazardous waste management unit or facility is secure)."

The purpose of this Closure Report is to document closure procedures that were performed in accordance with the closure performance standards as outlined in the Closure Plan Amendment (**Appendix A**).

## 3.0 CLOSURE PROCEDURES

### 3.1 UNIT CLOSURE OVERVIEW

In 1989, Radford AAP closed HWMU-7 in accordance with the VDEQ-approved Closure Plan for the Unit dated May 1988. HWMU-7 was an unlined holding and neutralization basin that received spills, runoff, and wash down waters from the Acid Tank Farms in the Oleum Plant Area; waste sulfuric acid and caustics from oleum production; and waste caustic mixed with acidic water for neutralization. At the time of closure, HWMU-7 was drained of all liquids, the residual material was treated in-place with flyash and cement kiln dust to achieve a target pH range of 6.3 and 10.5, and the basin was filled with the residual material and stone and capped. Following closure, Radford AAP monitored HWMU-7 in accordance with the post-closure care and groundwater monitoring procedures specified in the May 1988 Closure Plan. HWMU-7 was classified as an interim status Unit until the VDEQ issued the ***Post-Closure Permit for Hazardous Waste Management Unit 7*** (issued October 30, 1999; effective date November 30, 1999); the VDEQ subsequently revised the ***Post-Closure Permit***, and issued the ***Final Hazardous Waste Post-Closure Permit for HWMUs 5, 7, 10, and 16*** (Permit) on October 4, 2002. From October 1999 to the present, Radford AAP has monitored HWMU-7 in accordance with the post-closure care and groundwater monitoring procedures specified in the ***Post-Closure Permits***, as appropriate.

In October and November 2002, Radford AAP conducted subsurface investigations to determine the nature and extent of the residual material contained in closed HWMUs 5 and 7, respectively. Radford AAP intended to implement source removal activities in 2003 in support of clean closures for both Units. However, the laboratory analytical data collected during the subsurface investigations indicated that the residual material in the Units was not hazardous by characteristic; therefore, Radford AAP chose to pursue clean closure of the Units while leaving the residual material in-place. Radford AAP submitted the results of the subsurface investigations to the VDEQ in the ***Field Investigation Report and Risk Assessment for Units 5 and 7*** (March 2003). In correspondence to Radford AAP dated June 25, 2003 (**Appendix B**), the VDEQ indicated that in order for Radford AAP to continue pursuing clean closure for HWMU-7, a revised Closure Plan that included procedures and standards for clean closure must be submitted for the Unit. The VDEQ indicated that the revised Closure Plan must be prepared in accordance with the Draft Guidance Manual for Closure Plans and Post-Closure Plans (Draft Guidance) dated September 28, 2001.

In the June 25, 2003 correspondence, the VDEQ indicated that Radford AAP must sample the soil and liner material (if any) beneath the residual material to determine whether the soil and liner material meet the clean closure standards listed in the Draft Guidance. In February 2004, Radford AAP conducted a subsurface investigation to evaluate the soil and liner material beneath the residual material contained in closed HWMU 7. All subsurface investigation activities were conducted in accordance with the June 25, 2003 correspondence and the procedures specified in the Closure Plan Amendment.

A Closure Plan Amendment for HWMU 7 was submitted to VDEQ in February 2004. Based on subsequent VDEQ comments and discussions, three revisions of the document were submitted following the initial submittal in February 2004, with the final submittal in June 2007. VDEQ concurred with the June 2007 Closure Plan Amendment for HWMU-7 and determined

the information contained therein to be technically adequate in correspondence dated October 31, 2007, with incorporation of VDEQ comments presented in a VDEQ memorandum dated September 14, 2007 (**Appendix B**).

In a meeting between the VDEQ and Radford AAP on January 23, 2008, the VDEQ indicated that the Closure Plan Amendment for HWMU-7 would receive final approval until the public comment period was complete; however, Radford AAP could submit the Closure Report for HWMU-7 for preliminary VDEQ review as soon as the Closure Report was complete. A Closure Report including all the analytical results for the 2002 and 2004 subsurface samples was submitted to the VDEQ under a cover letter dated May 14, 2008. The May 2008 Closure Report was prepared in accordance with the June 2007 Closure Plan with incorporation of the VDEQ comments presented in the VDEQ memorandum dated September 14, 2007, which was deemed technically adequate by the VDEQ. Following receipt of the May 2008 Closure Report, the VDEQ indicated that it would not review the Closure Report until after the Closure Plan Amendment received final approval.

In March 2010, the VDEQ requested the 2007 Closure Plan Amendment for HWMU-7 be revised to reflect changes made to the groundwater monitoring program since 2007, and to incorporate all soil analytical data collected from the Unit to-date. Radford AAP revised the Closure Plan Amendment for HWMU-7 in accordance with the following:

- Draft Guidance Manual for Closure Plans and Post-Closure Plans (Draft Guidance) dated September 28, 2001;
- VDEQ correspondence dated June 25, 2003;
- VDEQ Notice of Deficiencies dated June 7, 2004;
- Radford AAP Response to Comments dated September 14, 2004;
- Teleconference between VDEQ and Radford AAP on January 18, 2007;
- VDEQ e-mail correspondence dated January 18, 2007 and January 25, 2007;
- VDEQ memorandum dated September 14, 2007;
- VDEQ correspondence dated October 31, 2007; and
- VDEQ e-mail correspondence dated March 2, 2010, March 9, 2010, and March 10, 2010.

Based on the March 2010 VDEQ request, Radford AAP submitted a revised Closure Plan Amendment to the VDEQ in July 2010. The July 2010 Closure Plan Amendment for HWMU-7 superseded the previous Closure Plan Amendment submitted in June 2007. In correspondence dated September 27, 2011, the VDEQ approved the Closure Plan Amendment for HWMU-7 as part of the Class 3 Permit Modification for the Permit. The Closure Plan Amendment for HWMU-7 was incorporated within Permit Attachment 1, Appendix C of the Permit. A copy of the Closure Plan Amendment for HWMU-7 is included (on CD-ROM) in **Appendix A**. Copies of relevant project correspondence are included (on CD-ROM) in **Appendix B**.

## 3.2 2002 SUBSURFACE INVESTIGATION

The 2002 subsurface investigation serves as a previous study for the purpose of providing generator knowledge regarding the residual material contained in the Unit. The results of the 2002 subsurface investigation were used to assist with the development of the Hazardous

Constituents of Concern (HCOC) list for the Unit. Additionally, the samples collected in the 2002 subsurface investigation are used to support the Clean Closure Evaluation to the extent possible. A copy of the *Field Investigation Report and Risk Assessment for Units 5 and 7* is included in the Closure Plan Amendment (**Appendix A**). Subsurface investigation activities were conducted in accordance with the procedures specified in the Closure Plan Amendment.

### 3.2.1 Investigation Procedures

On November 1, 2002, Draper Aden Associates advanced 16 soil borings at HWMU-7 using a track-mounted Geoprobe® rig. The boring locations are illustrated in **Figure 2**. The borings were located in a pattern to best determine the horizontal and vertical extent of the residual material in the Unit. Nine borings were advanced within the Unit boundaries, and six borings were advanced around the perimeter just outside of the Unit boundaries. One additional boring was advanced approximately 30 feet topographically upgradient from the Unit for the collection of a background soil sample (7GP-16). Soil samples were collected continuously throughout each of the borings. The differentiation between residual material and native soil was based on visual observation. The borings were backfilled with bentonite upon completion.

The nine borings located within HWMU-7 were advanced through the cap system and residual material and into the clay bottom liner; four of the borings were advanced through the clay liner and into native soils. The boring logs are presented in **Appendix C**.

Draper Aden Associates collected the background soil sample (7GP-16 [3'-4']) plus seven randomly-selected soil samples from the 16 borings for laboratory analysis for the USEPA Target Analyte List (TAL) inorganic compounds and for the USEPA Target Compound List (TCL) organic compounds. The laboratory analytical results were subjected to Level IV data validation. Data validation was conducted using summary tables and raw data provided by the analyzing laboratory. Data validation was conducted in general accordance with SW-846 Method requirements (Test Methods for Evaluating Solid Wastes – Physical and Chemical Methods, USEPA SW-846, 3rd Edition – Final Update I, II/IIA, and III) and CLP data validation guidelines (USEPA Contract Laboratory Program National Functional Guidelines for Organic Data Review, October 1999 and USEPA Contract Laboratory Program National Functional Guidelines for Inorganic Data Review, July 2002). The laboratory analytical data and data validation reports are presented (on CD-ROM) in **Appendix D**.

### 3.2.2 Material Profile of HWMU-7

The nine borings located within the HWMU-7 boundaries (7GP-1, 7GP-2, 7GP-3, 7GP-5, 7GP-6, 7GP-8, 7GP-9, 7GP-10, and 7GP-11; **Figure 2**) were advanced to depths ranging from 12 to 20 feet below ground surface (bgs). The nine borings encountered a layer of topsoil approximately 1 foot to 1.5 feet thick, which was underlain by yellow-brown sandy clay ranging in thickness from 1.25 feet to 2 feet. The yellow-brown sandy clay in turn was underlain by light gray sand (drainage layer) ranging in thickness from 0.50 foot to 1.5 feet. The 30-mil PVC liner was encountered beneath the drainage sand layer. The PVC liner was underlain by yellow-brown silty sand with green, compacted residual material. The thickness of the residual material ranged from 5 feet to 8.5 feet. The residual material in turn was underlain by red-brown to yellow-brown sandy clay ranging in thickness from 1.75 feet to 3 feet. Borings 7GP-5, 7GP-6,

7GP-8, 7GP-10, and 7GP-11 were terminated in the sandy clay. Borings 7GP-1, 7GP-2, and 7GP-9 penetrated the sandy clay and encountered dark gray fine sand and silt with round gravel; the dark gray sand and silt exhibited an aquatic odor. The red-brown to yellow-brown sandy clay was not encountered in boring 5GP-3; the dark gray sand and silt was encountered beneath the residual material at a depth of 9.5 feet bgs in boring 7GP-3. A geologic cross-section of HWMU-7 is included as **Figure 3**.

Five of the six borings located around the perimeter of HWMU-7 (7GP-7, 7GP-12, 7GP-13, 7GP-14, and 7GP-15) were advanced to a depth of 4 feet bgs each; boring 7GP-4 was advanced to a depth of 8 feet bgs. Brown sand was encountered in each of the perimeter borings, and dark gray fine sand and silt with round gravel was encountered at a depth of 7.75 feet bgs in boring 7GP-4. No residual material was encountered in the six perimeter borings.

Boring 7GP-16 was located approximately 30 feet topographically upgradient from HWMU-7 for the collection of a background soil sample. Boring 7GP-16 was advanced to a depth of 4 feet. Brown sand was encountered in boring 7GP-16.

### 3.2.3 Soil Sample Collection and Analytical Results

On November 1, 2002, Draper Aden Associates randomly collected eight soil samples from the 16 borings advanced at HWMU-7. The eight samples and the material from which they were collected are listed below:

- 7GP-1 (1-3') cap material (clay and sand above the PVC membrane);
- 7GP-2 (8-12') residual material;
- 7GP-2 (13.5-14.5') base clay (beneath the residual material);
- 7GP-3 (10-11') native soil (beneath the Unit);
- 7GP-4 (3-4') soil adjacent to the Unit;
- 7GP-5 (6-11') residual material;
- 7GP-8 (5-8') residual material; and
- 7GP-16 (3-4') background soil.

Aliquots of the eight soil samples were submitted to Severn Trent Laboratories of North Canton, Ohio for analysis for the USEPA Target Analyte List (TAL) inorganic compounds. Separate aliquots of the eight soil samples were submitted to Lancaster Laboratories of Lancaster, Pennsylvania for analysis for the USEPA Target Compound List (TCL) organic compounds. The laboratory analytical results were subjected to Level IV data validation. The laboratory analytical data and data validation reports are presented (on CD-ROM) in **Appendix D**. A summary of the TAL inorganic constituents and the TCL organic constituents detected in the eight soil samples from HWMU-7 is presented in **Table 1**. Please note that **Table 1** contains only those detected constituents that are defined as hazardous constituents in 40 CFR 261 Appendix VIII and in 40 CFR 264 Appendix IX; the non-hazardous TAL inorganic constituents detected (aluminum, calcium, iron, magnesium, manganese, and potassium) are not included in **Table 1**.

As shown in **Table 1**, 13 hazardous TAL inorganic constituents were detected in the cap material, residual material, bottom clay liner, native soil, adjacent soil, and background soil. The concentrations of hazardous TAL inorganic constituents detected in the samples of residual material are comparable to the hazardous TAL inorganic constituent concentrations detected in the samples of the cap material, bottom clay liner, native soil, adjacent soil, and background soil. Only three TCL organic constituents were detected in two of the eight soil samples from HWMU-7. The pesticide 4,4'-DDD was detected in bottom clay liner sample 7GP-2 (13.5-14.5') at a concentration of 0.0035 mg/kg. In native soil sample 7GP-3 (10-11'), the pesticide 4,4'-DDE and the semi-volatile compound n-nitrosodiphenylamine were detected at concentrations of 0.0035 mg/kg and 0.75 mg/kg, respectively. No other TCL organic constituents (including polychlorinated biphenyls [PCBs]) were detected in any of the November 2002 soil samples (including the residual material samples) collected at HWMU-7.

## 3.3 2004 SUBSURFACE INVESTIGATION

In correspondence dated June 25, 2003, the VDEQ indicated that Radford AAP must sample the soil and liner material (if any) beneath the residual material to determine whether the soil and liner material meet the clean closure standards listed in the VDEQ *Draft Guidance Manual for Closure Plans and Post-Closure Plans* (Draft Closure Guidance). In February 2004, Radford AAP conducted subsurface investigations to evaluate the soil and liner material beneath the residual material contained in closed HWMU-7. Subsurface investigation activities were conducted in accordance with the June 25, 2003 correspondence and the procedures specified in the Closure Plan Amendment (**Appendix A**).

### 3.3.1 Investigation Procedures

On February 17, 2004, Draper Aden Associates advanced eight (8) soil borings at HWMU-7 using a track-mounted Geoprobe® rig. The boring locations (7GP-17 through 7GP-24) are illustrated in **Figure 2**. The borings were advanced through the clay liner beneath HWMU-7 and into the underlying native soils. The boring logs are presented in **Appendix C**. A geologic cross-section of HWMU-7 is included as **Figure 3**. Soil samples were collected continuously throughout each of the borings. Draper Aden Associates collected a total of eight (8) soil samples (one sample from each boring) from the native soils and clay liner immediately beneath the residual material for laboratory analysis for the USEPA TAL inorganic compounds and for the TCL organic compounds. The borings were backfilled with bentonite upon completion.

The laboratory analytical results were subjected to Level IV data validation. Data validation was conducted using summary tables and raw data provided by the analyzing laboratory. Data validation was conducted in general accordance with SW-846 Method requirements (Test Methods for Evaluating Solid Wastes – Physical and Chemical Methods, USEPA SW-846, 3rd Edition – Final Update I, II/IIA, and III) and CLP data validation guidelines (USEPA Contract Laboratory Program National Functional Guidelines for Organic Data Review, October 1999 and USEPA Contract Laboratory Program National Functional Guidelines for Inorganic Data Review, July 2002). The laboratory analytical data and data validation reports are presented (on CD-ROM) in **Appendix D**.

### 3.3.2 Soil Sample Collection and Analytical Results

The eight soil samples collected on February 17, 2004, and the material from which they were collected are listed below:

- 7GP-17 (11') bottom clay liner/native soil;
- 7GP-18 (14') bottom clay liner;
- 7GP-19 (14') native soil;
- 7GP-20 (14.5') bottom clay liner/native soil;
- 7GP-21 (13.5') bottom clay liner;
- 7GP-22 (13') native soil;
- 7GP-23 (12.5') native soil; and
- 7GP-24 (14') bottom clay liner.

Each of the February 2004 soil samples was collected at depths greater than six inches beneath the bottom of the residual material contained within HWMU-7. Aliquots of the eight soil samples were submitted to Severn Trent Laboratories of North Canton, Ohio for analysis for the USEPA Target Analyte List (TAL) inorganic compounds. Separate aliquots of the eight soil samples were submitted to Lancaster Laboratories of Lancaster, Pennsylvania for analysis for the USEPA Target Compound List (TCL) organic compounds. The laboratory analytical results were subjected to Level IV data validation. The laboratory analytical data and data validation reports are presented (on CD-ROM) in **Appendix D**. A summary of the TAL inorganic constituents and the TCL organic constituents detected in the eight February 2004 soil samples is presented in **Table 1**, along with the results from the November 2002 subsurface investigation. Please note that **Table 1** contains only those detected constituents that are defined as hazardous constituents in 40 CFR 261 Appendix VIII and in 40 CFR 264 Appendix IX; the non-hazardous TAL inorganic constituents detected (aluminum, calcium, iron, magnesium, manganese, and potassium) are not included in **Table 1**.

As shown in **Table 1**, 11 hazardous TAL inorganic constituents were detected in the bottom clay liner and native soil samples. The concentrations of hazardous TAL inorganic constituents detected in the bottom clay liner and native soil samples are comparable to the hazardous TAL inorganic constituent concentrations detected in the November 2002 samples of residual material, cap material, bottom clay liner, native soil, adjacent soil, and background soil.

Four TCL organic constituents were detected in seven of the eight soil samples collected from the bottom clay liner and/or native soils. The volatile compound toluene was detected in bottom clay liner/native soil sample 7GP-20 (14.5') at a concentration of 0.006 mg/kg. The semi-volatile compound bis(2-ethylhexyl)phthalate was detected in bottom clay liner sample 7GP 21 (13.5') at a concentration of 1 mg/kg, and in bottom clay liner/native soil sample 7GP-17 (11') at a concentration of 0.56 mg/kg. The semi-volatile compound n-nitrosodiphenylamine was detected in bottom clay liner samples 7GP-18 (14') and 7GP-21 (13.5') at concentrations of 2.1 mg/kg and 2.8 mg/kg, respectively; in bottom clay liner/native soil samples 7GP-17 (11') and 7GP-20 (14.5') at concentrations of 3.5 mg/kg and 3.0 mg/kg, respectively; and in native soil samples 7GP-19 (14'), 7GP-22 (13'), and 7GP-23 (12.5') at concentrations of 0.9 mg/kg, 3.3 mg/kg, and 3.4 mg/kg, respectively. Furthermore, n-nitrosodiphenylamine was detected in duplicate native soil sample 7GP-22-22 (13') at a concentration of 4.3 mg/kg.

The PCB compound Aroclor-1254 was detected in bottom clay liner samples 7GP-18 (14') and 7GP-21 (13.5') at concentrations of 0.18 mg/kg and 0.5 mg/kg, respectively; in bottom clay liner/native soil samples 7GP-17 (11') and 7GP-20 (14.5') at concentrations of 0.34 mg/kg and 0.35 mg/kg, respectively; and in native soil samples 7GP-19 (14'), 7GP-22 (13'), and 7GP-23 (12.5') at concentrations of 0.53 mg/kg, 0.38 mg/kg, and 0.4 mg/kg, respectively. Furthermore, Aroclor-1254 was detected in duplicate native soil sample 7GP-22-22 (13') at a concentration of 0.33 mg/kg. However, review of the laboratory analytical data package indicated that the laboratory did not perform a five-point initial calibration for the detected aroclors. Additionally, the laboratory did not spike the laboratory control sample (LCS) and matrix spike/matrix spike duplicate (MS/MSD) samples with PCBs. Therefore, the detected Aroclor-1254 concentrations may be overestimated and inappropriate for use due to the limited availability of quality control data.

No other TCL organic constituents were detected in any of the soil samples collected from the bottom clay liner and/or native soils.

## 3.4 GROUNDWATER INVESTIGATIONS

As stated previously, Radford AAP has monitored groundwater at HWMU-7 in accordance with the procedures specified in the Unit's Permits from October 1999 to the present. In accordance with the Closure Plan Amendment, clean closure for groundwater at HWMU-7 may be demonstrated by comparing the most recent groundwater sample analytical results at the time that the Closure Report is prepared to the Groundwater Protection Standards (GPSs) for the Unit. If a groundwater constituent is detected at a concentration that is greater than the GPS, the concentration will be compared to background. HWMU-7 can receive clean closure for groundwater if all constituents are either below GPS or, if any constituents are above GPS, below background.

## 4.0 CLEAN CLOSURE EVALUATION FOR RESIDUAL MATERIAL AND SOIL

As stipulated in the VDEQ-approved Closure Plan Amendment, Radford AAP may achieve clean closure for HWMU-7 with the residual material remaining in-place provided that samples of the residual material as well as soil and any liner material immediately beneath the residual material meet the clean closure standards listed in the VDEQ Draft Closure Guidance, which include:

- Analytical non-detection;
- Comparison to background; and/or
- Risk assessment in accordance with *"Guidance for Development of Health Based Cleanup Goals Using Decision Tree/Risk Exposure and Analysis Modeling System (REAMS) Program, 1994, and Risk Based Methodology,"* as amended by the VDEQ, along with other risk-based guidance provided by the VDEQ.

In order for Radford AAP to achieve clean closure of HWMU-7 with the residual material remaining in-place, the VDEQ indicated that Radford AAP must demonstrate that the residual material meets the clean closure standards. Because of possible mixing, the top six inches of clay or native soil directly underneath the residual material was included with the residual material. Similarly, the bottom six inches of clean material placed above the residual material was included with the residual material. Therefore, closure procedures addressing the residual material included all materials from six inches beneath to six inches above the residual material.

As indicated in the Closure Plan Amendment, the residual material remaining in-place in HWMU-7 must meet the clean closure standards for the HCOCs specified in the Closure Plan Amendment. In November 2002 and February 2004, Radford AAP conducted subsurface investigations to determine the nature and extent of the residual material contained in closed HWMU-7 and to assess the native soils and clay liner immediately beneath the residual material. In order to comply with the clean closure standards, individual samples of the residual material, clay liner, and native soils were analyzed for HCOCs and compared to background data from the vicinity of the Unit, the facility-wide background values (for inorganic constituents; included in the Closure Plan Amendment in **Appendix A**), and risk-based concentrations (USEPA Region 3 or equivalent) for residential soil. The boring logs for the November 2002 and February 2004 soil borings are included in **Appendix C**. Laboratory analytical results and data validation reports for the residual material and soil samples are included (on CD-ROM) in **Appendix D**.

Detected inorganic HCOCs were compared to the inorganic constituent background values established during the August/September 2001 Facility-Wide Background Study conducted by the IT Corporation (a copy of which is included in the Closure Plan Amendment in **Appendix A**). No TCL organic compounds were detected in the background soil samples collected during the August/September 2001 Facility-Wide Background Study; therefore, comparisons to background concentrations will not be possible for any organic HCOCs detected in the clay liner and native soils beneath HWMU-7.

Clean closure of the clay liner and native soils beneath HWMU-7 was demonstrated by a risk-based assessment as an alternative to the non-detection decontamination standard or the statistical comparison of soil samples to background levels. In this way, Radford AAP demonstrates that the concentrations of HCOCs detected in the clay liner and native soils do not

pose an unacceptable level of risk to human health and the environment. The risk assessment was conducted in accordance with the VDEQ document titled *"Guidance for Development of Health Based Cleanup Goals Using Decision Tree/Risk Exposure and Analysis Modeling System (REAMS) Program, 1994, and Risk Based Methodology,"* as amended by the VDEQ, along with other risk-based guidance provided by the VDEQ.

## 4.1 HAZARDOUS CONSTITUENTS OF CONCERN

As discussed in Section 5.1 of the Closure Plan Amendment (**Appendix A**), the HCOC list for HWMU-7 was developed based on the following:

a. The results of analyses of lagoon water and sediment in 1981 (previously presented in the VDEQ-approved May 1988 Closure Plan);

b. The quarterly/semiannual groundwater monitoring constituents for the Unit listed in Appendix E of Permit Attachment 3 of the Permit, as revised by subsequent detections of additional 40 CFR Part 264 Appendix IX constituents; and

c. Hazardous constituents detected in soil samples collected from within and HWMU-7 during the November 2002 and February 2004 subsurface investigations at the Unit.

The HCOC list for HWMU-7 was included as Table 2 of the Closure Plan Amendment, and the HCOCs are also listed in **Table 1** of this Closure Report. The HCOCs were used to determine whether the residual material within the Unit and the bottom clay liner and underlying native soils meet the clean closure standards listed in the VDEQ Draft Closure Guidance.

## 4.2 CLEAN CLOSURE EVALUATION FOR RESIDUAL MATERIAL

During the November 2002 subsurface investigation, three (3) samples of the residual material were submitted for laboratory analyses for TAL inorganic constituents and TCL organic constituents. As shown in **Table 1**, only 10 hazardous TAL inorganic constituents (i.e., HCOCs) were detected in the three residual material samples. No other inorganic HCOCs and no organic HCOCs were detected in the three residual material samples.

In accordance with Section 8.1 of the Closure Plan Amendment (**Appendix A**), achievement of clean closure for the residual material within HWMU-7 may be demonstrated by comparing the concentrations of inorganic HCOCs in the material to the inorganic constituent background values established during the August/September 2001 Facility-Wide Background Study conducted by the IT Corporation (a copy of which is included in the Closure Plan Amendment in **Appendix A**). The 95% UTLs calculated by the IT Corporation for the inorganic constituents detected in the background soil samples from the Main Manufacturing Area are included in **Table 1**. As shown in **Table 1**, none of the inorganic HCOC concentrations detected in the residual material samples were greater than their respective Facility-Wide Background concentrations. Furthermore, no organic HCOCs were detected in the residual material samples. Therefore, the residual material contained within HWMU-7 meets the requirements for clean closure.

## 4.3 CLEAN CLOSURE EVALUATION FOR SOIL

During the November 2002 and February 2004 subsurface investigations, a total of ten (10) samples of the bottom clay liner and/or underlying native soil were submitted for laboratory analyses for TAL inorganic constituents and TCL organic constituents. Each of the 10 soil samples was collected at depths greater than six inches beneath the bottom of the residual material contained within HWMU-7. As shown in **Table 1**, 13 inorganic HCOCs and six (6) organic HCOCs were detected in the bottom clay liner and/or underlying native soil samples. No other inorganic or organic HCOCs were detected in the 10 samples of the bottom clay liner and/or underlying native soil.

### 4.3.1 Comparison to Background

As shown in **Table 1**, the concentrations of 9 of the inorganic HCOCs detected in the bottom clay liner and/or underlying native soil samples (arsenic, chromium, cobalt, copper, lead, nickel, thallium, vanadium, and zinc) were less than their respective Facility-Wide Background concentrations. Two inorganic HCOCs (barium and beryllium) were detected in the bottom clay liner and/or underlying native soil samples at concentrations greater than their respective Facility-Wide Background concentrations. The two remaining inorganic HCOCs – selenium and cyanide – do not have Facility-Wide Background concentrations, nor were they detected in Unit-specific background sample 7GP-16 (3-4') (**Table 1**). Therefore, the concentrations of selenium and cyanide detected in the bottom clay liner and/or underlying native soil samples were greater than background. Additionally, no organic compounds were detected during the August and September 2001 Facility-Wide Background Study, and no TCL organic compounds were detected in Unit-specific background sample 7GP-16 (3-4'). Therefore, the concentrations of the six organic HCOCs – toluene, bis(2-ethylhexyl)phthalate, n-nitrosodiphenylamine, 4,4'-DDD, 4,4'-DDE, and Aroclor-1254 – detected in the bottom clay liner and/or underlying native soil samples were greater than background.

### 4.3.2 Risk-Based Closure Evaluation

Clean closure of the clay liner and native soils beneath HWMU-7 may be demonstrated by a risk-based assessment as an alternative to the non-detection decontamination standard or the statistical comparison of soil sample constituent concentrations to background levels. Only those constituents that did not pass the non-detection and background clean-closure standards (i.e., detects above background levels) need to be included in the risk-based evaluation. Therefore, only barium, beryllium, selenium, cyanide, toluene, bis(2-ethylhexyl)phthalate, n-nitrosodiphenylamine, 4,4'-DDD, 4,4'-DDE, and Aroclor-1254 are included in the risk-based evaluation for the clay liner and native soils beneath HWMU-7. Barium selenium, cyanide, and toluene are classified as non-carcinogenic compounds. Beryllium, bis(2-ethylhexyl)phthalate, and Aroclor-1254 are classified as non-carcinogenic compounds and as carcinogenic compounds. N-nitrosodiphenylamine, 4,4'-DDD, and 4,4'-DDE are classified as carcinogenic compounds.

#### 4.3.2.1 Comparison to Risk-Based Concentrations (Residential Screen)

A comparison of the maximum detected concentrations of barium, beryllium, selenium, cyanide, toluene, bis(2-ethylhexyl)phthalate, n-nitrosodiphenylamine, 4,4'-DDD, 4,4'-DDE, and

Aroclor-1254 to their respective residential risk-based levels is presented in **Table 2**. The maximum detected concentrations of the eight constituents were compared to the regional screening level (RSL) for residential soil as well as to the soil screening level (SSL) for transfer from soil to air or groundwater as presented in the November 2011 *USEPA Region 3, 6, and 9 Regional Screening Levels for Chemical Contaminants at Superfund Sites*.

As shown in **Table 2**, the maximum detected concentrations of barium, selenium, n-nitrosodiphenylamine, and Aroclor-1254 were greater than their respective residential risk-based levels. The maximum detected concentrations of beryllium, cyanide, toluene, bis(2-ethylhexyl)phthalate, 4,4'-DDD, and 4,4'-DDE were less than their respective residential risk-based levels. However, in accordance with VDEQ risk assessment guidance, all of these ten constituents were retained for site-specific quantitative risk assessment due to detection above their respective background concentrations.

#### 4.3.2.2 Exposure Assessment

**Table 3** presents a site conceptual exposure model evaluating the potential exposure routes and media for the Unit and the receptors which may be exposed. For the purposes of this risk assessment, a residential scenario (adult and child) is assumed to present the most conservative assessment of risk. Furthermore, exposure to soil via dermal, ingestion, and inhalation pathways are the only exposure routes considered in this risk assessment. Groundwater is not being considered due to the fact that the HCOC concentrations detected in groundwater at the Unit are less than GPS or have been demonstrated to not be derived from the Unit to the satisfaction of VDEQ. Surface water is not being considered due to the fact that constituent concentrations within the groundwater discharging to the nearest surface water body (the New River; approximately 225 feet west of the Unit) are less than the GPS or have been demonstrated to not be derived from the Unit to the satisfaction of VDEQ. Sediment is not being considered due to the fact that the soil in question is encountered at depths greater than 11 feet below soil and/or residual material that meets the requirements for clean closure (see Section 4.2 of this Closure Report).

For the purposes of this risk assessment, the maximum detected concentrations of barium (279 mg/kg), beryllium (1.5 mg/kg), selenium (4.1 mg/kg), cyanide (0.69 mg/kg), toluene (0.006 mg/kg), bis(2-ethylhexyl)phthalate (1 mg/kg), n-nitrosodiphenylamine (4.3 mg/kg), Aroclor-1254 (0.53 mg/kg), 4,4'-DDD (0.0035 mg/kg), and 4,4'-DDE (0.0025 mg/kg) were used as the conservative (overly protective) estimation of the exposure point concentrations.

Chemical-specific chronic daily intake levels were calculated for the eight constituents of concern in soil for each receptor group (residential adult and residential child) and for each exposure pathway (dermal, ingestion, and inhalation). These calculations are presented in **Appendix E**. The exposure estimates are expressed as a mass of chemical per unit body weight per unit time (e.g., mg/kg-day). Chemical intakes were estimated by multiplying the exposure point concentrations by intake factors based on exposure factors presented in VDEQ and USEPA guidance documents. The references for each of the exposure factors are provided in **Appendix E**.

#### 4.3.2.3 Toxicity Assessment

Toxicity factors for the eight constituents of concern have been obtained from the USEPA Regions 3, 6, and 9 RSL table. The toxicity factors for the eight constituents of concern are included in **Appendix E**. For bis(2-ethylhexyl)phthalate and Aroclor-1254, which have both carcinogenic and non-carcinogenic toxicity factors, the toxicity assessment was conducted for both carcinogenic and non-carcinogenic effects.

#### 4.3.2.4 Risk Characterization

Cancer risks and non-cancer hazard quotients were estimated for each receptor group (residential adult and residential child; **Tables 4** and **5**, respectively) via each exposure pathway (dermal, ingestion, and inhalation) in soil. For bis(2-ethylhexyl)phthalate and Aroclor-1254, which have both carcinogenic and non-carcinogenic toxicity factors, the risk characterization was conducted for both carcinogenic and non-carcinogenic effects.

As shown in **Table 4**, the total cancer risk across all exposure pathways in soil for a residential adult is $1.00 \times 10^{-6}$, which is below the risk goal of total cumulative carcinogenic risk of $1 \times 10^{-4}$, and the risk from no individual carcinogen is greater than $1 \times 10^{-6}$. The total non-cancer hazard quotient across all exposure pathways in soil for a residential adult is $6.12 \times 10^{-2}$, which is below the risk goal of a total cumulative non-carcinogenic hazard index of 1.0.

As shown in **Table 5**, the total cancer risk across all exposure pathways in soil for a residential child is $1.67 \times 10^{-6}$, which is below the risk goal of total cumulative carcinogenic risk of $1 \times 10^{-4}$; however, the risk from one individual carcinogen (Aroclor-1254) is greater than $1 \times 10^{-6}$. The total non-cancer hazard quotient across all exposure pathways in soil for a residential child is $5.34 \times 10^{-1}$, which is below the risk goal of a total cumulative non-carcinogenic hazard index of 1.0.

#### 4.3.2.5 Uncertainty Analysis

Uncertainties inherent in this risk assessment are as follows:

- The maximum detected concentrations of barium (279 mg/kg), beryllium (1.5 mg/kg), selenium (4.1 mg/kg), cyanide (0.69 mg/kg), toluene (0.006 mg/kg), bis(2-ethylhexyl)phthalate (1 mg/kg), n-nitrosodiphenylamine (4.3 mg/kg), Aroclor-1254 (0.53 mg/kg), 4,4'-DDD (0.0035 mg/kg), and 4,4'-DDE (0.0025 mg/kg) were used as the exposure point concentrations. This may tend to over-estimate the risk to both residential receptor groups (adult and child).

- The soil containing barium and beryllium at concentrations greater than Facility-Wide Background as well as concentrations of selenium, cyanide, toluene, bis(2-ethylhexyl)phthalate, n-nitrosodiphenylamine, 4,4'-DDD, 4,4'-DDE, and Aroclor-1254 is encountered at depths greater than 11 feet below soil and/or residual material that meets the requirements for clean closure. Radford AAP intends to leave this soil in-place. Therefore, the exposure assessment based on a residential population

potentially exposed by dermal, ingestion, and inhalation pathways is an over-estimation of the risk presented by the soil remaining in-place.

- The risk from one individual carcinogen (Aroclor-1254) for a residential child was calculated to be $1.62 \times 10^{-6}$, the majority of which was comprised by the ingestion exposure pathway (calculated to be $1.16 \times 10^{-6}$, which is marginally greater than the risk threshold of $1 \times 10^{-6}$ for an individual carcinogen). As stated previously, the risk from Aroclor-1254 was calculated using the maximum detected concentration (0.53 mg/kg). Using the average Aroclor-1254 concentration of 0.38 mg/kg (calculated from all of the detected Aroclor-1254 concentrations) the cancer risk from Aroclor-1254 for a residential child across all exposure pathways was calculated to be $1.16 \times 10^{-6}$, the majority of which was comprised by the ingestion exposure pathway (calculated to be $8.33 \times 10^{-7}$, which is less than the risk threshold of $1 \times 10^{-6}$ for an individual carcinogen) (**Table 6**).

- The soil containing the Aroclor-1254 concentrations is encountered at depths greater than 11 feet below ground surface, thus the chance of exposure to this soil via any pathway and the duration of any exposure would be minimal. Therefore, any realistic risk presented by this soil would be well below acceptable thresholds.

- Additional discussions with the data validation specialist regarding the Aroclor-1254 data for the February 2004 soil samples indicated that the February 2004 Aroclor-1254 data may be overestimated and inappropriate for use due to the limited availability of quality control data are suspect due to inadequate quality control data. Specifically, a five-point initial calibration was not performed for the detected aroclors; also, the LCS and MS/MSD samples were not spiked with PCBs. Aroclor-1254 concentrations were not detected in any of the samples collected during the November 2002 subsurface investigation, including the two bottom clay liner/native soil samples collected in November 2002. As a result, the February 2004 Aroclor-1254 concentrations used in this risk assessment may be an overestimation and therefore may be inappropriate for use.

## 4.4 RESULTS OF CLEAN CLOSURE EVALUATION FOR RESIDUAL MATERIAL AND SOIL

None of the inorganic HCOC concentrations detected in the residual material samples were greater than their respective Facility-Wide Background concentrations. Furthermore, no organic HCOCs were detected in the residual material samples. Therefore, the residual material contained within HWMU-7 meets the requirements for clean closure as defined the Closure Plan Amendment.

The total cancer risk across all exposure pathways for the soils underlying the Unit for a residential adult is $1.00 \times 10^{-6}$, which is below the risk goal of total cumulative carcinogenic risk of $1 \times 10^{-4}$, and the risk from any individual carcinogen is below $1 \times 10^{-6}$. The total non-cancer hazard quotient across all exposure pathways in soil for a residential adult is $6.12 \times 10^{-2}$, which is below the risk goal of a total cumulative non-carcinogenic hazard index of 1.0. The total cancer risk across all exposure pathways in the soils for a residential child is $1.67 \times 10^{-6}$, which is below

the risk goal of total cumulative carcinogenic risk of 1 x $10^{-4}$; however, the risk from one individual carcinogen (Aroclor-1254) is greater than 1 x $10^{-6}$. The total non-cancer hazard quotient across all exposure pathways in soil for a residential child is 5.34 x $10^{-1}$, which is below the risk goal of a total cumulative non-carcinogenic hazard index of 1.0. Based on the uncertainties inherent in this risk assessment, the total cumulative carcinogenic and non-carcinogenic risks were calculated using conservative assumptions that are highly protective. Furthermore, data validation indicated that the Aroclor-1254 concentrations – which were only detected in samples collected during February 2004 – may be overestimated and inappropriate for use due to the absence of quality control data. Therefore, the soils beneath the Unit meet the requirements for clean closure by risk-based assessment.

## 5.0 CLEAN CLOSURE EVALUATION FOR GROUNDWATER

As the residual material and underlying soils at HWMU-7 meet the clean closure standards specified by the VDEQ, Radford AAP is presenting a demonstration of clean closure for groundwater at HWMU-7 as part of this Closure Report in accordance with the Closure Plan Amendment. The groundwater at HWMU-7 is currently monitored in accordance with the requirements of the Permit, as modified in the VDEQ-approved Class 3 Permit Modification dated September 27, 2011. The latest potentiometric surface map (Fourth Quarter 2011) is included as **Figure 4**.

As stipulated in the Closure Plan Amendment, clean closure for groundwater at HWMU-7 may be demonstrated by comparing the most recent groundwater sample analytical results at the time that the Closure Report is prepared to the Groundwater Protection Standards (GPS) for the Unit. For the HCOCs that are included in the semiannual Groundwater Compliance Monitoring List for HWMU-7 (Permit Attachment 3, Appendix E), the clean closure evaluation focuses on groundwater analytical data collected during Fourth Quarter 2011 (**Appendix F**). Those HCOCs that are not included in the semiannual Groundwater Compliance Monitoring List for HWMU-7 (with the exception of Aroclor-1254) are included in the Annual Groundwater Sampling Constituent List (Permit Attachment 1, Appendix I) for the Unit; therefore, the clean closure evaluation for those constituents focuses on groundwater analytical data collected during Second Quarter 2011 (**Appendix F**). Groundwater at HWMU-7 is not monitored for Aroclor-1254; however, an evaluation of the potential for Aroclor-1254 migration to groundwater is included in this clean closure evaluation (Section 5.5, below).

If a groundwater constituent is detected at a concentration that is greater than the GPS, the concentration will be compared to the calculated site-specific background concentration. HWMU-7 may receive clean closure for groundwater if no constituents are greater than GPS or, if any constituents are greater than GPS, the constituents are below background. With the exception of total cobalt, the GPS for HWMU-7 are based on USEPA Maximum Contaminant Levels (MCLs) for drinking water or on VDEQ-derived Alternate Concentration Limits (ACLs) for constituents without MCLs. The approved Class 3 Permit Modification dated September 27, 2011 reduced the GPS for total cobalt at HWMU-7 from the previous VDEQ-calculated ACL of 156.65 µg/L to the site-specific background concentration of 5 µg/L due to the reduction of the VDEQ-calculated ACL to 4.695 µg/l.

As requested in VDEQ correspondence dated September 14, 2007, Radford AAP statistically recalculated the background concentration values for the constituents listed in the Unit's Compliance groundwater monitoring program using the data from Second Quarter 2003 through Second Quarter 2007 (**Appendix G**). Additionally, the VDEQ revised the GPS for HWMU-7 in the approved Closure Plan Amendment dated September 27, 2011; the revised GPS are included in **Appendix H**. The updated background concentration values and GPSs are also included in the analytical data summary tables in **Appendix F**.

### 5.1 CONSTITUENTS NOT DETECTED ABOVE QUANTITATION LIMITS

As summarized in **Appendix F**, the following HCOCs that are included in the semiannual Groundwater Compliance Monitoring List for HWMU-7 (Permit Attachment 3,

Appendix E) were not detected in groundwater at concentrations greater than their respective quantitation limits (QLs) during Fourth Quarter 2011. The QLs for these constituents are less than or equal to their respective GPS.

| HCOC | QL (µg/L) | Background (µg/L) | USEPA MCL (µg/L) | VDEQ ACL (µg/L) | GPS (µg/L) |
|---|---|---|---|---|---|
| Arsenic | 10 | 10 | 10 | | 10 |
| Cadmium | 1 | 1 | 5 | | 5 |
| Copper | 5 | 5 | 1,300 | | 1,300 |
| Lead | 1 | 1 | 15 | | 15 |
| Selenium | 10 | 10 | 50 | | 50 |
| Silver | 2 | 2 | | 78.25 | 78.25 |
| Thallium | 1 | 1 | 2 | | 2 |
| Cyanide | 20 | 20 | 200 | | 200 |
| Bis(2-ethylhexyl)phthalate | 6 | 6 | 6 | | 6 |
| 2,4-Dinitrotoluene | 10 | 10 | | 31.3 | 31.3 |
| 2,6-Dinitrotoluene | 10 | 10 | | 15.65 | 15.65 |

Notes:
USEPA MCL, when available, supersedes VDEQ ACL.
VDEQ ACL: VDEQ-calculated Alternate Concentration Limit, January 31, 2011.

Additionally, the following HCOCs that are not included in the semiannual Groundwater Compliance Monitoring List for HWMU-7 but are included in the Annual Groundwater Sampling Constituent List (Permit Attachment 1, Appendix I) for the Unit were not detected in groundwater at concentrations greater than their respective QLs during Second Quarter 2011 (**Appendix F**). The QLs for these constituents are less than or equal to their respective drinking water standards (USEPA MCLs or VDEQ-calculated ACLs).

| HCOC | QL (µg/L) | USEPA MCL (µg/L) | VDEQ ACL (µg/L) |
|---|---|---|---|
| Antimony | 1 | 6 | |
| Beryllium | 1 | 4 | |
| Mercury | 2 | 2 | |
| Butyl benzyl phthalate | 10 | | 35.39 |
| 2,4-Dinitrophenol | 10 | | 31.2 |
| 4-Nitrophenol | 10 | | n/a |
| N-Nitrosodiphenylamine | 5 | | 13.72 |
| 4,4-DDD | 0.05 | | 0.28 |
| 4,4-DDE | 0.05 | | 0.20 |
| Toluene | 1 | 1,000 | |

Notes:
USEPA MCL, when available, supersedes VDEQ ACL.
VDEQ ACL: VDEQ-calculated Alternate Concentration Limit, January 31, 2011.
n/a: There is no USEPA MCL or VDEQ-calculated ACL for 4-Nitrophenol.

## 5.2 CONSTITUENTS DETECTED ABOVE QUANTITATION LIMITS

As summarized in **Appendix F**, no organic HCOCs were detected at concentrations equal to or greater than their respective QLs in groundwater at HWMU-7 during Second Quarter 2011 and Fourth Quarter 2011. Of the inorganic HCOCs monitored in groundwater at HWMU-7, only the following five were detected at concentrations greater than their respective QLs during Fourth Quarter 2011.

- **Barium**
  Barium was detected in every well at the Unit, including upgradient background well 7W12B, at concentrations greater than the QL of 10 µg/l but less than the GPS of 2,000 µg/l. Barium is naturally occurring and is consistently detected in groundwater across the Radford AAP facility.
- **Chromium**
  Chromium was detected only in upgradient background well 7W12B at a concentration greater than the QL of 5 µg/l but less than the GPS of 100 µg/l. Chromium was not detected at concentrations greater than the QL of 5 µg/l in the downgradient wells at the Unit.
- **Cobalt**
  Cobalt was detected in plume well 7W13 at a concentration of 11.7 µg/l, which is greater than the QL and GPS of 5 µg/l. Cobalt was not detected at concentrations greater than the QL of 5 µg/l in the other wells at the Unit. (The results of a VDEQ-approved alternate source demonstration (ASD) for cobalt are discussed in Section 5.3, below.)
- **Nickel**
  Nickel was detected in point of compliance (POC) well 7WCA at a concentration greater than the QL of 10 µg/l but less than the GPS of 313 µg/l. Nickel was not detected at concentrations greater than the QL of 10 µg/l in the other wells at the Unit.
- **Zinc**
  Zinc was detected in every well except plume well 7W9C at concentrations greater than the QL of 10 µg/l but less than the GPS of 4,695 µg/l. Zinc was not detected at a concentration greater than the QL of 10 µg/l in plume well 7W9C.

## 5.3 COMPARISON TO GROUNDWATER PROTECTION STANDARDS

As stipulated in the Closure Plan Amendment, clean closure for groundwater at HWMU-7 may be demonstrated by comparing the most recent groundwater sample analytical results at the time that the Closure Report is prepared to the GPS for the Unit. As shown in **Appendix F** and discussed above, cobalt was the only HCOC detected in groundwater at a concentration greater than its GPS. No other HCOCs that are included in the Permit groundwater monitoring lists for HWMU-7 were detected at concentrations greater than their respective GPS or drinking water standards (current USEPA MCLs and VDEQ ACLs) during the most recent groundwater monitoring event.

During Fourth Quarter 2011, total cobalt was detected in plume monitoring well 7W13 at a concentration of 11.7 µg/l, which is greater than the site-specific background concentration of 5 µg/l and the revised GPS of 5 µg/l; however, the total cobalt concentration detected in plume monitoring well 7W13 is consistent with previous concentrations detected in this well. During teleconferences on November 9, 2011 and November 17, 2011, the VDEQ recommended Radford AAP submit an alternate source demonstration (ASD) for total cobalt concentrations detected in groundwater at HWMU-7. Radford AAP submitted the ASD to the VDEQ on December 15, 2011. The results of the ASD concluded that the total cobalt concentrations

observed in groundwater at HWMU-7 are derived from ambient, naturally-occurring and naturally variable sources. The VDEQ concurred with the conclusions and approved the ASD in correspondence dated January 5, 2012, stating that the facility is not required to remediate cobalt in groundwater at HWMU-7. Copies of the December 15, 2011 ASD and the January 5, 2012 VDEQ approval letter re included (on CD-ROM) in **Appendix I**.

## 5.4 ALTERNATE SOURCE DEMONSTRATION FOR ADDITIONAL DETECTED CONSTITUENTS

Chloroform, which is not an HCOC for HWMU-7, was detected at low concentrations in upgradient well 7W12B (3 µg/l) and in POC wells 7WCA and 7W11B (both less than the QL of 1 µg/l) during Second Quarter 2011. Chloroform was first detected at low concentrations in upgradient well 7W12B and POC well 7W11B during Third Quarter 2006. As required by the Permit, chloroform is analyzed as part of annual monitoring for the constituents listed in the Annual Groundwater Sampling Constituent List (Permit Attachment 1, Appendix I). Historical information regarding operations at HWMU-7 prior to closure indicates that the wastes processed through the Unit did not contain chloroform, and chloroform was not detected in soil samples collected within, under, and around HWMU-7 during field investigations in 2002 and 2004. A number of drinking water supply lines are located upgradient of HWMU-7 and have been in service since Radford AAP became operational in 1940. Based on the age and location of the lines, the documented presence of chloroform in the drinking water, and the lack of chloroform in the wastes processed through the Unit, chloroform concentrations detected in wells 7W11B and 7W12B are attributable to leakage from the water lines rather than a release from unit HWMU-7. Radford AAP prepared an ASD for chloroform at HWMU-7, which was received by the VDEQ on January 31, 2007. The VDEQ concurred with the ASD in a letter dated June 14, 2007. Therefore, chloroform is not an HCOC for HWMU-7, and the detection of chloroform at low concentrations (less than the USEPA of 80 µg/l for trihalomethanes) does not affect the clean closure evaluation for groundwater at the Unit. Copies of the ASD for chloroform and the VDEQ approval letter are included (on CD-ROM) in **Appendix B**.

## 5.5 EVALUATION OF POTENTIAL FOR AROCLOR-1254 MIGRATION TO GROUNDWATER

Aroclor-1254 was detected in soil samples collected beneath HWMU-7 in February 2004. The groundwater at HWMU-7 is not analyzed for Aroclor-1254 under the Post-Closure Care Permit for the Unit. However, an evaluation of the potential for migration of Aroclor-1254 from the soil beneath the Unit to groundwater is discussed below:

- As shown in **Table 2**, the maximum Aroclor-1254 concentration detected in soil (0.53 mg/kg) is nearly two orders of magnitude greater than the soil screening level (SSL) soil to groundwater DAF 1. It should be noted that the maximum selenium and n-nitrosodiphenylamine concentrations detected in soil were greater than their SSL DAF 1 by one order of magnitude and two orders of magnitude, respectively. Neither selenium nor n-nitrosodiphenylamine have been detected in groundwater at HWMU-7 (**Appendix F**).

- Aroclor-1254 has a high binding capacity with soils; when released to soil, the PCB congeners present in Aroclor 1254 become tightly adsorbed to the soil particles. Generally, Aroclor-1254 does not leach significantly in most aqueous soil systems. The average molecular weight (327) for Aroclor-1254 is heavier than the molecular weights for n-nitrosodiphenylamine (198.23) and selenium (78.96); therefore, Aroclor-1254 would be expected to have a low mobility compared to n-nitrosodiphenylamine and cyanide. As stated previously, neither n-nitrosodiphenylamine nor selenium have been detected in groundwater at HWMU-7 (**Appendix F**).

- The risk from Aroclor-1254 in soil for a residential child was calculated to be 1.62 x $10^{-6}$, which is marginally greater than the risk threshold of 1 x $10^{-6}$ for an individual carcinogen. However, the soil containing the Aroclor-1254 concentrations is encountered at depths greater than 11 feet below ground surface and over 14 feet above the average water table, thus the chance of exposure to this soil via any pathway and the duration of any exposure would be minimal. Therefore, any realistic risk presented by the Aroclor-1254 concentrations detected in soil would be well below acceptable thresholds.

- As stated previously, discussions with the data validation specialist regarding the Aroclor-1254 data for the February 2004 soil samples indicated that the February 2004 Aroclor-1254 data are suspect due to inadequate quality control data. Specifically, a five-point initial calibration was not performed for the detected aroclors; also, the LCS and MS/MSD samples were not spiked with PCBs. Aroclor-1254 concentrations were not detected in the two bottom clay liner/native soil samples collected during the November 2002 subsurface investigation. Therefore, the February 2004 Aroclor-1254 concentrations used in this evaluation may overestimated and inappropriate for use.

Based on the above evaluation, the potential for migration of Aroclor-1254 from the soil beneath HWMU-7 to groundwater is considered to be minimal.

## 5.6 RESULTS OF CLEAN CLOSURE EVALUATION FOR GROUNDWATER

Based on the results of the clean closure evaluation, hazardous waste constituents are not present in groundwater at HWMU-7 at concentrations greater than their respective GPS or have been demonstrated to be derived from a source other than the Unit to the satisfaction of the VDEQ. Therefore, HWMU-7 has not adversely affected groundwater at the site. As a result, Radford AAP has met the criteria in the approved Closure Plan Amendment for clean closure for groundwater.

## 6.0 CONCLUSIONS

The closure activities conducted in accordance with the Closure Plan Amendment indicate that the residual material, underlying soil, and groundwater at HWMU-7 meet the requirements for clean closure. Radford AAP will continue to monitor groundwater at HWMU-7 in accordance with the requirements of the Permit until certifications for clean closure of soil and groundwater at the Unit have been approved by the VDEQ. Radford AAP anticipates that certifications for clean closure of soil and groundwater will trigger the reduction of the post-closure care period and signify the completion of post-closure care, thereby terminating the post-closure care period for HWMU-7.

## 7.0 CERTIFICATION OF CLOSURE

Radford AAP certifies that HWMU-7 has been closed in accordance with the specifications in the VDEQ-approved Closure Plan Amendment for the Unit.

> *I certify under penalty of law that this document and all attachments were prepared under my direction or supervision in accordance with a system designed to assure that qualified personnel properly gather and evaluate the information submitted. Based on my inquiry of the person or persons who manage the system, or those persons directly responsible for gathering the information, the information submitted is, to the best of my knowledge and belief, true, accurate, and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment for knowing violations.*

The required Owner/Operator Certification of Closure is contained in the attached transmittal letter.

Draper Aden Associates certifies that HWMU-7 has been closed in accordance with the specifications in the VDEQ-approved Closure Plan Amendment for the Unit.

NOTES:
HCOC: Hazardous Constituents of Concern. Based on 1981 analyses of lagoon water and sediment; Permit-defined quarterly groundwater monitoring constituents (as revised); and November 2002 analyses of residual material and soil samples.
*: Additional TCL organic constituent detected during the February 2004 Field Investigation.
~: Not detected above the Limit of Quantitation (LOQ).
Facility-Wide Background concentrations from Table 3 of the *Amended Closure Plan* (Appendix A of the *Closure Report*).

SSL 1 DAF and Residential RBC from USEPA Regions 3, 6, and 9 Regional Screening Levels for Chemical Contaminants at Superfund Sites. Current RSL Table dated November 2011.

C - Carcinogen; N - Non-carcinogen.

! - Noncarcinogenic RBC < carcinogenic RBC @ THQ=0.1 in accordance with EPA Region 3 guidance.

**Although certain constituent concentrations were less than residential risk-based levels, all constituents listed in this table were retained for risk assessment due to detection above background.**

**Note: The average Aroclor-1254 concentration calculated from the eight samples in which Aroclor-1254 was detected is 0.38 mg/kg (3.80E-01 mg/kg).**

- **VDEQ Class 3 Permit Modification Approval Letter dated September 27, 2011**

## APPENDIX C

### BORING LOGS

## APPENDIX D

### RESIDUAL MATERIAL AND SOIL SAMPLE LABORATORY ANALYTICAL RESULTS AND DATA VALIDATION REPORTS FOR HWMUS 5 AND 7

### OCTOBER/NOVEMBER 2002 SUBSURFACE INVESTIGATION
### FEBRUARY/MARCH 2004 SUBSURFACE INVESTIGATION

# APPENDIX E

## CHRONIC DAILY INTAKE CALCULATIONS; TOXICITY FACTORS

TABLE A
VALUES USED FOR DAILY INTAKE CALCULATIONS - DERMAL ABSORPTION - RESIDENTIAL ADULT
HAZARDOUS WASTE MANAGEMENT UNIT 7, RADFORD ARMY AMMUNITION PLANT, RADFORD, VIRGINIA

| | |
|---|---|
| Medium: | Soil |
| Exposure Medium: | Soil |
| Receptor Population: | **R** |
| | R = Current or Future Resident |
| | C = Construction/Utility Worker |
| | I = Commercial/Industrial Worker |
| Exposure Route: | Dermal |
| Receptor Age: | **A** |
| | A = Adult |
| | C = Child |

Intake Equation:
DAD=CS x ABS x IF
Intake Factor Equation:
IF=SA x CF x AF x EF x ED x 1/BW x 1/AT

| | |
|---|---|
| DAD [n-Nitrosodiphenylamine (carcinogen)] = | 1.01E-06 |
| DAD [bis(2-Ethylhexyl)phthalate (carcinogen)] = | 2.34E-07 |
| DAD [4,4-DDD (carcinogen)] = | 8.20E-10 |
| DAD [4,4-DDE (carcinogen)] = | 5.86E-10 |
| DAD [Aroclor-1254 (carcinogen)] = | 1.74E-07 |
| DAD [Aroclor-1254 (non-carcinogen)] = | 4.06E-07 |
| DAD [Toluene (non-carcinogen)] = | 9.84E-10 |
| DAD [Barium (non-carcinogen)] = | 1.52E-05 |
| DAD [Beryllium (non-carcinogen)] = | 8.20E-08 |
| DAD [Cyanide (non-carcinogen)] = | 3.77E-08 |
| DAD [Selenium (non-carcinogen)] = | 2.24E-07 |
| DAD [bis(2-Ethylhexyl)phthalate (non-carcinogen)] = | 5.47E-07 |

| Parameter Code | Parameter Definition | Units | Default Value | Rationale/ Reference | User Defined Value | Rationale/ Reference |
|---|---|---|---|---|---|---|
| DAD | Dermally Absorbed Dose | mg/kg-day | | | | |
| CS (n-Nitrosodiphenylamine) | Chemical Concentration in Soil | mg/kg | | | 4.3 | Sample Result |
| CS (bis(2-Ethylhexyl)phthalate) | Chemical Concentration in Soil | mg/kg | | | 1 | Sample Result |
| CS (4,4-DDD) | Chemical Concentration in Soil | mg/kg | | | 0.0035 | Sample Result |
| CS (4,4-DDE) | Chemical Concentration in Soil | mg/kg | | | 0.0025 | Sample Result |
| CS (Aroclor 1254) | Chemical Concentration in Soil | mg/kg | | | 0.53 | Sample Result |
| CS (Toluene) | Chemical Concentration in Soil | mg/kg | | | 0.006 | Sample Result |
| CS (Barium) | Chemical Concentration in Soil | mg/kg | | | 279 | Sample Result |
| CS (Beryllium) | Chemical Concentration in Soil | mg/kg | | | 1.5 | Sample Result |
| CS (Cyanide) | Chemical Concentration in Soil | mg/kg | | | 0.69 | Sample Result |
| CS (Selenium) | Chemical Concentration in Soil | mg/kg | | | 4.1 | Sample Result |
| CF | Conversion Factor | kg/mg | 1E-06 | | | |
| AF | Soil to Skin Adherence Factor | mg/cm^2 | 0.07 | EPA, 2001 | | |
| ABS | Absorption Factor | unitless | Chemical | EPA, 1995 | | |
| | | | Specific | and EPA, 2001 | | |
| ABS (n-Nitrosodiphenyl.) | Absorption Factor | unitless | | | 1.00E-01 | EPA, 2001 |
| ABS (bis(2-Ethylhexyl)phthalate) | Absorption Factor | unitless | | | 1.00E-01 | EPA, 2001 |
| ABS (4,4-DDD) | Absorption Factor | unitless | | | 1.00E-01 | EPA, 1995 |
| ABS (4,4-DDE) | Absorption Factor | unitless | | | 1.00E-01 | EPA, 1995 |
| ABS (Aroclor 1254) | Absorption Factor | unitless | | | 1.40E-01 | EPA, 2001 |
| ABS (Toluene) | Absorption Factor | unitless | | | 3.00E-02 | EPA, 1995 |
| ABS (Barium) | Absorption Factor | unitless | | | 1.00E-02 | EPA, 1995 |
| ABS (Beryllium) | Absorption Factor | unitless | | | 1.00E-02 | EPA, 1995 |
| ABS (Cyanide) | Absorption Factor | unitless | | | 1.00E-02 | EPA, 1995 |
| ABS (Selenium) | Absorption Factor | unitless | | | 1.00E-02 | EPA, 1995 |
| SA | Skin Surface Area Available | cm2/day | 5,700 | EPA, 2001 | | |
| | for Contact | | (3) | | | |
| EF | Exposure Frequency | days/years | 350 | EPA, 1991 | | |
| ED | Exposure Duration | years | 30 | EPA, 1991 | | |
| BW | Body Weight | kg | 70 | EPA, 1991 | | |
| AT-C | Averaging Time (Cancer) | days | 25,550 | EPA, 1989 | | |
| AT-N | Averaging Time (Non-Cancer) | days | 10,950 | EPA, 1989 | | |
| IF-C | Intake Factor (Cancer) | days^-1 | 2.34E-06 | calculated | | |
| IF-N | Intake Factor (Non-cancer) | days^-1 | 5.47E-06 | calculated | | |

EPA, 1989= Risk Assessment Guidance for Superfund: Volume I -- Human Health Evaluation Manual (Part A). Office of Emergency and Remedial Response. EPA/540/1-89/002.
EPA, 1991= Human Health Evaluation Manual, Supplemental Guidance: Standard Default Exposure Factors. Office of Solid Waste and Emergency Response. OSWER Directive 9285.6-03
EPA, 1995= Assessing Dermal Exposure from Soil. Region III. Office of Superfund Programs. EPA/903-K-95-003.
EPA, 2001= RAGS E, Chapter 3

(1) Based on soil-to-skin adherence data presented in U. S. EPA (2001) for a "utility worker".
(2) Represents face, hands, forearms, lower legs and feet
(3) Represents the face, hands, and forearms for workers; face hands, forearms and lower legs for resident adults.
**Note the following AFs from RAGS E for site specific scenarios:**

| | |
|---|---|
| groundskeeper | AF=0.1 |
| construction worker | AF=0.3 |
| utility worker | AF=0.9 |

TABLE B
VALUES USED FOR DAILY INTAKE CALCULATIONS - DERMAL ABSORPTION - RESIDENTIAL CHILD
HAZARDOUS WASTE MANAGEMENT UNIT 7, RADFORD ARMY AMMUNITION PLANT, RADFORD, VIRGINIA

| | |
|---|---|
| Medium: | Soil |
| Exposure Medium: | Soil |
| Receptor Population: | **R** |
| | R = Current or Future Resident |
| | C = Construction/Utility Worker |
| | I = Commercial/Industrial Worker |
| Exposure Route: | Dermal |
| Receptor Age: | **C** |
| | A = Adult |

EPA, 1999= EPA Region III Risk-Based Concentration Table: Technical Background Information

(1) Air concentrations may be estimated by applying the particulate emission factor (PEF) or volatilization factor (VF) to soil concentrations as described in Soil Screening Guidance: Technical Background Document. U. S. EPA, Office of Solid Waste and Emergency Response. May 1996. (EPA/540/R-95/128) and Soil Screening Guidance: User's Guide. U.S.EPA, Office of Solid Waste and Emergency Response. April 1996. (EPA/540/R-96/018).

(2) Indoor air concentrations for volatiles may be estimated with the Johnson and Etinger Model.

**Definitions:**

***The following definitions apply to results reported for Appendix IX monitoring events.***
***All Appendix IX monitoring results for compliance wells are reported to the detection limit.***

**QL** Denotes permit required quantitation limit.
**U** denotes not detected at or above the detection limit.
**UA** denotes not detected at or above the adjusted detection limit.
**J** Denotes result is estimated. When used with "U" (i.e., "UJ"), denotes analyte not detected at or above the detection limit and detection limit and QL are estimated. When used with "UA" (i.e., "UAJ"), denotes analyte not detected at or above adjusted detection limit and adjusted detection limit and QL are estimated.
**UN** Denotes analyte concentration is less than the quantitation limit and/or five times the blank concentration. Not reliably detected due to blank contamination. This qualifier used only for Appendix IX monitoring event when compliance well results are reported to at or above the project detection limit.
**R** Denotes result rejected.
**Q** Denotes data validation qualifier.
**Background** Denotes background concentrations listed in the pending Class 3 Permit Modification for the Post-Closure Care Permit for HWMUs 5, 7, 10 and 16.
**CAS#** Denotes Chemical Abstract Services registration number.
**GPS** Denotes groundwater protection standard.

***The following definitions apply to results reported for non-Appendix IX monitoring events.***
***All non-Appendix IX monitoring results for compliance wells are reported to at or above the quantitation limit.***

**QL** Denotes permit required quantitation limit.
**U** Denotes analyte not detected at or above QL.
**UA** Denotes analyte not detected at or above adjusted sample QL.
**J** Denotes result is estimated. When used with "U" (i.e., "**UJ**"), denotes analyte not detected at or above QL and QL is estimated. When used with "UA" (i.e., "**UAJ**"), denotes analyte not detected at or above adjusted QL and adjusted QL is estimated.
**R** Denotes result rejected.
**Q** Denotes data validation qualifier.
**Background** Denotes background concentrations listed in the pending Class 3 Permit Modification for the Post-Closure Care Permit for HWMUs 5, 7, 10 and 16.
**CAS#** Denotes Chemical Abstract Services registration number.
**GPS** Denotes groundwater protection standard.

Notes:
**-Appendix IX Groundwater Monitoring Events**:
***Third Quarter 2003, Second Quarter 2004, Second Quarter 2005, Third Quarter 2006, Second Quarter 2007, Second Quarter 2008, Second Quarter 2009, Second Quarter 2010, Second Quarter 2011***
All Appendix IX results evaluated and reported to detection limit.
-9/29/2003: Verification sampling event for 7MW6, 7W11B, 7W12B, 7WCA (copper and zinc). Verification results reported in this table for copper and zinc.
-6/21-22/2004: Verification sampling event for 7MW6, 7W11B, 7W12B, 7WCA. Verification results reported in this table for chloroform (7W12B).
-3/23/2005: Verification sampling event for 7MW6. Verification results reported in this table for bis(2-ethylhexyl)phthalate).
-7/26/2005: Verification sampling event for 7MW6, 7W11B, 7W12B, 7WCA (ethyl acetate), 7W11B (beta-BHC), and 7MW6 (alpha-BHC). All Verification results reported as not detected. Verification results reported.
-Sept 2006: Verification sampling event for 7W12B and 7W11B 3Q2006 for chloroform. Initial results reported in this table for chloroform (7W11B,
-July 17, 2008: Verification sampling event for 7W13 arsenic and cobalt. 7W9C cobalt
-June 11, 2009, Verification sampling event for 7MW6 Diethyl ether. Analyte not detected. Verification results reported.

**Definitions:**

***All plume monitoring well results reported to at or above the permit quantitation limit except for the upgradient well during the Appendix IX monitoring Event. During the Appendix IX monitoring event, results for the upgradient well are reported to the detection limit.***

**Q** Denotes data validation qualifier.
**QL** Denotes permit required quantitation limit.
**U** Denotes analyte not detected at or above QL.
**UA** Denotes analyte not detected at or above adjusted sample QL.
**J** Denotes result is estimated. When used with "U" (i.e., "**UJ**"), denotes analyte not detected at or above QL and QL is estimated. When used with "UA" (i.e., "**UAJ**"), denotes analyte not detected at or above adjusted QL and adjusted QL is estimated.
**UN** Denotes analyte concentration is less than the quantiation limit and five times the blank concentration. Not reliably detected due to blank contamination. This qualifier used only for Appendix IX monitoring event when compliance well results are reported to at or above the project detection limit.
**R** Denotes result rejected.
**Background** Denotes background concentrations listed in the pending Class 3 Permit Modification for the Post-Closure Care Permit for HWMUs 5, 7, 10 and 16.
**CAS#** Denotes Chemical Abstract Services registration number. **GPS** Denotes groundwater protection standard.

Notes:
-January 2005: Verification sampling event for 7MW13 4Q2004 arsenic. Verification results reported in this table for arsenic (7W13).
-March 2006: Verification sampling event for 7MW13 1Q2006 arsenic. Verification results reported in this table for arsenic (7W13).
-July 2006: Verification sampling event for 7MW13 2Q2006 arsenic. Verification results reported in this table for arsenic (7W13).
-Sept 2006: Verification sampling event for 7W12B 3Q2006 chloroform. Initial results reported in this table for chloroform (7W12B).
-July 17, 2007: Verification sampling event for 7W13 arsenic-verification event result reported, highest of four quadruplicate results, 7W13 cobalt-original result reported.. 7W9C cobalt- Verification result reported.

-Dec 17, 2008: Verification sampling event for 7W13 . cobalt- Original result reported.
-June 28, 2010 - Verification sampling event for 7W13 . cobalt- Original result reported.
Also, verification sampling event for 7W13 . cobalt- verification result reported.
-Dec 16, 2010 - Verification sampling event for 7W13 . arsenic- Verification result reported.
- June 27, 2011 - Verification sampling event for 7MW6 benzene and diethyl ether and 7W11B - Benzene - Verification result reported.

DAA Job No. B03204-122

DRAPER ADEN ASSOCIATES (DAA) PREPARED THIS DOCUMENT (WHICH MAY INCLUDE DRAWINGS, SPECIFICATIONS, REPORTS, STUDIES AND ATTACHMENTS) IN ACCORDANCE WITH THE AGREEMENT BETWEEN DAA AND ALLIANT TECHSYSTEMS INC.

THE STANDARD OF CARE FOR ALL PROFESSIONAL ENGINEERING, ENVIRONMENTAL AND SURVEYING AND RELATED SERVICES PERFORMED OR FURNISHED BY DAA UNDER THIS AGREEMENT ARE THE CARE AND SKILL ORDINARILY USED BY MEMBERS OF THESE PROFESSIONS PRACTICING UNDER SIMILAR CIRCUMSTANCES AT THE SAME TIME AND IN THE SAME LOCALITY. DAA MAKES NO WARRANTIES, EXPRESS OR IMPLIED, UNDER THIS AGREEMENT IN CONNECTION WITH DAA'S SERVICES.

CONCLUSIONS PRESENTED ARE BASED UPON A REVIEW OF AVAILABLE INFORMATION, THE RESULTS OF OUR FIELD STUDIES, AND/OR PROFESSIONAL JUDGMENT. TO THE BEST OF OUR KNOWLEDGE, INFORMATION PROVIDED BY OTHERS IS TRUE AND ACCURATE, UNLESS OTHERWISE NOTED.

DAA'S LIABILITY, HEREUNDER, SHALL BE LIMITED TO AMOUNTS DUE DAA FOR SERVICES ACTUALLY RENDERED, OR REIMBURSABLE EXPENSES ACTUALLY INCURRED.

ANY REUSE OR MODIFICATION OF ANY OF THE AFOREMENTIONED DOCUMENTS (WHETHER HARD COPIES OR ELECTRONIC TRANSMITTALS) PREPARED BY DAA WITHOUT WRITTEN VERIFICATION OR ADAPTATION BY DAA WILL BE AT THE SOLE RISK OF THE INDIVIDUAL OR ENTITY UTILIZING SAID DOCUMENTS AND SUCH USE IS WITHOUT THE AUTHORIZATION OF DAA. DAA SHALL HAVE NO LEGAL LIABILITY RESULTING FROM ANY AND ALL CLAIMS, DAMAGES, LOSSES, AND EXPENSES, INCLUDING ATTORNEY'S FEES ARISING OUT OF THE UNAUTHORIZED REUSE OR MODIFICATION OF THESE DOCUMENTS. CLIENT SHALL INDEMNIFY DAA FROM ANY CLAIMS ARISING OUT OF UNAUTHORIZED USE OR MODIFICATION OF THE DOCUMENTS WHETHER HARD COPY OR ELECTRONIC.

CONCLUSIONS PRESENTED BY DAA DO NOT REFLECT VARIATIONS IN SUBSURFACE GROUNDWATER QUALITY THAT MIGHT EXIST BETWEEN OR BEYOND SAMPLING POINTS OR BETWEEN SPECIFIC SAMPLE COLLECTIONS EVENTS. DAA SHALL INCUR NO LIABILITY RESULTING FROM INFORMATION SUPPLIED BY OTHERS.

## RADFORD ARMY AMMUNITION PLANT – HWMU-7
### CALCULATION OF CONSTITUENT BACKGROUND VALUES

Draper Aden Associates recalculated background values for the plume monitoring well constituents of the groundwater monitoring program for Hazardous Waste Management Unit No. 7 (HWMU-7) located at the Radford Army Ammunition Plant (Radford AAP) in Radford, Virginia. Background values were calculated for all plume monitoring well constituents.

The background values for HWMU-7 plume monitoring well constituents were calculated using the analytical data for upgradient well 7W12B using data from Second Quarter 2003 through Second Quarter 2007 (available most recent data with one exception-cyanide includes 4th Quarter 2007 data). Inter-well upper prediction limits (UPL) were calculated on the background data for the target parameters in accordance with the facility permit and VHWMR (40 CFR 264.97(h)). Where applicable, the background value calculations were based on site-wide 95% confidence, 95% coverage upper prediction intervals. The calculated background values for all target constituents are listed on **Table 1**.

### Background Data and Background Value Calculations

The constituents listed below were 100% non-detected (<LOQ) in the background well. The background values for these constituents were established as equal to their quantitation limits (QL).

| Background Value = Quantitation Limit (QL) | | | | |
|---|---|---|---|---|
| **Constituent** | **Sample Size** | **% Non-Detects** | **QL (µg/l)** | **Background Value (µg/l)** |
| Antimony | 17 | 100 | 1 | 1 |
| Arsenic | 17 | 100 | 10 | 10 |
| Cadmium | 17 | 100 | 1 | 1 |
| Cobalt | 17 | 100 | 5 | 5 |
| Copper | 16 | 100 | 5 | 5 |
| Lead | 17 | 100 | 1 | 1 |
| Mercury | 17 | 100 | 2 | 2 |
| Nickel | 17 | 100 | 10 | 10 |
| Selenium | 17 | 100 | 10 | 10 |
| Silver | 17 | 100 | 2 | 2 |
| Thallium | 17 | 100 | 1 | 1 |
| Cyanide | 18 | 100 | 20 | 20 |
| Bis(2-ethylhexyl)phthalate | 17 | 100 | 6 | 6 |
| Butyl benzyl phthalate | 17 | 100 | 10 | 10 |
| 2,4-Dinitrophenol | 17 | 100 | 10 | 10 |
| 2,4-Dinitrotoluene | 17 | 100 | 10 | 10 |
| 2,6-Dinitrotoluene | 17 | 100 | 10 | 10 |
| p-Nitrophenol | 17 | 100 | 10 | 10 |

Non-parametric prediction intervals were computed for the constituents for which the data from upgradient well 7W-12B satisfied one of the following two criteria, per VDEQ regulations and guidance as well as USEPA guidance:

- Percentage of non-detects was greater than or equal to 50 and less than 100; or
- Percentage of non-detects was less than 50, but data was not normally distributed in original or log-transformed mode.

Only one result for zinc was reported above its LOQ. The reported result (10.9 µg/l) is the NUPL for zinc. The non-parametric prediction limit computation for chromium is presented in **Appendix A**.

| **Background Value = UPL of Non-parametric Prediction Interval (NUPL)** | | | | | |
|---|---|---|---|---|---|
| **Parameter** | **Sample Size** | **% Non-Detects** | **QL (µg/l)** | **NUPL (µg/l)** | **Background Value (µg/l)** |
| Chromium | 17 | 12 | 5 | 9.9 | 9.9 |
| Zinc | 14 | 93 | 10 | 10.9 | 10.9 |

The following constituent (barium) exhibited normally distributed background data with less than 0% non-detects. One sided parametric prediction interval was computed on the background data for barium. The background value for barium was set as equal to its UPL. The background concentration calculations were based on a site wide 95% confidence, 95% coverage upper prediction intervals. The background and relevant statistical data for barium is summarized below. The prediction interval computation is presented in **Appendix A**.

| **Background Value = UPL of one-sided Prediction Interval** | | | | | |
|---|---|---|---|---|---|
| **Parameter** | **Sample Size** | **% Non-Detects** | **QL (µg/l)** | **UPL (µg/l)** | **Background Value (µg/l)** |
| Barium | 17 | 0 | 10 | 41.0 | 41.0 |

# TABLE 1

## HWMU-7
## CALCULATED BACKGROUND VALUES

| Constituent | Background Value (µg/l unless otherwise noted) |
|---|---|
| Antimony | 1 |
| Arsenic | 10 |
| Barium | 41.0 |
| Cadmium | 1 |
| Chromium | 9.9 |
| Cobalt | 5 |
| Copper | 5 |
| Lead | 1 |
| Mercury | 2 |
| Nickel | 10 |
| Selenium | 10 |
| Silver | 2 |
| Thallium | 1 |
| Zinc | 10.9 |
| Cyanide | 20 |
| Bis(2-ethylhexyl)phthalate | 6 |
| Butyl benzyl phthalate | 10 |
| 2,4-Dinitrophenol | 10 |
| 2,4-Dinitrotoluene | 10 |
| 2,6-Dinitrotoluene | 10 |
| p-Nitrophenol | 10 |

## HWMU-7
## BACKGROUND VALUE CALCULATIONS
## STATISTICAL COMPUTATIONS FOR BARIUM AND CHROMIUM

**RAAP-HWMU-7 - Background Calculation - December 2007**

17-Dec-07

Y2K Correction dates are as shown in table below.

| Actual Event | | | Date Used in Stat Software |
|---|---|---|---|
| 2003-Qtr2 | | | 8/1/1999 |
| 2003-Qtr3 | | | 8/2/1999 |
| 2003-Qtr4 | | | 8/3/1999 |
| 2004-Qtr1 | | | 8/4/1999 |
| 2004-Qtr2 | | | 8/5/1999 |
| 2004-Qtr3 | | | 8/6/1999 |
| 2004-Qtr4 | | | 8/7/1999 |
| 2005-Qtr1 | | | 8/8/1999 |
| 2005-Qtr2 | | | 8/9/1999 |
| 2005-Qtr3 | | | 8/10/1999 |
| 2005-Qtr4 | | | 8/11/1999 |
| 2006-Qtr1 | | | 8/12/1999 |
| 2006-Qtr2 | | | 8/13/1999 |
| 2006-Qtr3 | | | 8/14/1999 |
| 2006-Qtr4 | | | 8/15/1999 |
| 2007-Qtr1 | | | 8/16/1999 |
| 2007-Qtr2 | | | 8/17/1999 |

**Notes:**

1) Background data was computed for all target constituents using the 2Q 2003 - 2Q 2007 data for background well 7W12B. Background data was 100% <LOQ for all target parameters except barium, chromium and zinc. Zinc had only one reported result > LOQ.

Statistical computations using GRITS/STAT V5.0 performed only for barium and chromium, as applicable.

**RE:** Alternate Source Demonstration for Cobalt in monitoring wells 7WCA and 7W13
HWMU #7, Radford Army Ammunition Plant, Radford, Virginia
Radford Army Ammunition Plant, Radford, VA
EPA ID# VA1210020730

Dear Ms. Holt:

The above-noted Alternate Source Demonstration (ASD) investigation, submitted on behalf of Radford Army Ammunition Plant, by Alliant Techsystems Inc., dated December 2011, has been reviewed for technical content and consistency with the requirements of 40 CFR 264.99.(i). The need to submit an ASD was triggered by an exceedance of the Cobalt Groundwater Protection standard reported to the Department for monitoring wells 7WCA and 7W13.

As defined under 40 CFR 264.99.(i), the Alternate Source Demonstration (ASD) report must show one of the following in order to obtain approval:

1) The contamination was caused by natural variation in groundwater.
2) The contamination was a result of an error in field sampling.
3) The contamination was the result of an error in lab analysis.
4) The SSI contamination was result of an error in statistical analysis.

The ASD report focused on proving the applicability of item #1 by presenting a statistical trend analysis that shows no increasing trends of total cobalt concentrations in groundwater, presenting data showing that cobalt is widely observed at significant concentrations in non-waste derived materials and native soils at the site, and providing data that shows cobalt present at similar levels in other upgradient wells serving other waste management units at the site. The report concluded that the total cobalt

concentrations observed in groundwater monitoring wells 7WCA and 7W13 are derived from ambient, naturally-occurring and naturally variable trace elements in the aquifer matrix, and not from a temporally-varying source such as a release from the closed hazardous waste management unit (HWMU-7).

Based on the above discussion and the body of evidence presented to the Department, the content of the ASD is determined to be sufficient to meet the Regulatory criteria for approval and as a result, the facility does not have to remediate the cobalt GPS exceedances observed in wells 7WCA and 7W13. Please note that future exceedances of the GPS for Cobalt noted in 7WCA and 7W13 will not require the submittal of a separate ASD unless the monitoring results reveal a change in site conditions that may indicate a release from HWMU-7. Please make sure that this approval is reflected in future correspondence to the Department where appropriate.

If you have any additional technical questions, you may contact me at 276-676-4867 or by email at Vincent.Maiden@deq.virginia.gov.

Sincerely,

Vincent A. Maiden

NOTES:
HCOC: Hazardous Constituents of Concern. Based on 1981 analyses of lagoon water and sediment; Permit-defined quarterly groundwater monitoring constituents (as revised); and November 2002 analyses of residual material and soil samples.
*: Additional TCL organic constituent detected during the February 2004 Field Investigation.
~: Not detected above the Limit of Quantitation (LOQ).
Facility-Wide Background concentrations from Table 3 of the *Amended Closure Plan* (Appendix A of the *Closure Report*).

# 1.0 INTRODUCTION

## 1.1 PROJECT OVERVIEW

In 1989, Radford Army Ammunition Plant (Radford AAP; EPA ID No. VA1210020730) closed Hazardous Waste Management Unit 7 (HWMU-7) in accordance with the Virginia Department of Environmental Quality (VDEQ) approved Closure Plan for the Unit dated May 1988. HWMU-7 was an unlined holding and neutralization basin that received spills, runoff, and wash down waters from the Acid Tank Farms in the Oleum Plant Area; waste sulfuric acid and caustics from oleum production; and waste caustic mixed with acidic water for neutralization. At the time of closure, HWMU-7 was drained of all liquids, the residual material was treated in-place with flyash and cement kiln dust to achieve a target pH range of 6.3 and 10.5, and the basin was filled with the residual material and stone and capped. Following closure, Radford AAP monitored HWMU-7 in accordance with the post-closure care and groundwater monitoring procedures specified in the May 1988 Closure Plan. HWMU-7 was classified as an interim status Unit until the VDEQ issued the ***Post-Closure Permit for Hazardous Waste Management Unit 7*** (effective date October 30, 1999); the VDEQ subsequently revised the October 1999 ***Post-Closure Permit***, and issued the ***Final Hazardous Waste Post-Closure Permit for HWMUs 5, 7, 10, and 16*** (October 4, 2002). From October 1999 to the present, Radford AAP has monitored HWMU-7 in accordance with the post-closure care and groundwater monitoring procedures specified in the ***Post-Closure Permits***, as appropriate. In correspondence dated June 14, 2007, the VDEQ modified the ***Final Hazardous Waste Post-Closure Permit for HWMUs 5, 7, 10, and 16*** to change the groundwater monitoring frequency from quarterly to semiannually.

In October and November 2002, Radford AAP conducted subsurface investigations to determine the nature and extent of the residual material contained in closed HWMUs 5 and 7. Radford AAP intended to implement source removal activities in 2003 in support of clean closures for both Units; the results of the subsurface investigations would be used in the preparation of Closure Plan Amendments for both Units. However, the laboratory analytical data collected during the subsurface investigations indicated that the residual material in the Units was not hazardous by characteristic; therefore, Radford AAP chose to pursue clean closure of the Units while leaving the residual material in-place. Radford AAP submitted the results of the subsurface investigations to the VDEQ in the ***Field Investigation Report and Risk Assessment for Units 5 and 7*** (March 2003). In correspondence to Radford AAP dated June 25, 2003, the VDEQ indicated that in order for Radford AAP to continue pursuing clean closure for HWMUs 5 and 7, revised Closure Plans that include procedures and standards for clean closure must be submitted for each Unit. The VDEQ indicated that the revised Closure Plans must be prepared in accordance with the ***Draft Guidance Manual for Closure Plans and Post-Closure Plans*** (***Draft Guidance***) dated September 28, 2001. Closure Plan Amendments for HWMUs 5 and 7 were submitted to VDEQ in June 2007. VDEQ concurred with the Closure Plan Amendment for HWMU-7 and found the information contained therein to be technically adequate in correspondence dated October 31, 2007, with incorporation of VDEQ comments presented in a VDEQ memorandum dated September 14, 2007.

In correspondence dated June 25, 2003, the VDEQ indicated that Radford AAP must sample the soil and liner material (if any) beneath the residual material to determine whether the soil and liner material meet the clean closure standards listed in the ***Draft Guidance***. In February 2004, Radford AAP

conducted subsurface investigations to evaluate the soil and liner material beneath the residual material contained in closed HWMUs 5 and 7. All subsurface investigation activities were conducted in accordance with the June 25, 2003 correspondence and the procedures specified in the Closure Plan Amendment. The analytical results for the February 2004 soil samples will be presented and evaluated in the Closure Report for HWMU-7.

In March 2010, the VDEQ requested the 2007 Closure Plan Amendment for HWMU-7 be revised to reflect changes made to the groundwater monitoring program since 2007, and to incorporate all soil analytical data collected from the Unit to-date. Radford AAP revised the Closure Plan Amendment for HWMU-7 in accordance with the following:

- *Draft Guidance Manual for Closure Plans and Post-Closure Plans* (*Draft Guidance*) dated September 28, 2001;
- VDEQ correspondence dated June 25, 2003;
- VDEQ Notice of Deficiencies dated June 7, 2004;
- Radford AAP Response to Comments dated September 14, 2004;
- Teleconference between VDEQ and Radford AAP on January 18, 2007;
- VDEQ e-mail correspondence dated January 18, 2007 and January 25, 2007;
- VDEQ memorandum dated September 14, 2007;
- VDEQ correspondence dated October 31, 2007; and
- VDEQ e-mail correspondence dated March 2, 2010, March 9, 2010, and March 10, 2010.

Copies of all correspondence are included in **Appendix A (CD-ROM)**.

This July 2010 Closure Plan Amendment for HWMU-7 supersedes the previous Closure Plan Amendment submitted in June 2007.

## 1.2 PURPOSE AND OBJECTIVE

The purpose of the Closure Plan Amendment is to define the activities that will be performed to demonstrate that HWMU-7 does not contain characteristically hazardous wastes, and does not contain hazardous constituents at concentrations that pose a risk to human health and the environment. Accordingly, the objective of this plan is to perform those activities necessary to demonstrate that the previous closure activities were successful, and that the Unit no longer meets the definition of a hazardous waste unit. Therefore, the act of post-closure monitoring at the Unit will no longer be warranted. The Closure Plan Amendment will provide documentation of all procedures and data gathering efforts necessary to attain clean closure for HWMU-7 in compliance with the Virginia Hazardous Waste Management Regulations (VHWMR), 9 VAC 20-60-12, et seq., and with the requirements of the Resource Conservation and Recovery Act (RCRA) as presented in Title 40 of the Code of Federal Regulations (CFR). With the attainment of clean closure for soil and groundwater, Radford AAP will seek to end the post-closure care period for HWMU-7.

## 2.0 CLOSURE PERFORMANCE STANDARDS

HWMU-7 is a closed hazardous waste surface impoundment. The Closure Performance Standards, as presented in 40 CFR 264.111, specify that the owner/operator of a hazardous waste surface impoundment must close the Unit in a manner that:

(a) Minimizes the need for further maintenance; and

(b) Controls, minimizes or eliminates, to the extent necessary to protect human health and the environment, post-closure escape of hazardous waste, hazardous constituents, leachate, contaminated run-off, or hazardous waste decomposition products to the ground or surface waters or to the atmosphere; and

(c) Complies with the closure requirements of this subpart, including but not limited to the requirements of 40 CFR 264.228.

In 1989, HWMU-7 was closed in accordance with the closure requirements of 40 CFR 264.111 and 264.228. The Unit was closed with residual material left in-place as detailed in the VDEQ-approved Closure Plan dated May 1988. The goal of the Closure Plan Amendment is to provide a means for Radford AAP to achieve clean closure for HWMU-7 thereby ending the post-closure care period for the Unit. Such a process is allowed by 40 CFR 264.117(a)(2), which states:

> "…any time during the post-closure period for a particular unit, the Director may, in accordance with the permit modification procedures in parts 124 and 270:
> (i) Shorten the post-closure care period applicable to the hazardous waste management unit…if he finds that the reduced period is sufficient to protect human health and the environment (e.g., leachate or groundwater monitoring results, characteristics of the hazardous wastes, application of advanced technology, or alternative disposal, treatment, or re-use techniques indicate that the hazardous waste management unit or facility is secure)."

## 2.1 CLEAN CLOSURE FOR SOIL

During a teleconference between Radford AAP and VDEQ on January 18, 2007 (**Appendix A**), the VDEQ indicated that clean closure may be achieved for HWMU-7 with the residual material remaining in-place if samples of the residual material do not exceed the clean closure standards listed in the VDEQ ***Draft Closure Guidance***. In addition, the VDEQ indicated that the soil and any liner material immediately beneath the residual material must be sampled to determine whether it meets the clean closure standards listed in the ***Draft Guidance***, which include analytical non-detection, comparison to background, and/or risk assessment in accordance with ***"Guidance for Development of Health Based Cleanup Goals Using Decision Tree/Risk Exposure and Analysis Modeling System (REAMS) Program, 1994, and Risk Based Methodology,"*** as amended by the VDEQ, along with other risk-based guidance provided by the VDEQ.

Based on the January 18, 2007 teleconference, it is Radford AAP's understanding that the residual material remaining in-place in HWMU-7 must meet the clean closure standards for the

Hazardous Constituents of Concern (HCOCs) specified in this Closure Plan Amendment. In order to comply with the clean closure standards, individual samples of the residual material must be analyzed for the HCOCs.

## 2.2 CLEAN CLOSURE FOR GROUNDWATER

The groundwater at HWMU-7 currently is monitored in accordance with the requirements of the *Final Hazardous Waste Post-Closure Care Permit for Hazardous Waste Management Units 5, 7 10, and 16* (October 4, 2002). In the event that the residual material and underlying soils at HWMU-7 meet the clean closure standards specified by the VDEQ, Radford AAP will attempt to demonstrate clean closure for groundwater at HWMU-7 as well. Clean closure for groundwater at HWMU-7 will be demonstrated by comparing the most recent groundwater sample analytical results at the time that the Closure Report is prepared to the Groundwater Protection Standards (GPSs) for the Unit. The GPSs for HWMU-7 are based on USEPA Maximum Contaminant Levels (MCLs) for drinking water or on VDEQ-derived Alternate Concentration Limits (ACLs) for constituents without MCLs. Due to the fact that Radford AAP is an industrial facility with no users of groundwater, comparison of HWMU-7 groundwater data to residential drinking water standards will provide the most conservative assessment of risk. If a groundwater constituent is detected at a concentration that is greater than the GPS, the concentration will be compared to background. HWMU-7 can receive clean closure for groundwater if all constituents are either at or below GPS or, if any constituents are above GPS, at or below background.

Chloroform was detected at low concentrations in upgradient well 7W12B during Third Quarter 2006, Second Quarter 2007, and Second Quarter 2009, in compliance well 7W11B during Third Quarter 2006 and Second Quarter 2009, in compliance well 7MW6 during Second Quarter 2009, and in compliance well 7WCA during Second Quarter 2009. Chloroform was analyzed as part of annual monitoring in accordance with 40 CFR 264 Appendix IX as required by the permit. Historical information regarding operations at HWMU-7 prior to closure indicates that the wastes processed through the Unit did not contain chloroform. Chloroform was not detected in soil samples collected within, under, and around HWMU-7 during field investigations in 2002 and 2004. However, a number of drinking water supply lines are located upgradient of HWMU-7, and some of these lines have been in service since Radford AAP became operational in 1940. Drinking water used at Radford AAP has been monitored for Disinfectant By-Products (DBPs) since 2004 and contains confirmed concentrations of chloroform. Since some of the water lines upgradient of HWMU-7 have been in use for 60 years it is not unusual that chronic leaks have occurred. Based on the age and location of the lines, the documented presence of chloroform in the drinking water, and the lack of chloroform in the wastes processed through the unit, chloroform detected in wells 7W11B and 7W12B is attributable to leakage from the water lines rather than a release from unit HWMU-7. An Alternate Source Demonstration (ASD) for chloroform at HWMU-7 was submitted to VDEQ on January 9, 2007. VDEQ concurred with the ASD in a letter dated June 14, 2007.

Radford AAP will continue to monitor groundwater at HWMU-7 in accordance with the *Final Hazardous Waste Post-Closure Care Permit for Hazardous Waste Management Units 5, 7 10, and 16* (October 4, 2002) until approvals of clean closure of soil and groundwater at

HWMU-7 have been issued by the DEQ **and contingent upon the condition that the permit language allows a cessation of groundwater monitoring upon approval of clean closure of soils and groundwater**. **A Class 3 modification of the Radford's post-closure care permit would be required to reduce the post-closure period in accordance with 40 CFR § 270.42, Appendix I - Section E.3. In accordance with 40 CFR § 264.120, Certification of post-closure completion statements by Radford AAP (owner/operator) and the independent professional engineer registered in the Commonwealth of Virginia must be submitted to the DEQ for review and approval prior to approval of the closure of the groundwater and soils linked to HWMU #7.**

**The justifiable Class 3 modification is required to shorten the HWMU #7 post-closure period. The Class 3 modification could facilitate the end of the post closure period to coincide with the same date as the DEQ's approval of the soils and groundwater closure of the HWMU #7 portion of the post-closure permit. Alternately, and not requiring a permit modification, the HWMU #7 portion of the permit could be allowed to terminate upon permit expiration if clean closure is approved for soil and groundwater prior to permit expiration.**

In the event that HWMU-7 attains clean closure for soil, but does not attain clean closure for groundwater, Radford AAP will continue to monitor groundwater at HWMU-7 in accordance with the *Final Hazardous Waste Post-Closure Care Permit for Hazardous Waste Management Units 5, 7 10, and 16* (October 4, 2002). However, clean closure for soil would indicate that the original closure activities conducted in 1989 were clearly successful and that the residual material left in-place does not represent hazardous waste. Therefore, corrective action in the form of source removal would have occurred with the closure activities conducted in 1989. In accordance with 40 CFR 264.100(f), Radford AAP proposes that groundwater monitoring at HWMU-7 would cease in the event that the GPSs are not exceeded for a period of three (3) consecutive years following the attainment of clean closure for soil.

## 2.3 CLOSED IN-PLACE

In the unlikely event that HWMU-7 is unable to attain clean closure for soil, the Unit will remain closed with the residual material in-place. If this occurs, the Unit will remain in post-closure care in accordance with the *Final Hazardous Waste Post-Closure Permit for HWMUs 5, 7, 10, and 16* (October 4, 2002). Radford AAP will retain the option to demonstrate clean closure in the future by excavation and removal of the residual material.

## 3.0 RADFORD AAP FACILITY DESCRIPTION

### 3.1 LOCATION

The Radford AAP is located in the mountains of southwestern Virginia within Pulaski and Montgomery Counties. The installation consists of two noncontiguous areas - the Radford Unit (or Main Section) and the New River Ammunition Storage Area Unit. The Main Section is located approximately 4 miles northeast of the city of Radford, approximately 10 miles west of Blacksburg, and 47 miles southwest of Roanoke, Virginia. The New River Unit is located approximately 6 miles west of the Main Section, near the town of Dublin, Virginia. All uses of the terms "Radford AAP" or "the Facility" in this document refer to the Main Section only.

The Radford AAP is situated in one of a series of narrow valleys typical of the Valley and Ridge physiographic province of the Appalachian Highland Region of North America. Oriented in a northeast-southwest direction, the valley is approximately 25 miles long. The valley has a width of approximately eight miles at the southwest end and narrows to approximately two miles at the northeast end. The Radford AAP lies along the New River in the relatively narrow northeast corner of the valley. The maximum elevation at Radford AAP is 2,225 feet above mean sea level (msl) in the southeast corner and the minimum elevation is approximately 1,675 feet above msl along the New River at the northern property boundary.

The Radford AAP is divided by the New River into two areas (**Figure 1**). The southern area, which comprises approximately two-thirds of Radford AAP, is called the "Main Plant Area." The remaining northern one-third section is called the "Horseshoe Area," and is located within the meander of the New River. The entire Radford AAP is secured by artificial barriers to prevent unknowing or unauthorized entry. The Facility perimeter is surrounded by a six-foot chain link fence with three-strand barbed wire top guard. The access gates and perimeter fencing at the Radford AAP are posted with no trespassing signs. The signs are posted in sufficient number so as to be seen from any approach to the restricted portions of the property.

Forty three (43) Solid Waste Management Units (SWMUs) and eight (8) HWMUs are located in both the Main Plant Area and the Horseshoe Area (**Figure 2**). This ***Amended Closure Plan*** is specifically for HWMU-7. As shown on **Figure 2**, HWMU-7 is located in the Main Plant Area.

### 3.2 HISTORY

The Radford AAP is a government-owned, contractor-operated (GOCO) military industrial installation supplying solvent and solventless propellant grains and trinitrotoluene (TNT) explosives. From its inception as a GOCO installation in 1940 until 1995, the Radford AAP was operated by Hercules Incorporated. On March 6, 1995, Alliant Techsystems, Inc. bought Hercules Incorporated and took over operation of the Radford AAP.

Construction of the Radford AAP production facility began in 1940 with the impending participation of the United States in World War II, and the determination by Congress of a need for increased ammunition production facilities. Initially, Radford AAP consisted of two distinct

areas - a smokeless-powder plant (Radford Ordnance Works [ROW]) and a bag-manufacturing and loading plant for artillery, cannon, and mortar projectiles (New River Ordnance Works [NROW]). These two production facilities were operated separately from 1940 to 1945. Late in 1945, ROW was designated as the Radford Arsenal, and NROW was designated as a subpost. By January 1950, NROW was made an integral part of the Radford Arsenal and no longer considered a subpost. The arsenal was renamed Radford Ordnance Plant in 1961 and was finally redesignated as the Radford AAP in August 1963 (U.S. Army Toxic and Hazardous Materials Agency [USATHAMA], 1984).

Expansion of both ROW and NROW continued throughout World War II. Late in 1945, the Radford Unit was placed on standby status. The following year, the nitric acid area of the plant was reactivated to produce ammonium nitrate fertilizer, an activity that continued until 1949 under contract with Hercules Powder Company (later Hercules Incorporated). In September 1945, the NROW was declared surplus; but in April 1946, the magazine areas were changed from surplus to standby status. Between December 1946 and January 1948, large parcels of the NROW plant manufacturing area were sold (USATHAMA, 1984). These parcels were excess land holdings that had never been used for production purposes.

Between 1952 and 1958, Goodyear Aircraft Corporation of Akron, Ohio was contracted to manufacture component parts used in missile production at the Radford AAP. The close coordination required between Goodyear and Hercules resulted in Goodyear moving its assembly and coating operations to Radford AAP. In 1958, Hercules took over the Goodyear operations at the Plant (USATHAMA, 1984). Since 1968, Radford AAP has produced TNT on an intermittent basis.

## 3.3 RESPONSIBILITY

Based on discussions with Facility personnel, the general responsibilities assigned to the Radford AAP have not changed from those outlined by USATHAMA (1976). These include:

- Manufacturing of explosives and propellants;
- Handling and storage of strategic and critical materials as directed for other government agencies;
- Operation and maintenance, as directed, of active facilities in support of current operations. Maintenance and/or lay-away, in accordance with Ammunition Procurement and Supply Agency instructions, of standby facilities, including any machinery and packaged lines received from industry, in such conditions as will permit rehabilitation and resumption of production within the time limitations prescribed;
- Receipt, surveillance, maintenance, renovation, demilitarization, salvage, storage, and issue of assigned Field Service Stock and industrial stock as required or directed;

- Procurement, receipt, storage, and issue of necessary supplies, equipment, components, and essential materials;

- Mobilization planning, including review and revision of plant as required;

- Custodial maintenance and administrative functions of subinstallations; and

- Support services for tenants.

These responsibilities are met through the efforts of the operating contractor, Alliant Techsystems Inc. The Administrative Contracting Officer (ACO) and his staff provide technical assistance and administer the contracts with the civilian operating contractors. Radford AAP provides logistics support for tenant activities such as the U.S. Army Research, Development and Acquisition Information Systems Agency, (USARDAISA) which is charged with performing data processing activities during peacetime.

## 3.4 INDUSTRIAL OPERATIONS

From 1941 to the present, the principal end-products produced at Radford AAP have been single-base and multi-base propellants, and cast and solventless propellants. In the manufacture of these products, oleum (concentrated sulfuric acid), nitric acid, nitroglycerine (NG), and nitrocellulose are used. Since 1968, Radford AAP has produced TNT on an intermittent basis.

HWMU-7 is a former unlined holding and neutralization basin associated with the management and treatment of spills, runoff, and wash down waters from the Acid Tank Farms in the Oleum Plant Area; waste sulfuric acid and caustics from oleum production; and waste caustic mixed with acidic water.

# 4.0 HAZARDOUS WASTE MANAGEMENT UNIT 7

## 4.1 UNIT DESCRIPTION

HWMU-7 is a former unlined holding and neutralization basin located on the floodplain of the New River. The location of HWMU-7 is 37°11'12" N latitude and 80°33'15" W longitude. A Site Plan for HWMU-7 is illustrated in **Figure 3**. Intermittent drainages are located to the north and south of the Unit, and the New River is located approximately 225 feet to the west of the Unit.

When HWMU-7 was in operation, the impoundment measured approximately 90 feet wide by 160 feet long by 12 feet deep (side slope at 2:1). The resulting maximum capacity of the Unit was 566,131 gallons (75,685 cubic feet or 2,803 cubic yards). The closed HWMU-7 consists of a mound measuring approximately 90 feet wide by 160 feet long by 7 feet high, with a bottom elevation of approximately 1,711.1 feet above msl and a top elevation of approximately 1,718.3 feet above msl. The closed HWMU-7 is capped with a composite liner consisting of (from top to bottom):

- vegetative cover;
- 1 foot to 1.5 feet of topsoil;
- 1.25 feet to 2 feet of clay;
- 0.5 foot to 1.5 feet of sand (drainage layer; $10^{-3}$ cm/sec permeability); and
- a 30-mil PVC membrane liner.

The 30-mil PVC membrane liner is underlain by the neutralized residual material. The residual material in turn is underlain by a clay liner ranging in thickness from 1.75 feet to 3 feet throughout most of the Unit. At the northern end of the Unit, the neutralized residual material is underlain by native soils.

## 4.2 UNIT HISTORY

### 4.2.1 Operational History

HWMU-7 was put into operation in 1972. During operation, influent into HWMU-7 included spills, runoff, and wash down waters from the Acid Tank Farms in the Oleum Plant Area; waste sulfuric acid and caustics from oleum production; and waste caustic mixed with acidic water for neutralization. The wastes were characteristically hazardous as corrosive (EPA I.D. No. S04). The acidic waste waters were both nitric ($NO_3$) and sulfuric ($SO_4$) in origin with a pH ranging from 1.5 to 1.6 and a dominant constituent of mixed acids. The waste caustics were also corrosive in characteristic (pH >12.5), resulting in a similar EPA designation of D002. The dominant constituent of the caustic wastes was sodium hydroxide. The relative abundance of both waste streams was less than 1 percent. As the primary function of the Unit was to neutralize high and low pH influents, the Unit could be interpreted to meet the criteria of a T31 – Neutralization treatment unit under the RCRA Treatment, Storage and Disposal (TSD) Handling Codes designation system.

During a hydrographic survey conducted in December 1984, the thickness of accumulated sediments (primarily residues of lime precipitation) in HWMU-7 was measured at approximately 5 feet. According to Radford AAP personnel, no waste stream from the NC-line was ever discharged to HWMU-7. Therefore, no reactive wastes were likely present in HWMU-7. According to EP toxicity analyses conducted on the lagoon influent water and sediment, several heavy metals were detected in low concentrations (i.e., nonhazardous). The pH of the lagoon water was 11.4 when the analysis was conducted, which was also classified as nonhazardous. However, as the pH of the lagoon's influent was known to fluctuate (below 2.0 and above 12.5), the wastewater was classified as a corrosive substance. The results of the EP toxicity analysis conducted on the lagoon water and sediment are presented below. The samples collected from the lagoon water and sediment indicate that heavy metals were not present in concentrations that would classify the wastes as hazardous.

| EP Toxicity Parameter | Lagoon Water Concentration | Sediment Concentration |
|---|---|---|
| pH | 11.4 s.u. | ND |
| Arsenic | ND | ND |
| Barium | ND | 0.33 mg/l |
| Cadmium | 0.016 mg/l | 0.027 mg/l |
| Chromium | ND | 0.73 mg/l |
| Lead | ND | 0.58 mg/l |
| Mercury | ND | ND |
| Selenium | ND | ND |
| Silver | ND | 0.027 mg/l |

ND: Non-detect.

### 4.2.2 Unit Closure and Post-Closure Care

Radford AAP ceased operation of HWMU-7 in 1986 and closed the Unit in 1989 in accordance with the VDEQ-approved Closure Plan dated May 1988. At the time of closure, HWMU-7 was drained of all waters, the residual material was treated in-place with flyash and cement kiln dust to achieve a target pH range of 6.3 and 10.5, and the basin was filled with the residual material and stone and capped. No waste has been processed through HWMU-7 since it was closed. A copy of the May 1988 Closure Plan and the certification of closure are included (on CD-ROM) in **Appendix B**.

The May 1988 Closure Plan (**Appendix B**) documents the closure performance standards, environmental assessment of closure methods, and justifications of in-place closure that were used for HWMUs 5, 7, and 16. The four major sections of the May 1988 Closure Plan are discussed below:

**Waste Characterization/Maximum Waste Inventory** – Includes physical descriptions of HWMUs 5, 7, and 16, along with detailed descriptions of each Unit's functions.

**Construction Procedure** – Details basic closure construction procedures and the methods by which wastes and contaminated soils were handled during closure construction. Additional specific or unique information regarding site preparation, demolition cleanup, soil treatment, soil sampling and soil sample analysis is included.

**Soil Treatment** – Includes special instructions for soil treatment prior to and during closure. Presents the two objectives of the soil treatment program: 1) to neutralize acidic sediments and soils, and 2) to solidify soft subsoils for greater manageability. The objectives were accomplished by using pH as a guide for acidity, and by testing compressive strength. Also describes procedures including but not limited to: cover system analysis, drain installation, backfill, grading, drainage control, performance evaluation, and certification of closure.

**Post-Closure Care and Groundwater Monitoring** – Presents basic procedures for groundwater monitoring, inspections, maintenance, and contingency activities for the Units. Also includes engineering specifications for construction procedures, standards to be used, testing requirements, construction submittals, materials to be used, quality controls, unsatisfactory materials, and specific special construction instructions.

Certifications of closure for HWMUs 5, 7, and 16 were submitted to the VDEQ in letters dated October 26, 1989 and January 4, 1990. Following closure, Radford AAP monitored HWMU-7 in accordance with the post-closure care and groundwater monitoring procedures specified in the May 1988 Closure Plan. HWMU-7 was classified as an interim status Unit until the VDEQ issued the *Post-Closure Permit for Hazardous Waste Management Unit 7* (effective date October 30, 1999); the VDEQ subsequently revised the October 1999 *Post-Closure Permit*, and issued the *Final Hazardous Waste Post-Closure Permit for HWMUs 5, 7, 10, and 16* (October 4, 2002). Since 1999, Radford AAP has monitored HWMU-7 in accordance with the post-closure care and groundwater monitoring procedures specified in the *Post-Closure Permits*, as appropriate.

### 4.2.3 October/November 2002 Field Investigation

In October and November 2002, Radford AAP conducted subsurface investigations to determine the nature and extent of the residual material contained in closed HWMUs 5 and 7. Radford AAP intended to implement source removal activities in 2003 in support of clean closures for both Units; the results of the subsurface investigations would be used in the preparation of amended Closure Plans for both Units. Samples of the residual material within and the soil surrounding the Units were analyzed for the USEPA Target Analyte List (TAL) inorganic compounds and for the USEPA Target Compound List (TCL) organic compounds. In addition, composite samples of the residual material for both Units were submitted for waste characterization analysis in accordance with 40 CFR 261 Subpart C – Characteristics of Hazardous Waste.

A summary of the hazardous TAL inorganic constituents and the TCL organic constituents detected in the soil and residual material samples from HWMU-7 during the October/November 2002 Field Investigation is presented in **Table 1**. As shown in **Table 1**, only TAL inorganic constituents were detected in the samples of the residual material; no TCL organic constituents were detected in any of the residual material samples. Three TCL organic constituents were detected in the base clay and native soil beneath the residual material. The waste characterization analytical results for the composite sample of residual material from HWMU-7 indicated that the residual material was not hazardous by characteristic. Based on the

analytical results for the soil and residual material samples, Radford AAP chose to pursue clean closure of HWMU-7 while leaving the residual material in-place. Radford AAP submitted the results of the subsurface investigations and risk assessment to the VDEQ in the *Field Investigation Report and Risk Assessment for Units 5 and 7* (March 2003). A copy of the March 2003 *Field Investigation Report* is included (on CD-ROM) in **Appendix B**.

### 4.2.4 February 2004 Subsurface Investigation

In correspondence dated June 25, 2003, the VDEQ indicated that Radford AAP must sample the soil and liner material (if any) beneath the residual material to determine whether the soil and liner material met the clean closure standards listed in the VDEQ *Draft Guidance Manual for Closure Plans and Post-Closure Plans* (*Draft Guidance*). In February 2004, Radford AAP conducted subsurface investigations to evaluate the soil and liner material beneath the residual material contained in closed HWMU-7. Subsurface investigation activities were conducted in general accordance with the June 25, 2003 correspondence and the procedures specified in the Closure Plan Amendment.

A summary of the hazardous TAL inorganic constituents and the TCL organic constituents detected in the February 2004 soil samples is presented in **Table 1** along with the data from the October/November 2002 Field Investigation. Each of the February 2004 soil samples was collected at depths greater than six inches beneath the bottom of the residual material contained within HWMU-7. As shown in **Table 1**, 11 hazardous TAL inorganic constituents and 4 TCL organic constituents were detected in the bottom clay liner and native soil samples collected during the February 2004 subsurface investigation. The laboratory analytical data and data validation reports for the February 2004 soil samples are presented (on CD-ROM) in **Appendix B**. The analytical results for February 2004 soil samples will be presented and evaluated in the Closure Report for HWMU-7. The analytical results for the February 2004 soil samples will be presented and evaluated in the Closure Report for HWMU-7.

## 5.0 OVERVIEW OF CLOSURE PROCEDURES

The Closure Plan Amendment presents the procedures for collection and evaluation of additional data that will be used to demonstrate clean closure for HWMU-7 in compliance with the VDEQ correspondence (**Appendix A**), and with the Virginia Hazardous Waste Management Regulations (VHWMR) and RCRA as presented in 40 CFR Part 264.

The Closure Plan Amendment *Plan* includes the following options for closure:

Option 1: Clean closure with the residual material remaining in-place can be successfully demonstrated in accordance with the clean closure standards.

Option 2: Clean closure cannot be achieved with the residual material remaining in-place. The Unit will remain closed with the residual material in-place in accordance with the VDEQ-approved May 1988 Closure Plan, and the Unit will remain in post-closure care in accordance with the Final Permit (October 4, 2002). Radford AAP will retain the option to attempt to demonstrate clean closure in the future by excavation and removal of the residual material.

Option 3: Clean closure cannot be achieved with the residual material remaining in-place. The residual material will be excavated and transported off-site for disposal. Composite sample(s) of the excavated material will be submitted for waste characterization analyses to determine the proper disposal method (hazardous vs. non-hazardous). Following excavation, confirmation samples will be collected to document sufficient removal of residual material. The procedures and criteria that will be used to document clean closure by removal are defined in Section 5.4 of this plan. Should the material in the Unit be excavated and disposed of, the work will be performed in accordance with the Excavation Plan, which is included in **Appendix C (CD-ROM)**.

The closure plan may be amended in the future at the request of Radford AAP in accordance with 40 CFR 264.112.

## 5.1 HAZARDOUS CONSTITUENTS OF CONCERN (HCOC)

The HCOC list for HWMU-7 will be developed based on the following:

a. The results of analyses of lagoon water and sediment in 1981 (previously presented in the VDEQ-approved May 1988 Closure Plan);

b. The quarterly groundwater monitoring constituents for the Unit listed in Appendix E of Permit Attachment 3 of the Final Permit (October 4, 2002), as revised by subsequent detections of additional 40 CFR Part 264 Appendix IX constituents, and as proposed by the VDEQ in March 2010; and

c. Hazardous constituents detected in soil samples collected from within and around the Unit during the 2002 Field Investigation and the subsequent 2004 subsurface investigation.

The HCOCs will be used to determine whether the soil and liner material beneath the Unit meet the clean closure standards listed in the VDEQ *Draft Guidance*.

In 1981, analyses of lagoon water and sediment collected from HWMU-7 indicated the presence of inorganic constituents at concentrations below levels defined as hazardous by the EP Toxicity test. Specifically, cadmium was detected in the lagoon water sample at a concentration of 0.016 mg/l; no other inorganic constituents were detected in the lagoon water sample. Barium, cadmium, chromium, lead, and silver were detected in the sediment sample at concentrations of 0.33 mg/l, 0.027 mg/l, 0.73 mg/l, 0.58 mg/l, and 0.027 mg/l, respectively. In addition, the sediment sample was analyzed for arsenic, mercury, and selenium; concentrations of these constituents were not detected in the sediment sample.

In correspondence dated June 14, 2007, the VDEQ modified the ***Final Hazardous Waste Post-Closure Permit for HWMUs 5, 7, 10, and 16*** to change the groundwater monitoring frequency from quarterly to semiannually. In March 2010, the VDEQ proposed revisions to the quarterly (now semiannual) groundwater monitoring list for HWMU-7 presented in Appendix E of Permit Attachment 3 of the Final Permit. As revised by the VDEQ, the semiannual groundwater monitoring list for HWMU-7 consists of the following constituents:

| | | |
|---|---|---|
| Arsenic, total | Copper, total | Thallium, total |
| Barium, total | Lead, total | Bis (2-ethylhexyl) phthalate |
| Cadmium, total | Nickel, total | 2,4-Dinitrotoluene |
| Chromium, total | Selenium, total | 2,6-Dinitrotoluene |
| Cobalt, total | Silver, total | Cyanide, total |

During the 2002 Field Investigation at HWMU-7, samples of the residual material and surrounding soils were analyzed for the USEPA Target Analyte List (TAL) inorganic compounds, and for the USEPA Target Compound List (TCL) organic compounds. The following hazardous constituents (as listed in 40 CFR Part 261 Appendix VIII) were detected in the samples:

| | | | |
|---|---|---|---|
| Arsenic | Chromium | Cyanide | N-Nitrosodiphenylamine |
| Barium | Lead | 4,4-DDD | |
| Beryllium | Nickel | 4,4-DDE | |

During the February 2004 subsurface investigation at HWMU-7, samples of the soil and liner material beneath the residual material were analyzed for the TAL inorganic compounds and for the TAL organic compounds. Two additional TCL organic compounds (toluene and Aroclor-1254) were detected during the February 2004 subsurface investigation and added to the HCOC list for the Unit. The analytical results for the February 2004 soil samples will be presented and evaluated in the Closure Report for HWMU-7.

**The HCOC list for HWMU-7 is included as Table 2.**

Interpretation of the VDEQ *Draft Closure Guidance* indicates that Radford AAP need only analyze for the HCOC list. In an effort to remain consistent with the detection requirements of the facility-wide federal RCRA Corrective Action Permit, Radford AAP proposes to sample for a list of constituents (the TAL/TCL list) that includes the HCOCs for this Unit. In doing so, Radford AAP is demonstrating their pro-active and conservative approach to environmental compliance. Radford AAP realizes that if additional constituents detected using this expanded list of constituents are not represented on the proposed HCOC list (which contains all previously detected compounds), Radford AAP may prepare a demonstration to show that their presence is due to an alternate source or laboratory contamination. Alternatively, Radford AAP will be required to add those detected constituents to the HCOC list for the Unit. This "belt and suspenders" approach provides a level of protection that far exceeds the minimum requirements of the closure process.

## 5.2 SOIL SAMPLE COLLECTION AND ANALYSIS

In the June 25, 2003 correspondence, the VDEQ indicated that Radford AAP must sample the soil and liner material (if any) beneath the residual material to determine whether the soil and liner material meet the clean closure standards listed in the *Draft Guidance*. In accordance with this Closure Plan Amendment and VDEQ June 25, 2003 correspondence, a total of eight (8) soil samples were collected from the native soils and clay liner immediately beneath the residual material in February 2004. To facilitate soil sample collection, eight (8) soil borings were advanced through the clay liner beneath HWMU-7 and into the underlying native soils using a track-mounted Geoprobe® rig. The soil samples were submitted for laboratory analysis for the TAL inorganic compounds and for the TCL organic compounds.

Data validation was conducted using summary tables and raw data provided by the analyzing laboratory. Data validation was conducted in general accordance with SW-846 Method requirements (Test Methods for Evaluating Solid Wastes – Physical and Chemical Methods, USEPA SW-846, 3rd Edition – Final Update I, II/IIA, and III) and CLP data validation guidelines (USEPA Contract Laboratory Program National Functional Guidelines for Organic Data Review, October 1999 and USEPA Contract Laboratory Program National Functional Guidelines for Inorganic Data Review, July 2002). Analytical results for the February 2004 soil samples will be presented and evaluated in the Closure Report for HWMU-7.

## 5.3 GROUNDWATER SAMPLE COLLECTION AND ANALYSIS

In correspondence dated June 14, 2007, the VDEQ modified the *Final Hazardous Waste Post-Closure Permit for HWMUs 5, 7, 10, and 16* to change the groundwater monitoring frequency from quarterly to semiannually. The groundwater at HWMU-7 is sampled in accordance with the procedures specified in the *Final Hazardous Waste Post-Closure Care Permit for Hazardous Waste Management Units 5, 7 10, and 16* (October 4, 2002).

## 5.4 CLEAN CLOSURE EVALUATION

### 5.4.1 Residual Material

In order for Radford AAP to achieve clean closure of HWMU-7 with the residual material remaining in-place, the VDEQ indicated that Radford AAP must demonstrate that the residual material does not exceed the clean closure standards. Because of possible mixing, the top six inches of clay or native soil directly underneath the residual material will be included with the residual material. Similarly, the bottom six inches of clean material placed above the residual material will be included with the residual material. Therefore, closure procedures addressing the residual material must included all materials from six inches beneath to six inches above the residual material.

The 2002 Field Investigation serves as a previous study for the purpose of providing generator knowledge regarding the residual material contained in the Unit. The results of the October/November 2002 Field Investigation indicated only 16 TAL inorganic constituents were detected in the residual material samples; no TCL organic constituents were detected in the residual material samples. The results of the 2002 Field Investigation will be used to assist with the development of the HCOC list for the Unit. Additionally, the samples collected in the 2002 Field Investigation may be used to support the Clean Closure Demonstration to the extent possible.

If excavation of the Unit is planned, composite samples will be analyzed by TCLP to demonstrate compliance with the land disposal (LDR) treatment standards specified in 40 CFR 268 Subpart D.

### 5.4.2 Soil Samples

As stated in Section 5.2, eight (8) soil samples were collected from the native soils and clay liner immediately beneath the residual material in February 2004; the analytical results for these soil samples will be presented and evaluated in the Closure Report for HWMU-7. In the event that the soil sample analytical results indicate non-detection for all HCOCs, the clay liner and native soils beneath HWMU-7 will be considered to meet the clean closure decontamination standard. In the event that HCOCs are detected in the soil samples, Radford AAP may demonstrate clean closure by either: 1) statistical comparison of the soil sample HCOC concentrations to the background HCOC concentrations or 2) a risk assessment evaluation of the HCOCs present in the soil samples.

Detected inorganic HCOCs will be compared to the inorganic constituent background values established during the August/September 2001 Facility-Wide Background Study conducted by the IT Corporation (**Appendix B**). No TCL organic compounds were detected in the background soil samples collected during the August/September 2001 Facility-Wide Background Study; therefore, comparisons to background concentrations will not be possible for any organic HCOCs detected in the clay liner and native soils beneath HWMU-7.

Clean closure of the clay liner and native soils beneath HWMU-7 may be demonstrated by a risk-based assessment as an alternative to the non-detection decontamination standard or the statistical comparison of soil samples to background levels. In this way, Radford AAP may attempt to demonstrate that the concentrations of HCOCs detected in the clay liner and native soils do not pose an unacceptable level of risk to human health and the environment. The risk assessment will be conducted in accordance with the VDEQ documents titled *"Guidance for Development of Health Based Cleanup Goals Using Decision Tree/Risk Exposure and Analysis Modeling System (REAMS) Program, 1994, and Risk Based Methodology,"* as amended by the VDEQ, along with other risk-based guidance provided by the VDEQ.

### 5.4.3 Groundwater

Clean closure for groundwater at HWMU-7 will be demonstrated by comparing the most recent groundwater sample analytical results at the time that the Closure Report is prepared to the Groundwater Protection Standards (GPSs) for the Unit. If a groundwater constituent is detected at a concentration that is greater than the GPS, the concentration will be compared to background. HWMU-7 can receive clean closure for groundwater if all constituents are either below GPS or, if any constituents are above GPS, below background.

## 6.0 CLOSURE SAMPLING AND ANALYSIS PLAN–SOIL

In the June 25, 2003 correspondence (**Appendix A**), the VDEQ indicated that the soil and any liner material immediately beneath the residual material must be sampled to determine whether it meets the clean closure standards listed in the *Draft Guidance*. The residual material in HWMU-7 is underlain by a clay liner ranging in thickness from 1.75 feet to 3 feet throughout most of the Unit. At the northern end of the Unit, the residual material is underlain by native soils.

This Closure Sampling and Analysis Plan (SAP) for soil samples has been developed to ensure high quality of the sampling results, to verify the analytical results, and to assess any analytical error. This SAP is consistent with USEPA SW-846 (Test Methods for Evaluating Solid Waste, 3rd Edition, November 1986, as updated). All procedures detailed in this SAP will be followed when soil sampling occurs.

### 6.1 SOIL SAMPLE COLLECTION PROCEDURES

In order to meet the requirements of the VDEQ and in accordance with the Closure Plan Amendment, a total of eight (8) soil samples were collected from the native soils and clay liner immediately beneath the residual material in February 2004. To facilitate soil sample collection, eight (8) soil borings were advanced through the clay liner beneath HWMU-7 and into the underlying native soils. The boring locations are illustrated in **Figure 4**. A stratified grid-based sampling approach was used to accurately characterize the horizontal and vertical extent of the residual material. Eight sample locations were evenly spaced across the Unit to provide a representative evaluation of the entire Unit. Results of the soil sampling event conducted in February 2004 will be included in the Closure Report for HWMU-7.

The soil borings were advanced using a track-mounted Geoprobe® rig. The Geoprobe® system utilizes direct-push technology to facilitate sample collection. At each boring location, soil core samples were collected continuously using a four-foot long, 1.5-inch diameter piston-type sampler. Each soil core sample was collected and retained in a non-reactive acetate liner within the four-foot sampler. Following sample collection, the acetate liner was split longitudinally to expose the soil core, which was visually inspected and classified in the field by a geologist. Visual observation allowed for the differentiation between residual material, the clay liner, and native soils. The depth below ground surface of the contact between the residual material, clay liner, and native soils was recorded for each boring and plotted on a map using in-field triangulation with a known point. Schematic cross sections of the Unit were compiled from the data. As the sample collection device passed through the residual material, bottom liner, and subsoils, there was potential for cross-contamination from the residual material to the subsoils. Therefore, subsoil samples were collected from the undisturbed center of the cores to minimize potential cross-contamination.

A total of eight (8) soil samples were collected from the native soils and clay liner encountered in the eight (8) soil borings. The soil samples were submitted for laboratory analysis for the TAL inorganic compounds and for the TCL organic compounds. The laboratory analytical results were subjected to Level IV data validation.

In order to achieve clean closure, the facility must meet one of the decontamination standards in accordance with Section 3.13 of the VDEQ *Guidance Manual for Closure Plans and Post-Closure Plans for Hazardous Waste Management Facilities*. The decontamination standards are as follows:

1. **Analytical Non-Detection** – The concentrations of HCOCs in the compliance samples are below the method detection limits (MDLs) for the analytical test methods presented in Section 6.7.

2. **Comparison to Background Levels using Statistical Methods** – The concentrations of HCOCs in the compliance samples are below or not statistically different from the background sample levels using the appropriate statistical methods and performance standards specified in VDEQ guidance.

3. **Risk Assessment Standards and Criteria** – The concentrations of the HCOCs in the compliance samples are at levels that meet the acceptable risk-based performance standards (i.e., the HCOCs do not pose an unacceptable risk to human health or the environment) using the *"Guidance for Development of Health Based Cleanup Goals Using Decision Tree/Risk Exposure and Analysis Modeling System (REAMS) Program, 1994, and Risk Based Methodology,"* as amended by the VDEQ, along with other risk-based guidance provided by the VDEQ.

As an alternative, if clean closure standards are not met, Radford AAP may choose to excavate and dispose of the material within the Unit in accordance with Section 3.15.1 of the VDEQ *Draft Closure Guidance*. Should the material be excavated and disposed, the work will be performed in accordance with the Excavation Plan, which is included on CD-ROM in **Appendix C**.

### 6.1.1 Sample Containers and Preservation

Soil sample containers consisted of pre-cleaned, 16-ounce, glass jars equipped with Teflon-lined lids. The containers were prepared prior to sampling by the contract laboratory in accordance with the procedures for appropriate analytical method as specified in SW-846. After collection, the soil samples were placed in a cooler chilled to approximately $4^{o}$ C and sealed with a custody seal for shipment to the analytical laboratory under chain-of-custody.

All soil sample containers were packed in a cooler chilled to approximately $4^{o}$ C with ice as soon as they were collected. Upon the completion of activities at the Unit, the coolers were packed with additional ice and sealed with a custody seal for transport to the contract laboratory. The samples were shipped to the laboratory by common carrier.

### 6.1.2 Sample Label and Seal

Each sample was assigned a unique identification number. The sample identification number included symbols/numbers to indicate the following information:

- the name of the Facility,
- the name of the closure Unit from which the sample is collected,
- the depth from which the sample is collected, and
- the laboratory analyses associated with the sample.

The sample labels displayed the sample identification number, the sampling date and time, the initials of the sampler, the preservative(s) used (if any), and the type of analytical test. All sample containers were labeled in advance of or at the time of sampling. The sample information was printed on the label in a legible manner. The identification on the label, as described above, was sufficient to enable cross reference with the analytical laboratory logbook.

Labels were affixed to sample containers prior to or at the time of sampling and were filled out at the time of collection.

Before the sample was packed into the sample shipping container, or before the sample left the custody of sampling personnel, a sample custody seal was affixed over the lid/cap of the sample container in a manner that it is necessary to break the seal to open the sample container. The seal included the following information:

- Sample identification number (this number must be identical with the number on the sample label).
- Name of sampler.
- Date and time of sampling.

All entries were printed in waterproof ink.

### 6.1.3 Sample Packaging and Shipping

Sample packaging and shipping complied with the U.S. Postal Service regulations, Department of Transportation regulations, Virginia regulations governing transportation of hazardous materials, if applicable, and USEPA SW-846 (Chapter 9).

When the sample containers were shipped to the laboratory, a minimum of two custody seals were placed on the shipping container in such a way that the shipping containers could not be opened in transport without breaking the seal. In addition, the shipping sample containers were sealed with strapping tape in a manner that the shipping container could not be opened without cutting through the tape.

In the event that final receipt by the laboratory of any shipping container or sample bottle indicated evidence of compromised sample integrity, the laboratory QA/QC officer or his/her representative would have notified the operator within 24 hours of receipt. Subsequent to

notification, sample integrity would have been evaluated and appropriate actions would have been taken to assure representative samples. Sample integrity determinations and needs for additional actions would have been conducted, if necessary, according to QA/QC guidance from USEPA SW-846. Resampling would have been conducted if determined necessary.

## 6.2 FIELD DOCUMENTATION

Sampling events that occurred during the closure activities were recorded in a field notebook. All pertinent sampling and field survey information were recorded in the logbook. All logs are kept in a waterproof, bound notebook with numbered pages. All entries were printed in waterproof ink. No pages were or will be removed. Corrections were made, where necessary, by drawing a single line through the incorrect data and initializing and dating the correction that was made to the side of the error. Entries in the logbook contain at a minimum the following information:

- Location of sampling point.
- Name and address of field contact.
- Type of sample (i.e., soil).
- Number and volume of samples taken.
- Purpose of sampling (i.e., closure activities).
- Description of sampling point and sampling methodology.
- Date and time of collection.
- Parameters for analysis.
- Sample identification number.
- Sample distribution and transport method (i.e., name of laboratory, name of courier).
- Field observations.
- Any field measurements taken (i.e., pH, conductivity).
- Appearance of the samples.
- Relevant field conditions.
- Signatures of personnel responsible for observations.

## 6.3 CHAIN-OF-CUSTODY DOCUMENTATION

The soil sampling program incorporates a chain-of-custody program to track the route and handlers of the soil samples. The monitoring of sample possession from field sampling to laboratory analysis is important in the event that unexpected lab results occur and the security of transportation is evaluated. This documentation contains several records and logs that assist in the quality control of the program.

The chain-of-custody record was filled out for the Unit and accompanied the samples to the contract laboratory. The completed form was returned to Radford AAP with the analyses for each Unit. An example chain-of-custody form is included on CD-ROM in **Appendix D**. The sample possession was established from time of collection to the time of analysis. This record contains the following information:

- Sample identification and location.
- Signature of sampler.
- Date and time of sampling.
- Sample type.
- Well identification.
- Number of containers.
- Required analysis.
- Signatures of person(s) involved in possession.
- Times and dates of possession.
- Method of transportation.
- Statement for packing on ice.
- Temperature during shipment (minimum and maximum).
- Internal temperature upon arrival at laboratory.

The chain-of-custody form was forwarded to the laboratory with the samples. As a precaution against this record being lost or altered, the sampling personnel retained a copy of the chain-of-custody form documenting all information up until the first change of sample custody.

A sample analysis request sheet can further clarify the samples for each requested constituent. This additional check sheet was utilized. This sheet sent along with the samples contained the following information:

- Name of person receiving samples.
- Laboratory sample number.
- Date of sample receipt.
- Analysis to be performed.
- Internal temperature during shipping.

## 6.4 DECONTAMINATION

All downhole probing tools were decontaminated prior to initiating field activities, between each boring, and prior to demobilization from the Site using a non-phosphate detergent/distilled water solution wash followed by a distilled water rinse. The Geoprobe® sample collection system used dedicated, disposable acetate liners for each sample collected in order to prevent cross-contamination; therefore, no reusable equipment came into contact with the samples. In the event that future site activities require the use of reusable sampling equipment, the following decontamination procedures for reusable equipment have been established per the VDEQ *Draft Closure Guidance* and are as follows.

- Between soil samples and sampling locations, material were physically removed from the sampling equipment with brushes or water.
- Then, equipment was washed using a non-phosphorous detergent/distilled water solution followed by a distilled water rinse.
- If constituents to be analyzed included trace metals, the equipment were rinsed with a 10% nitric acid solution followed by a distilled water rinse.

- If samples were analyzed for trace organics, the equipment were rinsed with a pesticide grade solvent followed by a distilled water rinse.
- Following decontamination, the equipment was allowed to air-dry completely.

## 6.5 BORING ABANDONMENT

Upon completion of the borings and collection of the necessary samples, each borehole was sealed with a bentonite slurry to the ground surface. The geosynthetic layer within the cap for HWMU-7 was penetrated by the Geoprobe® borings. However, due to the fact that laboratory analytical data collected during previous subsurface investigations indicated that the residual material in HWMU-7 was not hazardous by characteristic, no additional measures were taken to repair the geosynthetic layer within the cap.

## 6.6 DISPOSITION OF INVESTIGATION-DERIVED WASTE

All rinsate water that was generated during decontamination activities was collected in containers and subsequently emptied into the Biological Wastewater Treatment Plant at Radford AAP.

The soil cuttings and waste Geoprobe® sample collection sleeves were containerized within a steel drum and staged at a central location on-site pending proper disposal.

## 6.7 ANALYTICAL PROCEDURES

Aliquots of the eight soil samples were submitted to Severn Trent Laboratories of North Canton, Ohio, for analysis for the USEPA Target Analyte List (TAL) inorganic compounds. Separate aliquots of the eight soil samples were submitted to Lancaster Laboratories of Lancaster, Pennsylvania for analysis for the USEPA Target Compound List (TCL) organic compounds.

The analytical methods set forth in USEPA SW-846 (Test Methods for Evaluating Solid Waste, latest edition) were used to analyze all constituents. Recommended analytical methods and associated quantitation limits are listed in **Table 2**. Lancaster Laboratories used Statement of Work OLM03.2 for analysis of TCL organic constituents for sampling performed at the Unit in 2002. The Statement of Work OLM04.3 was published in March 2003. For consistency, Statement of Work OLM03.2 was used for the additional sampling conducted in support of this Closure Plan Amendment. Results of the 2004 sampling event will be presented in the HWMU-7 Closure Report.

Radford AAP realizes that the VDEQ *Draft Closure Guidance* recommends the use of methods that achieve the lowest possible detection limits for clean closure documentation. While in theory the use of those methods may provide marginally lower detections than methods used in standard professional practice of analysis, they are inherently not definitive, by definition, and have significant limitations with respect to reliability, validity and reproducibility. Appendix III to 40 CFR Part 261 – *Chemical Analysis Test Methods* references the use of SW-846 in the selection of test methods. Chapter 2 of SW-846, Section 2.2.5 – *Detection and*

*Monitoring* recommends the use of the ***most practical*** methods approved for detection. All of the analytical methods proposed by Radford AAP are considered the most practical and robust methods and are specifically approved for detection monitoring.

Additionally, many nationally accredited commercial laboratories do not routinely provide these methods for entire standard parameter lists. For example, Lancaster Laboratories only offers method 8021B for the suite of compounds that includes Benzene, Ethylbenzene, Toluene, and Xylenes (BTEX). Analysis of a full Volatile Organic Compound list for soil using method 8021B would constitute a research level effort, thereby more than tripling the cost. Additionally, many units at Radford AAP have been closed under the federal RCRA Corrective Action Permit for the entire facility using the methods proposed here. Using similar methods provides a consistent approach with respect to decision making at the facility and interpretation of the intent of RCRA. Accordingly, Radford AAP proposes to use the following methods:

- Analysis by SW-846 Method 6010B (ICP-trace) generally provides detection and quantitation limits comparable to SW-846 7000 series methods. In general, ICP-trace analysis is preferred since the method is subject to less interferences and potential false positives. Radford AAP requests the use of Method 6010B.

- Analysis by SW-846 Method 8021B typically achieves lower detection and quantitation limits for select chlorinated and aromatic volatiles. However, use of SW-846 Method 8260B is preferred due to the reliability associated with target analyte identification (less potential for false positives). In many cases, laboratory specific detection limits for Method 8260B analytes may be comparable to Method 8021B. Radford AAP requests the use of Method 8260B.

- Analysis by SW-846 Method 8330 is subject to interferences and potential false positives. For this project, use of SW-846 Method 8270C is preferred due to the reliability associated with target analyte identification (less potential for false positives). As well, Lancaster Laboratories' specific detection and quantitation limits for Method 8270C analytes 2,4- and 2,6-dinitrotoluene are lower than Method 8330. Radford AAP requests the use of Method 8270C.

The above noted methods are reliable, cost-effective and can generate data to support clean closure demonstration at this facility. Therefore, RFAAP respectfully requests the use of SW-846 Methods 6010B, 8260B and 8270C for this project.

Data validation was conducted using summary tables and raw data provided by the analyzing laboratory. Data validation was conducted in general accordance with SW-846 Method requirements (Test Methods for Evaluating Solid Wastes – Physical and Chemical Methods, USEPA SW-846, 3rd Edition – Final Update I, II/IIA, and III) and CLP data validation guidelines (USEPA Contract Laboratory Program National Functional Guidelines for Organic Data Review, October 1999 and USEPA Contract Laboratory Program National Functional Guidelines for Inorganic Data Review, July 2002).

## 6.8 QUALITY ASSURANCE/QUALITY CONTROL

During sample collection and analysis, Radford AAP and the laboratories performing the analytical testing followed quality assurance and quality control (QA/QC) procedures consistent with chapter one of SW-846, 3rd Edition, November 1986, as updated.

The appropriate QA/QC samples, sample data, laboratory data, and laboratory QA/QC control procedures specified within the Closure Plan Amendment will be discussed and summarized in the Closure Report as it pertains to the demonstration of closure. All of the QA/QC laboratory data will be included with all other field and sampling data and will be provided in an appendix of the Closure Report.

### 6.8.1 Field QA/QC Program

The field QA/QC program is designed to ensure the reliability and validity of the field data gathered as part of the Closure soil sampling program. The field QA/QC program consists of routine collection and analysis of trip and equipment blanks and blind duplicates.

For each day of soil sampling, one trip blank was filled with laboratory-grade reagent water in the laboratory that was selected to conduct the TCL organic compounds analyses. The trip blank was analyzed only for the same volatile organic compounds for which the soil samples will be analyzed. The trip blank accompanied the sampling kit, in the transport cooler, at all times. A minimum of one trip blank per cooler per day of sampling accompanied the samples collected for TCL organic compounds analyses.

No non-dedicated equipment was used during the February/March 2004 sampling event. Therefore, no equipment blanks were collected. However, if any non-dedicated equipment is used in any subsequent sampling activities, equipment blanks will be collected to monitor the decontamination of any non-dedicated equipment that may be used in the sampling process. The equipment blank will be prepared by filling the sampling device with laboratory-grade reagent water and transferring the water from the sampling device to the sample containers. Any equipment blank(s) will be analyzed for the same constituents for which the soil samples and residual material samples are being analyzed. One equipment blank will be collected during each day of soil sampling at HWMU-7. A minimum of one equipment blank per day of sampling will be collected in the event that non-dedicated equipment is used during the sampling process.

One field duplicate sample was collected during each day of soil sampling at HWMU-7. The field duplicate was analyzed for the TAL inorganic and TCL organic constituents. The field duplicate was collected by simultaneously aliqouting a sample into separate containers. The containers for field duplicates were labeled as such. A minimum of one field duplicate sample per day of sampling was collected at the Unit.

The occurrence of constituents in blank samples may serve to qualify the results presented by the laboratory. Additional blanks or duplicate samples may be prepared and

analyzed to address specific, unanticipated conditions. Resampling and reanalysis may be required in certain cases depending on project objectives.

### 6.8.2 Laboratory QA/QC Program

The contract laboratories performing the analytical testing followed quality assurance and quality control (QA/QC) procedures consistent with chapter one of SW-846, 3rd Edition, November 1986, as updated. Copies of the Severn Trent Laboratories Quality Assurance Plan and of the Lancaster Laboratories Quality Assurance Plan are included (on CD-ROM) in **Appendix B**.

Each contract laboratory kept a logbook to document the processing steps that were applied to each soil sample. All sample preparation techniques and instrumental methods were identified in this logbook. The results of the analysis of all quality control samples were identified specific to each batch of soil samples analyzed. The logbook also included the time, date, and name of person who performed each processing step.

Dilution during analyses has a major impact on the overall quality and usability of the soil sample data. Large dilution factors may mask hazardous constituents that are present at low concentrations, which may result in constituent concentrations not being identified completely. Therefore, when multiple analyses using sequential dilutions were required, the results from these multiple analyses were reported.

In addition to the trip and equipment blanks and blind duplicates collected for the field QA/QC program, the laboratory shall prepared and analyzed at least one matrix spike for each sampling batch or every 20 samples. The laboratory shall also prepared and analyzed either one matrix duplicate or matrix spike duplicate for each analytical method employed. Sufficient sample volume was collected in the field so that the laboratory could prepare the matrix spike and matrix spike duplicate. MS/MSDs were prepared and analyzed at a frequency of one MS/MSD per sampling batch or 20 samples (whichever was more frequent) per matrix type.

## 6.9 HEALTH AND SAFETY PLAN

During the soil sample collection activities, health and safety requirements as per 29 CFR Parts 1910.120 were followed by all personnel present at the Site. All contractors adopted, as a minimum, the Radford AAP Facility Health and Safety Plan (HASP). The Radford AAP HASP outlines the minimum health and safety requirements for the facility. The contractors assured that all personnel entering the Site had all appropriate health and safety training required by the Occupational Safety and Health Administration (OSHA) and USEPA, and that all requirements of the HASP were implemented.

## 7.0 CLOSURE SAMPLING AND ANALYSIS PLAN–GROUNDWATER

The groundwater at HWMU-7 continues to be sampled in accordance with the procedures specified in the *Final Hazardous Waste Post-Closure Care Permit for Hazardous Waste Management Units 5, 7 10, and 16* (October 4, 2002). Clean closure for groundwater at HWMU-7 will be demonstrated by comparing the most recent groundwater sample analytical results at the time that the Closure Report is prepared to the Groundwater Protection Standards (GPSs) for the Unit.

## 8.0 CLEAN CLOSURE STANDARDS

## 8.1 CLEAN CLOSURE STANDARDS FOR RESIDUAL MATERIAL

In the June 25, 2003 correspondence (**Appendix A**), the VDEQ indicated that clean closure may be achieved for HWMU-7 with the residual material remaining in-place if samples of the residual material meet the clean closure standards outlined in the VDEQ *Draft Closure Guidance*.

During the October/November 2002 Field Investigation, three (3) samples of the residual material were submitted for laboratory analyses for TAL inorganic constituents and TCL organic constituents. As shown in **Table 1**, only 10 hazardous TAL inorganic constituents were detected in the three residual material samples. No TCL organic constituents were detected in the three residual material samples.

Achievement of clean closure for the residual material at HWMU-7 will be demonstrated by comparing the concentrations of HCOCs in the material to one of the following clean closure standards, as appropriate:

1. **Analytical Non-Detection** – The concentrations of HCOCs in the compliance samples are below the method detection limits (MDLs) for the analytical test methods presented in Section 6.7.

2. **Comparison to Background Levels using Statistical Methods** – The concentrations of HCOCs in the compliance samples are below or not statistically different from the background sample levels using the appropriate statistical methods and performance standards specified in VDEQ *Draft Closure Guidance*.

3. **Risk Assessment Standards and Criteria** – The concentrations of the HCOCs in the compliance samples are at levels that meet the acceptable risk-based performance standards (i.e., the HCOCs do not pose an unacceptable risk to human health or the environment) using the *"Guidance for Development of Health Based Cleanup Goals Using Decision Tree/Risk Exposure and Analysis Modeling System (REAMS) Program, 1994, and Risk Based Methodology,"* as amended by the VDEQ, along with other risk-based guidance provided by the VDEQ.

As an alternative, if clean closure standards are not met, Radford AAP may choose to excavate and dispose of the material within the Unit in accordance with Section 3.15.1 of the VDEQ *Draft Closure Guidance*. Should the material be excavated and disposed, the work will be performed in accordance with the Excavation Plan, which is included in **Appendix C**. If excavation of Unit 7 is planned, composite samples will be analyzed by TCLP to demonstrate compliance with LDRs.

## 8.2 CLEAN CLOSURE STANDARDS FOR SOIL

In the June 25, 2003 correspondence, the VDEQ indicated that the soil and any liner material immediately beneath the residual material at HWMU-7 must be sampled to determine

whether they meet the clean closure standards listed in the *Draft Guidance*. In accordance with the *Draft Guidance*, achievement of clean closure for soils at HWMU-7 will be demonstrated by comparing the concentrations of hazardous constituents of concern (HCOCs) in subsurface soil samples to one of the following three clean closure standards, as appropriate:

1. **Analytical Non-Detection** – The concentrations of HCOCs in the compliance samples are below the method detection limits (MDLs) for the analytical test methods presented in Section 6.7.

2. **Comparison to Background Levels using Statistical Methods** – The concentrations of HCOCs in the compliance samples are below or not statistically different from the background sample levels using the appropriate statistical methods and performance standards specified in VDEQ *Draft Closure Guidance*.

3. **Risk Assessment Standards and Criteria** – The concentrations of the HCOCs in the compliance samples are at levels that meet the acceptable risk-based performance standards (i.e., the HCOCs do not pose an unacceptable risk to human health or the environment) using the *"Guidance for Development of Health Based Cleanup Goals Using Decision Tree/Risk Exposure and Analysis Modeling System (REAMS) Program, 1994, and Risk Based Methodology,"* as amended by the VDEQ, along with other risk-based guidance provided by the VDEQ.

As an alternative, if clean closure standards are not met, Radford AAP may choose to excavate and dispose of the material within the Unit in accordance with Section 3.15.1 of the VDEQ *Draft Closure Guidance*. Should the material be excavated and disposed, the work will be performed in accordance with the Excavation Plan, which is included in **Appendix C**.

### 8.2.1 Hazardous Constituents of Concern

In order for Radford AAP to achieve clean closure for HWMU-7, all hazardous waste or HCOCs must be removed from the Unit to levels such that direct contact with any parts of the Unit or with any HCOCs that remain after closure will not pose a threat to human health and/or the environment, nor adversely impact any environmental media in excess of the VDEQ-established exposure levels. The HCOCs for HWMU-7 are listed in **Table 2**.

### 8.2.2 Analytical Non-Detection

In the event that the soil sample analytical results indicate non-detection for all of the HCOCs analyzed using the test methods and detection limits presented in Section 6.7, the specific sample locations exhibiting the non-detects will be deemed to be uncontaminated. Should all soil sample analytical results indicate non-detection for all HCOCs, then the soils at HWMU-7 will be considered to meet the clean closure decontamination standard.

In the event that HCOCs are detected in the soil samples, Radford AAP may demonstrate clean closure by either: 1) statistical comparison of the soil sample HCOC concentrations to the

background HCOC concentrations, or 2) a risk assessment evaluation of the HCOCs present in the soil samples.

### 8.2.3 Comparison to Background

#### 8.2.3.1 Establishment of Background Concentrations

In August and September 2001, the IT Corporation conducted a Facility-Wide Background Study at the Main Manufacturing Area and the New River Unit of Radford AAP in accordance with a USEPA Region III-approved Work Plan. A copy of the ***Radford Army Ammunition Plant Facility-Wide Background Report*** (December 2001) is included (on CD-ROM) in **Appendix B**. As stated in the ***Facility-Wide Background Report***, the primary objective of the study was to collect soil samples representative of background conditions to establish a baseline for inorganic constituents of concern at Radford AAP. Sampling locations were positioned in tree stands to ensure associated soil samples were representative of areas that had not been affected by previous site activities or releases. Wherever possible, background sample locations were placed in tree stands estimated to predate potential construction activity at each location. The background soil samples were analyzed for the USEPA TAL inorganic compounds and for the USEPA TCL organic compounds. No TCL organic compounds were detected in the background soil samples.

Following the collection and analysis of the background soil samples, IT Corporation initially calculated facility-wide point estimates for the background soil data as confidence limits. As a result of discussions with the USEPA and VDEQ, the final facility-wide point estimates for the background soil data were calculated as tolerance limits. The use of tolerance limits rather than confidence limits evolved from comments questioning the use of the 95% upper confidence limit (UCL) as the point estimate for the background value. The 95% UCL was originally included in the Facility-Wide Background Study as a general point of reference. A confidence interval is used for comparisons within a single population. A compliance data set is then typically compared to a known standard. Using the 95% UCL as a single point comparison or background value, however, is likely to result in classifying many chemicals as greater than background when they are not. These misclassifications would be due to the 95% UCL representing an estimate of the mean. Such misclassifications could occur as often as 50% of the time. A tolerance limit is used for comparisons of similar but distinct populations. A concentration range is defined from a background data set, within which a large proportion of compliance data should fall with high probability. Therefore, it was recommended that a 95% upper tolerance limit (UTL) be developed in the Background Study for use as point-by-point comparisons.

Radford AAP has established the validity of the December 2001 Facility-Wide Background Report with the VDEQ and USEPA Region III, and has substantial documentation regarding VDEQ and USEPA Region III approval of the study and its use as a screening tool for soils at the facility. Specifically, Radford AAP has utilized the data from the Facility-Wide Background Report to the satisfaction of the VDEQ and USEPA Region III in the Site Screening Document for SWMU-6, in the Soil Screening Reports for SWMUs 8 and 36, and in the draft RCRA Facility Investigation Report for SWMU-58. (Copies of the VDEQ and USEPA Region

III approval letters for the above-referenced documents are included on CD-ROM in **Appendix B**.)

With respect to Section 3.11.3 of the *Draft Closure Guidance*, which indicates that background soils and subsoil samples should be of the same geologic properties, type and texture and be from the same soil horizons, if possible, as the corresponding soil or subsoil samples from the unit, please note that the VDEQ provided the following comment regarding the background soil data presented in the draft Facility-Wide Background Report on September 10, 2001:

> *"Given the conditions of mixed surface and subsurface soils at the potentially contaminated sites, it is recommended that the background data for both surface and subsurface soils be combined for each element to determine the 95% UTL to be used in conjunction with the USEPA Region III RBCs for human health risk screening, and with various ecological screening data for ecological screening purposes. This will not only simplify the screening process, but will add power to the statistical comparison and prevent the unnecessary, and costly, carrying forward of naturally occurring elements into the full-fledged risk assessment process."*

Therefore, it is Radford AAP's opinion that the soil samples analyzed in support of the Facility-Wide Background Study should be of sufficient quantity to meet the requirements of the *Draft Closure Guidance* to provide background inorganic constituent concentrations for HWMU-7. Correspondence regarding use of the Facility-Wide Background Study is included on CD-ROM in **Appendix B**.

#### 8.2.3.2 Comparison to Background – Inorganic Constituents

The 95% UTLs calculated by the IT Corporation for the inorganic constituents detected in the background soil samples from the Main Manufacturing Area are summarized in **Table 3**. These facility-wide background values, in conjunction with the Unit-specific background concentrations detected in the sample from boring 7GP-16 during the October/November 2002 Field Investigation (**Table 1**), will be used in the initial comparisons to background for any inorganic HCOCs detected in the soil samples obtained from the clay liner and native soils beneath HWMU-7. If the concentration of every inorganic HCOC in a soil sample is below the appropriate UTL, that sampling location will be deemed to be uncontaminated for inorganic constituents. If the concentration of any inorganic HCOC in a soil sample exceeds its respective UTL, Radford AAP may attempt to demonstrate that the concentrations of the inorganic HCOCs detected in the clay liner and/or native soils beneath HWMU-7 do not pose an unacceptable risk to human health and the environment.

#### 8.2.3.3 Comparison to Background – Organic Constituents

No TCL organic compounds were detected in the background soil samples collected during the August and September 2001 Facility-Wide Background Study. In addition, no TCL organic compounds were detected in the Unit-specific background sample collected from boring 7GP-16 during the October/November 2002 Field Investigation. Therefore, comparisons to background concentrations will not be possible for any organic HCOCs detected in the clay liner

and/or native soils beneath HWMU-7. If any organic HCOCs are detected in the clay liner and/or native soils beneath HWMU-7, Radford AAP may attempt to demonstrate that the detected organic HCOCs concentrations do not pose an unacceptable risk to human health and the environment.

### 8.2.4 Risk Assessment

Clean closure of the clay liner and native soils beneath HWMU-7 may be demonstrated by a risk-based assessment as an alternative to the non-detection decontamination standard or the statistical comparison of soil samples to background levels. Radford AAP may propose to demonstrate that the concentrations of hazardous constituents detected and remaining in the clay liner and native soils do not pose an unacceptable level of risk to human health and the environment. The risk assessment will be conducted in accordance with the VDEQ documents titled *"Guidance for Development of Health Based Cleanup Goals Using Decision Tree/Risk Exposure and Analysis Modeling System (REAMS) Program, 1994, and Risk Based Methodology,"* as amended by the VDEQ, along with other risk-based guidance provided by the VDEQ. Only those constituents that did not pass the non-detection and background clean-closure standards (i.e., detects above background levels) need to be included in the risk-based evaluation.

A copy of the VDEQ Risk Assessment Guidance is provided on CD-ROM in **Appendix E**. The risk assessment protocol detailed in **Appendix E** includes risk formulas for both residential and occupational/industrial exposure scenarios. As stated in the Risk Assessment Guidance, a residential exposure scenario initially will be assumed for the purpose of attempting to document unrestricted closure of the soil. If the risk for potential residential exposure does not exceed the performance standards, unrestricted closure of soil will be documented/accepted. If the site cannot be clean closed for residential use, then the option to pursue restricted closure (commercial/industrial) will be exercised. Use of the commercial/industrial exposure scenario to demonstrate clean closure will require Radford AAP to enact a deed restriction that eliminates the possibility of future residential use of the site. The requirements for establishing such a deed restriction are detailed in the VDEQ document "*Guidelines for Developing Health-Based Cleanup Goals Using Risk Assessment at A Hazardous Waste Site Facility for Restricted Industrial Use*," dated June 1995 (included in **Appendix E**).

The Risk Exposure and Analysis Modeling System (REAMS) Program requires fate and transport modeling in the event that HCOCs remain in soils at the Unit. The fate and transport modeling used in REAMS is necessary to demonstrate that the HCOCs remaining in soils should not result in contamination of the groundwater underneath the Unit above acceptable risk-based levels.

## 8.3 CLEAN CLOSURE STANDARDS FOR GROUNDWATER

The groundwater at HWMU-7 currently is monitored in accordance with the requirements of the *Final Hazardous Waste Post-Closure Care Permit for Hazardous Waste Management Units 5, 7 10, and 16* (October 4, 2002). In the event that the residual material and underlying soils at HWMU-7 meet the clean closure standards specified by the VDEQ, Radford

AAP will attempt to demonstrate clean closure for groundwater at HWMU-7 as well. Clean closure for groundwater at HWMU-7 will be demonstrated by comparing the most recent groundwater sample analytical results at the time that the Closure Report is prepared to the Groundwater Protection Standards (GPSs) for the Unit. The GPSs for HWMU-7 are based on USEPA Maximum Contaminant Levels (MCLs) for drinking water or on VDEQ-derived Alternate Concentration Limits (ACLs) for constituents without MCLs. Due to the fact that Radford AAP is an industrial facility with no users of groundwater, comparison of groundwater data to residential drinking water standards will provide the most conservative assessment of risk. If a groundwater constituent is detected at a concentration that is greater than the GPS, the concentration will be compared to background. HWMU-7 can receive clean closure for groundwater if all constituents are either at or below GPS or, if any constituents are above GPS, at or below background.

Radford AAP will continue to monitor groundwater at HWMU-7 in accordance with the *Final Hazardous Waste Post-Closure Care Permit for Hazardous Waste Management Units 5, 7 10, and 16* until approvals for clean closure of soil and groundwater at HWMU-7 have been issued by the VDEQ **and contingent upon the condition that the permit language allows a cessation of groundwater monitoring upon approval of clean closure of soils and groundwater**. **A Class 3 modification of the Radford's post-closure care permit would be required to reduce the post-closure period in accordance with 40 CFR § 270.42, Appendix I - Section E.3. In accordance with 40 CFR § 264.120, Certification of post-closure completion statements by the Radford AAP (owner/operator) and the independent professional engineer registered in the Commonwealth of Virginia must be submitted to the DEQ for review and approval prior to approval of the closure of the groundwater and soils linked to HWMU #7.**

**The justifiable Class 3 modification is required to shorten the HWMU #7 post-closure period. The Class 3 modification could facilitate the end of the post closure period to coincide with the same date as the DEQ's approval of the soils and groundwater closure of the HWMU #7 portion of the post-closure permit. Alternately, and not requiring a permit modification, the HWMU #7 portion of the permit could be allowed to terminate upon permit expiration if clean closure is approved for soil and groundwater prior to permit expiration.**

## 9.0 CLOSURE COST ESTIMATE AND FINANCIAL ASSURANCE

40 CFR Subpart H (Financial Requirements) specifies the requirements for cost estimates and financial assurance for closure and post-closure care (40 CFR 264.140 through 264.151). The following is directly cited from § 264.140(c):

> "States and the Federal government are exempt from the requirements of this subpart."

Radford AAP is a federal government installation; therefore, HWMU-7, and all other HWMUs at the Radford AAP, are exempt from the requirements of 40 CFR 264 Subpart H.

## 10.0 SCHEDULE FOR CLOSURE

HWMU-7 received certification for closure with waste in place in 1990 and is currently in the Compliance Period, which extends until October 30, 2017. The sampling activities outlined in this Closure Plan Amendment constitute additional closure activities in support of clean closure of HWMU-7. Based on generator knowledge and previous studies, Radford AAP has determined that residual material contained in HWMU-7 is not a hazardous waste as defined in 40 CFR Part 261. Radford AAP completed the additional sampling activities in accordance with the Closure Plan Amendment and VDEQ correspondence dated June 25, 2003, in February 2004. The analytical results for the February 2004 soil samples will be presented and evaluated in the Closure Report for HWMU-7.

In correspondence to the VDEQ dated August 9, 2007, Radford AAP submitted a Class 3 permit modification for the Post-Closure Care Permit for HWMUs 5, 7, 10, and 16. This Closure Plan Amendment will be subject to public notice as part of the Class 3 permit modification. Final approval of the Closure Plan Amendment is contingent upon the VDEQ's decision to grant or deny the Class 3 permit modification request after conclusion of the 45-day public comment period. Upon approval of the Class 3 permit modification, Radford AAP will prepare and submit the Closure Report for HWMU-7. The Closure Report will include a clean closure evaluation for soil and groundwater at the Unit. Radford AAP will continue to monitor groundwater at HWMU-7 in accordance with the *Final Hazardous Waste Post-Closure Care Permit for Hazardous Waste Management Units 5, 7 10, and 16* until approvals for clean closure of soil and groundwater at HWMU-7 have been issued by the VDEQ **and contingent upon the condition that the permit language allows a cessation of groundwater monitoring upon approval of clean closure of soils and groundwater**. **A Class 3 modification of the Radford's post-closure care permit would be required to reduce the post-closure period in accordance with 40 CFR § 270.42, Appendix I - Section E.3. In accordance with 40 CFR § 264.120, Certification of post-closure completion statements by the Radford AAP (owner/operator) and the independent professional engineer registered in the Commonwealth of Virginia must be submitted to the DEQ for review and approval prior to approval of the closure of the groundwater and soils linked to HWMU #7.**

**The justifiable Class 3 modification is required to shorten the HWMU #7 post-closure period. The Class 3 modification could facilitate the end of the post closure period to coincide with the same date as the DEQ's approval of the soils and groundwater closure of the HWMU #7 portion of the post-closure permit. Alternately, and not requiring a permit modification, the HWMU #7 portion of the permit could be allowed to terminate upon permit expiration if clean closure is approved for soil and groundwater prior to permit expiration.**

In the event that clean closure is not achieved, HWMU-7 will remain in post-closure care in accordance with the Final Permit (October 4, 2002). If Radford AAP chooses to demonstrate clean closure by removal at a future date, additional closure schedule information will be submitted.

## 11.0 CLOSURE PLAN AMENDMENT

Future amendments to the Closure Plan will be conducted in accordance with the requirements of the regulations under 40 CFR 264.112. These regulations specify the following requirements:

1. The written notification or request to the Director of the VDEQ must include a copy of the amended closure plan for review and approval.

2. The owner or operator must submit a written notification or a modification request to the Director of the VDEQ to authorize a change in the approved closure plan whenever the following occurs:

   i. Changes in operating plans or facility design affect the closure plan.

   ii. There is a change in the expected year of closure.

   iii. In conducting partial or final closure activities, unexpected events require a modification of the approved closure plan.

3. The owner or operator must submit a written request for a permit modification including a copy of the amended closure plan for approval at least 60 days prior to the proposed change in facility design or operation, or no later than 30 days after an unexpected event has occurred which has affected the closure plan.

   If an unexpected event occurs during the partial or final closure period, the owner or operator must request a modification no later than 30 days after the unexpected event.

   The Director will approve, disapprove, or modify the amended plan in accordance with the procedures in parts 124 and 270.

4. In accordance with the authority under 40 CFR 264.112(c)(4), the Director may request modifications to the closure plan under the conditions described in 40 CFR 264.112(c)(2).

## 12.0 CERTIFICATION OF CLOSURE

Radford AAP and an independent professional engineer, registered in the Commonwealth of Virginia, will both certify that HWMU-7 has been closed in accordance with the specifications in this Closure Plan. The certification statements will be in accordance with 40 CFR 270.11 – Signatories to Permit Applications and Reports. The certifications will be made by an authorized person described in 40 CFR 270.11(a), or by a duly authorized representative of that person as delineated in 40 CFR 270.11(b).

The certification of closure by the Radford AAP and the professional engineer will be in accordance with the requirements of 40 CFR 270.11(d), and will be signed, dated, include the title of the person certifying the closure, and include the certification text that is specified within the regulations as follows:

> *I certify under penalty of law that this document and all attachments were prepared under my direction or supervision in accordance with a system designed to assure that qualified personnel properly gather and evaluate the information submitted. Based on my inquiry of the person or persons who manage the system, or those persons directly responsible for gathering the information, the information submitted is, to the best of my knowledge and belief, true, accurate, and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment for knowing violations.*

The certification of closure will be submitted by registered mail to the VDEQ within 60 days of completion of closure within the Closure Report (within 240 days after initiation of closure).

Prior to signing the closure certification statement, the engineer will review all procedures, systems, analytical data, laboratory reports, QA/QC Plan, QA/QC procedures, QA/QC data, calculations, statistical analyses, and risk-based assessment evaluations, criteria, and conclusions. The engineer's review also will include a determination that appropriate closure plan procedures and systems, including QA/QC procedures, have been followed and observed in the closure activities at the site and by the contracted laboratory, and that the appropriate equations have been correctly applied and calculated as specified in the closure plan and appropriate guidance documents of the EPA and the VDEQ. In addition, prior to certification of closure, the engineer's review will verify demonstration that the data verifies that the decontamination standards of the Closure Plan have been achieved, and that the facility has been closed in accordance with the closure performance standards of the Closure Plan.

## 13.0 CLOSURE REPORT

In accordance with 40 CFR 264.115 – Certification of Closure, a Closure Report will be submitted to the Director of the VDEQ to provide documentation supporting the certification of closure and to demonstrate that HWMU-7 has been closed in accordance with the procedures, criteria, decontamination standards, and performance standards of the Closure Plan Amendment. The Closure Report will provide sufficiently detailed and summary information for the following items, as applicable, which demonstrate that the closure decontamination standards have been achieved, and that the facility has been closed in accordance with the closure performance standards of the Closure Plan: closure procedures, decontamination procedures, hazardous waste inventory disposal, closure generated waste disposal, manifests of all wastes, sampling procedures, sampling analytical test data, laboratory reports, the QA/QC plan and procedures, QA/QC data, calculations, statistical analyses of the data, risk-based assessment calculations, model evaluations, results, and conclusions. The Closure Report also will include the certification of closure statements of Radford AAP and the independent professional engineer registered in the Commonwealth of Virginia.

The Closure Report will be submitted within 90 days of approval of the August 2007 Class 3 permit modification for the Post-Closure Care Permit for HWMUs 5, 7, 10, and 16**.** Radford AAP will continue to monitor groundwater at HWMU-7 in accordance with the *Final Hazardous Waste Post-Closure Care Permit for Hazardous Waste Management Units 5, 7 10, and 16* until approvals for clean closure of soil and groundwater at HWMU-7 have been issued by the VDEQ **and contingent upon the condition that the permit language allows a cessation of groundwater monitoring upon approval of clean closure of soils and groundwater**. **A Class 3 modification of the Radford's post-closure care permit would be required to reduce the post-closure period in accordance with 40 CFR § 270.42, Appendix I - Section E.3. In accordance with 40 CFR § 264.120, Certification of post-closure completion statements by the Radford AAP (owner/operator) and the independent professional engineer registered in the Commonwealth of Virginia must be submitted to the DEQ for review and approval prior to approval of the closure of the groundwater and soils linked to HWMU #7.**

**The justifiable Class 3 modification is required to shorten the HWMU #7 post-closure period. The Class 3 modification could facilitate the end of the post closure period to coincide with the same date as the DEQ's approval of the soils and groundwater closure of the HWMU #7 portion of the post-closure permit. Alternately, and not requiring a permit modification, the HWMU #7 portion of the permit could be allowed to terminate upon permit expiration if clean closure is approved for soil and groundwater prior to permit expiration.**

In the event that HWMU-7 attains clean closure for soil, but does not attain clean closure for groundwater, Radford AAP will continue to monitor groundwater at HWMU-7 in accordance with the Final Permit (October 4, 2002). In this case, groundwater monitoring at HWMU-7 will cease (and the post-closure care period for the Unit will be reduced) in the event that the GPSs are not exceeded for a period of three (3) consecutive years following the attainment of clean closure for soil, in accordance with 40 CFR 264.100(f).

In the unlikely event that HWMU-7 is unable to attain clean closure for soil, the Unit will remain closed with the residual material in-place. If this occurs, the VDEQ-approved May 1988 Closure Plan included in the Final Permit (October 4, 2002) will serve as the Contingent Closure Plan for the Unit in accordance with 40 CFR 264.225(c)(1), and the Unit will remain in post-closure care in accordance with the Final Permit. Radford AAP will retain the option to demonstrate clean closure in the future by excavation and removal of the residual material.

| 4,4-DDE | 8081A/8082 | 0.002 | 0.0004 | mg/kg |
| Cyanide | 9012A | 0.5 | 0.5 | mg/kg |
| Toluene | 8260B | 0.006 | 0.001 | mg/kg |
| Aroclor-1254 | 8082 | 0.1 | 0.02 | mg/kg |

Notes:

Actual sample quantitation and detection limits will be adjusted based on dry weight.

Limits provided above may change based on dry weight, matrix variability, instrumentation, and method detection limit studies.

# Meeting Minutes

| | | | |
|---|---|---|---|
| **Project Name:** | Radford AAP HWMUs 5 and 7 Closure Plans | **Project Number:** | B03204-102 |
| | | **Date:** | January 18, 2007 |
| **Meeting Location:** | Radford AAP | **Time:** | 11:00 am |
| **Minutes by:** | L. Livingston | | |
| **In Attendance:** | VDEQ – Matt Stepien, Hassan Vakili, Erich Weissbart, Fuxing Zhou, Jim Cutler, Sonal Iyer<br>Army – Jim McKenna<br>ATK – Bill Glover, Jeremy Flint<br>DAA – Mike Lawless, Ross Miller, Lori Livingston | | |
| **cc:** | | | |

Alliant Techsystems Inc. (ATK) called a meeting with the Virginia Department of Environmental Quality (VDEQ) to discuss the Amended Closure Plans submitted for Hazardous Waste Management Units (HWMUs) 5 and 7 at the Radford Army Ammunition Plant (Radford AAP) in November 2006.

- Bill Glover of ATK explained that the amended plans were submitted to pick up where the project was left in 2004. Draft plans were sent to VDEQ to assist in review of the plans and to demonstrate how VDEQ's June 7, 2004 comments would be addressed.
- Matt Stepien has reviewed the plan for HWMU-5 based on Garwin Eng's comments dated June 2004 and ATK's response dated September 2004. Matt Stepien did not review the plan for HWMU-7 as he did not receive it. **Bill Glover forwarded a copy of the Amended Closure Plan for HWMU-7 to Matt Stepien in the afternoon of January 18, 2007.**
- Discussion regarding the HWMU-5 Amended Closure Plan was as follows. VDEQ comments and a summary of discussion are included. Radford AAP action items are included in bold.
  - Comment 2: Individual samples must meet clean closure performance standards. If clean closure performance standards are not met, a composite sample must be compared to Land Disposal Regulations (LDRs). Detailed discussion of LDRs as previously required by VDEQ confuses the process. **The closure plans will be revised to state that LDRs must be met only when clean closure performance standards cannot be achieved and removal is planned. Detailed discussion of LDRs will be removed.**
  - Comments 9 and 14: Additional discussion of decontamination standards for the HWMU-5 and for equipment used during removal should be incorporated to address potential excavation of the Unit. Standards are discussed in Section 3.13 of the VDEQ Closure Guidance. **Discussion of decontamination standards will be added.**
  - Comment 9: Sentence stating "Prior to excavation, soil samples will be collected to determine the volume of material to be excavated" should be removed. **This language will be removed.**
  - Comment 12: The Hazardous Constituents of Concern (HCOC) list should include all constituents that were handled in HWMU-5, that were detected in soil samples collected in 2002, that are included in the quarterly groundwater monitoring list, and that were listed in the 1988 Closure Plan. Constituents that are naturally occurring do not need to be included on the HCOC list. If a constituent is detected underneath the Unit and is not in the residual material, a

2206 South Main Street ◆ Blacksburg, VA ◆ 24060 ◆ (540) 552-0444 ◆ Fax: (540) 552-0291
Charlottesville ◆ Hampton Roads ◆ Richmond

demonstration can be prepared to indicate that its presence is due to an alternate source or laboratory contamination. Section 3.7.1 of the VDEQ Closure Guidance may be used as a reference. **The HCOC list will be reviewed, and language discussing the origin of the HCOC list will be included.**

- Comment 17: The report should include a provision to require decontamination of equipment if non-dedicated sampling equipment is used. **Language will be added to indicate that, if equipment is reused, the equipment will be decontaminated in accordance with the Closure Guidance.**
- Comment 26: Sentence stating "Should all soil samples be uncontaminated for inorganic constituents in this manner, the soil will have met the clean closure decontamination standard for inorganic constituents" should be removed. **This language will be removed.**
- Comments 29 and 30: The closure activity schedule needs to be more detailed. Section 3.20 of the VDEQ Closure Guidance can be used as a reference. **The schedule will be revised based on the guidance.** Also, there was discussion about which type of permit modification will be required for the Amended Closure Plans and closure. **VDEQ will review the permit modification requirements, and Matt Stepien will call or e-mail Bill Glover.**
- Groundwater Comments: VDEQ stated that all groundwater data collected from each Unit should be used to demonstrate clean closure rather than only the data from the quarter when soil samples were collected. If a groundwater constituent is detected at a concentration that is greater than the Groundwater Protection Standard (GPS), the concentration should be compared to background. The Units can receive clean closure for groundwater if all constituents are either below GPS or, if any constituents are above GPS, below background. **The groundwater sections will be revised to reflect these changes.** There have been no GPS exceedances at HWMU-7. **A revised Alternate Source Demonstration (ASD) will be prepared for trichloroethene (TCE) at HWMU-5.**

- Based on our discussion regarding comments at HWMU-5, VDEQ suggested that the Closure Plan for HWMU-7 be updated and revised in accordance with our discussion regarding comments for HWMU-5. **The plans will be revised accordingly. Bill Glover brought any significant differences in the plans for both units to Matt Stepien's attention when he forwarded the HWMU-7 plan to the VDEQ.**
- The meeting concluded at approximately noon.

**RESPONSE TO COMMENTS**
**CLOSURE PLAN AMENDMENTS**
**HAZARDOUS WASTE MANAGEMENT UNITS 5 AND 7**
**RADFORD ARMY AMMUNITION PLANT**
**PERMIT NO. VA1210020730**

This document has been prepared to serve as a guide for the response to the Virginia Department of Environmental Quality (VDEQ) letter to the Radford Army Ammunition Plant (Radford AAP) dated June 7, 2004, regarding the Closure Plan Amendments for Units 5 and 7 – Notice of Deficiencies. In that letter (signed by Mr. Garwin Eng), 39 individual comments were presented; these comments are addressed in this Response to Comments. The comments have been reproduced in full within this guide to provide a convenient context for the responses. The following presents Radford AAP's response to each comment.

## Hazardous Waste Management Unit 5 (HWMU-5)

1. *Although most of the comments below refer to a particular section, paragraph, or sentence, similar or related concepts are often repeated throughout the Closure Plan Amendment, HWMU 5 (Plan-HWMU 5). Therefore, when making revisions as a result of a particular comment, please ensure that corresponding revisions are made in all applicable sections of the Plan-HWMU 5.*

**Response to Comment 1**

When a revision is made as the result of a particular comment, corresponding revisions will be made in all applicable sections of the Amended Closure Plan.

2. *The Plan-HWMU 5 indicates that the RFAAP will attempt to achieve clean closure without removing any wastes or potentially contaminated equipment and subsoils. Several sections of the Plan-HWMU 5 state that in order to leave the residual material in-place (i.e., meet clean closure standards), the residual material will need to meet only the land disposal restrictions (LDRs) treatment standards specified in 40 CFR 268. Please be advised that this is incorrect, and the Department apologizes for any confusion that the wording in its June 25, 2003 letter may have caused.*

*In order to prevent any further confusion, the following clarification is provided. At closure, all contamination, i.e., wastes, equipment, structures, soils, and groundwater (for certain types of units), must be removed or decontaminated to clean closure standards (see Section 3.13 of the Department's Draft Guidance Manual for Closure Plans and Post-Closure Plans; September 28, 2001). In addition, all hazardous wastes must meet the 40 CFR 268 LDRs treatment standards prior to land disposal. Since the residual material is actually hazardous waste from the surface impoundment, it must meet both the clean closure standards as well as the LDRs treatment standards in order to remain in-place.*

**Response to Comment 2**

Based on the June 22, 2004 teleconference between Radford AAP and the VDEQ, it is Radford AAP's understanding that the residual material remaining in-place in HWMU-5 must meet the clean closure standards as well as the 40 CFR 268.48 land disposal restrictions (LDRs) universal treatment standards for the Hazardous Constituents of Concern (HCOCs) specified in the Amended Closure Plan. In order to comply with the clean closure standards, individual samples of the residual material will be analyzed for the HCOCs. In order to comply with the LDRs universal treatment standards, a composite sample of the residual material will be analyzed for the HCOCs (please note: the LDRs universal treatment standards for inorganic constituents are based on TCLP results; therefore the inorganic HCOC analyses for the residual material composite sample will be conducted using TCLP). Based on the June 22, 2004 teleconference, it is Radford AAP's understanding that analysis of a composite sample of the residual material for the LDRs universal treatment standards is sufficient, as the LDRs are based on waste disposal criteria, and composite samples are acceptable for waste characterization purposes. In effect, if Radford AAP were to have placed the residual waste material that is present in HWMU-5 into HWMU-5 as a disposal action, they would have demonstrated compliance with the LDRs by conducting a composite sample on the containerized waste. Therefore Radford AAP feels that the composite sample of in-place residual material to demonstrate compliance with the LDRs is more representative and appropriate than discreet samples.

3. *1.1, paragraph 3, 1st sentence - Pursuant to the March 12, 2004 telephone conference with Mr. J. J. Redder of your staff, no amendments to the Post-Closure Care Plan-HWMU 5 are being made at this time. Please delete all references to the Post-Closure Care Plan throughout this document.*

**Response to Comment 3**

All references to amendment of the Post-Closure Care Plan will be removed from the Amended Closure Plan.

4. *3.1, paragraph 4 - This paragraph should refer to HWMU-5.*

**Response to Comment 4**

The reference will be changed to HWMU-5.

5. *4.2.1, paragraph 1, 6th sentence - The previous use of and the process code currently listed in EPA's RCRAInfo database for HWMU-5 is Surface Impoundment Storage (S04). If RFAAP wishes to modify the process code for this unit, a revised Part A Permit Application may be submitted.*

**Response to Comment 5**

In order to maintain consistency with the RCRAInfo database, the process code for HWMU-5 specified in Section 4.2.1, paragraph 1, 6th sentence will be changed to "S04."

6. *4.2.1, paragraph 2, 2nd sentence - This sentence should be revised to read "...similar streams were tested..."*

**Response to Comment 6**

The referenced sentence will be revised accordingly.

7. *4.2.4, paragraph 2, 1st sentence - This sentence should refer to HWMU-5.*

**Response to Comment 7**

The reference will be changed to HWMU-5.

8. *4.2.4, paragraph 2, 6th sentence - This states that the residual material does not pose a threat to human health or the environment. Please remove this sentence as this conclusion has not been reviewed and approved by the Department.*

**Response to Comment 8**

The referenced sentence will be removed.

9. *5.0 - This section provides procedures for collecting samples and evaluating the results to confirm clean closure. However, no procedures are provided in the event that wastes or potentially contaminated equipment, structures, and soils must be removed in order to achieve clean closure. As such, this Plan-HWMU 5 appears to indicate that under no circumstances will any materials be removed. If this is the case, please clearly state this in the Plan-HWMU 5. If this is not the case, procedures for decontamination by removal should be provided.*

**Response to Comment 9**

The Amended Closure Plan will be revised to include the following options for closure:

Option 1: Clean closure with the residual material remaining in-place can be successfully demonstrated, in accordance with the clean closure standards and the LDRs universal treatment standards.

Option 2: Clean closure cannot be achieved with the residual material remaining in-place. The Unit will remain closed with the residual material in-place in accordance with the VDEQ-approved May 1988 Closure Plan, and the Unit will remain in post-closure care in accordance with the Final Permit (October 4, 2002). Radford AAP will retain the option to attempt to demonstrate clean closure in the future by excavation and removal of the residual material.

Option 3: Clean closure cannot be achieved with the residual material remaining in-place. The residual material will be excavated and transported off-site for disposal.

Prior to excavation, soil samples will be collected to determine the volume of material to be excavated. Composite sample(s) of the excavated material will be submitted for waste characterization analyses to determine the proper disposal method (hazardous vs. non-hazardous). Following excavation, confirmation samples will be collected to ensure removal of all contaminated materials. The procedures and criteria that will be used to document clean closure by removal will be fully defined in Section 5.0 of the Amended Closure Plan.

The Amended Closure Plan also will include the statement that the closure plan may be amended in the future at the request of Radford AAP in accordance with 40 CFR 264.112.

**10.** *5.3.1 - The residual material shall include everything above the bottom liner (including any sand and rip-rap) and below any clean material placed on top of the residual material. The bottom six (6) inches of clean material contacting the residual material shall be included with the residual material because of possible mixing with the residual material during its placement. Therefore, closure procedures addressing the residual material must include all materials above the bottom liner up to the first six inches of clean material placed above the residual material.*

**Response to Comment 10**

Radford AAP concurs with this definition of the residual material. This definition of the residual material will be included in Section 5.3.1 of the Amended Closure Plan.

**11.** *5.3.1 - This section indicates that the samples taken during the 2002 Field Investigation results will be used to demonstrate that clean closure can be achieved with the residual materials remaining in-place. As such, please note that the 2002 Field Investigation must meet all of the requirements (e.g., constituent list, number of samples, sample locations, field and laboratory methodologies, QA/QC, etc.) specified in the final approved closure plan amendment. Therefore, the Field Investigation Report and Risk Assessment for Units 5 and 7 submitted March 5, 2003 has not been reviewed as to its adequacy for the closure of HWMU-5.*

**Response to Comment 11**

The 2002 Field Investigation serves as a previous study for the purpose of providing generator knowledge regarding the residual material contained in the Unit. The results of the 2002 Field Investigation will be used to assist with the development of the HCOC list for the Unit. Additionally, the samples collected in the 2002 Field Investigation may be used to support the Clean Closure Demonstration to the extent possible.

**12.** *5.3.2, paragraph 1 - As stated in Section 3.7.1 of the Closure Guidance, the list of hazardous constituents of concern (HCOCs) is developed as part of the closure plan, that is, prior to beginning closure procedures. For the purposes of closure under RCRA, the HCOC list must include the following:*

*a. all hazardous waste constituents that were handled at the unit (this list may be found in approved closure plan);*

*b. all groundwater monitoring constituents that have been detected above background levels; and*

*c. any other hazardous constituents detected in the course of other investigations at the unit.*

*Please provide the HCOC list and an explanation as to why each constituent was included. Also, any other hazardous constituents (in addition to those constituents included above) detected during the course of closure activities shall be included in the list of HCOCs for the unit.*

**Response to Comment 12**

The HCOC list for HWMU-5 will be developed based on the following:

a. The results of the analysis of influent water in 1981 (previously presented in the VDEQ-approved May 1988 Closure Plan);

b. The quarterly groundwater monitoring constituents for the Unit listed in Appendix E of Permit Attachment 2 of the Final Permit (October 4, 2002), as revised by subsequent detections of additional 40 CFR Part 264 Appendix IX constituents; and

c. Any hazardous constituents detected in soil samples collected from within and around the Unit during the 2002 Field Investigation.

In 1981, an analysis of influent water collected during low flow conditions indicated the presence of inorganic constituents at concentrations below levels defined as hazardous by the EP Toxicity test. Specifically, cadmium, chromium, and mercury were detected in the influent water sample at concentrations of 0.029 mg/l, 0.20 mg/l, and 0.020 mg/l, respectively. In addition, the influent water sample was analyzed for arsenic, barium, lead, selenium, and silver; concentrations of these constituents were not detected.

The quarterly groundwater monitoring list for HWMU-5, as presented in Appendix E of Permit Attachment 2 of the Final Permit (October 4, 2002), was developed in accordance with procedures specified by the VDEQ. As directed by the VDEQ during development of the January 2002 Permit Modification for the Draft Final Permit, Radford AAP carefully reviewed the groundwater monitoring data for HWMU-5 from First Quarter 1996 through Fourth Quarter 2001 in order to determine whether any constituents in the Unit's then-current groundwater monitoring list (as presented in the August 1999 GWQAR) were consistently <u>not</u> detected. Any constituents that had never been detected within the groundwater at the Unit were not included in the proposed Compliance Monitoring Constituent List presented in the January 2002 Permit Modification document. The VDEQ directed Radford AAP to follow this procedure in order to avoid the need to remove non-detected constituents later during the duration of the active permit. (Please note: in accordance with the May 19, 1999 agreement between the VDEQ and Radford AAP, pre-1996 groundwater analytical data were not to be used for regulatory decisions. Prior to 1996, the analytical data were generated from several different laboratories. In many cases, the analytical reports did not include detection limits. In several instances, different analytical methods were used during different quarters, resulting in noticeable variations in the reported

detection limits and practical quantitation limits. The analytical data collected during 1996 and subsequent sampling events proved to be more reliable. As a result, and as agreed with the VDEQ, any regulatory decisions with respect to historical analytical data would not be made using any data prior to 1996.) Based on this review, and as presented in Appendix E of Permit Attachment 2 of the Final Permit, the quarterly groundwater monitoring list for HWMU-5 consists of the following constituents:

| | | |
|---|---|---|
| Antimony, total | Nickel, total | 1,2-Dichloroethane |
| Arsenic, total | Selenium, total | Methylene chloride |
| Barium, total | Silver, total | Toluene |
| Beryllium, total | Thallium, total | Trichloroethene |
| Cadmium, total | Vanadium, total | Xylenes, total |
| Cobalt, total | Zinc, total | Bis (2-ethylhexyl) phthalate |
| Copper, total | Acetone | Diethyl phthalate |
| Lead, total | 2-Butanone | 2,4-Dinitrotoluene |
| Mercury, total | Chloroform | 2,6-Dinitrotoluene |

In addition, the following additional constituents have been detected in the groundwater at HWMU-5 during annual monitoring for the constituents listed in 40 CFR Part 264 Appendix IX: chromium, 2-nitroaniline, 4-nitroaniline, and nitrobenzene. As a result, these constituents have been added to the quarterly groundwater monitoring list for HWMU-5.

During the 2002 Field Investigation at HWMU-5, samples of the residual material and surrounding soils were analyzed for the USEPA Target Analyte List (TAL) inorganic compounds, and for the USEPA Target Compound List (TCL) organic compounds. The following hazardous constituents (as listed in 40 CFR Part 261 Appendix VIII) were detected in the samples:

| | | | |
|---|---|---|---|
| Arsenic | Beryllium | Lead | Nickel |
| Barium | Chromium | Mercury | 4,4-DDD |

The hazardous constituents detected in the samples of the residual material and surrounding soil, as well as the inorganic constituents detected in the 1981 influent water sample, are included in the quarterly groundwater monitoring list for HWMU-5 (with the exception of 4,4-DDD). Therefore, the HCOC list for HWMU-5 will be the same as the current quarterly groundwater monitoring list for the Unit, plus 4,4-DDD.

Interpretation of the closure guidance indicates that Radford AAP need only analyze for the HCOC list. In an effort to remain consistent with the detection requirements of the facility-wide federal RCRA Corrective Action Permit, Radford AAP proposes to sample for a list of constituents (the TAL/TCL list) that includes the HCOCs for this Unit. In doing so, Radford AAP is demonstrating their pro-active and conservative approach to environmental compliance. Radford AAP realizes that if any constituents detected using this expanded list of constituents are not represented on the proposed HCOC list (which contains all previously detected compounds), Radford AAP will be required to add those detected constituents to the HCOC list for the Unit. This "belt and suspenders" approach provides a level of protection that far exceeds the minimum requirements of the closure process.

**13.** *8.2.3 - This section states that the levels of inorganics found during the development of the Radford Army Ammunition Plant Facility-Wide Background Report (December 2001) will be used as background. Section 3.11.3 of the Closure Guidance indicates that background soils and subsoil samples should be of the same geologic properties, type and texture and be from the same soil horizons, if possible, as the corresponding soil or subsoil samples from the unit. In addition, background samples must be collected in a manner identical to that of the closure samples and must comply with all Quality Assurance/Quality Control (QA/QC) procedures of the final approved closure plan. Not all of the Facility-Wide Background samples appear to meet these requirements. Please provide additional information concerning the Facility-Wide Background samples to determine which samples may meet the Closure Guidance requirements for background samples. Please note that if a large enough (minimum of eight) subset of the Facility-Wide Background samples does not meet the Closure Guidance requirements, additional background samples will need to be collected.*

**Response to Comment 13**

Radford AAP has established the validity of the December 2001 Facility-Wide Background Report with the VDEQ and USEPA Region III, and has substantial documentation regarding VDEQ and USEPA Region III approval of the study and its use as a screening tool for soils at the facility. Specifically, Radford AAP has utilized the data from the Facility-Wide Background Report to the satisfaction of the VDEQ and USEPA Region III in the Site Screening Document for SWMU-6, in the Soil Screening Reports for SWMUs 8 and 36, and in the draft RCRA Facility Investigation Report for SWMU-58 (copies of the VDEQ and USEPA Region III approval letters for the above-referenced documents are included in Appendix A of this Response to Comments).

With respect to Section 3.11.3 of the Closure Guidance, which indicates that background soils and subsoil samples should be of the same geologic properties, type and texture and be from the same soil horizons, if possible, as the corresponding soil or subsoil samples from the unit, please note that the VDEQ provided the following comment regarding the background soil data presented in the draft Facility-Wide Background Report on September 10, 2001:

*"Given the conditions of mixed surface and subsurface soils at the potentially contaminated sites, it is recommended that the background data for both surface and subsurface soils be combined for each element to determine the 95% UTL to be used in conjunction with the USEPA Region III RBCs for human health risk screening, and with various ecological screening data for ecological screening purposes. This will not only simplify the screening process, but will add power to the statistical comparison and prevent the unnecessary, and costly, carrying forward of naturally occurring elements into the full-fledged risk assessment process."*

Therefore, it is Radford AAP's opinion that the soil samples analyzed in support of the Facility-Wide Background Study should be of sufficient quantity to meet the requirements of the Closure Guidance to provide background inorganic constituent concentrations for HWMU-5.

14. *6.1, paragraph 1 - Per Section 3.11.1 of the Closure Guidance, different sampling approaches are used to address differences in unit types, distributions or contamination, and assumptions concerning the unit. It appears that eight (8) samples locations shall be evenly spaced across the unit. Provide the rationale for this sampling approach. In addition, describe how decontamination by removal (if needed) will be conducted in light of this sampling approach (see Comment 8 above).*

**Response to Comment 14**

A stratified grid-based sampling approach is proposed to accurately characterize the horizontal and vertical extent of the residual material. Eight sample locations shall be evenly spaced across the Unit to provide a representative evaluation of the entire Unit.

15. *6.1, paragraph 2 - Because the sample collection device will pass through the residual material then the bottom liner and subsoils, there is a potential for cross-contamination from the residual material to the subsoils. Therefore, the Department recommends collecting subsoil samples from the undisturbed center of the cores to minimize possible cross-contamination.*

**Response to Comment 15**

This procedure will be specified in Section 6.1, paragraph 2.

16. *6.1, paragraph 2, 2nd sentence - Section 4.2.1 states that the unit is lined with a 60-mil Hypalon liner. This liner must meet clean closure standards if RFAAP is to achieve clean closure without removal of wastes and potentially contaminated equipment, structures, and soils. However, the proposed sample collection method may not collect a sufficient amount of the liner material for analyses (i.e., at most, a 1.5 inch diameter circle if the sample is able to collect any at all). Please describe how sufficient samples of the liner will be collected.*

**Response to Comment 16**

Recent investigations indicate that the 60-mil liner is not present beneath HWMU-5.

17. *6.4 - Section 3.11.5 of the Closure Guidance recommends additional rinses after sampling for metals and organic constituents. Please revise this section accordingly.*

**Response to Comment 17**

The Geoprobe sample collection system uses dedicated, disposable acetate liners for each sample collected. Therefore, decontamination using additional rinses between sample collection will not be required.

18. *6.7 - This section states that samples will be analyzed for Target Analyte List (TAL) and Target Compound List (TCL) constituents. However, the list of constituents provided in Table 2 does not include all TCL constituents. Please explain why certain TCL constituents were excluded.*

**Response to Comment 18**

The laboratory selected for the analyses (Lancaster Laboratories) uses statement of work OLM03.2 for the analysis of TCL organic constituents. This is the list that was presented in the Amended Closure Plan.

***19.*** *6.7, paragraph 2, last sentence - Specify what criteria against which the data will be validated (e.g., CLP Functional Guidelines, SW-846 QA-QC criteria, etc.).*

**Response to Comment 19**

Section 6.7, paragraph 2 will be revised to specify the following: "Data validation will be conducted using summary tables and raw data provided by the analyzing laboratory. Data validation will be conducted in general accordance with SW-846 Method requirements (Test Methods for Evaluating Solid Wastes - Physical and Chemical Methods, USEPA SW-846, 3rd edition - Final Update I, II/IIA and III) and CLP data validation guidelines (USEPA Contract Laboratory Program National Functional Guidelines for Organic Data Review, October 1999 and USEPA Contract Laboratory Program National Functional Guidelines for Inorganic Data Review, July 2002)."

***20.*** *6.8.1 - In addition to indicating the total expected quantity of each type of QA/QC sample that will be collected, state the minimum collection frequency of each type of QA/QC sample (e.g., one trip blank/cooler/day of sampling).*

**Response to Comment 20**

The following minimum collection frequency of each type of QA/QC sample will be specified in Section 6.8.1:

"A minimum of one trip blank per cooler per day of sampling will accompany the samples collected for TCL organic compounds analyses."

"A minimum of one equipment blank per day of sampling will be collected in the event that non-dedicated equipment is used during the sampling process."

"A minimum of one field duplicate sample per day of sampling will be collected at the Unit."

***21.*** *6.8.1, paragraph 3, 3rd and 5th sentences - Both of these appear to refer to constituents for which the equipment blank(s) will be analyzed. Please clarify these confusing sentences.*

**Response to Comment 21**

The 5th sentence of Section 6.8.1, paragraph 3 will be removed. The 3rd sentence of Section 6.8.1, paragraph 3 will be revised to read: "Any equipment blank(s) will be analyzed for the same constituents for which the soil samples and residual material samples are being analyzed."

22. *6.8.1, paragraph 5, 1st sentence - Data shall be qualified appropriately if contamination is found in QA/QC blanks, however, such blank contamination may not be used to "invalidate" data.*

**Response to Comment 22**

Section 6.8.1, paragraph 5 will be revised to read: "The occurrence of constituents in blank samples may serve to qualify the results presented by the laboratory. Additional blanks or duplicate samples may be prepared and analyzed to address specific, unanticipated conditions. Re-sampling and re-analysis may be required in certain cases depending on project objectives.

23. *6.8.2, paragraph 4 - Matrix spike/matrix spike duplicates (MS/MSD) shall be prepared and analyzed at a frequency of one MS/MSD per sampling batch or 20 samples (whichever is more frequent) per matrix type.*

**Response to Comment 23**

This statement will be added to the referenced section.

24. *8.1, paragraph 4, 2nd sentence - Per Section 3.11.1 of the Closure Guidance, composite samples are not acceptable for demonstrating achievement of clean closure standards.*

**Response to Comment 24**

Radford AAP concurs with this statement. Based on the June 22, 2004 teleconference between Radford AAP and the VDEQ, it is Radford AAP's understanding that in order to comply with the clean closure standards, individual samples of the residual material must be analyzed for the HCOCs. However, it is also Radford AAP's understanding that a composite sample is sufficient for demonstrating compliance with the LDRs universal treatment standards.

25. *8.2.1, last sentence - This appears to refer to HWMU 7 by mistake. Please clarify or correct.*

**Response to Comment 25**

The referenced sentence will be clarified.

26. *8.2.3.2 - This section states that if all inorganic results do not exceed the background concentrations, then "that sampling location will be deemed uncontaminated." It further states that if all sampling locations are uncontaminated then "the soil will have met the clean closure decontamination standard." Please be advised that these statements are not correct. In order to meet the background clean closure standard, sampling results of **all** HCOCs (not just inorganics) must not exceed detection limits or background. Please revise accordingly.*

**Response to Comment 26**

The referenced section will be revised to read as follows: "If the concentration of every inorganic HCOC in a soil sample is below the appropriate UTL, that sampling location will be deemed to be uncontaminated for inorganic constituents. Should all soil samples be uncontaminated for inorganic constituents in this manner, the soil will have met the clean closure decontamination standard for inorganic constituents."

27. *8.2.4 - Only those constituents that did not pass the non-detection and background clean closure standards (i.e., detects above background levels) need to be included in the risk-based evaluation.*

**Response to Comment 27**

Radford AAP concurs with this statement. This statement will be included in Section 8.2.4 of the Amended Closure Plan.

28. *10.0, 2nd sentence - This states that the residual material left in-place is not a hazardous waste. Please remove this sentence as this conclusion has not been reviewed and approved by the Department.*

**Response to Comment 28**

The referenced sentence will be revised to read as follows: "Based on generator knowledge and previous studies, Radford AAP has determined that the residual material contained in HWMU-5 is not a hazardous waste as defined in 40 CFR Part 261."

29. *10.0 - Please revise the schedule pursuant to Comment 3 above.*

**Response to Comment 29**

The schedule will be revised by removing references to the Post-Closure Care Plan.

It is Radford AAP's understanding that the VDEQ wants Radford AAP to submit a Closure Report and a Class II Permit Modification at the same time, and that the VDEQ will review both documents together. Assuming that approval for clean closure is obtained, Radford AAP will then submit a request to shorten the Post-Closure Care Period. If the request to shorten the Post-Closure Care Period is approved, the Final Permit will be modified accordingly.

30. *10.0 - Please provide additional details concerning closure activities. Enough detail should be provided to allow tracking of the progress of closure. In addition, contingent closure activities (such as those described in paragraph 4 of Section 13.0) must be included in the closure schedule.*

**Response to Comment 30**

The following closure schedule will be included in Section 10.0:

| CLOSURE ACTIVITY | TIMEFRAME FOR COMPLETION |
|---|---|
| Radford AAP:<br>Submittal of Amended Closure Plan | 30 days from VDEQ approval of Response to Comments |
| VDEQ:<br>Review and Approval of Amended Closure Plan | 90 days from submittal |
| Radford AAP:<br>Soil and Groundwater Sampling;<br>Submittal of Closure Report (with Class II Permit Modification if clean closure is demonstrated) | 90 days from VDEQ approval of Amended Closure Plan |
| VDEQ:<br>Review and Approval of Closure Report;<br>Review and Approval of Class II Permit Modification (if clean closure is certified) | 120 days from submittal |

In the event that clean closure is not achieved, the Unit will remain in post-closure care in accordance with the Final Permit (October 4, 2002). If Radford AAP chooses to demonstrate clean closure by removal, additional closure schedule information will be submitted.

31. *13.0, paragraph 3, 2nd and 3rd sentences - These are not correct. Please remove these sentences.*

**Response to Comment 31**

The referenced sentences will be removed.

32. *13.0, paragraph 4 - Pursuant to 40 CFR 264.225(c)(1), a Contingent Closure Plan for closure with wastes/waste constituents in-place must be provided in the event that clean closure cannot be achieved.*

**Response to Comment 32**

Section 13.0, paragraph 4 will be revised to read as follows: "In the unlikely event that HWMU-5 is unable to attain clean closure for soil, the Unit will remain closed with the residual material in-place. If this occurs, the VDEQ-approved May 1988 Closure Plan included in the Final Permit (October 4, 2002) will serve as the Contingent Closure Plan for the Unit in accordance with 40 CFR 264.225(c)(1), and the Unit will remain in post-closure care in accordance with the Final Permit."

33. *Table 2 - This list does not contain a complete list of HCOCs (see Comment 12 above) for HWMU 5.*

**Response to Comment 33**

In accordance with **Response to Comment 12**, Table 2 will be revised as follows:

**TABLE 2**

| HAZARDOUS WASTE MANAGEMENT UNIT 5<br>HAZARDOUS CONSTITUENTS OF CONCERN<br>RADFORD ARMY AMMUNITION PLANT, RADFORD, VIRGINIA | | | | |
|---|---|---|---|---|
| Analyte | SW-846 Method | Limit of Quantitation | Limit of Detection | Units |
| Antimony | 6010B | 6 | 0.2 | mg/kg |
| Arsenic | 6010B | 1 | 0.11 | mg/kg |
| Barium | 6010B | 20 | 0.073 | mg/kg |
| Beryllium | 6010B | 0.5 | 0.019 | mg/kg |
| Cadmium | 6010B | 0.5 | 0.022 | mg/kg |
| Chromium | 6010B | 1 | 0.13 | mg/kg |
| Cobalt | 6010B | 5 | 0.077 | mg/kg |
| Copper | 6010B | 2.5 | 0.38 | mg/kg |
| Lead | 6010B | 0.3 | 0.14 | mg/kg |
| Mercury | 7471A | 0.1 | 0.018 | mg/kg |
| Nickel | 6010B | 4 | 0.25 | mg/kg |
| Selenium | 6010B | 0.5 | 0.43 | mg/kg |
| Silver | 6010B | 1 | 0.077 | mg/kg |
| Thallium | 6010B | 1 | 0.42 | mg/kg |
| Vanadium | 6010B | 5 | 0.066 | mg/kg |
| Zinc | 6010B | 2 | 1.3 | mg/kg |
| Acetone | 8260B | 0.02 | 0.007 | mg/kg |
| 2-Butanone | 8260B | 0.01 | 0.004 | mg/kg |
| Chloroform | 8260B | 0.005 | 0.001 | mg/kg |
| 1,2-Dichloroethane | 8260B | 0.005 | 0.001 | mg/kg |
| Methylene chloride | 8260B | 0.005 | 0.002 | mg/kg |
| Toluene | 8260B | 0.005 | 0.001 | mg/kg |
| Trichloroethene | 8260B | 0.005 | 0.001 | mg/kg |
| Xylenes, total | 8260B | 0.005 | 0.001 | mg/kg |
| Bis (2-ethylhexyl) phthalate | 8270C | 0.4 | 0.08 | mg/kg |
| Diethyl phthalate | 8270C | 0.4 | 0.08 | mg/kg |
| 2,4-Dinitrotoluene | 8270C | 0.4 | 0.08 | mg/kg |
| 2,6-Dinitrotoluene | 8270C | 0.4 | 0.04 | mg/kg |
| 2-Nitroaniline | 8270C | 0.4 | 0.04 | mg/kg |
| 4-Nitroaniline | 8270C | 0.4 | 0.08 | mg/kg |
| Nitrobenzene | 8270C | 0.4 | 0.04 | mg/kg |
| 4,4-DDD | 8081A/8082 | 0.002 | 0.0004 | mg/kg |

Notes:
Actual sample quantitation and detection limits will be adjusted based on dry weight.
Limits provided above may change based on dry weight, matrix variability, instrumentation, and method detection limit studies.

**34.** *Table 2 - Section 8.2.2 of the Plan-HWMU 5 states that, initially, RFAAP will attempt to demonstrate clean closure by analytical non-detection and comparison to background (for detected HCOCs). Section 3.9 of Closure Guidance recommends using the analytical methods with the lowest quantitation limits for each HCOC when demonstrating clean closure at these standards. Specifically:*

- *SW-846 Methods 7000 Series typically achieve lower detection and quantitation limits than Method 6010 for inorganics;*
- *SW-846 Method 8021B typically achieves lower detection and quantitation limits that Method 8260 for many chlorinated and aromatic volatiles; and*
- *SW-846 Method 8330 typically achieves lower detection and quantitation limits than Method 8270 for 2,4- and 2,6-dinitrotoluene.*

*Please review the achievable detection and quantitation limits with your laboratory and revise table 2 accordingly.*

**Response to Comment 34**

Radford AAP realizes that the closure guidance document recommends the use of methods that achieve the lowest possible detection limits for clean closure documentation. While in theory the use of those methods may provide marginally lower detections than methods used in standard professional practice of analysis, they are inherently not definitive, by definition, and have significant limitations with respect to reliability, validity and reproducibility. Appendix III to 40 CFR Part 261 – *Chemical Analysis Test Methods* references the use of SW-846 in the selection of test methods. Chapter 2 of SW-846, Section 2.2.5 – *Detection and Monitoring* recommends the use of the *most practical* methods approved for detection. All of the analytical methods proposed by Radford AAP are considered the most practical and robust methods and are specifically approved for detection monitoring.

Additionally, many nationally accredited commercial laboratories do not routinely provide these methods for entire standard parameter lists. For example, Lancaster Laboratories only offers method 8021B for the suite of compounds that includes Benzene, Ethylbenzene, Toluene, and Xylenes (BTEX). Analysis of a full Volatile Organic Compound list for soil using method 8021B would constitute a research level effort, thereby more than tripling the cost. Additionally, many units at Radford AAP have been closed under the federal RCRA Corrective Action Permit for the entire facility using the methods proposed here. Using similar methods provides a consistent approach with respect to decision making at the facility and interpretation of the intent of RCRA. Accordingly, Radford AAP proposes to use the following methods:

- Analysis by SW-846 Method 6010B (ICP-trace) generally provides detection and quantitation limits comparable to SW-846 7000 series methods. In general, ICP-trace analysis is preferred since the method is subject to less interferences and potential false positives. Radford AAP requests the use of Method 6010B.

- Analysis by SW-846 Method 8021B typically achieves lower detection and quantitation limits for select chlorinated and aromatic volatiles. However, use of SW-846 Method 8260B is preferred due to the reliability associated with target analyte identification (less potential for false positives). In many cases, laboratory specific detection limits for

Method 8260B analytes may be comparable to Method 8021B. Radford AAP requests the use of Method 8260B.

- Analysis by SW-846 Method 8330 is subject to interferences and potential false positives. For this project, use of SW-846 Method 8270C is preferred due to the reliability associated with target analyte identification (less potential for false positives). As well, Lancaster Laboratories' specific detection and quantitation limits for Method 8270C analytes 2,4- and 2,6-dinitrotoluene are lower than Method 8330. Radford AAP requests the use of Method 8270C.

The above noted methods are reliable, cost-effective and can generate data to support clean closure demonstration at this facility. Therefore, RFAAP respectfully requests the use of SW-846 Methods 6010B, 8260B and 8270C for this project.

## Hazardous Waste Management Unit 7 (HWMU-7)

1. *Although most of the comments below refer to a particular section, paragraph, or sentence, similar or related concepts are often repeated throughout the Amended Closure Plan (Plan). Therefore, when making revisions as a result of a particular comment, please ensure that corresponding revisions are made in all applicable sections of the Plan.*

**Response to Comment 1**

When a revision is made as the result of a particular comment, corresponding revisions will be made in all applicable sections of the Amended Closure Plan.

2. *Because of the similarity between the Closure Plan Amendments for HWMUs 5 and 7, the comments provided for the Plan-HWMU 5 also apply to the Plan-HWMU 7 with the exception of comments 4, 6, 7, 10, 16, 25, 32, and 33. Although some of the paragraph and sentence numbers referenced for Plan-HWMU 5 do not exactly match those for Plan-HWMU7, the working is close enough such that referring back to the text of Plan-HWMU 5 should resolve any discrepancies.*

**Response to Comment 2**

The sections in the Amended Closure Plan for HWMU-7 that are similar to those in the Amended Closure Plan for HWMU-5 that require revision will be addressed accordingly.

3. *5.3.1 - Section 6.0 indicates that the unit is underlain by a clay liner and native soils. Because of possible mixing, the top six inches of clay or native soils directly beneath the residual material shall be included with the residual material. Similarly, the bottom six inches of clean material placed above the residual material shall be included with the residual material. Therefore, closure procedures addressing the residual material must include all materials from six inches beneath to six inches above the residual material.*

**Response to Comment 3**

Radford AAP concurs with this definition of the residual material. This definition of the residual material will be included in Section 5.3.1 of the Amended Closure Plan.

4. *13.0, paragraph 4 - Since this unit does not meet the 40 CFR 264.221(a) liner requirements, a Contingent Closure Plan for closure with wastes/waste constituents in-place must be provided.*

**Response to Comment 4**

Section 13.0, paragraph 4 will be revised to read as follows: "In the unlikely event that HWMU-5 is unable to attain clean closure for soil, the Unit will remain closed with the residual material in-place. If this occurs, the VDEQ-approved May 1988 Closure Plan included in the Final Permit (October 4, 2002) will serve as the Contingent Closure Plan for the Unit in accordance with 40 CFR 264.225(c)(1), and the Unit will remain in post-closure care in accordance with the Final Permit."

5. *Table 2 - Please verify that all applicable HCOCs for HWMU 7 (see Comment 12 for the Plan-HWMU 5, above) are included in this list.*

**Response to Comment 5**

The HCOC list for HWMU-7 will be developed based on the following:

a. The results of analyses of lagoon water and sediment in 1981 (previously presented in the VDEQ-approved May 1988 Closure Plan);

b. The quarterly groundwater monitoring constituents for the Unit listed in Appendix E of Permit Attachment 3 of the Final Permit (October 4, 2002), as revised by subsequent detections of additional 40 CFR Part 264 Appendix IX constituents; and

c. Any hazardous constituents detected in soil samples collected from within and around the Unit during the 2002 Field Investigation.

In 1981, analyses of lagoon water and sediment collected from HWMU-7 indicated the presence of inorganic constituents at concentrations below levels defined as hazardous by the EP Toxicity test. Specifically, cadmium was detected in the lagoon water sample at a concentration of 0.016 mg/l; no other inorganic constituents were detected in the lagoon water sample. Barium, cadmium, chromium, lead, and silver were detected in the sediment sample at concentrations of 0.33 mg/l, 0.027 mg/l, 0.73 mg/l, 0.58 mg/l, and 0.027 mg/l, respectively. In addition, the sediment sample was analyzed for arsenic, mercury, and selenium; concentrations of these constituents were not detected in the sediment sample.

The quarterly groundwater monitoring list for HWMU-7, as presented in Appendix E of Permit Attachment 3 of the Final Permit (October 4, 2002), was developed in accordance with procedures specified by the VDEQ. As directed by the VDEQ during development of

the January 2002 Permit Modification for the Draft Final Permit, Radford AAP carefully reviewed the groundwater monitoring data for HWMU-7 from First Quarter 1996 through Fourth Quarter 2001 in order to determine whether any constituents in the Unit's then-current groundwater monitoring list (as presented in the September 1999 Post-Closure Care Permit for HWMU-7) were consistently not detected. Any constituents that had never been detected within the groundwater at the Unit were not included in the proposed Compliance Monitoring Constituent List presented in the January 2002 Permit Modification document. The VDEQ directed Radford AAP to follow this procedure in order to avoid the need to remove non-detected constituents later during the duration of the active permit. (Please note: in accordance with the May 19, 1999 agreement between the VDEQ and Radford AAP, pre-1996 groundwater analytical data were not to be used for regulatory decisions. Prior to 1996, the analytical data were generated from several different laboratories. In many cases, the analytical reports did not include detection limits. In several instances, different analytical methods were used during different quarters, resulting in noticeable variations in the reported detection limits and practical quantitation limits. The analytical data collected during 1996 and subsequent sampling events proved to be more reliable. As a result (and as agreed with the VDEQ), any regulatory decisions with respect to historical analytical data would not be made using any data prior to 1996.) Based on this review, and as presented in Appendix E of Permit Attachment 3 of the Final Permit, the quarterly groundwater monitoring list for HWMU-7 consists of the following constituents:

| | | |
|---|---|---|
| Antimony, total | Mercury, total | 2,4-Dinitrophenol |
| Arsenic, total | Nickel, total | 2,4-Dinitrotoluene |
| Barium, total | Selenium, total | 2,6-Dinitrotoluene |
| Cadmium, total | Silver, total | 4-Nitrophenol |
| Chromium, total | Thallium, total | Cyanide, total |
| Cobalt, total | Bis (2-ethylhexyl) phthalate | |
| Lead, total | Butyl benzyl phthalate | |

In addition, copper has been detected in the groundwater at HWMU-7 during annual monitoring for the constituents listed in 40 CFR Part 264 Appendix IX. As a result, copper has been added to the quarterly groundwater monitoring list for HWMU-7.

During the 2002 Field Investigation at HWMU-7, samples of the residual material and surrounding soils were analyzed for the USEPA Target Analyte List (TAL) inorganic compounds, and for the USEPA Target Compound List (TCL) organic compounds. The following hazardous constituents (as listed in 40 CFR Part 261 Appendix VIII) were detected in the samples:

| | | | |
|---|---|---|---|
| Arsenic | Chromium | Cyanide | N-Nitrosodiphenylamine |
| Barium | Lead | 4,4-DDD | |
| Beryllium | Nickel | 4,4-DDE | |

As a result, Table 2 will be revised as follows:

## TABLE 2

| HAZARDOUS WASTE MANAGEMENT UNIT 7<br>HAZARDOUS CONSTITUENTS OF CONCERN<br>RADFORD ARMY AMMUNITION PLANT, RADFORD, VIRGINIA | | | | |
|---|---|---|---|---|
| Analyte | SW-846 Method | Limit of Quantitation | Limit of Detection | Units |
| Antimony | 6010B | 6 | 0.2 | mg/kg |
| Arsenic | 6010B | 1 | 0.11 | mg/kg |
| Barium | 6010B | 20 | 0.073 | mg/kg |
| Beryllium | 6010B | 0.5 | 0.019 | mg/kg |
| Cadmium | 6010B | 0.5 | 0.022 | mg/kg |
| Chromium | 6010B | 1 | 0.13 | mg/kg |
| Cobalt | 6010B | 5 | 0.077 | mg/kg |
| Copper | 6010B | 2.5 | 0.38 | mg/kg |
| Lead | 6010B | 0.3 | 0.14 | mg/kg |
| Mercury | 7471A | 0.1 | 0.018 | mg/kg |
| Nickel | 6010B | 4 | 0.25 | mg/kg |
| Selenium | 6010B | 0.5 | 0.43 | mg/kg |
| Silver | 6010B | 1 | 0.077 | mg/kg |
| Thallium | 6010B | 1 | 0.42 | mg/kg |
| Bis (2-ethylhexyl) phthalate | 8270C | 0.4 | 0.08 | mg/kg |
| Butyl benzyl phthalate | 8270C | 0.4 | 0.08 | mg/kg |
| 2,4-Dinitrophenol | 8270C | 2.4 | 0.8 | mg/kg |
| 2,4-Dinitrotoluene | 8270C | 0.4 | 0.08 | mg/kg |
| 2,6-Dinitrotoluene | 8270C | 0.4 | 0.04 | mg/kg |
| 4 Nitrophenol | 8270C | 1 | 0.2 | mg/kg |
| N-Nitrosodiphenylamine | 8270C | 0.4 | 0.04 | mg/kg |
| 4,4-DDD | 8081A/8082 | 0.002 | 0.0004 | mg/kg |
| 4,4-DDE | 8081A/8082 | 0.002 | 0.0004 | mg/kg |
| Cyanide | 9012A | 0.5 | 0.5 | mg/kg |

Notes:

Actual sample quantitation and detection limits will be adjusted based on dry weight.

Limits provided above may change based on dry weight, matrix variability, instrumentation, and method detection limit studies.

RE: SWMU 6 Sampling Results Report
Radford Army Ammunition Plant
Radford, Virginia, January 2001

Dear Mr. McKenna:

Thank you for the opportunity to review the above referenced document. There is only one minor comment at this time.

- Page ii, first full paragraph, second sentence – I believe that there is a typographical error and that the intent was to state that aluminum detections were above residential RBCs and below industrial RBCs.

As an additional note, I have forwarded the soil background study to our staff statistician for additional review. Please contact me at 804-698-4143 if you have any questions.

Very truly,

Sharon Wilcox

Re: Radford Army Ammunition Plant
SWMU 6
Draft *Site Screening Document* submittal and review

Dear Mr. McKenna and Ms. Jake:

The U.S. Environmental Protection Agency (EPA) has reviewed the Army's revised draft Site Screening *Sampling Results Report* for soil sampling at SWMU 6, located at the Radford Army Ammunition Plant (RFAAP). Based upon our review, the revised draft *Sampling Results Report* is approved. In accordance with Part II.(G)(2) of RFAAP's Corrective Action Permit, the schedule contained within Section 7, Figure 11 of the *Sampling Results Report* is now considered final and is henceforth incorporated into the Permit, via the Installation Action Plan.

RE: Work Plan Addendum No. 18, SWMU 41
Soil Screening Report SWMU 8
Soil Screening Report SWMU 36

Dear Mr. McKenna:

Thank you for providing the staff the opportunity to review and comment on the referenced documents. The staff has the following comments:

Work Plan Addendum No. 18, SWMU 41

Figure 1-16. The symbol for soil boring in the legend (closed black circle) does not correspond to the symbol used in the figure (open circle). Also, Table 1-9 indicates that soil samples SB 6, 7 and 8 will be taken outside Area B, while the figure clearly shows the samples to be within the inferred boundary line.

Figure 1-15. Table 1-9 indicates that soil samples SB 3, 4 and 5 will be taken outside Area A, while Figure 1-15 shows the samples within the inferred boundary line. Please explain.

Soil Screening Reports SWMUs 8 and 36

There are no additional comments on the Soil Screening Reports for SWMUs 8 and 36.

Please do not hesitate to contact Jennifer Jones, 804-698-4328, or myself if you have questions concerning these comments.

Sincerely,

Durwood Willis

Re: Radford Army Ammunition Plant
SWMUs 8 and 36
Draft *Soil Screening Report*
Review of the Army's 2/6/04 response to EPA's 12/11/03 comment letter

Dear Mr. McKenna and Ms. Jake:

The U.S. Environmental Protection Agency (EPA) has reviewed the Army's February 6, 2004 response to EPA's December 11, 2003 letter concerning the review of the Army's draft *Soil Screening Report* for SWMUs 8 and 36, located at the Radford Army Ammunition Plant (RFAAP). Outlined below, please find EPA's comments based upon that review:

***EPA General Comment 2***

2. As concluded in Section 5.0 of the Report, the soil screening at Solid Waste Management Units (SWMUs) 8 and 36 indicated the presence of "selected targeted constituents." However, it is concluded in this section that "point comparisons of the discrete data to Residential RBCs [risk-based concentrations], Industrial RBCs, and

RFAAP background did not indicate a potential to human health." There are potential flaws in this conclusion, among them:

- The screening process was not completed in accordance with the RFAAP *Site Screening Process* (SSP [October 26, 2001]). At this stage, the chemicals of potential concern (COPCs) should have been identified (COPC identification step in Section 6.1.1.1 of the SSP). Based on the data presented in the report, it appears manganese, lead, mercury, zinc, and antimony are the COPCs.

***RFAAP Response***

In order to achieve the project objectives of assessing for the presence or absence of hazardous constituents in soil and characterizing site materials for RCRA characteristics, particular elements enumerated in the RFAAP SSP were used to perform qualitative risk screening for the SWMUs 8 and 36 Soil Screening. There was no intent within the Report to identify COPCs for purposes of conducting an RFI risk assessment, thus the screening process for SWMUs 8 and 36 did not follow every element within the SSP developed at RFAAP for Site Screening Areas.

**EPA review**

Please note that the SSP, as envisioned, is not conducive towards the elimination of process steps within the SSP. It is not a "pick and choose" methodology. Either the SSP process is followed or it isn't. In the future, please follow the SSP process. The central questions that need to be answered BY THIS REPORT are: (a) which soil constituents failed the residential soil screening criteria and are above background values; (b) which soil constituents failed the industrial soil screening criteria and are above background values; (c) which soil constituents failed the BTAG soil screening criteria and are above background values; and (d) what soil constituents failed the SSL soil screening criteria and are above background values. The Report generally answers these questions, but not in a direct approach. Additionally, in the future, please differentiate between those soil constituents which exceed the residential RBC and background and those soil constituents which exceed the industrial RBC and background values. This is important in determining whether or not the site will need long-term monitoring, i.e. whether waste is left in-place. The conclusions section of the report should address this in future SSP documents.

***EPA General Comment 2 continued***

- No cumulative risk screening was conducted in accordance with the SSP. This evaluation includes uncertainty analysis of the cumulative risk screening. As the vertical and horizontal extent of contamination of all the chemicals detected in soil is not fully characterized, whether the data generated from this soil screening is sufficient to conduct a cumulative risk assessment will also need to be demonstrated.

***RFAAP Response***

The objectives of the Soil Screening did not include full characterization of the site for completion of a cumulative risk assessment. Characterization of the site, if necessary, will take place at some time after treatment activities cease at these locations.

**EPA review**

It is important to note that defining the full nature and extent of contamination is NOT part of the SSP, but is the function of the RFI. The uncertainty section of the SSP basically acknowledges this. The function of the SSP is to determine whether or not there has been a release at the site. To accomplish this, a proposed number of samples contained in an approved Work Plan is sufficient. Thus, the central questions that need to be answered revolve around (a) which soil constituents failed the residential soil screening criteria and are above background values; (b) which soil constituents failed the industrial soil screening criteria and are above background values; (c) which soil constituents failed the BTAG soil screening criteria and are above background values; and (d) what soil constituents failed the SSL soil screening criteria and are above background values. Defining nature and extent is left to the RFI phase, if needed.

***EPA General Comment 2 continued***

• Some potential exposure pathways were not evaluated. According to the conceptual site models (CSMs) presented in Figures 2-4 and 2-5, the potential impact from soil to groundwater and eventually surface water exists. However, the Report does not evaluate chemical migration of contaminants from soil to groundwater as required by the SSP. The SSP requires use of USEPA's *Soil Screening Guidance* (USEPA, 1996) as a source of information when conducting comparison to soil screening levels (SSLs). The Report did not compare soil concentrations to the USEPA Region 3 SSLs listed on the RBC Table. Based on the data provided in the Report, several metals (e.g., arsenic, chromium, manganese, vanadium, etc.) exceed their respective SSLs at dilution attenuation factor (DAF) 20.

***RFAAP Response***

The report will be revised to include a comparison of soil concentrations to the USEPA Region 3 soil to groundwater SSLs at DAF 20 listed on the most recent RBC Table.

**EPA review**

The Army's response is acceptable. However, in the future, please include the SSL screening in the text of the screening section of the report. Please note that the SSL screening was not discussed in Section 4 of the report.

***EPA comment 2 continued***

• In the Summary (Section 4.4) of the Report, only those metals with concentrations exceeding both the RBCs and the background concentrations are noted. Other metals that exceeded one or more screening criteria are dismissed

because their concentrations did not exceed the site background values. The risk conclusions, thus, consider only those metals noted in Section 4.4. At this stage, it appears inappropriate to eliminate metals from the risk assessment based solely on a comparison to background or ambient levels. In order to provide a more complete characterization of potential risks associated with exposures at the site, metals that exceed risk-based screening concentrations should not be excluded from quantitative consideration in the risk assessment. The contribution to the overall risk due to metals with high background concentrations should be presented in a risk characterization (EPA. 2002. *Role of Background in the CERCLA Cleanup Process.* Office of Solid Waste and Emergency Response. OSWER 9285.6-0P. April 26).

***RFAAP Response***

Per previous agreement with USEPA, investigations performed prior to WPA 016 would be allowed to screen out COPCs based on background comparison. Work at SWMUs 8 and 36 was performed under WPA 015. Also, please refer to the response to specific USEPA comment 18 below regarding the presentation of data for constituents exceeding relevant screening criteria but not their inorganic constituent background point estimates.

**EPA review**

The Army's response is acceptable.

This concludes EPA's review of the Army's February 6, 2004 response to EPA's December 11, 2003 letter concerning the review of the Army's draft *Soil Screening Report* for SWMUs 8 and 36, located at the RFAAP. All Army responses to EPA's December 11, 2003 letter were determined to be acceptable. The above comments reflect a need for refinement in the submittal of SSP documents in the future.

Based upon our review, the January, 2004 *Soil Screening Report* for SWMUs 8 and 36 is approved. In accordance with Part II.(G)(2) of RFAAP's Corrective Action Permit, the January, 2004 *Soil Screening Report* for SWMUs 8 and 36 is now considered final.

Based upon the above, please submit a draft *SWMU Decision Document* for SWMU 8 and 36, separately, to EPA for review. Please bear in mind the comments outlined above when preparing the text of the draft *SWMU Decision Documents.*

If you have any questions, please call me at 215-814-3357.

Re: Radford Army Ammunition Plant
SWMU 58
Rubble Pile
Document submittal and review

Dear Mr. McKenna and Ms. Jake:

The U.S. Environmental Protection Agency (EPA) has reviewed the U.S. Army's (Army's) March 2004 response to EPA's September 18, 2003 review comments pertaining to the draft *RCRA Facility Investigation Report* (RFI) for SWMU 58, located at the Radford Army Ammunition Plant (RFAAP). Based upon that review, EPA finds the Army's March 2004 response to be acceptable.

Given the above, the referenced draft *RCRA Facility Investigation Report* (RFI) is conditionally approved by EPA, provided that EPA's comments are satisfactorily addressed in the final RFI Report. Please forward two copies of the final SWMU 58 RFI Report to EPA for review and approval.

If you have any questions, please call me at 215-814-3357.

Sincerely,

Robert Thomson, PE
Federal Facilities Branch

Bill,

3-hard copies would work and 1-electronic.

I was reviewing the comments and I saw one that I overlooked that should not be a problem to address, I hope!

Comment #34, Table 2
The Detection Limit of the SW-846 method that RFAAP chooses to use should be below the Risk and/or Background #. If both methods provide a Detection Limit that is below the risk and/or background # than either one can be used. Example:
Background for constituent x: 5 ug/mg
Detection Limit using 8260B: 3 ug/mg
Detection Limit using 8021B: 1 ug/mg

In this case you can use either one 8260 or 8021.

I will have a definite answer for you early next week on the Class Determination. I am off tomorrow but will be in the office all of next week. Thanks for the conference call and information and let me know if you have any other questions.

Thanks,

Matthew M. Stepien

**Subject:** HWMU-7 Review

Good Afternoon Bill,

I completed my review of HWMU-7. All of the comments made on HWMU-5 during our 1-18-07 conference shall be addressed in HWMU-7 as well. In particular:

- References made to the LDRs throughout Closure Plan
- Section 5.0, option 3
- Section 5.3.2, HCOC list, also where did the interpretation of the closure guidance "belt and suspenders" approach disappear too? This paragraph was in the HWMU-5 report but not HWMU-7? That said lets just be sure to have a comprehensive HCOC list in both plans.
- Section 6.7, see my Jan. 18, 2007 email comment

These were the main areas of discussion but as stated above all comments made on HWMU-5 that apply to HWMU-7 shall be addressed.

Please submit the comments discussed during our 1-18-07 conference call and 1-18-07 email, with RFAAP's responses in letter format similar to the ***September 17, 2004 Response to Comments HWMUs 5 and 7 letter*** from RFFAP to the Department.

Any questions feel free to call or email me. Also, when you get a chance please call Erich Weissbart (804-698-4393) to discuss the HWMU-5 ASD for TCE.

Thanks and have a good day,

**Closure Plan Amendments for Units 5 and 7 – Notice of Deficiencies**[1]
(Unit 5/S04; Unit 7/S04)

Dear Ms. Jake:

The Department of Environmental Quality, Office of Waste Permitting (the Department) has reviewed your February 20, 2004 request to amend the closure plan for Units 5 and 7. The Groundwater Monitoring portions of the proposed amendments is being reviewed by the Department's hydrogeology staff, and comments will be provided under separate cover.

Please provide responses to the enclosed comments within ninety (90) days of receipt of this letter. If you have questions, please contact me at (804) 698-4131 or by e-mail at gweng@deq.virginia.gov.

Sincerely,

Garwin W. Eng
Environmental Engineer Senior
Office of Waste Permitting

Notice of Deficiency – Closure Plan/CL320

# NOTICE OF DEFICIENCIES
## Closure Plan Amendment, Hazardous Waste Management Unit 5
## Radford Army Ammunition Plant (RFAAP)

Comments are referenced by section, paragraph (counting from the beginning of the section), and sentence (counting from the beginning of the paragraph).

1. Although most of the comments below refer to a particular section, paragraph, or sentence, similar or related concepts are often repeated throughout the *Closure Plan Amendment, HWMU 5* (*Plan-HWMU 5*). Therefore, when making revisions as a result of a particular comment, please ensure that corresponding revisions are made in all applicable sections of the *Plan-HWMU 5*.

2. The *Plan-HWMU 5* indicates that RFAAP will attempt to achieve clean closure without removing any wastes or potentially contaminated equipment and subsoils. Several sections of the *Plan-HWMU 5* state that in order to leave the residual material in-place (i.e., meet clean closure standards), the residual material will need to meet only the land disposal restrictions (LDRs) treatment standards specified in 40 CFR 268. Please be advised that this is incorrect, and the Department apologizes for any confusion that the wording in its June 25, 2003 letter may have caused.

   In order to prevent any further confusion, the following clarification is provided. At closure, all contamination, i.e., wastes, equipment, structures, soils, and groundwater (for certain types of units), must be removed or decontaminated to clean closure standards (see Section 3.13 of the Department's *Draft Guidance Manual for Closure Plans and Post-Closure Plans*; September 28, 2001). In addition, all hazardous wastes must meet the 40 CFR 268 LDRs treatment standards prior to land disposal. Since the residual material is actually the hazardous waste from the surface impoundment, it must meet both the clean closure standards as well as the LDRs treatment standards in order to remain in-place.

3. 1.1, paragraph 3, 1st sentence – Pursuant to the March 12, 2004 telephone conference with Mr. J. J. Redder of your staff, no amendments to the Post-closure Care *Plan-HWMU 5* are being made at this time. Please delete all references to the Post-closure Care Plan throughout this document.

4. 3.1, paragraph 4 – This paragraph should refer to HWMU-5.

5. 4.2.1, paragraph 1, 6th sentence – The previous use of and the process code currently listed in EPA's RCRAInfo database for HWMU-5 is Surface Impoundment Storage (S04). If RFAAP wishes to modify the process code for this unit, a revised Part A Permit Application may be submitted.

6. 4.2.1, paragraph 2, 2nd sentence – This sentence should be revised to read "... similar waste streams were tested..."

7. 4.2.4, paragraph 2, 1st sentence – This sentence should refer to HWMU-5.

8. 4.2.4, paragraph 2, 6th sentence – This states that the residual material does not pose a threat to human health or the environment. Please remove this sentence as this conclusion has not been reviewed and approved by the Department.

9. 5.0 – This section provides procedures for collecting samples and evaluating the results to confirm clean closure. However, no procedures are provided in the event that wastes or potentially contaminated equipment, structures, and soils must be removed in order to achieve clean closure. As such, this *Plan-HWMU 5* appears to indicate that under no circumstances will any materials be removed. If this is the case, please clearly state this in the *Plan-HWMU 5*. If this is not the case, procedures for decontamination by removal should be provided.

10. 5.3.1 – The residual material shall include everything above the bottom liner (including any sand and rip-rap) and below any clean material placed on top of the residual material. The bottom six (6) inches of the clean material contacting the residual material shall be included with the residual material because of possible mixing with the residual material during its placement. Therefore, closure procedures addressing the residual material must include all materials above the bottom liner up to the first six inches of clean material placed above the residual material.

11. 5.3.1 – This section indicates that the samples taken during the 2002 Field Investigation results will be used to demonstrate that clean closure can be achieved with the residual materials remaining in-place. As such, please note that the 2002 Field Investigation must meet all of the requirements (e.g., constituent list, number of samples, sample locations, field and laboratory methodologies, QA/QC, etc.) specified in the final approved closure plan amendment. Therefore, the *Field Investigation Report and Risk Assessment for Units 5 and 7* submitted March 5, 2003 has not been reviewed as to its adequacy for the closure of HWMU-5.

12. 5.3.2, paragraph 1 – As stated Section 3.7.1 of the *Closure Guidance*, the list of hazardous constituents of concern (HCOCs) is developed as part of the closure plan, that is, prior to beginning closure procedures. For the purposes of closure under RCRA, the HCOC list must include the following:
    a. all hazardous waste constituents that were handled at the unit (this list may be found in the approved closure plan);
    b. all groundwater monitoring constituents that have been detected above background levels; and
    c. any other hazardous constituents detected in the course of other investigations at the unit.

    Please provide the HCOC list and an explanation as to why each constituent was included. Also, any other hazardous constituents (in addition to those constituents included above) detected during the course of closure activities shall be included in the list of HCOCs for the unit.

13. 8.2.3 – This section states that the levels of inorganics found during the development of the *Radford Army Ammunition Plant Facility-Wide Background Report* (December 2001) will be used as background. Section 3.11.3 of the *Closure Guidance* indicates that background soil and subsoil samples should be of the same geologic properties, type and texture and be from the same soil horizons, if possible, as the corresponding soil or subsoil samples from the unit. In addition, background samples must be collected in a manner identical to that of the closure samples and must comply with all Quality Assurance/Quality Control (QA/QC) procedures of the final approved closure plan. Not all of the *Facility-Wide Background* samples appear to meet these requirements. Please provide additional information concerning the *Facility-Wide Background* samples to determine which samples may meet the *Closure Guidance* requirements for background samples. Please note that if a large enough (minimum of eight) subset of the *Facility-Wide Background* samples does not meet the *Closure Guidance* requirements, additional background samples will need to be collected.

14. 6.1, paragraph 1 – Per Section 3.11.1 of the *Closure Guidance*, different sampling approaches are used to address differences in unit types, distributions of contamination, and assumptions concerning the unit. It appears that eight (8) sample locations shall be evenly spaced across the unit. Provide the rationale for this sampling approach. In addition, describe how decontamination by removal (if needed) will be conducted in light of this sampling approach (see Comment 9 above).

15. 6.1, paragraph 2 – Because the sample collection device will pass through the residual material then the bottom liner and subsoils, there is a potential for cross-contamination from the residual material to the subsoils. Therefore, the Department recommends collecting subsoil samples from the undisturbed center of the cores to minimize possible cross-contamination.

16. 6.1, paragraph 2, 2nd sentence – Section 4.2.1 states that the unit is lined with a 60-mil Hypalon liner. This liner must meets clean closure standards if RFAAP is to achieve clean closure without removal of wastes and potentially contaminated equipment, structures, and soils. However, the proposed sample collection method may not collect a sufficient amount of the liner material for analyses (i.e., at most, a 1.5 inch diameter circle if the sampler is able to collect any at all). Please describe how sufficient samples of the liner will be collected.

17. 6.4 – Section 3.11.5 of the *Closure Guidance* recommends additional rinses after sampling for metals and organic constituents. Please revise this section accordingly.

18. 6.7 – This section states that samples will be analyzed for Target Analyte List (TAL) and Target Compound List (TCL) constituents. However, the list of constituents provided in Table 2 does not include all TCL constituents. Please explain why certain TCL constituents were excluded.

19. 6.7, paragraph 2, last sentence – Specify what criteria against which the data will be validated (e.g., CLP Functional Guidelines, SW-846 QA/QC criteria, etc.).

20. 6.8.1 – In addition to indicating the total expected quantity of each type of QA/QC sample that will be collected, state the minimum collection frequency of each type of QA/QC sample (e.g., one trip blank/cooler/day of sampling).

21. 6.8.1, paragraph 3, 3rd and 5th sentences – Both of these appear to refer to constituents for which the equipment blank(s) will be analyzed. Please clarify these confusing sentences.

22. 6.8.1, paragraph 5, 1st sentence – Data shall be qualified appropriately if contamination is found in QA/QC blanks, however, such blank contamination may not be used to "invalidate" data.

23. 6.8.2, paragraph 4 – Matrix spike/matrix spike duplicates (MS/MSD) shall be prepared and analyzed at a frequency of one MS/MSD per sampling batch or 20 samples (whichever is more frequent) per matrix type.

24. 8.1, paragraph 4, 2nd sentence – Per Section 3.11.1 of the *Closure Guidance*, composite samples are not acceptable for demonstrating achievement of clean closure standards.

25. 8.2.1, last sentence – This appears to refer to HWMU 7 by mistake. Please clarify or correct.

26. 8.2.3.2 – This section states that if all inorganic results do not exceed the background concentrations, then "that sampling location will be deemed to be uncontaminated." It further states that if all sampling locations are uncontaminated, then "the soil will have met the clean closure decontamination standard." Please be advised that these statements are not correct. In order to meet the background clean closure standard, sampling results for **all** HCOCs (not just inorganics) must not exceed detection limits or background. Please revise accordingly.

27. 8.2.4 – Only those constituents that did not pass the non-detection and background clean closure standards (i.e., detects above background levels) need to be included in the risk-based evaluation.

28. 10.0, 2nd sentence – This states that the residual material left in-place is not a hazardous waste. Please remove this sentence as this conclusion has not been reviewed and approved by the Department.

29. 10.0 – Please revise the schedule pursuant to Comment 3 above.

30. 10.0 – Please provide additional details concerning closure activities. Enough detail should be provided to allow tracking of the progress of closure. In addition, contingent closure activities (such as those described in paragraph 4 of Section 13.0) must be included in the closure schedule.

31. 13.0, paragraph 3, 2nd and 3rd sentences – These are not correct. Please remove these sentences.

32. 13.0, paragraph 4 – Pursuant to 40 CFR 264.228(c)(1), a Contingent Closure Plan for closure with wastes/waste constituents in-place must be provided in the event that clean closure cannot be achieved.

33. Table 2 – This list does not contain a complete list of HCOCs (see Comment 12 above) for HWMU 5.

34. Table 2 – Section 8.2.2 of the *Plan-HWMU 5* states that, initially, RFAAP will attempt to demonstrate clean closure by analytical non-detection and comparison to background (for detected HCOCs). Section 3.9 of *Closure Guidance* recommends using the analytical methods with the lowest quantitation limits for each HCOC when demonstrating clean closure to these standards. Specifically:
    - SW-846 Methods 7000 Series typically achieve lower detection and quantitation limits than Method 6010 for inorganics;
    - SW-846 Method 8021B typically achieves lower detection and quantitation limits than Method 8260 for many chlorinated and aromatic volatiles; and
    - SW-846 Method 8330 typically achieves lower detection and quantitation limits than Method 8270 for 2,4- and 2,6-dinitrotoluene.

    Please review achievable detection and quantitation limits with your laboratory and revise Table 2 accordingly.

**NOTICE OF DEFICIENCIES**
**Closure Plan Amendment, Hazardous Waste Management Unit 7**
**Radford Army Ammunition Plant (RFAAP)**

Comments are referenced by section, paragraph (counting from the beginning of the section), and sentence (counting from the beginning of the paragraph).

1. Although most of the comments below refer to a particular section, paragraph, or sentence, similar or related concepts are often repeated throughout the Amended Closure Plan (Plan). Therefore, when making revisions as a result of a particular comment, please ensure that corresponding revisions are made in all applicable sections of the Plan.

2. Because of the similarity between the *Closure Plan Amendments* for HWMUs 5 and 7, the comments provided for the *Plan-HWMU 5* also apply to the *Plan-HWMU 7* with the exception of Comments 4, 6, 7, 10, 16, 25, 32, and 33. Although some of the paragraph and sentence numbers referenced for *Plan-HWMU 5* do not exactly match those for *Plan-HWMU 7*, the wording is close enough such that referring back to the text of *Plan-HWMU 5* should resolve any discrepancies. Additional comments specific to the *Plan-HWMU 7* are provided below.

3. 5.3.1 – Section 6.0 indicates that the unit is underlain by a clay liner and native soils. Because of possible mixing, the top six inches of clay or native soils directly beneath the residual material shall be included with the residual material. Similarly, the bottom six inches of clean material placed above the residual material shall be included with the residual material. Therefore, closure procedures addressing the residual material must include all materials from six inches beneath to six inches above the residual material.

4. 13.0, paragraph 4 – Since this unit does not meet the 40 CFR 264.221(a) liner requirements, a Contingent Closure Plan for closure with wastes/waste constituents in-place must be provided.

5. Table 2 – Please verify that all applicable HCOCs for HWMU 7 (see Comment 12 for the *Plan-HWMU 5*, above) are included in this list.

**Re: Radford Army Ammunition Plant (RFAAP), Radford, VA**
**EPA ID No. VA1210020730**
**Field Investigation Report and Risk Assessment for Units 5 and 7[1]**
(Unit 5/S04; Unit 7/S04)

Dear Ms. Jake:

The Department of Environmental Quality, Office of Waste Permitting (the Department) has reviewed the *Field Investigation Report and Risk Assessment for Units 5 and 7* (*Report*) submitted with your correspondence of March 5, 2003. According to previous discussions and correspondence, RFAAP will attempt to remove the sources of contamination by achieving clean closure at the units. RFAAP had originally planned to revise the closure plans for HWMUs 5 and 7 based upon the results of the initial investigative sampling. Since, RFAAP believes the sampling results may already show that concentrations of contaminants are not a risk to human health or the environment, the *Report* provides a risk assessment instead of revised closure plans.

The May 27, 1988 approved closure plans for HWMUs 5 and 7 provided for closure only by landfilling (i.e., wastes in-place and capping). Therefore, if RFAAP wishes to continue pursuing clean closure of the capped units, revised closure plans that include procedures and standards for clean closure must be submitted. To assist with the revising the closure plans, an electronic copy of

[1] PCCP
Permit Event Code/NA

the Department's *Draft Guidance Manual for Closure Plans and Post-Closure Plans* (*Draft Guidance*), September 28, 2001 has been provided to Mr. J. Redder of your staff.

Concerning the *Field Investigation Report and Risk Assessment for Units 5 and 7*, the Department is providing the following comments:

1) The closure requirements for hazardous waste surface impoundments of 40 CFR 264.228(a)(1) requires the removal or decontamination of "contaminated containment system components (liners, etc.), contaminated subsoils, and structures and equipment contaminated with waste and leachate." Therefore, in order to demonstrate clean closure of these units, the soil and liner material immediately beneath the wastes must be sampled as well to determine if they meet clean closure standards.
2) EPA Region III Risk-Based Concentration (RBC) and Soil Screening Levels (SSLs) are not appropriate clean closure standards. Refer to Section 3.13 of the *Draft Guidance* for the requirements of all acceptable clean closure standards (i.e., analytical non-detection, background, and risk-based).
3) If RFAAP intends to demonstrate that clean closure may be achieved with wastes in-place, every sample of waste must not exceed the land disposal restrictions (LDRs) treatment standards specified in 40 CFR 286, Subpart D.

In addition to the above comments, the Department recommends that the revised closure plans include more than one option for meeting clean closure standards (e.g., no removal of wastes or soils, excavation and removal of contaminated materials, etc.) in order to minimize the need for future revisions. Please submit the revised closure plans within ninety (90) calendar days calendar of receipt of this letter.

The Department has also received the Professional Geologist's certification submitted with your correspondence of April 30, 2003. However, as indicated in comment 5 of the Department's October 18, 2002 letter, 40 CFR 264.115 requires that the certification be signed by an independent Professional Engineer registered in the Commonwealth of Virginia. Please provide the P.E. certification within thirty (30) calendar days of receipt of this letter.

If you have questions, please contact me at (804) 698-4131 or by e-mail at gweng@deq.state.va.us.

Sincerely,

Garwin W. Eng

VIRGINIA DEPARTMENT OF ENVIRONMENTAL QUALITY
WASTE DIVISION
OFFICE OF HAZARDOUS WASTE

Memorandum

**TO:** Matthew Stepien
Environmental Engineer Sr.

**THROUGH:** Jutta Schneider
Hazardous Waste/Groundwater Manager

**FROM:** Fuxing Zhou
Environmental Specialist II

**DATE:** September 14, 2007

**SUBJ:** Closure Plan Amendment for HWMU 7
Radford Army Ammunition Plant, Radford; EPA ID# VA1210020730

---

I have completed the review of the groundwater portions of the "Closure Plan Amendment for HWMU 7", dated June 2007.

The "Closure Plan Amendment" presents closure plans for both soil and groundwater, including general background, closure procedures and standards, sampling and analysis plan, and closure report requirements. The groundwater portions of the plan, including the references to the ASD for chloroform approved by the Department on June 14, 2007, are appropriate and should be approved.

As Radford AAP indicates in the cover letter of the August 9, 2007, Class 3 Permit Modification, the Department never forwarded any comments regarding the groundwater monitoring portions of the Amended Closure Plans to Radford AAP, even though the Department had indicated that the groundwater comments would be sent to Radford AAP under separate cover. There are a few issues pertaining to groundwater that Radford AAP should address in the closure report. These are outlined below.

**REPORTING REQUIREMENTS -- UPDATING GPSs and BACKGROUND VALUES** (Section 5.4.3)

A summary table for the groundwater monitoring data (concentrations) to date should be included in the closure report. Using the groundwater monitoring data collected to date, the Permittee should statistically recalculate the **background concentration values** and,

where applicable, update their **GPSs** for the constituents in the Compliance Monitoring List (Appendices E, F and G in Permit Attachment 3). An updated background concentration table should be submitted to replace Appendix E in Permit Attachment 3 with the closure report. In its review of the closure report, the Department will apply the GPSs for constituents monitored based on current MCLs, ACLs (if no MCL promulgated), and background concentrations pursuant to Permit Condition V.F.2.a ("Groundwater Protection Standard" for Unit 7).

**Copper** was added to the constituent list following Third Quarter 2003 and **zinc** was added to the constituent list following Second Quarter 2004. These two metals have no current background values. Using the groundwater monitoring data collected to date, the Permittee should statistically establish the background concentration values for copper and zinc. These values will be added to the background concentrations and GPS table (Appendices F and G in Permit Attachment 3). The Department will apply the GPSs for constituents monitored based on current MCLs, ACLs (if no MCL promulgated), and background concentrations pursuant to Permit Condition V.F.2.a ("Groundwater Protection Standard" for Unit 7).

To facilitate this process, an updated GPS table is attached. Please note that MCLs and ACLs have been updated since the Permit issuance: the current MCL for Arsenic is 10 µg/l and Cobalt and 4-Nitrophenol currently have no ACLs, resulting in the GPSs for Cobalt and 4-Nitrophenol based on background and PQL concentration, respectively. The Department will apply the GPSs for constituents monitored based on current MCLs, ACLs (if no MCL promulgated), and background concentrations pursuant to Permit Condition V.F.2.a ("Groundwater Protection Standard" for Unit 7).

Clean closure for groundwater at HWMU-7 will be demonstrated by comparing the groundwater sample analytical results collected to date to the updated Groundwater Protection Standards (GPSs) for the unit. HWMU-7 can receive clean closure for groundwater if all constituents are below their corresponding GPSs and clean closure for soils has been approved.

**PERMIT DATE** (Sections 2.2; 7.0 and 8.3)

The closure report should reflect the following: the original permit for unit 7 was issued on October 30, 1999,with an effective date of November 30, 1999. One consolidated Permit for HWMUs 5, 7, 10 and 16 was issued on October 4, 2002, and modified on June 14, 2007 (Class 1 modification to change monitoring frequency). The compliance period begins when the owner initiates a compliance monitoring program, which is the effective date of the original Permit. The current compliance period, therefore, continues until November 30, 2017, not October 30, 2017, if Radford AAP is not engaged in a corrective action program.

**CONTINUING GW MONITORING** (Sections 2.2, 5.3, 8.3 and 10.0)

The closure report should reflect the following: currently the groundwater at HWMU-7 is sampled and analyzed semiannually, not quarterly, in accordance with the requirements of the consolidated Final Hazardous Waste Post-Closure Care Permit for Hazardous Waste Management Units 5, 7, 10, and 16 modified June 14, 2007.

## APPENDIX G

## GROUNDWATER PROTECTION STANDARDS: UNIT 7

Unit: µg/l Unless Otherwise Noted

| Constituents | SW-846 Method | PQL (µg/l) | Back-ground (µg/l) | EPA MCL (µg/l) | VDEQ ACL (µg/l) | GPS (µg/l) |
|---|---|---|---|---|---|---|
| Antimony, total | 6010B, 6020 | 3 | 30 | 6 | | 30 |
| Arsenic, total | 6010B, 6020 | 10 | 2 | 10/~~50~~ | | 10/~~50~~ |
| Barium, total | 6010B, 6020 | 10 | 28.92 | 2,000 | | 2,000 |
| Cadmium, total | 6010B, 6020 | 1 | 0.4 | 5 | | 5 |
| Chromium, total | 6010B, 6020 | 5 | 34 | 100 | | 100 |
| Cobalt, total | 6010B, 6020 | 7 | 17 | | ~~313~~ | 17/~~313~~ |
| Copper, total | 6010 | 80 | ?? | 1300 | | ?? |
| Lead, total | 6010B, 6020 | 1 | 12.13 | 15* | | 15* |
| Mercury, total | 7470A, 7471A | 1 | 0.4 | 2 | | 2 |
| Nickel, total | 6010B, 6020 | 10 | 63 | | 313 | 313 |
| Selenium, total | 7740 | 10 | 58 | 50 | | 50 |
| Silver, total | 6010B, 6020 | 2 | 3.1 | | 78.25 | 78.25 |
| Thallium, total | 6010B, 6020 | 1 | 8 | 2 | | 2 |
| Zinc, total | 6010 | 20 | ?? | | 4695 | ?? |
| Bis (2-ethylhexyl) phthalate | 8270C | 10 | 9 | 6 | | 6 |
| Butyl benzyl phthalate | 8270C | 10 | 5 | | 3,130 | 3,130 |
| 2,4-Dinitrophenol | 8270C | 50 | 11 | | 31.3 | 31.3 |
| 2,4-Dinitrotoluene | 8270C | 10 | 0.2 | | 31.3 | 31.3 |
| 2,6-Dinitrotoluene | 8270C | 10 | 0.1 | | 15.65 | 15.65 |
| 4-Nitrophenol | 8270C | 50 | 9 | | ~~125.2~~ | 50/~~125.2~~ |
| Cyanide | 9010B, 9012A | 40 | 5 | 200 | | 200 |

Notes:

**EPA MCL:** Maximum Contaminant Level of USEPA National Primary Drinking Water Regulations (September 10th, 2007). Current MCL for Arsenic is 10 µg/l.

**Background:** Calculated using analytical data for upgradient well 7W12B (GWQAR, December 1998), except copper and zinc. Please calculate the background values for copper and zinc using analytical data for upgradient well 7W12B to-date.

**DEQ ACL:** VA DEQ Alternate Concentration Limit, April 2007. Cobalt and 4-Nitrophenol currently have no ACLs.

**GPS:** Pursuant to Permit Condition V.F.2.a ("Groundwater Protection Standard" for Unit 7) the GPSs for constituents monitored for HWMU-7 is based on background concentration from the upgradient well 7W12B and USEPA Maximum Contaminant Level (MCL) for drinking water or VDEQ-derived Alternate Concentration Level (ACL), if no MCL promulgated, whichever is higher.

Re: **Hazardous Waste Class 3 Permit Modification Request – Review Response**
**Post-Closure Care Permit – Hazardous Waste Management Units (HWMUs) 5, 7, 10, & 16; Open Burning Ground (OBG) Permit – HWMU 13**
**Radford Army Ammunition Plant, Radford, VA**
**EPA ID No. VA1210020730**

Dear Ms. Holt:

The Virginia Department of Environmental Quality, Office of Hazardous Waste (the Department) received the Class 3 permit modification request for the *Post-Closure Care Permit – Hazardous Waste Management Units (HWMUs) 5, 7, 10, & 16; and Open Burning Ground (OBG) Permit – HWMU 13,* associated with Radford Army Ammunition Plant (RFAAP) located in Radford, Virginia. RFAAP's Class 3 permit modification request was received by the Department on August 13, 2007. The Department has completed a review of the *Permit Modification Summary* and corresponding attachments included with the Class 3 permit modification request and has provided the following comments:

Item 1: The Department has reviewed the Closure Plan Amendment (CPA) for HWMU-7, revised June 2007, and concurs that the information presented in the CPA is technically adequate. Final approval of the CPA is contingent upon the Director's decision to grant or deny the Class 3 permit modification request after conclusion of the 45-day public comment period. Should the Director approve the Class 3 permit modification; at that time RFAAP will be advised to prepare and submit a Closure Report for HWMU-7. The Department's groundwater staff has provided comments included in Enclosure 1 to assist in the Closure Report preparation.

Item 2: The Department's groundwater staff has reviewed the Alternate Source Demonstration (ASD) for HWMU-5 and has provided a summary of that review in Enclosure 2. The Department has determined that the ASD does not provide sufficient information to demonstrate that the trichloroethene (TCE) present in the groundwater near HWMU-5 is from an alternate source. Therefore, upon receipt of this letter, RFAAP is advised to submit to the Director a permit modification to establish a corrective action program meeting **40 CFR Part 264.100** requirements within 180 days for HWMU-5.

Item 3: In the Permit Modification Summary, Item 3, RFAAP states, "RFAAP is requesting that DEQ review the data that RFAAP will submit to DEQ and incorporate the recommended reductions in monitoring constituents in the revised permit." RFAAP is advised to submit the referenced data to the Department for review.

Item 4: The Department's groundwater staff has reviewed the Constituent Background Values for the Compliance Groundwater Monitoring Program and Module V – Groundwater Compliance Monitoring Plan. Comments and revisions to Module V, Groundwater Compliance Monitoring, are provided in Enclosure 3.

Item 5: The Department's groundwater staff has reviewed the Source Area Evaluation Sampling and Analysis Plan (SAP) in support of the Open Burning Ground Corrective Action Plan and has provided a summary of that review in Enclosure 4. The Department has provided the following comments in addition to the summary in Enclosure 4.

Section 2.3, Soil Sample Selection Criteria, page 5: The following soil sample selection criteria should be utilized for both VOC and perchlorate analysis. At each boring location a 6" soil sample shall be collected at the interface of the fill material soils and underlying native soil (base of former burn pit), as well as a 6" sample of the native soil just above the water table. If there are no obvious differences between the burn pits fill material and the native soil, and the base of the former burn pit cannot be determined, then the first 6" soil sample will be collected at the first confining layer of soils or clay. If contamination is evident from a single boring, based on PID readings as well as visual and olfactory observations, then additional soil samples will be taken every 6' in the soil boring. If no obvious signs of contamination are observed in a boring, then only the two above-mentioned soil samples shall be taken.

Section 3.6, Disposition of Investigation Derived Waste, page 10: Disposition of Investigation Derived Waste should be in accordance with the Department's Guidance on the Handling of Investigation Derived Waste (IDW). Please include a reference to this guidance in Section 3.6. For your convenience the above-referenced guidance has been included in Enclosure 5.

Item 6: RFAAP has sufficiently established that no constituents were detected at concentrations above the Soil Monitoring Program (SMP) Action Limits (ALs). Based on this information, the Department concurs with RFAAP to decrease the soil sampling frequency from semiannually to annually.

The Department does not concur with RFAAP to cease random sampling at the northern and southern OBG boundaries (NB-1, NB-2, SB-1, and SB-2), at the berm located on the southeast side of the site (Berm-1), and in the center of the sediment pond (Pond-1). Although no ALs were exceeded, some constituents were detected well above their reporting limit (RL) at these locations. In particular, lead exhibited concentrations to warrant continual monitoring in these locations. RFAAP is advised to continue sampling these locations annually.

RFAAP requested eight Constituents of Potential Concern (COPC) to be removed from the monitoring events that were not detected above ALs in any of the 2005 through 2007 soil monitoring events. These eight constituents include antimony, benzoic acid, dibenzofuran, di-n-octyl phthalate, nickel, nitroglycerin, pyrene, and zinc. The Department concurs with removing seven of the eight constituents from the sampling events with the one exception being nitroglycerin. Although nitroglycerin did not exceed its AL, the concentrations exhibited warrant its inclusion on the COPC list.

Should the Director approve the Class 3 permit modification; at that time RFAAP will be advised to implement the above-mentioned changes and to submit a revised SMP to be incorporated into the Open Burning Grounds Permit.

Item 7: At their earliest convenience, the facility is advised to contact the Department in order to schedule a meeting between John Lowe of CH2MHill (representing RFAAP) and Sanjay Thirunagari, the Department's Office of Waste Technical Support Manager.

Please review and address each comment within forty-five (45) days of your receipt of this letter. If you have any questions regarding the information presented in this letter, please contact me at (804) 698-4026 or you may e-mail me at mmstepien@deq.virginia.gov.

Sincerely,

Matthew M. Stepien

## Comments on HWMU-7 Closure Report Preparation

VIRGINIA DEPARTMENT OF ENVIRONMENTAL QUALITY
WASTE DIVISION
OFFICE OF HAZARDOUS WASTE

Memorandum

**TO:** Matthew Stepien
Environmental Engineer Sr.

**THROUGH:** Jutta Schneider
Hazardous Waste/Groundwater Manager

**FROM:** Fuxing Zhou
Environmental Specialist II

**DATE:** September 14, 2007

**SUBJ:** Closure Plan Amendment for HWMU 7
Radford Army Ammunition Plant, Radford; EPA ID# VA1210020730

---

I have completed the review of the groundwater portions of the "Closure Plan Amendment for HWMU 7", dated June 2007.

The "Closure Plan Amendment" presents closure plans for both soil and groundwater, including general background, closure procedures and standards, sampling and analysis plan, and closure report requirements. The groundwater portions of the plan, including the references to the ASD for chloroform approved by the Department on June 14, 2007, are appropriate and should be approved.

As Radford AAP indicates in the cover letter of the August 9, 2007, Class 3 Permit Modification, the Department never forwarded any comments regarding the groundwater monitoring portions of the Amended Closure Plans to Radford AAP, even though the Department had indicated that the groundwater comments would be sent to Radford AAP under separate cover. There are a few issues pertaining to groundwater that Radford AAP should address in the closure report. These are outlined below.

**REPORTING REQUIREMENTS -- UPDATING GPSs and BACKGROUND VALUES** (Section 5.4.3)

A summary table for the groundwater monitoring data (concentrations) to date should be included in the closure report. Using the groundwater monitoring data collected to date, the Permittee should statistically recalculate the **background concentration values** and,

where applicable, update their **GPSs** for the constituents in the Compliance Monitoring List (Appendices E, F and G in Permit Attachment 3). An updated background concentration table should be submitted to replace Appendix E in Permit Attachment 3 with the closure report. In its review of the closure report, the Department will apply the GPSs for constituents monitored based on current MCLs, ACLs (if no MCL promulgated), and background concentrations pursuant to Permit Condition V.F.2.a ("Groundwater Protection Standard" for Unit 7).

**Copper** was added to the constituent list following Third Quarter 2003 and **zinc** was added to the constituent list following Second Quarter 2004. These two metals have no current background values. Using the groundwater monitoring data collected to date, the Permittee should statistically establish the background concentration values for copper and zinc. These values will be added to the background concentrations and GPS table (Appendices F and G in Permit Attachment 3). The Department will apply the GPSs for constituents monitored based on current MCLs, ACLs (if no MCL promulgated), and background concentrations pursuant to Permit Condition V.F.2.a ("Groundwater Protection Standard" for Unit 7).

To facilitate this process, an updated GPS table is attached. Please note that MCLs and ACLs have been updated since the Permit issuance: the current MCL for Arsenic is 10 µg/l and Cobalt and 4-Nitrophenol currently have no ACLs, resulting in the GPSs for Cobalt and 4-Nitrophenol based on background and PQL concentration, respectively. The Department will apply the GPSs for constituents monitored based on current MCLs, ACLs (if no MCL promulgated), and background concentrations pursuant to Permit Condition V.F.2.a ("Groundwater Protection Standard" for Unit 7).

Clean closure for groundwater at HWMU-7 will be demonstrated by comparing the groundwater sample analytical results collected to date to the updated Groundwater Protection Standards (GPSs) for the unit. HWMU-7 can receive clean closure for groundwater if all constituents are below their corresponding GPSs and clean closure for soils has been approved.

**PERMIT DATE** (Sections 2.2; 7.0 and 8.3)

The closure report should reflect the following: the original permit for unit 7 was issued on October 30, 1999,with an effective date of November 30, 1999. One consolidated Permit for HWMUs 5, 7, 10 and 16 was issued on October 4, 2002, and modified on June 14, 2007 (Class 1 modification to change monitoring frequency). The compliance period begins when the owner initiates a compliance monitoring program, which is the effective date of the original Permit. The current compliance period, therefore, continues until November 30, 2017, not October 30, 2017, if Radford AAP is not engaged in a corrective action program.

**CONTINUING GW MONITORING** (Sections 2.2, 5.3, 8.3 and 10.0)

The closure report should reflect the following: currently the groundwater at HWMU-7 is sampled and analyzed semiannually, not quarterly, in accordance with the requirements of the consolidated Final Hazardous Waste Post-Closure Care Permit for Hazardous Waste Management Units 5, 7, 10, and 16 modified June 14, 2007.

## APPENDIX G

## GROUNDWATER PROTECTION STANDARDS: UNIT 7

Unit: µg/l Unless Otherwise Noted

| Constituents | SW-846 Method | PQL (µg/l) | Back-ground (µg/l) | EPA MCL (µg/l) | VDEQ ACL (µg/l) | GPS (µg/l) |
|---|---|---|---|---|---|---|
| Antimony, total | 6010B, 6020 | 3 | 30 | 6 | | 30 |
| Arsenic, total | 6010B, 6020 | 10 | 2 | 10/~~50~~ | | 10/~~50~~ |
| Barium, total | 6010B, 6020 | 10 | 28.92 | 2,000 | | 2,000 |
| Cadmium, total | 6010B, 6020 | 1 | 0.4 | 5 | | 5 |
| Chromium, total | 6010B, 6020 | 5 | 34 | 100 | | 100 |
| Cobalt, total | 6010B, 6020 | 7 | 17 | | ~~313~~ | 17/~~313~~ |
| Copper, total | 6010 | 80 | ?? | 1300 | | ?? |
| Lead, total | 6010B, 6020 | 1 | 12.13 | 15* | | 15* |
| Mercury, total | 7470A, 7471A | 1 | 0.4 | 2 | | 2 |
| Nickel, total | 6010B, 6020 | 10 | 63 | | 313 | 313 |
| Selenium, total | 7740 | 10 | 58 | 50 | | 50 |
| Silver, total | 6010B, 6020 | 2 | 3.1 | | 78.25 | 78.25 |
| Thallium, total | 6010B, 6020 | 1 | 8 | 2 | | 2 |
| Zinc, total | 6010 | 20 | ?? | | 4695 | ?? |
| Bis (2-ethylhexyl) phthalate | 8270C | 10 | 9 | 6 | | 6 |
| Butyl benzyl phthalate | 8270C | 10 | 5 | | 3,130 | 3,130 |
| 2,4-Dinitrophenol | 8270C | 50 | 11 | | 31.3 | 31.3 |
| 2,4-Dinitrotoluene | 8270C | 10 | 0.2 | | 31.3 | 31.3 |
| 2,6-Dinitrotoluene | 8270C | 10 | 0.1 | | 15.65 | 15.65 |
| 4-Nitrophenol | 8270C | 50 | 9 | | ~~125.2~~ | 50/~~125.2~~ |
| Cyanide | 9010B, 9012A | 40 | 5 | 200 | | 200 |

Notes:

**EPA MCL:** Maximum Contaminant Level of USEPA National Primary Drinking Water Regulations (September 10th , 2007). Current MCL for Arsenic is 10 µg/l.

**Background:** Calculated using analytical data for upgradient well 7W12B (GWQAR, December 1998), except copper and zinc. Please calculate the background values for copper and zinc using analytical data for upgradient well 7W12B to-date.

**DEQ ACL:** VA DEQ Alternate Concentration Limit, April 2007. Cobalt and ~~4-~~ Nitrophenol currently have no ACLs.

**GPS:** Pursuant to Permit Condition V.F.2.a ("Groundwater Protection Standard" for Unit 7) the GPSs for constituents monitored for HWMU-7 is based on background concentration from the upgradient well 7W12B and USEPA Maximum Contaminant Level (MCL) for drinking water or VDEQ-derived Alternate Concentration Level (ACL), if no MCL promulgated, whichever is higher.

**Subject:** RAAP Class 3 Mod

Hey Jeremy,

I reviewed the CD you provided me and still need the following.

- These are the maps I needed for Module V:

  Figure V.A.1 OBG/HWMU-13 Geological Cross Section Location Map

  Figure V.A.2 OBG/HWMU-13 Geological Cross Section Figures

  Figure V.A.3 OBG/HWMU-13 Groundwater Monitoring (wells) System Map

  Figure V.A.4 OBG/HWMU-13 Groundwater Elevation Contour Maps (4th and 2nd Quarters 2006) I have these

- You haven't provided me with anything for Module III. Am I to assume you want me to make the updates to the Table and text?

- Also I didn't notice the items below addressed in the Closure Plan for HWMU-7. The Closure Plan you provided was never updated appropriately and should also be updated with any new gw and/or soil analytical data collected from over the years.

Let me know if we need to further discuss. Thanks,

**Matthew M. Stepien**

**Sent:** Tuesday, March 02, 2010 4:28 PM
**To:** 'Flint, Jeremy'
**Subject:** RAAP HWMU - 5 Closure Plan

Hey Jeremy,

I did notice some things that need revised in the Closure Plan (not sure if I am looking at most current version June 2007).

**#1) Page 14 – These are being updated with permit mod**

The analytical data collected during 1996 and subsequent sampling events proved to be more reliable. As a result (and as agreed with the VDEQ), any regulatory decisions with respect to historical analytical data would not be made using any data prior to 1996.) Based on this review, and as presented in Appendix E of Permit Attachment 3 of the Final Permit, **the quarterly groundwater monitoring list for HWMU-7** consists of the following constituents:

Antimony, total Mercury, total 2,4-Dinitrophenol

Arsenic, total Nickel, total 2,4-Dinitrotoluene

Barium, total Selenium, total 2,6-Dinitrotoluene

Cadmium, total Silver, total 4-Nitrophenol

Chromium, total Thallium, total Cyanide, total

Cobalt, total Bis (2-ethylhexyl) phthalate

Lead, total Butyl benzyl phthalate

**#2) Page 35 – Schedule for Closure is incorrect. As part of Class 3 mod we are public noticing the Closure Plan. If it is approved then we will review report and approve closure (see January 2008 meeting summary)**

## 10.0 SCHEDULE FOR CLOSURE

HWMU-7 received certification for closure with waste in place in 1990 and is currently in the Compliance Period, which extends until October 30, 2017. The sampling activities outlined in this *Amended Closure Plan* constitute additional closure activities in support of clean closure of HWMU-7. Based on generator knowledge and previous studies, Radford AAP has determined that residual material contained in HWMU-7 is not a hazardous waste as defined in 40 CFR Part 261. Radford AAP completed the additional sampling activities in accordance with the *Amended Closure Plan* and VDEQ correspondence dated June 25, 2003, in February/March 2004.

It is Radford AAP's understanding that the VDEQ wants Radford AAP to submit a Closure Report and Class III Permit Modification at the same time and that the VDEQ will review both documents together. A Closure Report will be submitted within 90 days of approval of the *Amended Closure Plan.* A Class III Permit Modification will be submitted with the Closure Report if clean closure is demonstrated.

In the event that clean closure is not achieved, HWMU-7 will remain in post-closure care in accordance with the Final Permit (October 4, 2002). If Radford AAP chooses to demonstrate clean closure by removal at a future date, additional closure schedule information will be submitted.

Let me know how you are coming along, things are pretty much ready for Hassan's review on our end.

Thanks,

**Matthew M. Stepien**

VDEQ Office of Remediation Programs

# APPENDIX E

## GROUNDWATER COMPLIANCE MONITORING (QUARTERLY) CONSTITUENT AND REQUIRED ANALYTICAL METHOD LIST

| Analyte | METHOD | PQL (ug/l) | MDL (ug/l) |
|---|---|---|---|
| Arsenic, total | 6020 | 10 | 2 |
| Barium, total | 6020 | 10 | 1 |
| Cadmium, total | 6020 | 1 | 0.2 |
| Chromium, total | 6020 | 5 | 1 |
| Cobalt, total | 6020 | 5 | 1 |
| Copper | | 5 | 1 |
| Lead, total | 6020 | 1 | 0.2 |
| Nickel, total | 6020 | 10 | 2 |
| Selenium, total | 6020 | 10 | 3 |
| Silver, total | 6020 | 2 | 0.2 |
| Thallium, total | 6020 | 1 | 0.2 |
| Bis(2-ethylhexyl)phthalate | 8270 | 10 | 0.54 |
| 2,4-Dinitrotoluene | 8270 | 10 | 0.5 |
| 2,6-Dinitrotoluene | 8270 | 10 | 0.46 |
| Cyanide, total | 9010 | 20 | 4 |

Notes:

ug/l = micrograms per liter
PQL = Practical Quantitation Limit
MDL = Method Detection Limit

All methods are as described in EPA's SW-846, Test Methods in support of the RCRA program, December 3, 2008. Web site: http://www.epa.gov/epawaste/hazard/testmethods/index.htm. Single samples are required for each parameter and constituent during each sampling event. Alternate SW-846 Methods may be approved by the Department if the request is in writing and submitted at least 30 days prior to the sample collection event. Proposed alternate methods shall achieve the same practical quantitation limit/estimated quantitation limit (or lower) as the specified method.

RE Closure Plans
(HWM #5, #7, #16)
EPA ID# VA121002730

Dear Colonel Savitske,

Enclosed, please find a copy of the Approved Closure plans developed for Hazardous Waste Management Units #5, #7, and #16. The approved plans are essentially the same as those plans submitted to our office dated November 1986 with the agreed to changes detailed in your letter dated May 11, 1988. Please note that the completion date of closure must be 180 days from the date of this letter.

Should you have any questions, please contact Kevin Greene at (804) 225-2466.

Sincerely,

Karol A. Akers
Technical Services Chief
Division of Technical Services

Re: Radford Army Ammunition Plant,
Closure Certification, HWM 5, 7
and 16 EPA, ID # VA1210020730

Dear Kevin:

This letter is to provide certification to the Department of Waste Management that the above three (3) referenced sites were closed in accordance with the approved closure plan, dated May 27, 1988. Olver Incorporated had a professional engineer on-site from September 19, 1988, through October 14, 1988 during every day that the contractor worked and throughout the entire length that the contractor was on the referenced project sites. Additional inspections were accomplished on each of the harzardous waste management units on the dates indicated in the attached table. All inspection trips meet the requirements of the closure plan.

I trust that this letter is adequate to certify from the professional engineer's standpoint that these three sites have been closed in accordance with the approved closure plan.

If you should have any questions concerning these closures, please do not hesitate to contact me.

Sincerely,

Robert M. Roberts
Vice President

Radford Army Ammunition Plant
Radford, VA 24141

Re: Radford Army Ammunition Plant, Job No. 11074

Dear Pat:

Enclosed please find a copy of the letter that I have re-written to satisfy the Department of Waste Management concerning certification of Hazardous Waste Management Units 5, 7 and 16. Mr. Greene was concerned that Mr. Murray of our office was the professional engineer on site during the actual construction work and not myself, and asked that the letter be amended to reflect this. I did not have a problem with this request and revised the letter accordingly.

If you should have any questions concerning this matter, please do not hesitate to contact me.

Sincerely,

Robert M. Roberts, P.E.
Vice President

RMR/ma

Richmond, VA 23219

Re: Radford Army Ammunition Plant, Closure Certification; HWM 5, 7, and 16, EPA ID No. VA1210020730, Job No. 11074

Dear Kevin:

This letter is to provide certification to the Department of Waste Management that the three above-referenced sites were closed in accordance with the approved closure plan dated May 27, 1988. Olver Incorporated had a professional engineer, Kevin Murray, on site from September 19, 1988, through October 14, 1988, which was every day that the contractor worked, and throughout the entire length of time that the contractor was on the referenced project sites. Additional inspections were accomplished on each of the hazardous waste management units on the dates indicated in the table previously sent to you. All inspection trips met the requirements of the closure plan. I have reviewed all of Mr. Murray's notes and memoranda concerning the above-referenced project and, as he no longer works for Olver Incorporated, I am certifying that the work was completed in conformance with the approved closure plan.

If you should have any questions concerning this matter, please do not hesitate to contact me.

Sincerely,

Robert M. Roberts, P.E.
Vice President

RMR/ma

cc: Mr. Patrick J. Golden, Radford Army Ammunition Plant

Closure Performance Standards

The closure performance standards, as presented in the Virginia Hazardous Waste Regulations (10.6.B), require that the owner or operator of a hazardous waste disposal facility shall close the facility in a manner that:

- o minimizes the need for further maintenance, and
- o controls, minimizes or eliminates to the extent necessary to prevent threats to human health and the environment, post-closure escape of hazardous waste, hazardous waste constituents, leachate, contaminated rainfall or waste decomposition products to the ground or surface waters or to the atmosphere.

The escape of contaminants to the environment occurs primarily through migrating water and, to a limited extent, migrating gas. At the Radford AAP hazardous waste management sites, the generation and migration of gas is not expected due to the nature of the wastes disposed. Therefore, the aforementioned closure standards can be met by effectively isolating the hazardous wastes from migrating water in the subsurface environment. Since hazardous waste facilities should be situated above the fluctuating groundwater table, as is the case for the Radford AAP hazardous waste management facilities, the lateral groundwater flow would not be directly responsible for the migration of contaminants in the groundwater. Thus, the primary components of the Closure Plan include a final cover system to minimize the percolation of rainwater into the waste material and, if applicable, a leachate collection system to prevent the leachate from migrating downward to the groundwater table. Post-closure care requirements emphasize maintaining the integrity of the waste containment system (especially the final cover) and monitoring groundwater (10.6.I)

The in-place closure method is selected for the closure of HWM facilities HWM 5, HWM 7, and HWM 16. HWM 16 will be closed with all waste material remaining in place and a final cover system and post-closure care will be provided. The closure of surface impoundments (HWM 5 and HWM 7) involves the draining of all liquids, removal of wastes and contaminated materials, a limited extent of sediment/subsoil treatment, and backfilling. As a result of recent groundwater monitoring, it was confirmed that groundwater in the vicinity of HWM 5 and HWM 7 has been contaminated. Although not directly confirmed by sampling and analysis, it is believed, based on the confirmed groundwater contamination, that the subsoil underneath these surface impoundments is likely to be contaminated to a certain degree. Therefore, a final cover system and post-closure care will also be required for HWM 5 and HWM 7. This section provides an environmental assessment associated with the closure of the HWM facilities with wastes and/or contaminated subsoil remaining in place.

## In-Place Closure of Surface Impoundments

The presence of contaminated soil in the closed surface impoundment is considered to be a potential source of future groundwater contamination by contaminants released over a long period of time. At the Radford site, however, the potential for future groundwater contamination from the in-situ contaminated soil should be insignificant. This is based on several factors as listed below:

- The major source of groundwater contamination, liquids in the surface impoundments, will not be present after closure of these facilities;

- The remaining source of groundwater contamination, the soil interstitial water having a low pH and possible elevated concentrations of minerals and metals, is very limited in quantity;

- Elevated metals in the groundwater would be likely to be adsorbed to the soil once the low pH of the groundwater has been neutralized by dilution, and would therefore not be detectable at a great distance from the source; and,

Further evaluations of the contaminated subsoil as related to groundwater quality at the specific site are provided herein.

SECTION 2

# WASTE CHARACTERIZATION/MAXIMUM WASTE INVENTORY

Presented in this section is a waste characterization discussion for each of the HWM facilities (Nos. 5, 7, and 16) that are to be closed at the Radford AAP. This discussion is on information collected regarding past waste disposal practices at the HWM facilities and analytical data from sampling/analysis efforts previously performed.

## 2.1 HAZARDOUS WASTE MANAGEMENT FACILITY NO. 5

HWM 5 is a surface impoundment serving as a holding basin for runoff, spill and washdown waters from an acid tank farm. HWM 5 has been in service since the mid-70's. The impoundment is approximately 160 feet by 90 feet at the crest elevation of the dike, and is approximately 6 feet deep with side slopes of 2 to 1. The depth of the acidic water is normally 2 to 4 feet for a total volume of about 140,000 to 300,000 gallons. The maximum waste inventory is 524,557 gallons. The bottom of the impoundment was lined in 1981 with Hypalon of 60 mils in thickness. The liner is covered with about 12 inches of sand,

and the sides are covered with approximately 6 inches of sand and 6 inches of granite riprap. The compatibility of the Hypalon liner with the acidic water has been rated as "good" according to a previous report (Wyss et al, September 1980).

The effluent from HWM 5 is discharged to an equalization basin, HWM 4. The effluent is conveyed via a subsurface gravity pipe. The effluent from HWM 4 is treated by lime slurry neutralization and allowed to settle in SWM 8 prior to discharged to the New River under NPDES permit No. VA0000248.

Process wastewater containing low concentrations of nitrocellulose (NC) was previously conveyed to HWM 5 from the acid screen house located on-site at the Radford AAP. In the fall of 1983, this practice was discontinued and the pipe conveying this waste stream was relocated.

An analysis of influent water taken during low flow in 1981 indicated that the influent wastewater contained concentrations of several heavy metals below levels defined as hazardous by the EP Toxicity test. These results are presented in Table 1. Although non-hazardous by EP toxicity, the lagoon water is classified as a hazardous waste because of its low pH. The pH of the influent when tested in 1981 was 1.5 (corrosive wastes are those with pH below 2.0 or above 12.5).

The accumulated solids that have settled in HWM 5 have not been sampled and analyzed to determine if contaminants (heavy metals) are present. No other data on the lagoon's influent are available to determine the extent of contamination at HWM 5.

Analytical testing to determine the concentration of NC in the accumulated solids at HWM 5 has not been conducted to date. Several other acid waste lagoons that receive similar waste streams have been tested to determine the concentration of NC in their accumulated solids. Microscopic examination of sludge samples from these lagoons found NC in concentrations of less than one percent. According to reactivity test criteria, sludges containing less than 26 percent NC are non-reactive when NC is the only reactive constituent present. Analyses for other explosive materials including nitroglycerin and dinitroglycerin showed very low NC concentrations (nondetectable, or less than one percent) in the lagoon sludges. These results indicate that it is unlikely that the solids in HWM 5 are reactive since very low concentrations of NC were found in other waste lagoons that are used for similar purposes at the Radford AAP.

## 2.2 HAZARDOUS WASTE MANAGEMENT FACILITY NO. 7

The dimensions of HWM 7 measured at the top of the impoundment are approximately 160' x 90' and the side slopes are 2 to 1. The depth is approximately 12 feet and has a maximum

waste inventory of 566,131 gallons. The impoundment serves as a holding and neutralization basin for spills, rainwater, and washdown waters from acid tank farms in the Oleum Plant Area. The drainage from the dikes is conveyed through a twelve inch underground gravity sewer to the impoundment. Typical daily flows are variable ranging from almost zero to several hundred gallons per minute during a rainstorm.

Waste caustic is hauled to the lagoon by a tank truck and mixed with the acidic wastewater for neutralization. The wastes are mixed by two air diffusers. The neutralized effluent from HWM 7 is pumped to an unlined holding basin (No. 7A) prior to being discharged to SWM9 for settling. In some cases, however, the effluent from HWM 7 is discharged via a temporary surface pipe system directly to SWM9. After settling, the effluent from SWM9 is discharged to the New River under NPDES Permit No. VA 000024E.

The HWM 7 influent contains waste sulfuric acid and caustics from the production of oleum. According to EP toxicity analyses conducted on the lagoon water and sediment, several heavy metals were detected but in very low concentrations (i.e., non-hazardous). The pH of the lagoon water was 11.4 when the analysis was conducted, which is also classified as non-hazardous. However, the pH of the lagoon's influent is known to fluctuate (below 2.0 and above 12.5), thereby classifying the wastewater as a corrosive substance. These analytical results

4.3.1 The landfill has been used for the disposal of the following Hazardous Waste from November 1980 until August 1986:

a) 3898 Tons of ash from the burning of waste explosives and explosives contaminated material. This material is hazardous because of toxicity from low levels of lead and chromium.

b) 545 tons of waste water treatment sludges which was considered hazardous by definition because they are K-044 and K-045 listed wastes. Results of reactivity tets have indicated that this material is not reactive.

c) 6 tons of asbestos which is no longer considered a hazardous waste.

d) The following laboratory chemicals:

| P.D. No. | Date | Quantity | Material |
|---|---|---|---|
| 80-83 | 9-19-80 | 58 lbs. | Lead Salicylate |
| 80-100 | 11-3-80 | 550 lbs. | Sulfur |
| 80-108 | 11-18-80 | 500 lbs. | Sulfur |
| 81-3 | 1-7-81 | 250 lbs. | Nitrodiphenylamine |
| 81-7 | 2.2-81 | 76 lbs. | Carbolac |
| 81-7 | 2-2-81 | 25 lbs. | Alum. Powder |

| | | 9 bottles | Triphenyl Phosphate |
| | | 1 lb. | Uranyl Acetate |
| | | 1 bottle | Zinc Metal Dust |
| | | 4 pks. | Total Count Millipore Filters |

4.3.2 The materials that have been disposed in this landfill should not pose a health or safety hazard because they have been covered with earth and the proposed construction does not require that the waste be disturbed. If any unusual conditions are encountered, the Operating Contractor should be notified.

are presented in Table 2.

As with HWM 5, the accumulated solids in HWM 7 have not been analyzed to determine if reactive constituents are present. However, according to Radford AAP personnel, wastewater discharged to HWM 7 in the past in the form of washdown water from the acid tank farm did not contain NC. It is unlikely that NC is present in concentrations that could render the solids reactive, however, a sample will be taken to determine if NC Fines are present.

## 2.3 HAZARDOUS WASTE MANAGEMENT FACILITY NO. 16

The Radford AAP generates a variety of wastes that are disposed in the on-site hazardous waste landfill trench (HWM 16). Presented in Table 3 is a list of the reactive and corrosive materials that are ultimately disposed in HWM 16 following treatment. The waste materials presented are generated from Radford AAP activities including the incineration of waste propellants, and disposal of laboratory waste chemicals and materials.

As of December 1984, Approximately 4200 cubic yards of waste had been disposed in the landfill. Presented in Table 4 is a summary of the wastes disposed in HWM 16. It should be noted that the ash from waste propellant incineration and residue from explosive contaminated waste burning are listed as reactive

wastes. This information is based on the assumption that residues from the treatment of reactive wastes are considered reactive hazardous waste until proven otherwise (USAEHA, 1981). Since HWM 16 began disposal operations in 1980, wastes characterized as reactive (Table 3) were incinerated or open burned prior to disposal in the landfill to render them non-reactive. Reactivity test methods including thermal stability, unconfined burning, No. 8 blasting cap and the impact test were used to analyze potentially reactive sludges prior to disposal in HWM 16. This testing determined that the landfilled sludges were non-reactive. Presently, these sludges are not disposed in the landfill. Based on the analysis by the Radford AAP laboratory utilizing the USEPA approved reactivity testing methods (i.e., Bureau of Mines Gap Test and Deflagration Detonation Transition (DOD) Test), ash and residues from the incineration and open burning of waste propellants were also non-reactive. The ash and residues that were analyzed and found to be non-reactive are similar to the wastes landfilled prior to reactivity testing performed using the USEPA approved methods.

Presented in Table 3 are EP toxicity results for several ash residues disposed in HWM 16. These analytical results indicate that with the exception of lead in the propellant burning ground ash, none of the residues contain concentrations of heavy metals that would classify the waste as hazardous (USAEHA, 1981). However, this determination is based on one sampling event conducted in 1981 and may not be representative of the waste

residues presently disposed in the landfill. According to Radford personnel, various laboratory waste chemicals and materials were also disposed in HWM 16. A sampling and analysis program will be conducted during the closure of HWM 16 to further document the nature of wastes in HWM 16.

# SECTION
# CONSTRUCTION PROCEDURE

This section describes the construction procedure for the closure of the Radford AAP hazardous waste management facilities. Included in this closure plan are the hazardous waste lagoons (HWM 5 and HWM 7) and the hazardous waste landfill (HWM 16).

## OVERVIEW OF CLOSURE CONSTRUCTION

All Radford AAP HWM facilities are to be closed with hazardous wastes (HWM 16) and/or contaminated subsoils (HWM 5 and HWM 7) in place. Initial site preparation tasks, such as neutralization of impoundment liquids and flashing of the potentially NC-laden sediments in HWM 5 will be performed by Radford AAP (Hercules, Inc.) because of safety concerns associated with acidic liquids and reactive compounds.

Closure construction for the surface impoundments (HWM 5 and HWM 7) involves demolition of appurtenant structures, treatment of subsoil and sediments, sampling/analysis, backfilling and cover system installation.

Closure construction for the hazardous waste landfill (HWM 16) includes leachate drain installation and cover system installation. The final cover system, the most important component in the closure of the hazardous waste facilities with waste in place, consists of: one foot of topsoil with grass cover; one foot of cover soil; one foot of drainage sand layer; a 30-mil PVC membrane liner; and a two-foot thick clay liner.

SITE PREPARATION

Site preparation includes all activities to be performed by Radford AAP (Hercules, Inc.) prior to initiation of closure construction by the contractor. These activities primarily consist of the handling of liquids and solids in the surface impoundments after the influent is diverted and the surface impoundments can be closed. Details of site specific activities are summarized as follows:

HWM 5

Following the completion of the bypass pipeline, the acidic water be diverted to the new pipeline and the impoundment will be ready for closure. The following site preparation activities will be performed by Radford AAP:

- Lower the liquid level in HWM 5 to a practical minimum via the existing effluent line.
- Flush the old influent pipe, manholes, stainless steel trough and granite riprap on the side slopes with a weak sodium hydroxide solution and water. Once acidic residues on these materials and structures are neutralized and flushed with water, they can be reused, buried in place, or disposed of in the on-site dumps in accordance with all applicable state, local, and federal requirements.
- Allow the sodium hydroxide solution to soak into the sediment and cover sand for the impoundment thereby neutralizing acidic liquids. Additional sodium hydroxide may have to be added if the quantity used for flushing of pipes and other materials is not sufficient.

- Drain the neutralized liquid and allow excess liquid in low spots to dry.

- Sample and test the bottom sediment for reactivity. If the sediment is reactive, remove and flash all bottom solids (sand and sediments) to destroy NC fines at the open burning ground. Store the sand near HWM 5 for use as backfill material.

HWM 7

Following the completion of the bypass pipeline, the acidic water will be diverted to the new pipeline and the impoundment would be ready for closure. The following will be performed by Hercules:

- Flush the old influent pipe (from the diversion point to the discharge outlet) and manhole with a weak sodium hydroxide solution and water.

- Add lime slurry to the lagoon wastewater and mix using the air diffusers until the wastewater in the lagoon is neutralized.

- Remove the air diffuser pipes and flash prior to disposal at the open burning ground. The pipes may be recycled as scrap metal or disposed of in the non-combustible dump.

- Drain neutralized (Ph between 5 and 9) wastewater to SWM 9 and allow the bottom of the impoundment to dry.

HWM 16

No site preparation work is needed for HWM 16.

## 2.3 DEMOLITION AND CLEANUP

HWM 5

The demolition and cleanup activities for HWM 5 include the following:

- Remove all the appurtenant structures including the trough, manhole, influent pipe, decant pipe and guard rails. The influent pipe sections not affected by the construction activities at the HWM 5 site may remain in place after plugging both ends with concrete. If there is any indication that the underground piping has leaked, it will be reported to the USEPA. The concrete and clay pipe will be disposed at the non-combustible dump and the metallic material hauled to the

contaminated waste incinerator (solid waste incinerator) for handling by Hercules.

- Remove the riprap on the side slopes of the impoundment and stockpile near the HWM 5 site for later use. If this material is determined to be contaminated it will be underlain with a liner when it is stockpiled. This will be used for the perimeter of the cover system for HWM 5 and HWM 7. The estimated volume of riprap from HWM 5 is about 190 cubic yards.

- Remove the cover sand on the bottom and on the side slopes and use later as backfill material in HWM 5. The cover sand on the side slopes does not need flashing. The total volume of sand from HWM 5 is estimated at about 450 cubic yards (290 CY from the bottom and 160 CY from the slopes).

- Remove the Hypalon liner, cut into pieces and later dispose of in HWM 5 as part of backfilling. Save 20 one-foot by one-foot coupons for performance evaluation by COE.

- Remove the trough support columns and foundations.

HWM 7

The demolition and cleanup activities at the HWM 7 site involve the removal of all the appurtenant structures such as guard rails, influent pipe, concrete pad, and effluent (3-inch stainless steel) pipe. If there is any indication that the underground piping has leaked, it will be reported to the USEPA. The concrete and clay pipe will be disposed at the non-combustible dump and the metallic material hauled to the contaminated waste (solid waste) incinerator for handling by Hercules. The influent pipe outside of the closure construction area may remain in place after plugging both ends with concrete.

HWM 16

No demolition and cleanup activities are required for HWM 16. However, the leachate drain system will be operational prior to installation of final cover.

The soil sampling program should be conducted prior to backfilling and cover system installation. Due to the access problem and the need to confirm the effect of subsoil treatment, sampling at the HWM 5 and HWM 7 sites will be done after soil treatment.

A summary of the sampling and analysis program to be conducted is provided in Table 3. At each of the surface impoundment sites HWM 5 and HWM 7, three borings will be drilled within each impoundment. Each boring will be advanced and three soil samples, the first sample in the treated zone and the next two samples in the untreated zone, will be collected. Samples will be analyzed for pH and heavy metals. The boring holes shall be plugged prior to initiation of backfilling.

TABLE 3

SUMMARY OF SAMPLING AND ANALYSIS PROGRAM

| | HWM 5 | HWM 7 |
|---|---|---|
| Number of borings | 3 | 3 |
| Bottom elevation of boring | 1759 | 1691 |
| Number of samples per boring and sample elevations | 3 at 1769, 1765 and 1759 | 3 at 1700, 1694 and 1961 |
| Analytical parameters | pH and EP toxicity heavy metals | pH and EP toxicity heavy metals |

SECTION

SOIL TREATMENT

## QUALITY CONTROL PARAMETERS

The objective of the soil treatment is two-fold: neutralizing the acidic sediment/subsoil and solidifying the soft subsoil. Neutralization of the subsoil is to minimize the future groundwater contamination which can be caused by mobilization of soluble metals from soils in acidic water. Solidification of the soft subsoil will aid in providing a stable foundation for backfilling of the surface impoundments and subsequent cover system installation. To assure the quality of the soil treatment work, therefore, the treated material will be tested for two key parameters: soil pH and compressive strength.

The pH of the natural soils at the site is slightly higher than 5. The target pH of the treated material is set between 6.3 and 10.5, and the target unconfined compressive strength of the HWM 7 sediment is 1500 pounds per square foot upon 14 days of curing. Based on the limited laboratory test performed for sediment/subsoil from HWM 7, 82 pounds of reagent (one part cement kiln dust and three part flyash) per cubic foot of sediment/subsoil will be required for the strength requirement. However, the resultant pH may be higher than the upper limit of 10.5 at this mix ratio. Although no laboratory test was performed for the subsoil of HWM 5, it is anticipated that 15 percent by weight of reagent (lime kiln dust) would be required due to the past operational characteristics of HWM 5 (i.e., no liner prior to 1981). The contractor selected for the closure construction will perform a pilot test to develop an optimum mix design to satisfy both pH and strength requirements. Quality control to achieve the target pH and strength begins with control of reagent application rate. (Appendix E )

## CONTROL OF REAGENT APPLICATION RATE

U.S. Gypsum at Kimballton, Virginia, the most likely lime kiln dust supplier because of its proximity to the site, can supply about 25 tons of lime kiln dust a day. To control the application rate of lime kiln dust at HWM 5, a section of the impoundment bottom will be first prepared, and the amount of lime kiln dust required for the section will be blown out of the pneumatic truck. Since about 80 tons of reagent is required for HWM 5, a truck load of reagent (20 tons) may be used for a 6-inch lift of the entire impoundment area. In this approach, there is no need for reagent storage and the application rate will be adequate as long as the reagent is uniformly spread over the entire area.

The source of cement kiln dust for HWM 7 sediment treatment would be Lonestar Cement in Culverdale, Virginia, about 45 miles from the site. There will be sufficient quantity of the material available for use at HWM 7. For a section of HWM 7 to be treated, flyash needed for the section will be first hauled and dumped in the impoundment. Next, the clamshell will be used to pick up and spread flyash over the area to be treated. Then, the required amount of cement kiln dust will be blown into the impoundment prior to initiation of mixing with the clamshell.

## FIELD pH CONTROL

Upon completion of the soil treatment on each section or lift, field pH tests will be performed to confirm the pH of the treated soil. The soil pH can be measured in accordance with ASTM G 51 or the procedures described herein. An electrometric type pH meter, buffer solutions, small glass beakers, balance glass pipette, glass stirrer rod and distilled water are needed to perform field soil pH tests.

Calibration of pH Meter: To calibrate the pH meter, use a standard buffer solution of pH 7 and set the meter at pH 7. Then set the manual temperature compensator at the temperature of the buffer. Use a standard buffer of pH 4 to check the instrument's accuracy at pH 4. If neccessary, adjust the reading to pH 4 with the temperature

compensator knob. Repeat the above procedure until the meter reading agrees with both buffer pHs.

Determination of pH:

1) Using a scale or balance, weigh a 5 g sample of air-dry soil into a beaker suitable for shaking.

2) With automatic pipette, add 5 ml of distilled water to the beaker.

3) Shake, or mix thoroughly for 5 to 10 seconds.

4) Let stand for 10 minutes.

5) Insert the electrodes into the container and stir the soil suspension by swirling the electrodes slightly.

6) Read the pH immediately on the calibrated pH meter.

Corrective Action: If the test results do not meet the target pH, the section or entire area will be reworked by mixing with additional reagent or buffer material. The details of the corrective action will be developed after the Contractor's pilot test.

FIELD COMPRESSIVE STRENGTH CONTROL

HWM 5 has been operated with a Hypalon liner since 1981. In the absence of continuous liquid infiltration, the subsoil at HWM 5 impoundment would have a moisture content and compressive strength similar to the surrounding soils. The condition of the impoundment bottom, during the soil treatment and backfilling operations, would be sufficient to support earthwork equipment. However, 14 day unconfined compressive strength shall be preformed as detailed for HWM #7.

HWM 7 is an unlined lagoon and has allowed continuous infiltration of liquids and sediment buildup. The bottom of the impoundment is very

soft and cannot support earthwork equipment. During the soil treatment task at HWM 7, therefore, it is necessary to attain a minimum strength of the treated soil prior to the initiation of backfilling. Thus, a 14-day unconfirmed compressive strength of 1,500 pounds per square foot (PSF) is chosen as a target compressive strength.

For field quality control, both moisture content and unconfined compression test (ASTM 2166) will be used to determine the field strength of the treated soil. Details of the field quality control procedures are presented in the specifications. (Appendix E, pg 2D-3 )

COVER SYSTEM ANALYSIS

Proposed Cover System

The proposed cover system consists of several components to ensure its performance. The basic components of the cover system and their functions are:

- A grass-covered surface to prevent erosion of the cover soil and to promote evapotranspiration of moisture from the soil. The slope of the proposed surface ranges from three to eleven percent depending on the surrounding topography.

- One foot of topsoil and one foot of cover soil to support the growth of grass and to protect the underlying PVC liner.

- A one-foot sand drainage layer with a permeability no less than $10^{-3}$ cm/sec. This layer will promote drainage of any infiltrated water.

- A primary liner consisting of 30-mil PVC membrane to prevent infiltration of surface water into the subsoil or wastes within the closed facilities.

- A clay liner to serve as a bedding layer for the PVC liner and as a secondary liner in case of primary liner failure. The thickness of the compacted clay liner will be two feet and the compacted liner soil will meet the permeability requirement of $10^{-7}$ cm/sec or less.

Additional features associated with the cover system include:

- A riprap perimeter (for HWM 5 and HWM 7) designed to do the following: protect the slope against erosion; promote drainage of the cover soil layer; clearly mark the extent of the closed facility; and deter accidental vehicle or personnel access.

- A filter fabric between the riprap and the cover soil (for HWM 5 and HWM 7). This is necessary to prevent internal erosion (piping) of the cover soil into the riprap zone.

- Drainage swales to divert surface flows around and away from the containment area.

- A leachate drain system (HWM 16 only) consisting of a drain pipe and a leachate collection sump. The leachate drain system will minimize escape of hazardous waste constituents should any leachate be formed in the landfill.

Design Standards

The general design criteria for the final cover system are contained in the Virginia Hazardous Waste Regulations ( 10.13.K ) and (10.10.I ) . It is specifically required that the permeability of the cover liner material be less than or equal to the permeability of any bottom liner system or natural subsoils present. Since only natural subsoils (treated with lime kiln dust at the HWM 5 and HWM 7 sites and recompacted to form a clay liner at the HWM 16 site) are present at these facilities, the minimum requirement for cover liner material with respect to the permeability would be a soil liner compacted out of selected on-site soil (e.g., clay). If a synthetic membrane liner were used, the minimum thickness required by Virginia regulations would be 20 mil. For the proposed cover system, however, a 30-mil synthetic liner (PVC) on a compacted clay liner is recommended for maximum performance.

A sand drainage layer, with a permeability of no less than $10^{-3}$ cm/-sec, is often recommended above the low permeability barrier (Department of Army, 1984). The drainage layer would promote drainage of water infiltrating through cover soil layers. Thus, all hazardous waste facilities (HWM 5, HWM 7 and HWM 16) will be closed with a drainage layer as part of their cover system.

LEACHATE DRAIN INSTALLATION

A leachate drain system will be installed at the last section of HWM 16. This is intended to facilitate removal of the leachate should any leachate form within the landfill.

The bottom of the trench must be compacted prior to installation of the leachate drain system. The pipe section placed within the cover system will be perforated and embedded in gravel wrapped with a filter cloth to facilitate drainage function without clogging. The drain pipe will be extended by unperforated sections to the leachate collection sump. (Appendix G)

BACKFILL AND GRADING

Surface Impoundments

The surface impoundments (HWM 5 and HWM 7) will be backfilled after soil treatment and sampling are completed. Sand and Hypalon liner removed from HWM 5 will be disposed of in HWM 5 as part of backfilling. HWM 6 will be backfilled after removing three feet of soft subsoil in the ponded area. The backfill material will be excavated from the designated borrow pits, and adjusted for the optimum moisture content (i.e., spraying water or drying as needed). Materials designated as Strata B and B1 will be used for common fill. Materials from Strata A and A1 will be stockpiled for use in secondary soil liner construction. The backfill material should be compacted within two percent of the optimum moisture content to no less than 95 percent of the maximum dry density as determined in accordance with ASTM D-698, Method A. The optimum moisture content and the maximum dry density for each soil stratum from the borrow pits are summarized in the Geotechnical Report (Schnabel, 1985). (Appendix F )

The general grading plans for HWM 5, and HWM 7 are provided in Construction Plan. Within the limit of the cover system installation, the backfill and compaction will be performed to the grade indicated in the plan minus the thickness of the cover system. The areas beyond the limit of the cover system installation will be graded as indicated in the plans. The relevant sections applicable to the backfill and grading of the surface impoundment sites are also provided in the Construction Plan.

The previously filled section of HWM 16 has been compacted and graded flush with the surrounding area. Prior to the cover system installation, the existing soil cover will be recompacted after scarification and moisture adjustment.

## COVER SYSTEM INSTALLATION

The cover system consists of a 2-foot secondary soil liner, a 30-mil PVC liner, one-foot drainage layer, one-foot soil cover, and one-foot topsoil and grass cover. The additional elements of the cover system include riprap slope protection and a filter cloth underneath the riprap to prevent piping of the cover soil along the perimeter of HWM 5 and HWM 7.

The secondary soil liner will be compacted to a minimum of 95% of the maximum dry density per ASTM D-698 at a moisture content 2 to 5 percent wet of optimum. The PVC liner will be installed on the secondary soil liner. The drainage layer, consisting of one foot of sand, should have a permeability no less than $10^{-3}$ cm/sec. The common fill material (classified as SM) excavated from the designated borrow pit will be used for the specified one-foot of cover soil. Topsoil will be imported from a local supplier. After placing the topsoil, the perimeter slope protection with filter fabric will be installed and seeding will follow. Details of the material quality and construction methods for each cover system component are described in the Specifications.

## VEGETATION

The entire cover area and other disturbed areas will be seeded to establish grass covers. Drainage swales are also to be seeded to minimize channel erosion. The existing access roads and pads will not be vegetated to provide access for maintenance and inspection during the post-closure period. The total area of vegetation is estimated at about four acres. Selection of species, fertilizer, soil pH adjustment and seeding application will be made in accordance with the Specifications. The vegetated area will be watered until full grass cover is established. The contractor will be responsible for watering until seed germination occurs.

Clay Liner

It is recommended by the Army (TM 5-814-7) that a clay liner with a permeability not exceeding $10^{-7}$ cm/sec be provided underneath the primary synthetic liner. Portions of site soils from the borrow areas met this permeability requirement when tested after recompaction in the laboratory. Specifically, it was recommended that, to meet this permeability requirement, clayey soils from Strata A and A1 be compacted at a moisture content three to four percent above the optimum to 95 percent of maximum dry density per ASTM D-698, Method A (Schnabel, January 1985). Since meeting the moisture range of one percent in the field condition is impractical, a moisture range of two to five percent above the optimum may be used for field compaction control. (Appendix A )

Drainage Layer

The drainage sand material must meet two performance criteria:

- The drainage sand should be coarse enough to meet the permeability requirement of no less than $1 \times 10^{-3}$ cm/sec and to allow adequate drainage of infiltrated rainwater.

- The drainage sand should meet the filter criteria (i.e., not too coarse) to prevent internal erosion (piping) of cover soil and subsequent clogging of the drainage layer.

To satisfy these two conflicting requirements, the range of sand gradation necessary to meet the filter criteria was developed first and then narrowed down to meet the permeability requirement.

The cover soil is to be obtained from Stratum B of the borrow pit and classified as silty sand (SM) by the Unified Soil Classification System. The gradation envelope of this cover soil is shown in Figure 1. The filter gradation criteria are:

1. $$\frac{D_{15}\ (\text{filter})}{D_{85}\ (\text{soil})} < 5 < \frac{D_{15}\ (\text{filter})}{D_{15}\ (\text{soil})}$$

2. $$\frac{D_{50}\ (\text{filter})}{D_{50}\ (\text{soil})} \leq 25$$

The first criterion requires the filter material to have a $D_{15}$ no larger than 1 mm while the lower limit can not be determined because of

Subject: Contract V84482, Borrow Site Investigation for Closure of Hazardous Waste Management Facilities, Radford Army Ammunition Plant, Radford, Virginia

Gentlemen:

Submitted herewith are fourteen copies of our report for the above referenced project in accordance with our agreement dated October 8, 1984.

The study included inspection of test borings performed by others and preparation of a geotechnical engineering study for this project. The study included evaluation of test borings, geologic, soil test and project data to develop the following:

1. Estimated subsoil conditions and groundwater levels with the area investigated.

2. Recommendations regarding availability of site borrow materials for use as common fill and cap liner fill.

3. Recommendations for placement and compaction of borrow materials.

Detailed quantity estimates, plans, and services in connection with horizontal or vertical lines and grades were not included in this study.

Soil samples will be held until June 30, 1985 and will then be disposed of unless further disposition is requested.

We appreciate the opportunity to be of service for this project. Please do not hesitate to contact either of the undersigned if clarification is needed for any aspect of this report.

Very truly yours,

SCHNABEL ENGINEERING ASSOCIATES, P.C.

## 1. CONCLUSIONS AND RECOMMENDATIONS

Based on the information contained herein, the following summary of conclusions and recommendations is presented:

1. Soils within the investigated borrow areas located on Sheet 1 consist of alluvial silty clays (CL), clayey silts (ML and MH) to clayey silty sands (SM). The silty clay soils have been designated Strata A and A1 while the remaining soil types have been designated Strata B and B1.

2. Strata A and A1 soils meeting the requirements specified herein are considered suitable for use as compacted cap liner material, but will have to be compacted within a narrow range of moisture contents to achieve a permeability of $1.0 \times 10^{-7}$ cm/sec.

3. Limited quantities of cap liner material were encountered at both borrow sites as outlined on Sheets B-1 and B-2, with estimated quantities of 4700 cy at Borrow Site 1 and 1200 cy at Borrow Site 2.

4. Strata B and B1 soils may be used as common fill to backfill lagoons and to provide a topsoil/cover layer above the clay cap. Vast quantities of these materials are available at each borrow site.

5. Common fill and cap liner fill should be placed and compacted to the specification requirements described herein. Both fills should be tested by the Geotechnical Engineer to verify conformance with these requirements.

6. Presently natural moisture contents range from 1.9 to 6.7 percent above optimum. Moisture conditioning will be required for proper compaction of fill, and construction delays should be expected if earthwork proceeds during the wet winter months.

We have prepared this report in accordance with generally accepted geotechnical engineering practice and make no other warranties, either expressed or implied, as to the professional advice provided under the terms of our agreement and included in this report.

## 2. SITE LOCATION AND DESCRIPTION OF BORROW AREAS

Three acid waste lagoons designated HWM-5, -6, and -7, and a landfill designated HWM-16 located within the Radford Army Ammunition Plant, Radford, Virginia are to be closed in accordance with Resource Conservation and Recovery Act requirements. The lagoons are surface impoundments typically about 10 ft deep. Contents are generally a mixture of rainfall, runoff and spent sulfuric and nitric acid.

This study includes investigation of potential plant site borrow soils to be used as common fill and cap material during closure. Two sites were considered as potential borrow sources. These borrow sites, designated Borrow Site 1 and Borrow Site 2, are located within the magazine area within the peninsula formed by the New River at the north end of the plant site. Borrow site locations are shown on the Site Location Map, Sheet 1.

Borrow Site 1 is an extension of the presently used borrow area which is south of an adjacent to building 1937. The unexcavated portion of the site is a 4.5 acre grass covered site and slopes gently downward to the south, with surface grades varying from about El 1893 to El 1878.

Borrow Site 2, located northwest and adjacent to HWM-16 consists of about 1.5 acres. This site was also grass covered but was being covered with a thin lift of fill during our site investigation. This site is fairly level with surface grades varying only from about El 1833.5 to El 1837.5.

## 3. SUBSURFACE INVESTIGATION

Eighteen soil test borings were drilled within the borrow areas by Ayers and Ayers, Inc., Richmond, Virginia on November 14 through 16, 1984 under our continuous inspection. Test boring logs are included in Appendix B along with the Test Boring Location Plans, Sheets B-1 and B-2. Borings B-4, B-5 and B-19 were deleted and Boring B-11A was added during the subsurface exploration program. Discussion of drilling methods are also included in Appendix B. Estimated subsurface profiles are included at the end of this section of the text. Based on the test boring data, the following generalized subsoil strata are present:

| | | |
|---|---|---|
| Stratum A1: | From the ground surface to depths of 0.7 to 3 ft | Brown fine to medium sandy silty clay, FILL and PROBABLE FILL (CL); medium to very stiff consistency (N = 4 to 17) |
| Stratum B1: | From the ground surface to depths of 1 to 3 ft | Brown fine sandy clayey silt (ML) and fine to coarse silty sand, trace gravel (SM), FILL; firm density (N = 8 to 17) |
| Stratum A: | From the ground surface and below Strata A1 and B1 to depths of 3 to 14 ft | Brown sandy SILTY CLAY, with mica (CL); medium to very stiff consistency (N = 6 to 20) |

| | | |
|---|---|---|
| Stratum B: | Below and interbedded with Stratum A to the maximum depth of penetration, 20 ft | Brown and red-brown fine sandy CLAYEY SILT, with mica (ML to MH); fine to medium SAND, trace gravel (SM) and fine silty clayey SAND, with mica (SC); loose to very compact (N = 6 to 45) |

The above N values indicate the low and high Standard Penetration Test resistances encountered in a particular layer as determined from the number of blows required to drive a 2 inch O.D., 1-3/8 inch I.D. sampling spoon one foot using a 140 pound hammer falling 30 inches. This test is conducted after seating the sampler six inches in the bottom of the hole according to ASTM D-1586.

Four to eighteen inches of topsoil were encountered at the test boring locations. The soils of Strata A1 and B1 represent fill and probable fill materials placed during previous site development. Stratum A1 soils classify CL while Stratum B1 consists of clayey silts and sands classifying ML, CL-ML, MH, SC and SM. The soils of Strata A and B represent alluvial soil deposits of Recent to Pleistocene geologic age.

No groundwater was encountered in any of the test borings during sampling. All test borings were dry upon completion. No long-term readings were made as test borings were backfilled upon completion for safety.

## GENERAL NOTES

1. NUMBERS TO THE LEFT OF THE BORING COLUMNS INDICATE NUMBER OF BLOWS REQUIRED TO DRIVE A 2 INCH O. D., 1 3/8 INCH SAMPLING SPOON 12 INCHES USING A 140 LB. HAMMER FALLING 30 INCHES.
2. ESTIMATED GROUNDWATER LEVEL INDICATED BY ▽. THESE LEVELS ARE ONLY ESTIMATES FROM AVAILABLE DATA AND MAY VARY WITH PRECIPITATION, POROSITY OF SOIL, SITE TOPOGRAPHY, ETC.
3. G.S. = GROUND SURFACE  * UNDISTURBED SAMPLE
4. TEST BORINGS DRILLED BY AYERS AND AYERS, RICHMOND, VIRGINIA.
5. THIS DRAWING CONTAINS INTERPRETATION OF TEST BORING DATA AND SHOULD NOT BE USED AS PART OF THE CONTRACT DOCUMENTS.
6. THESE PROFILES WERE DEVELOPED BY INTERPOLATION BETWEEN WIDELY SPACED BORINGS. ONLY AT THE BORING LOCATIONS SHOULD THEY BE CONSIDERED AS AN APPROXIMATELY ACCURATE REPRESENTATIVE AND THEN ONLY TO THE DEGREE IMPLIED BY THE NOTES ON THE BORING LOGS.
7. TEST BORINGS INSPECTED BY SCHNABEL ENGINEERING ASSOCIATES.

## STRATA DESCRIPTIONS

Stratum A-1: Brown fine to medium sandy silty clay, FILL and PASSABLE FILL (CL); medium to very stiff consistency (N = 4 to 17)

Stratum A: Brown sandy SILTY CLAY, with silt (CL); medium to very stiff consistency (N = 6 to 20)

Stratum B-1: Brown fine sandy clayey silt (ML) and fine to coarse silty sand, trace gravel (SM), FILL; firm density (N = 8 to 17)

Stratum B: Brown and red-brown fine sandy CLAYEY SILT, with silt (ML to MH); fine to medium SAND, trace gravel (SM) and fine SILTY CLAYEY SAND, with silt (SC); loose to very compact (N = 8 to 63)

## 4. SOIL LABORATORY TESTING

### a. Laboratory Testing and Procedures

Soil classification tests, compaction tests, and permeability tests were performed in accordance with applicable ASTM methods. Soil classifications are in accordance with the Unified Soils System, ASTM D-2487. Soil descriptions are in accordance with the "Identification of Soils" included in Appendix B.

Classification tests, including grain size analyses and Atterberg Limits testing, were performed on 79 jar samples taken from borings drilled within the borrow areas. Atterberg limits and percent fines passing the No. 200 sieve were also performed on six bulk samples, along with compaction and permeability tests. Standard Proctor Compaction tests were performed in accordance with ASTM D-698, Method A.

Falling head permeability tests were performed in accordance with EM 1110-2-1906 on samples compacted to 95 percent of maximum dry density when remolded at moisture contents of about +3 and -3 percent of optimum moisture for Strata A and A1 soils. Following compaction, samples were saturated with deaired water and deaired utilizing a vacuum pressure of 22 psi. Tests were conducted following saturation by subjecting the sample to a column of water with total excess head of 14 ft. Several readings were taken on each sample over a period of 24 hours. Calculations were made based on the falling head method.

### b. Laboratory Test Results

The results of the soil laboratory testing are included on the Summary and graphs of Appendix A. Based on the permeability test

results the soils were divided into four strata: Strata A and A1, representing materials classifying CL; and Strata B and B1, representing materials generally classifying ML, MH, SM and SC. The general soil characteristics of these strata are summarized below:

Stratum A and A1: Fine sandy silty clay, with mica (CL)

Soils of these strata are generally of low to medium plasticity with Liquid Limits varying from 20 to 43 and Plasticity Indices from 10 to 26. The coarse fraction of these materials vary from fine graded to fine to medium graded. The percent fine material by weight passing the No. 200 sieve varies from 51 to 72 percent.

Standard Proctor Compaction tests and falling head permeability tests performed on remolded samples resulted in the following values.

| Sample | Classification | % Passing No. 200 Sieve | Optimum Moisture (%) | Max (pcf) | Permeability (cm/sec) (+3%) | Permeability (cm/sec) (-3%) |
|---|---|---|---|---|---|---|
| B-3/2.5-6' | CL | 54 | 19.7 | 105.0 | $1.0 \times 10^{-7}$ | $9.0 \times 10^{-5}$ |
| B-8/5-10' | CL | 55 | 17.5 | 106.7 | $1.6 \times 10^{-7}$ | $2.9 \times 10^{-6}$ |
| B-13/5-10' | CL | 54 | 20.3 | 104.4 | $7.7 \times 10^{-8}$ | $1.6 \times 10^{-5}$ |

The compacted permeability values are very low, all on the order of $10^{-7}$ cm/sec. Permeability test values performed on the samples when compacted dry of optimum were also low, as expected, but were relatively higher under this as indicated. Permeability vs compaction moisture content plots are indicated in Appendix A.

Strata B and B1: Fine sandy clayey silt (ML and MH), fine silty sand (SM)

Soils of these strata vary from non-plastic to low to medium plastic with Liquid Limits of 20 to 67 and Plasticity Indices of 2 to 30. A wider variation occurred in the fine-grained portion of these samples with the percent fines passing the No. 200 sieve ranging from 21 to 83 percent.

Compaction tests and permeability tests performed on three samples compacted wet of optimum resulted in the following values:

| Sample | Classification | % Passing No. 200 Sieve | Optimum Moisture (%) | Max (pcf) | Permeability (cm/sec) |
|---|---|---|---|---|---|
| Bulk 1 | SM | 46 | 20.8 | 101.5 | $6.2 \times 10^{-7}$ |
| B14/2-7' | ML | 65 | 20.8 | 100.6 | $3.4 \times 10^{-7}$ |
| B18/3-7' | MH | 66 | 23.4 | 99.0 | $3.0 \times 10^{-6}$ |

Permeability values for the Stratum B soils were also very low, but were greater than $1.0 \times 10^{-7}$ cm/sec. The compaction moisture content also was not as significant in effecting the permeability of this material. A graph of permeability vs moisture content is included in Appendix A for sample B18/3-7'.

## 5. EVALUATION OF BORROW MATERIAL

### Cap Liner Material

Borrow material from Sites 1 and 2 was evaluated for use as common fill and as cap liner material. Suitable cap liner material is considered to have a permeability, $k = 1 \times 10^{-7}$ cm/sec or less. Suitable cap liner material was encountered at both borrow sites in limited quantity.

Cap liner material should consist of silty clays classified CL in accordance with the Unified Soils System, ASTM D-2487 with minimum Plasticity Index of 10 and maximum particle size of 1.0 inch. Soil of Strata A and A1 meet this criteria and may be utilized as cap liner material when suitably placed and compacted.

In order to achieve the permeability requirement, the placement moisture content must be controlled during construction. Cap liner material should be placed in maximum 8 inch horizontal loose lifts and should be compacted to at least 95 percent of maximum dry density per ASTM D-698. Moisture content at compaction should be between 3 and 4 percent above optimum moisture content in order to achieve the required permeability. Placement moisture content will be more important than dry density in achieving permeability results. A sheepsfoot roller is recommended due to its efficiency in compacting this type of material and because a kneading compaction will result in a lower permeability than was achieved in the laboratory utilizing standard compaction procedures.

Usable cap liner material has been identified within a triangular-shaped area along the south end of Borrow Site 1 as

shown on Sheet B-1. Cap liner material is concentrated within this zone to have an average thickness of about eight feet. Stratum B overburden thicknesses in this area vary from three to eight feet. Cap liner mateial is represented by Strata A and A1 as shown on the subsurface profiles at the end of Section 3. Available cap liner material is estimated at 4700 cy from Borrow Site 1.

Cap liner material is also available from Borrow Site 2. Usable quantities occur in the area shown on Sheet B-2. This material occurs at a depth of 1.5 to 7.5 with average thickness of about six feet.

Common Fill

Strata B and B-1 soils may be used as common fill for backfilling the existing acid lagoons, and as topsoil cover material above the proposed liner. Topsoil stripped from the borrow site should be stockpiled so that it may be used within the final lift of the topsoil/cover.

Strata B and B1 soils classifying ML, CL-ML, MH, SC, and SM may be utilized as common fill. Common fill should be placed in horizontal lifts not exceeding 12 inches in loose thickness, and should be compacted to at least 95 percent of maximum dry density per ASTM D-698. No limits on the compaction moisture content will be necessary although the required density will be easiest to achieve when placed at a moisture content between +3 and -3 percent of optimum moisture.

In order to facilitate compaction, an initial thick base lift may be placed with a maximum lift thickness of 24 inches. This initial lift should be compacted to at least 90 percent of maximum dry density in accordance with the same standard. Cap liner performance may be affected by settlement of the fill following placement of common fill, as specified above, including the initial lift.

## 6. CONSTRUCTION CONSIDERATIONS

Some construction dewatering to remove ponded water from the fill areas should be assumed following storm events. It will be important to maintain fill surfaces free of water and to avoid prolonged saturation in order to prevent disturbance. Site drainage will also be important during placement of the cap liner. Any fill soils which have been placed and later weakened due to saturation and disturbance should be removed as directed by the Geotechnical Engineer.

Earthwork performed during the wet and freezing winter months is likely to encounter delays since the on-site soils are highly susceptible to moisture changes and will be difficult to compact during wet weather. The natural moisture content of the borrow soils ranged from 1.9 to 6.7 percent above optimum moisture at the time of our investigation. In addition, moisture conditioning will be required for placement of the cap liner so that compaction within the specified moisture range can be achieved.

Surface drainage should be maintained within borrow areas to prevent ponding of water. Final grading and seeding should be provided to prevent erosion. Any cut slope made adjacent to the paved road along the south edge of Borrow Site 1 should be no greater than 2H:1V. Top of slope should be no closer than five feet from the edge of pavement.

SECTION 2C

LEACHATE COLLECTION AND SEEPAGE DRAIN SYSTEMS

1. APPLICABLE PUBLICATION: The American Society for Testing and Materials (ASTM) publication listed below forms a part of this specification to the extent referenced. The publication is referred to in the text by the basic designation only.

D 2729 83 Polyvinyl Chloride (PVC) Sewer Pipe and Fittings

2. SUBMITTALS:

2.1 PVC Pipe: The Contractor shall submit a certificate provided by the manufacture of the PVC pipe and fittings attesting that the PVC material meets all requirements of ASTM D 2729.

2.2 Drum Overpack Container: A 55-gallon drum overpack container, approved by the Department of Transportation (DOT) for salvage containers, shall be used as the leachate collection sump. The Contractor shall submit a certificate provided by the manufacturer of the drum overpack container attesting that the container meets all DOT requirements.

3. DELIVERY AND STORAGE OF MATERIALS: Materials shall be delivered, stockpiled and stored so as not to be buried or damaged.

4. MATERIALS:

4.1. Polyvinyl Chloride (PVC) Pipe: PVC pipe shall conform to ASTM D 2729 standards.

4.2 Perforations in PVC Pipe: Perforations in PVC pipe shall conform to ASTM D 2729 standards.

4.3 Gravel: For the leachate collection system of HWM 16, gravel drainage material shall be provided around the six-inch PVC pipe as indicated. Gravel material shall be provided as specified in SECTION: EARTHWORK.

4.4 Drainage Sand: Drainage sand to be used around the gravel drain shall be the drainage sand material as defined in SECTION: EARTHWORK.

4.5 Filter Fabric: Filter fabric shall be as specified in SECTION: FILTER FABRIC.

4.6 Leachate Collection Sump: A DOT approved, drum overpack container shall be used for the leachate collection sump.

5. PROTECTION FROM EXPOSURE TO SUN: Prior to and during installation, PVC pipe shall not be exposed to direct sunlight for more than 14 days.

6. INSTALLATION:

6.1 Pipe Installation: PVC pipes shall be laid to true grades and alignment with a continuous fall in the direction of flow and shall be of the size and length as indicated. Bells of pipe sections shall face upgrade. Interior of pipe shall be cleaned free of soil or debris before being laid. Any length that has had its grade or joints disturbed shall be removed and relaid

The open end of the initial upgradient section of PVC drain pipe shall be capped to prevent intrusion of gravel. The drain pipe shall be daylighted with cement concrete encasement as shown.

6.2 Filter Fabric: Installation of filter fabric shall be as specified in SECTION: FILTER FABRIC.

6.3 Leachate Collection Sump Installation: The container shall be installed as indicated. The container shall be placed on a level foundation. A hole shall be provided to install a six-inch PVC inlet pipe. After the connection is complete it shall be calked or sealed as recommended by the manufacturer of the container to provide a water tight seal.

SECTION 2I

TURF

PART 1 - GENERAL

1. APPLICABLE PUBLICATIONS: The following publications form a part of this specification to the extent referenced. The publications are referred to in the text by basic designation only.

1.1 Federal Specification (Fed. Spec.):

O-F-241d — Fertilizers, Mixed, Commercial.

1.2 US Department of Agriculture Federal Seed Act of August 9, 1939:

53 Stat. 1275 — Rules and Regulations.

1.3 American Society for Testing and Materials (ASTM) Publications:

D 977-84 — Emulsified Asphalt.

D 2028-76 (R 1981) — Cutback Asphalt (Rapid-Curing Type).

2. TOPSOIL SOURCE INSPECTION: The source of topsoil shall be approved by the Contracting Officer to determine the acceptability of the topsoil prior to shipment to the jobsite.

3 SUBMITTALS:

3.1 Certificates of Compliance and Certified Laboratory Test Reports for non-Government furnished material: Before delivery, certificates of compliance shall be submitted certifying that materials meet the requirements specified. Where such certification requires a laboratory test, the test shall be certified by an independent laboratory and reported as part of the certificate of compliance. Certified copies of the reports for the following materials shall be submitted:

a. Off-Site Topsoil - for pH, salts, potash, and phosphorus.

b. Soil Conditioners - for classification of total nitrogen, moisture, ash and organic matter, sand content, and pH.

3.2 Maintenance Instructions: Written instructions for year-round care of installed turf shall be furnished.

4. DELIVERY AND STORAGE:

4.1 Soil conditioners shall be delivered to the site in the original, unopened containers bearing the manufacturer's guaranteed chemical analysis, and name. In lieu of containers, soil conditioners may be furnished in bulk, and a certificate from the manufacturer indicating the above information shall accompany each delivery.

4.2 Lime and fertilizer shall be delivered to the site in bags or other containers, each fully labeled, conforming to the applicable state fertilizer laws, and bearing the name, trademark, and warranty of the producer.

4.3 Seed, fertilizer, lime and soil conditioners shall be kept in dry storage away from contaminants, insects and rodents.

## PART 2 - PRODUCTS

5. MATERIALS:

5.1 Seed shall be certified to be the latest season's crop and shall be delivered in original sealed packages bearing the producer's guaranteed analysis for percentages of mixtures and pure live seed. Seed shall be labeled in conformance with U.S. Department of Agriculture rules and regulations under the Federal Seed Act and applicable state

seed laws. Seed shall be inspected by the Virginia Crop Improvement Association and must bear an official "Certified Seed" label. Seed that has become wet, moldy, or otherwise damaged will not be acceptable. On-site seed mixing will not be allowed unless approved by the Contracting Officer. Seed mixtures shall be proportioned by weight as follows:

| Application Conditions | Seeding Mixture | Percentage of Seed | Percentage of Pure Live Seed | Application Rate per Acre |
|---|---|---|---|---|
| Fall/Spring | Tall fescue | 80 | 82.5 | |
| | Kentucky bluegrass | 20 | 68.0 | 200 lbs. |
| Summer | Tall Fescue | 50 | 82.5 | |
| | Ladino clover | 10 | 82.5 | |
| | Red clover | 10 | 82.5 | |
| | Korean lespedeza | 15 | 82.5 | |
| | Annual ryegrass | 15 | 83.3 | 80 lbs. |
| Slopes | Crown vetch | 50 | 61.8 | |
| | Perenial ryegrass | 40 | 83.3 | |
| | Redtop | 10 | 76.5 | 40 lbs. |

For summer seeding after May 1, use 10 lbs/A german miller or 2 lb/A weeping lovegrass in place of annual ryegrass or redtop. After May 15, omit Korean lespedeza and increase red clover to 20% of mixture. Application shall be as indicated in the application section.

5.2 Topsoil: Topsoil shall be obtained by the Contractor from the approved source and shall be free of any admixture of subsoil, foreign matter, objects larger than one inch in any dimension, toxic substances, clay lumps, and any material or substance that may be harmful to plant growth. The pH range shall be 5.3 to 6.0. Topsoil that does not meet this pH range shall be amended by the addition of pH adjusters, at a rate recommended based on soil tests.

5.3 pH Adjusters:

5.3.1 Agricultural limestone shall have a minimum calcium carbonate equivalent of 90 percent and shall be ground to such a fineness that at

least 90 percent will pass a 10-mesh sieve and at lease 50 percent will pass a 60-mesh sieve. Coarser materials will be acceptable provided they pass the 10-mesh sieve and the specified rates of application are increased in linear proportion to the quantities passing the 60-mesh sieve where zero passage indicates doubling the application rate.

5.3.2 Other liming material shall have a minimum calcium carbonate equivalent of 80 percent and shall be crushed to such a fineness that at least 90 percent will pass an 8-mesh sieve and at least 80 percent will pass a 10-mesh sieve.

5.4 Soil Conditioner: In order to modify the texture, structure, or drainage characteristics of the soil located within the limit of seeding but not part of the cover system, thoroughly rotted sawdust shall be used for soil conditioning. Sawdust shall have 6 lbs of nitrogen added to each cubic yard and shall be free of stones, sticks, and toxic substances.

5.5 Fertilizer: Fertilizer shall be commercial grade, free flowing, uniform in composition and shall conform to applicable State and Federal regulations. Granular fertilizer shall conform to Fed. Spec. O-F-241, Type I, Level B, with a minimum of ten percent nitrogen content, and shall bear the manufacturer's guaranteed statement of analysis. Fertilizer shall be used for all areas located within the limits of seeding.

5.6 Mulch: Mulch shall be straw or hay mulch, tacked with asphalt; straw or hay mulch fixed in place with disk land packers or disk harrows; or fiber mulch applied simultaneously with grass seed and fertilizer by the use of hydroseeding machinery. Mulch shall be used for all areas within the limits of seeding.

5.6.1 Straw shall be stalks from oats, wheat, rye, barley, or rice that are free from noxious weeds, mold, or other objectionable material. Straw shall be in an air-dry condition and suitable for placing with blower equipment.

5.6.2 Hay shall be native hay, sudan-grass hay, broomsedge hay, or other herbaceous mowing, free from noxious weeds, mold, or other objectionable material. Hay shall be in an air-dry condition and suitable for placing with blower equipment.

5.6.3 Wood cellulose fiber for use with hydraulic application of grass seed and fertilizer shall consist of specially prepared wood cellulose fiber or a combination of wood cellulose and recycled newsprint fibers, processed to contain no growth or germination-inhibiting factors and dyed an appropriate color to facilitate visual metering of the application of materials. On an air-dry weight basis, the wood cellulose fiber shall contain a maximum of 12 percent moisture, plus or minus 3 percent at the time of manufacture. The combination of wood cellulose and recycled newsprint fibers shall contain a maximum of 10 percent moisture plus or minus 3 percent at the time of manufacture. The pH range for either mix shall be between 4.5 and 6.5. The wood cellulose fiber shall be manufactured so that:

a. After addition and agitation in slurry tanks with fertilizers, grass seeds, water, and other approved additives, the fibers in the material will become uniformly suspended to form a homogenous slurry.

b. When hydraulically sprayed on the ground, the material will form a blotterlike cover impregnated uniformly with grass seed.

c. The cover will allow the absorption of moisture and allow rainfall or applied water to percolate to the underlying soil. Shrinkage after wetting shall not exceed 20 percent of the surface area.

5.7 Asphalt Adhesive: Asphalt adhesive for application with stray or haymulch shall be cutback asphalt conforming to ASTM D 2028, designation RC-70, or emulsified asphalt conforming to ASTM D 977, Grade SS-1.

5.3 Water: Water shall not contain elements toxic to plant life.

PART 3 - EXECUTION

6. SITE PREPARATION:

6.1 Tillage: The soil shall be tilled to a depth for at least 4 inches except on slopes steeper than 2 horizontal to 1 vertical where tillage depth shall be 2 inches. Tillage shall be accomplished by plowing, disking, harrowing, roto-tilling or other approved operations until the condition of the soil is acceptable. The work shall be performed only during periods when beneficial results are likely to be obtained. When drought, excessive moisture, or other unsatisfactory conditions prevail, the work shall be stopped when directed by the Contracting Officer. Undulations or irregularities in the surface shall be leveled before the next specified operations.

6.3 Application of Soil Conditioner: The soil conditioner shall be applied onto the soil in one inch layers or at a rate of 134 cubic yards per acre. Urea (46-0-0) shall be applied over the sawdust at a rate of 200 lbs per acre. The soil conditioner shall then be incorporated into the soil with the fertilizer to a depth of at least 4 inches and may be incorporated as part of the tillage operation. Immediately before seeding, the soil shall be restored to an even condition. Soil conditioner shall not be used for the cover system.

7. APPLICATION:

7.1 Seeding Seasons and Conditions: Seeding shall not be applied when the ground is frozen, snow covered, during droughts, high winds, excessive moisture, or in an unsatisfactory condition for seeding. Seeding shall be done within the following dates:

| Application Condition | Seeding Date |
|---|---|
| Fall/Spring | 3/15 - 5/1 and 8/15 - 10/1 |

| | |
|---|---|
| Summer | 5/1 - 8/15 |
| Slopes | 3/15 - 5/1 and 8/15 - 10/1; for 5/1-8/15 use summer seed application. |

Summer seed application may be used for Fall and Spring conditions.

7.2 Seeding:

7.2.1 Seed shall be broadcast uniformly by approved sowing equipment at the rate designated in Paragraph 5.1. One half of the seed shall be sown in one direction, and the remainder shall be sown at right angles to the first sowing. The seed shall be covered to a maximum depth of 1/4 inch by means of spike-tooth harrow, cultipaker, or other approved device. Seed shall not be broadcast when winds are above 10 miles per hour.

7.2.2 Drill seeding shall be accomplished using approved equipment such as cultipaker seeders and grass seed drills. The seed shall be drilled uniformly to an average depth of 1/4 inch.

7.2.3 When hydroseeding, the seed, fertilizer, and approved mulch material shall be mixed in the required amount of water to produce a homogeneous slurry and then uniformly applied under pressure at the rate specified in Paragraphs 5 and 6. Wood cellulose mulch shall be added after the seed and fertilizer have been thoroughly mixed and shall be applied at the rate of 1000 pounds per acre (dry weight). Lime, if applied hydraulically, shall be a single, separate operation.

7.2.4 Immediately after seeding, the entire area shall be rolled with a roller not exceeding 90 pounds for each foot of roller width, and the soil moistened with water. If seeding is performed with a cultipacker-type seeder or if seed is applied in combination with hydromulching, rolling will be required.

7.2.5 Mulch shall be spread uniformly in a continuous blanket, using 1-1/2 tons per acre. Mulch shall be spread by hand or by a manure spreader, a modified grain combine with straw-spreader attachment, a blower-type mulch spreader, or a blower-type spreader so equipped that straw or hay will be ejected simultaneously with asphalt adhesive or other suitable equipment. Mulching shall be started at the windward of relatively flat areas, or at the upper part of a steep slope, and continued uniformly until the area is covered. The mulch shall not be bunched. Immediately following spreading, the mulch shall be anchored to the soil by applying an asphalt adhesive. When asphalt adhesive is to be applied to a previously placed mulch or on slopes and embankments, application shall be by spraying at the rate of 10 to 13 gallons per 1,000 square feet. When applying straw and asphalt simultaneously, SS-1 emulsion with penetration between 150-200 shall be used, and shall be applied with the straw at the rate of 150 gallons of emulsion per ton of straw. If the emulsion is further diluted at the ratio of 60 parts of emulsion to 40 parts of water, the diluted emulsion shall be applied with the straw at the rate of 250 gallons of emulsion per ton of straw. The adhesive-coated mulch shall be applied evenly over the surface so that the depth and thickness of the mulch will be approximately uniform throughout the treated area and sunlight will not be completely excluded from penetration to the ground surface. The adhesive-coated mulch shall be applied at the rate of 1-1/2 tons per acre.

7.3 Fertilizer: Fertilizer shall be applied at a rate of 1000 pounds per acre, 10-20-10. Fertilizers shall be incorporated into the soil to a depth of at least 4 inches and may be incorporated as part of the tillage operation.

7.4 Temporary Winter Cover: When the completion schedule of the work under the contract requires a delay in the seeding operations due to the limitation dates above, the areas not yet seeded or which do not have a vegetative cover shall be seeded immediately with a temporary winter grass. Temporary winter cover planting shall include the application of 1/2 the amounts of fertilizer specified with the remaining 1/2 to be

included with the permanent seeding operations. The areas to be seeded to a temporary winter cover shall be thoroughly tilled prior to seeding in the same manner as specified for the permanent seeding. Areas which have been provided with temporary winter cover shall be thoroughly tilled and turfed with permanent species.

8. PROTECTION OF SEEDED AREAS: Immediately after seeding, the area shall be protected against traffic until final acceptance.

9. TURF ESTABLISHMENT PERIOD:

9.1 Length of Period: The turf establishment period will be in effect for 3 months or until the turf has been mowed three times, whichever is longer.

9.2 Proper Stand of Turf: A proper stand of turf is defined as a minimum of 100 grass plants per square foot and where no gaps larger than 4 inches in diameter occur anywhere in the turfed area. Any seeded areas that do not meet this criteria, shall be reseeded at the Contractor's expense.

9.3 Maintenance During the Establishment Period:

9.3.1 The turfed area shall be mowed to a height of 3 inches whenever the average height becomes 4 inches. The clippings shall be removed. Mowing shall be done with sharp equipment on dry grass and firm soil.

9.3.2 The turf shall be watered at such intervals and at such a rate that wilting, puddling, and runoff do not occur.

9.3.3 The turf shall be fertilized after the first month of growth applying 0.50 pounds of available nitrogen per 1,000 square feet, and again in 3 weeks using the same mix.

10. FINAL ACCEPTANCE: Final inspection and acceptance will be at the end of the turf establishment period. Acceptance will be based upon a satisfactory stand of turf as defined in paragraph TURF ESTABLISHMENT PERIOD.

1.4 Calculations showing drainage swales can handle RUN-OFF

U. S. ARMY
HUNTSVILLE DIVISION, CORPS OF ENGINEERS

| SUBJECT: Radford AAP Closure of Acid Waste Lagoons and Hazardous Waste Landfill | COMPUTED BY: C. Robert Britton | DATE: 20 May 87 |

| | CHECKED BY: | (205) 895-5240 DATE: |

Problem: Provide Calculations showing that the drainage swales at each unit can handle estimated runoff from a 25-year storm event.

$Q = CIA$

$C = .8$

$I = 5$ in/hr

Area = Amount of land Area drained into swale. More than 1 swale may drain each Lagoon, This Area may not be actual size of Lagoon.

Calculate Q

1. HWM 5

Area = .103 Ac.

$Q = (.8)(5)(.103) = .412$ cfs

3. HWM 7

Area = ~~(.028)~~ .028 Ac

$Q = (.8)(5)(.028) = .112$ cfs

4. HWM 16

Area = ~~.201 Ac~~ .526 Ac

$Q = (.8)(5)$ ~~(.201)~~ (.526) Acre = ~~.804 cfs~~ 2.104

## HWM # 5

$$V \Rightarrow \frac{1.486}{N} R^{2/3} S^{1/2}$$

$Q \Rightarrow .412$ CFS ANTICIPATED FLOW FROM DESIGN STORM.

$$V \Rightarrow \frac{1.486}{.025} \times 1.05^{2/3} \times .025^{1/2}$$

$$V \Rightarrow 59.44 \times 1.03 \times .16$$

$$V \Rightarrow 9.79$$

$$Q = VA$$

$$Q \Rightarrow 9.79 \times 4 = 39.6 \text{ CFS}$$

$39.6 \text{ CFS} > .412 \text{ CFS}$

$\therefore$ DRAINAGE IS ADEQUATE

AREA OF CHANNEL = 30 SF

# HWM = 7

$Q \Rightarrow$ 1.12 ANTICIPATED FLOW FROM DESIGN STD

$$V \Rightarrow \frac{1.486}{.025} \times (1.34)^{\frac{2}{3}} \times (.014)^{\frac{1}{2}}$$

$$V \Rightarrow 59.44 \times 1.215 \times .118$$

$V \Rightarrow 8.52$ CFS

$Q = VA$

$Q = (8.52\,CFS)(14) \Rightarrow 119.8$ CFS

DITCH IS CAPABLE OF HANDLING

$119.3\,CFS > 1.12\,CFS$

$\therefore$ DRAINAGE IS ADEQUATE

# HWM #16

$Q \Rightarrow$ 2.104 CFS

ANTICIPATED FLOW FROM DESIGN STORM

$$V \Rightarrow \frac{1.486}{.025} \times (.533)^{2/3} \times (.071)^{1/2}$$

$$V \Rightarrow (59.44) \times (.660) \times (.266)$$

$V =$ 10.43

$Q = VA$

$Q =$ (10.43 X 16.5) $=$ 166.96

Ditch CAPABLE OF HANDLING 166.96CFS

166 > 2.104CFS

∴ DRAINAGE SWALE IS ADEQUATE

Drainage Control

At the HWM 5 and HWM 7 sites, external drainage is well controlled by existing features (e.g., roads, ditches, culverts and pipes) and no run-on is anticipated. Runoff from the closed facilities will be routed to peripheral drainage swales. Since the drainage areas for these drainage swales are very small (no more than one-half acre), these swales should be able to handle flows without any potential threat to the cover system.

Due to the natural drainage patterns found in the vicinity of HWM 16, there are no existing controlled drainage systems with the exception of a depressed area located northeast of the site, which drains through an existing 18-inch RCP. Runoff from the proposed cover area and immediate vicinity will be routed by drainage swales around the closed facility to the existing depressed area where it will drain through the existing 18-inch RCP. The pipe capacity necessary to handle a 25-year storm event under the new contour conditions was checked using the rational formula as described in the Virginia Erosion and Sediment Control Handbook (VSWCC, 1980). The peak discharge to the 18-inch RCP was calculated to be approximately 6.2 cfs for the 25-year storm event based on a drainage area of approximately 10 acres. The capacity of the existing 18-inch RCP is sufficient to discharge a flow rate of 12 cfs. Therefore, the pipe capacity is sufficient for drainage of surface waters in the vicinity of HWM 16.

## Performance Evaluation

To determine more completely the adequacy of the proposed cover system, an additional evaluation was made to ensure the performance of the proposed cover system under various environmental and climatic conditions.

### Frost Action

If the impermeable liner material is within the depth of frost penetration, the freezing soil could apply a high stress to the liner and cause an excessive deformation of the liner, which eventually might lead to the failure of the liner system. The depth of frost penetration in the Radford area is about 15 inches (Figure 12 from Lutton, 1980). Since the thickness of the cover soil above the PVC liner is 36 inches, frost penetration should not reach the soil layer supporting the membrane liner.

### Erosion Potential

The erosion potential can be evaluated by the Universal Soil Loss Equation (USLE) which is a convenient and widely accepted method. The USLE gives average annual soil loss as the product of six erosion-related factors. The equation is:

$$A = R\,K\,L\,S\,C\,P$$

where A = average annual soil loss, in tons/acre
R = rainfall and runoff erosivity index
K = soil erodibility factor, tons/acre
L = slope-length factor
S = slope-steepness factor
C = cover/management factor
P = practice factor

| | | 6.35/3 = 2.12 |

SCHEDULE

Within 180 days after the approval of the closure plan, the owner/operator and Independent Professional Engineer will certify that closure was completed in accordance with the approved closure plan.

CERTIFICATION OF CLOSURE

The Professional Engineer shall be present at each unit at the following frequencies.

a) Twice during the construction of the clay cap

b) Once during the installation of the PVC liner

c) Once when closure is completed

Test results showing desired permeability has been achieved, optimum fly ash/limedust mix at HWM #7, and a schedule of these submissions as well as for A - C above will be submitted to the Department of Waste Management.

DEPARTMENT OF THE ARMY
RADFORD ARMY AMMUNITION PLANT
CALLER SERVICE 2
RADFORD, VIRGINIA 24141-0298

REPLY TO ATTENTION OF

September 16, 1987

Office of Chief Engineer

Mr. Kevin L. Greene
Division of Technical Services
Virginia Department of Waste Management
11th Floor, Monroe Building
101 N. 14th Street
Richmond, Virginia 23219

Dear Mr. Greene:

In reference to your July 22, 1987, letter, enclosed is RAAP's response to the Virginia Department of Waste Management comments on closure plans for hazardous waste management (HWM) units 5, 7 and 13. We regret the delay in submitting this information to you.

As discussed with Mr. Wayne King (U.S. Army Engineer Division, Huntsville) and Ms. Shelley Barker (RAAP), the information on HWM unit 16 will be submitted as it becomes available.

If you have any further questions or comments, please contact Ms. Shelley Barker, AC 703 639-8482.

Sincerely,

Todd E. Blose
Captain, Ordnance Corps
Acting Commander

Enclosure

Copy Furnished:

Mr. Jim Morris, Hercules Inc., RAAP, Radford, VA 24141-0299 (w/encl)

RADFORD AAP CLOSURE PLANS

RESPONSE TO STATE OF VIRGINIA COMMENTS

1. Reference

c. Results of Sludge Bench Test HWM-7, Radford AAP, Radford, Virginia. Engineering Science, Fairfax, Virginia, June 1986.

d. Closure of Hazardous Waste Lagoons and Hazardous Waste Landfill, Radford Army Ammunition Plant, Radford, Virginia.

e. Soil Mechanics Lambe, T.W., Whitman, R.V., Wiley and Sons, 1969.

f. Soil Mechanics, Perloff W.H., Baron W., Wiley and Sons, 1976.

2. The references in paragraph 1 contain the Geotechnical Data and methods for the determination of bearing strengths of stabilized sludges, bearing capacity of the impoundment fill material, settlement of the foundation and, ultimately, the estimated settlement of the impoundment cap, as shown in the following sections. The item numbers in the following sections correspond to the RCRA Part B Permit requirements and Regulator's comment designations.

3 Item I-1e(1) (b) HWM-5

3.1 Waste Stabilization

3.2 Although stated in the Closure Plans, the construction documents (Ref D) do not specify the equipment or methods for mixing the soil and reagent. The "Results Spec" used in the contract documents requires the Contractor to compact the soil - lime kiln dust mixture to a percentage of the maximum possible density as specified in section Earthwork. Also see section Sediment and Subsoil Treatment.

3.3 Bearing Capacity of Structural Fills - HWM-5:

3.3.1 Soil Data -

Common Structural Fill: Loose to dense, sandy clayey silts and fine silty sand

Subsoils at HWM-5: Medium dense fine sand

Use bearing capacity factors for loose materials.

($N_c$ - 0 $N_\gamma$ - 5 $N_q$ - 8 For bearing strength calculations.

Df - $d_\gamma$ d - depth of soil removed B - width of cap

3.3.2 Beneath the Cap

Depth - $D_f$ - 5', Unit Weight - 110 pcf (assumed)

Bearing Capacity - Qult - $CN_c + D_fN_q$ - 1/2 $BN_\gamma$

- 0 + __ + 1/2 (60) (5) (110)

- 16,500 psf

Cap Loading - 5(110) - 550 psf

3.3.3 What the Bottom of the Impoundment Can Support

(1) Assume since impoundment is empty Df - 0

(2) Weight of native soil is 110 psf - $\gamma$

Qult - 0 + 0 + 1/2 (60) (5)(110)

- 16,500 psf

Backfill + Cap Loading - (110) (15) - 1650 psf

3.3.4 Note that the above calculations are very conservative, since the parameters are for loose soils rather than compacted, medium dense to dense soils.

3.4 Item I - 1e(6) Settlement and Subsidence - HWM-5

3.4.1 Settlement in compacted fills - HWM-5.

From Figure 1, Consolidation Data obtained for fine sandy clayey silts (which is typical for the common structural fill materials and also corresponds to the soils at the elevation of the impoundment bottom):

The settlement in the compacted fill produced by five feet of cap material is as follows:

Original Load = 5 x 110 = 550 psf

Applied Load = 5 x 110 = 550 psf

Strain from Figure 1 for 550 psf to 1050 psf = 0.018 - 0.0009 = 0.009%

Settlement = H X strain

= 10 x .009

= .09 Feet

= 1.08 inches say 1.1 inches

3.4.2 Settlement in the foundation soils.

For the soil stratum extending to 20 feet below the impoundment -

Initial loading = 10' x 110 pcf = 1100 psf

Applied Loading, say 15' x 110 pcf = 1550 psf

Strain from 1100 psf to 2650 psf (Figure 2)

= .027 - 0.016 = 0.011%

Settlement in the first 20 feet below the lagoon

= 20 (0.011)

= .22 feet

= 2.64 inches

3.4.3 Performance of the 5-foot thick cap will not be adversely affected by settlement totaling only 1.5 inches for both the fill material and the 20' of foundation soils below the impoundment.

Item 3.e(1)(b) HWM-7

4.1. Waste Stabilization, Bearing Strength, and Settlement Data was submitted March 1987.

4.2. Bearing Capacity of Structural Fills at HWM-7

Fill materials will be similar to these discussed in Paragraph 3.3.

4.3. Bearing Capacity of Foundations

Data obtained from borings in the vicinity of HWM-7 indicate the subsoils consist of loose to medium dense silty sand, and sandy clayey silts.

Use Bearing Capacity Factors $N_c = 0$ $N_\gamma = 5$ $N_q = 8$

Depth of Cap = 5 Feet, $\gamma = 110$ pcf

Depth of Common Fill = 8 Feet, $\gamma = 110$ pcf

Depth of Stabilized Waste = 7 Feet, $\gamma = 100$ pcf

$$q_{ult} = cN_c + [28\ psf]\ N_q + 1/2\ BN_\gamma$$

$$q_{ult} = 0 + [(110)(5) + (110)(8) + (100)(7)]8 + 1/2\ (60)(5)$$

$$q_{ult} = 0 + 17,040 + 150 = 17,190\ psf$$

Overburden Loading = 2,130 psf

5. Item I - 1e(6) Settlement and Subsidence - HWM-7

5.1. Settlement of Structural Fill Material

Settlement due to five feet of cap materials and eight foot layer of structural fill is as follows:

Initial Loading = 4(110) = 440 psf = 0.22 tsf

Cap Loading = 5(110) = 550 psf = 0.28 tsf

Final Loading = 9(110) = 980 psf = 0.50 tsf

Strain from 0.50 tsf to 0.22 tsf (From Figure 1)

= 0.0125 - 0.008 = 0.0045%

Settlement = H X Strain

= 8(.0045)

= 0.04 Feet

= 0.43 Inches

5.2. Settlement of Stabilized Sludges -

Information on Settlement of Stabilized Sludges was previously submitted March 1987. Settlement was estimated to be 3.4 inches.

5.3. Settlement of Foundation Soils

For the soil stratum extending to 20 feet below the impoundment:

At the mid layer initial loading

= 10 X 110 psf = 1100 psf = 0.55 tsf

Applied loading from backfill, cap and stabilized waste

= 2130 psf = 1.07 tsf

Final loading = 0.55 + 1.07 = 1.62 tsf

Strain (From Figure 2)

= 0.029 - 0.016 = 0.013%

Settlement = H X Strain

= 20(0.013)

= 0.26 feet = 3.12 inches

5.4. The cap at HWM-7 will experience only very minor settlement after completion. The silt and sand structural backfills and subsoils usually compress very rapidly during filling and compaction operations. Very little long term settlement is expected. The above figures indicate the performance of the cap will not be adversely affected by settlement of the foundation, stabilized sludges or common structural backfill.

6. Comments on HWM-16

Below are calculations based on very conservative estimates using loose sand. These calculations are to be used only a "worst case" estimation for HWM #16.

Bearing Capacity of Fill

$(N_c = 0,\ N = 5,\ N_q = 8)$

$D_f = 14$ ft  Unit Weight = 110

Bearing Capacity = qult = $CN_c + D_fN_q + 1/2\ BN_+$

= $0 + (14)(8) + 1/2(60)(5)(110)$

= $112 + 16{,}500$

= 16,612 psf

CAP Loading

$(5)(110) = 550$ psf

550 psf < 16,612 psf

What Bottom of Landfill Can Support

(19 ft)(110 psf) = 2090 psf

Settlement in compacted fill

Original Load = (5)(110) = 550 psf

Applied Load = (5)(110) = 550 psf

Strain from figure 1 for 550 psf to 1100 psf

.018 - .009 = .009%

Settlement = (Height)(Strain)

(10)(.009) = .09 ft

= 1.08 inches say 1.1 inches

Settlement in foundation soils

Initial Loading - (14)(110 pcf) - 1540

Applied Loading - (19)(110 pcf) - 2090

Strain from 1540 psf to 2090 psf (Figure 2)

.023 - .019 - .004%

Settlement in first 20 feet

(20)(.004) - .08 feet

- .96 inches

Say 1 inch

Performance of the 5-foot cap will cause an estimated settlement for both the material and 20 feet of foundation soils of 2.1 inches.

RADFORD AAP, VIRGINIA

DATE 7-24-85

CONTRACT NO. V84482

DRAINAGE AND DEWATERING:

General: Drainage and dewatering shall consist of the control of surface water, regardless of origin, nature or quantity, flowing toward and tending to collect in fills, backfills, or excavations. This water shall be controlled in a manner providing effective, continual drainage of excavations, fills and surrounding area.

Surface Water Control: Diversion ditches, dikes and grading shall be provided and maintained as necessary during construction to prevent external surface water from entering or exiting excavated areas. Excavation slopes and backfill surfaces shall be protected so as to prevent erosion and sloughing. Water accumulated with HWM 5 and HWM 7 shall be controlled in accordance with Paragraph 6, SECTION: WASHDOWN STATION AND EQUIPMENT CONTAMINATION. (Appendix C)

Ground Water Control: groundwater flowing toward or into excavations shall be controlled to prevent sloughing of excavation slopes and walls, boils, uplift and heave in the excavation, and to eliminate interference with the orderly progress of construction.

Sediment Control: Sediment and suspended solids in run-off water shall be contained within the construction areas.

During the closure period, groundwater monitoring shall occur at least quarterly.

# POST CLOSURE CARE AND GROUNDWATER MONITORING

## HAZARDOUS WASTE SURFACE IMPOUNDMENTS

In accordance with the Virginia Hazardous Waste Regulations, this section presents the post-closure plan for HWM 5 and 7 based on the closure of both sites as hazardous units. Unless otherwise determined by the State Executive Director post-closure care is to extend over a 30-year period (10.6.H). The major components of post-closure care as proposed in this plan are groundwater monitoring, inspection and maintenance. Possible contingency activities are also described in this section. This plan will extend until such time as a post closure care permit is issued.

### Post Closure Contact

Regginald Tyler
RADFORD ARMY AMMUNITION PLANT
(703) 639-8641

### Groundwater Monitoring

Results of the Groundwater Quality Assessment Program conducted at the sites indicate that groundwater contamination has occurred. In response to these monitoring results a Compliance Monitoring program will be instituted under 10.5.B and will continue during the post-closure period.

This Compliance Monitoring Program will be implemented using a minimum of four wells (one upgradient and three downgradient), constructed in accordance with 10.5.H. The wells to be used will be selected after final review of the Groundwater Quality Assessment Program.

Samples will be collected in accordance with 10.5.H.4 and (5) on a quarterly basis. Background groundwater quality will be determined for each constituent as specified in 10.5.H.7. The water quality parameters that will be analyzed as part of this program include:

- Specific conductance
- Total organic carbon (TOC)
- Total organic halogen (TOX)
- pH
- Any additional parameters as agreed

For quality control purposes, samples will be split into four portions for analysis. Groundwater elevations will be measured for each sampling event and the direction and rate of groundwater flow will be determined on an annual basis. Additionally, all monitoring wells will be analyzed for Virginia Regulations Appendix 3.6 hazardous constituents on an annual basis.

It is anticipated that because of the nature of the wastes in the surface impoundments and the closure activities to be conducted as described in Section 6.0, the Radford AAP may elect after several years of groundwater monitoring to discuss with the State the requirement for monitoring over a 30-year period. It is probable that the groundwater quality at these sites will improve to ambient levels after several years. If monitoring confirms this then groundwater monitoring could be terminated or reduced in scope.

Inspection

In accordance with 10.6.I.2.(a) regular post-closure inspections of the sites will be made to ensure the integrity of the cover system and all associated structures. Inspections will be conducted by qualified personnel on a monthly basis, with additional inspections following inclement weather or catastrophic events (e.g., fire or explosion elsewhere at the Radford AAP). To ensure that all items of

interest are addressed during the inspection, an inspection log will be used during each inspection. This inspection log will list the potential problems/conditions that the inspector should note while conducting the inspection. The inspector will be asked to identify the existence or absence of each problem and, if present, to address its degree of severity (e.g., low, moderate or high). Table 7.1, discussed in the following paragraphs, provides a listing of all items to be inspected.

Because failure of the soil cover or the underlying PVC liner could result in increased infiltration and leachate generation, it is necessary to inspect the cover for surface erosion, subsidence, or ponding; plant root penetration, or exposure of the liner. The grass cover should be inspected for general health and the presence of undesirable competitive species, particularly deep-rooted plants or shrubs. Vegetation should be kept trimmed to prevent encroachment on access controls, roads and signs. Stormwater drainage controls (i.e., slopes and swales) should be inspected for erosion, subsidence, and in the case of swales, accumulated sediment that might block the flow of stormwater. Locks and caps on groundwater monitoring wells should be inspected for damage.

The need for additional security is expected to be minimal due to the overall secure nature of the Radford plant. Therefore, the installation of warning signs will be the only additional security measure taken during the post-closure care period, as only authorized personnel are allowed to enter the restricted portion of the Radford AAP.

Maintenance

The nature and degree of post-closure maintenance of the site will be primarily determined by observations made during the routine inspections. However, since the Radford AAP will remain in operation, plant personnel will have the opportunity to observe the need for maintenance on a more frequent basis. A description of the expected maintenance activities that will be performed in accordance with

10.6.I is discussed below.

The cover, drainage slopes, and vegetation will be maintained as needed. Damage due to erosion and subsidence will be corrected by adding soil and regrading the site. It is expected that no significant subsidence will occur following closure, and thus only erosion would be the major long term concern. Maintenance of vegetation necessary to control erosion will include removing deep-rooted plants and adding fertilizer to enhance growth as necessary. Overgrowth into drainage swales and access roads will be controlled. Swales will be cleared of any accumulated material. These precipitation run-off pathways will be tested annually for the constituents of which were disposed in the units to determine if precipitation run-off is becoming contaminated.

Security will be maintained by immediately repairing or replacing any damaged signs or access roads. Damaged monitoring wells will be repaired if possible. If it is determined that the integrity of the well has been destroyed, then the well will be replaced. Surveyed benchmarks used to indicate the location of the site will be protected and maintained as necessary. The general perimter of the surface impoundment will be easily recognizable due to the presence of riprap for slope protection.

Contingency Activities

In the event of major damage, contingency measures will be promptly taken erosion will be repaired by the most appropriate of the following measures: replacement of cover or fill soil; restoration of original grade design or replacement with new grade design; and/or installation of riprap. Any other cover deterioration due to deep-rooted plants, cracking, cold weather, or slope instability will be promptly corrected by filling, regrading and reseeding, as appropriate. Damage to vegetation will be controlled by the addition of nutrients, manual watering (in the event of drought), and/or pest control as appropriate.

# INSPECTION CHECKLIST FOR CLOSED ON-SITE FACILITIES

Inspector Name:

Date:

| access road | disrepair | | |
| LEACHATE COLLECTION SYSTEM (H&M #16) | BASIN FULL | | |
| | OPERATING EFFECTIVLY | | |

HAZARDOUS WASTE LANDFILL TRENCH

Since post-closure care is also required for HWM 16, groundwater monitoring and inspection programs similar to those outlined will be implemented. An additional inspection item for HWM 16 would be the leachate collection sump. If any leachate is found to have accumulated in the sump, it will be removed and managed as a listed hazardous waste and more frequent inspections will be conducted. If it is deemed necessary, a routine leachate removal program will be implemented. As in the case of the surface impoundments, surface water monitoring will be performed annually along drainage ditches to determine if surface water run-off has become contaminated to ensure that there will be no release to surface water from the site. Post-closure care will continue for 30 years, unless otherwise determined by the Executive Director. This plan will remain in effect until such time as a Post Closure Permit is issued.

FUTURE USE RESTRICTIONS

In accordance with 10.6.H.3., there will be no use of the disposal areas (HWM #5, HWM #7, and HWM #16) which would allow any disturbance of the integrity of the final cover, liner(s) or any other components of any containment system, or of the function of the associated monitoring systems. Land use activities that will be prohibited at each facility include:

- On-site construction
- Excavation (except as necessary for major maintenance activities)
- Well construction on or near the site
- Agricultural use
- Silvicultural use
- Water infiltration (run-on, ponding, irrigation)
- Recreational use
- Disposal operations
- Vehicular traffic (except as necessary for major maintenance activities)
- Housing on or near the site.

NOTICE TO LOCAL LAND AUTHORITY

As required by 10.6.J, the Radford AAP will submit to the local land authority survey plans prepared and certified by a professional land surveyor which show the disposal areas (HWM #5,

#7, and #16) with respect to permanently surveyed benchmarks. These plans shall contain a note stating that there will be no disturbance of the disposal areas by Radford AAP.

NOTICE IN DEED TO PROPERTY

As required by 10.6.J, a notation (HWM #5, #7, and #16) will be made on the deed to the facility property that will notify, in perpetuity, any potential purchaser of the property that: (1) the land has been used to manage hazardous waste; (2) its use is restricted to that of open space; and (3) the survey plan and record of the type, location, and quantity of hazardous wastes disposed on site has been filed with the Executive Director and local land authority.

## SOIL TREATMENT

The bottom sediments and subsoil of HWM 5 and HWM 7 will be treated with lime kiln dust and a mixture of cement kiln dust and flyash, repectively. The objectives of this treatment are to stabilize the soft sediments, especially at HWM 7, and to retard release of potential contaminants.

### Source of Soil Treatment Reagent

U.S. Gypsum at Kimballton, Virginia, the supplier of lime to Radford AAP, can supply about 25 tons of lime kiln dust per day, delivered in a pneumatic truck. Cement kiln dust is also available locally in large quantities from Lonestar Cement, Culverdale, Virginia about 45 miles from the RAAP. Flyash is available from the RAAP. For application at the HWM 7 site, three parts flyash and one part cement kiln dust will be used. Once unloaded, storing and handling of this type of material would involve many problems (e.g., storage space, dust, and protection from rain and wind). Therefore, it is desirable to plan the soil treatment work in accordance with the material production and delivery schedule.

### Method of Construction

The impoundment bottom of HWM 5 is not likely to be soft and therefore, any light equipment (e.g., loader, grader, small bulldozer, tiller, etc.) should be able to work on it to mix lime kiln dust into the soil. At HWM 7, however, the bottom sediments and soil are anticipated to be too soft to support any equipment. Therefore, the mixing equipment for the HWM 7 sediment treatment will be a clamshell or the equivalent, with a bucket or hoe extensible to the center of the lagoon from the bank.

## SOIL SAMPLING AND ANALYSIS

The objective of the soil sampling and analysis program is to document the characteristics of subsoils (HWM Nos. 5 and 7) for future reference. This documentation could be very useful should a need arise to trace the source of any future groundwater contamination and to develop a corrective action program.

SECTION 2F

EARTHWORK

1. APPLICABLE PUBLICATIONS: The publications listed below form a part of this specification to the extent referenced. The publications are referred to in the text by the basic designation only.

1.1 Military Standards (Mil. Std.):

D 4318-84 Liquid Limit, Plastic Limit, and plasticity Index of Soils

2. SUBMITTALS:

2.1 Gradation Curves for Drainage Material: The Contractor shall furnish the Contracting Officer gradation curves provided by the approved laboratory for drainage sand and gravel in accordance with ASTM C 136.

2.2 Construction Plans: Prior to commencement of earthwork, the Contractor shall submit in writing, for the Contracting Officer's approval, a Grading, Excavation and Backfilling plan with the sequence of operation. The plans shall show: the type, rated capacity, and quantity of equipment to be used; location of proposed temporary stockpiles; the drainage, sediment control, and dewatering plan which shows the diversion and removal of surface water from excavated areas; and a storage plan for materials: drainage sand, gravel and riprap.

2.3 Test Results: Two copies of all geotechnical test results, including calibration curves and results of calibration tests, shall be submitted to the Contracting Officer within 24 hours of conclusion of physical tests.

3. MATERIALS:

3.1 Satisfactory Materials: Satisfactory materials for use as fill or backfill shall be materials classified in MIL-STD-619, as GW, GP, GM, GC, SW, SP, SM, SC, ML, MH and CL, and free from roots and other organic matter, trash, debris, frozen materials, and stones larger than 3 inches in any dimension.

3.2 Compacted Fill: Compacted fill shall be satisfactory materials obtained from borrow pits as shown. Additionally, all material excavated from the bank for construction of the HWM 5 and HWM 7 access ramps shall be used as compacted fill. Hypalon liner removed from HWM 5 shall be buried as part of the backfill in HWM 5.

3.3 Clay Liner: Material to be used in constructing the compacted clay liner shall be CL as classified in MIL-STD-619, having a liquid limit between 30 and 60.

3.4 Drainage Material: Drainage materials shall be sand or gravel as indicated. Drainage materials shall be graded between the limits specified hereinafter.

3.4.1 Cover System Drainage Sand: The drainage sand material shall be free of sharp stones or any material that would puncture the PVC liner. The sand shall conform to the following gradation:

| Sieve Size | Percent by Weight Passing |
|---|---|
| 3/8 inch | 100 |
| No. 4 | 86 - 100 |
| No. 10 | 44 - 87 |
| No. 20 | 12 - 52 |
| No. 40 | 0 - 26 |
| No. 100 | 0 - 5 |
| No. 200 | 0 - 1 |

3.4.2 Gravel: Gravel drainage material shall conform to the following gradation:

| Sieve Size | Percent by Weight Passing |
|---|---|
| 2 inch | 100 |
| 1-1/2 inch | 95 - 100 |
| 1-inch | 76 - 100 |
| 1/2-inch | 30 - 80 |
| 3/8 inch | 20 - 73 |
| No. 4 | 0 - 34 |
| No. 10 | 0 - 1 |

3.5 Cover Soil: Cover soil material shall be free of roots and other organic matter, trash, debris, frozen materials, and stones larger than

3 inches. Cover soil materials shall be SM as classified in MIL-STD-619 and obtained from Borrow Pits.

3.6 Topsoil: Topsoil shall be in accordance with SECTION: TURF

3.7 Riprap: Riprap for the cover system perimeter of HWM 5 and HWM 7 shall be salvage riprap from HWM 5. Additional riprap required shall be imported and consist of sound and durable stone. All riprap material shall have a maximum size of 6 inches and be reasonably well-graded between the maximum size stone permitted and 3-inch stone, with not more than five percent by weight smaller than the 3-inch size. The least dimension of a stone shall be considered its size.

3.8 Unsatisfactory Materials: Unsatisfactory materials shall be materials that do not comply with the requirements for satisfactory materials. Materials excavated during stripping, regardless of classification, shall be treated as unsatisfactory materials for use as fill or backfill, unless directed otherwise by the Contracting Officer. Unsatisfactory materials include, but are not limited to, those materials containing roots and other organic matter, trash, debris frozen materials, stones larger than 3 inches, and materials classified in MIL-STD-619 as Pt, OH and OL. Unsatisfactory materials also include manmade fills, refuse or backfills for previous construction. Clay shale, although classified as a CL or CH, is not a satisfactory material for fills or backfills.

4. CLEARING AND GRUBBING:

4.1 General: The areas requiring excavation shall be cleared of brush and other vegetation, debris, existing foundation, pavements, utility lines, structures, fences, and other items that would interfere with construction operations. Roots and other organic matter shall be completely removed. The resulting depressions shall be filled with satisfactory material and compacted as specified.

4.2 Disposal of Cleared Materials: Materials removed shall be disposed of in the dumps as indicated. The cleared materials from the HWM 7 impoundment slopes shall be disposed of in HWM 7 and compacted as part of backfilling.

5. STRIPPING OF BORROW AREAS: The borrow areas shall be stripped to clear all roots, vegetation and organic materials. Stripped materials, regardless of classification, shall not be used for fill or backfill. The location of borings and boring logs for borrow areas are indicated in SECTION: SPECIAL CLAUSES. Stripped topsoil and unsatisfactory material shall be spread back into the borrow areas. Finished slopes of borrow area excavation shall not exceed one (vertical) to three (horizontal) and shall have positive drainage away from the site without ponded areas.

6. DRAINAGE AND DEWATERING:

6.1 General: Drainage and dewatering shall consist of the control of surface water, regardless of origin, nature or quantity, flowing toward and tending to collect in fills, backfills, or excavations. This water shall be controlled in a manner providing effective, continual drainage of excavations, fills and surrounding area.

6.2 Surface Water Control: Diversion ditches, dikes and grading shall be provided and maintained as necessary during construction to prevent external surface water from entering or exiting excavated areas. Excavation slopes and backfill surfaces shall be protected so as to prevent erosion and sloughing. Water accumulated within HWM 5 and HWM 7 shall be controlled in accordance with Paragraph 6, SECTION: WASHDOWN STATION AND EQUIPMENT CONTAMINATION.

6.3 Ground Water Control: groundwater flowing toward or into excavations shall be controlled to prevent sloughing of excavation slopes and walls, boils, uplift and heave in the excavation, and to eliminate interference with the orderly progress of construction.

6.4 Sediment Control: Sediment and suspended solids in run-off water shall be contained within the construction areas.

7. EXCAVATION:

7.1 Excavation shall conform to the lines, grades, dimensions and elevations indicated on the drawings. Excavation below indicated depths will not be permitted. The minimum distance from stockpile to excavation shall not be less than one-half of the depth of excavation, but in no instance less than three feet.

7.2 Excavation for the leachate collection sump shall be at least 24 inches larger in diameter than the sump to allow backfill compaction. Any overdepth excavation below the sump bottom will be considered unauthorized and shall be backfilled with satisfactory material at no additional cost to the Government.

7.3 Borrow Pit No. 2 shall not be used until no more borrow material is available from Borrow Pit No. 1. Clay materials obtained during excavation of the borrow materials shall be stockpiled and be used for clay liner construction only. Where satisfactory materials are not available in sufficient quantity from the borrow areas, satisfactory materials shall be obtained from approved sources outside the limits of Government-controlled land.

8. STOCKPILES:

8.1 Satisfactory excavated material from the borrow areas shall be stockpiled if it cannot be readily placed. Stockpiles shall be kept in a neat and well-drained condition and the surface shall be sealed by

rubber-tired equipment. Unsatisfactory material shall be spread within the excavated borrow area.

8.2 Material from HWM 5 and HWM 7 access ramp excavation shall be stockpiled and later used for backfilling. A run-on diversion dike shall be provided for the stockpiles of materials excavated from the HWM 5 and 7 access ramps. The stockpiles of sand and liner from the bottom of HWM 5 shall be kept covered and underlain with plastic sheets if contaminated.

8.3 Areas on Government-controlled land not previously used as stockpile areas shall be cleared prior to stockpiling material thereon.

10. PLACING:

10.1 Riprap: Riprap shall be placed as a reasonably well-graded mass of rock with the minimum practicable percentage of voids, to the lines

and grades indicated. Riprap shall be placed to its full course thickness at one operation. Freefall height of stones shall be less than two feet to avoid damaging the underlying clay liner and filter fabric. Rearranging of individual stones by mechanical equipment or by hand will be required to the extent necessary to obtain a reasonably well graded distribution of stone sizes.

10.2 Sand Drainage Material: The sand drainage material shall be placed as indicated. The sand drainage material shall be placed on the liner as a single lift of 12 inches using a light track dozer. Equipment shall not be driven on the liner with less than 12 inches of cover sand

10.3 Compacted Fills, Clay Liner and Cover Soil: Satisfactory material shall be placed in horizontal layers as specified hereinafter. The moisture content of the fill material shall be adjusted in the stockpile, borrow areas, or other approved areas to obtain the uniform moisture content as required to obtain the density specified. The surface of each lift shall be scarified before the next lift is placed. When compaction is to be accomplished by use of hand or hand-operated machine compactors, the layer thickness of each lift shall not exceed six inches in uncompacted thickness.

The clay liner shall not be installed in freezing temperatures.

10.4 Use of Clay: Clay material meeting the requirements of Paragraph 3.3 shall be used only for the construction of the compacted clay liner.

11. COMPACTION:

11.1 Laboratory Compaction Curves: The Contractor shall determine the ASTM D 698 maximum density and optimum moisture content for each different type of fill material prior to placing the fill material.

These compaction curves shall be used for field compaction quality control. The mositure control for the laboratory compaction test of the HWM 5 subsoil shall be made after mixing a required amount of lime kiln dust to the uncompacted sample.

11.2 Field Density: Field density shall be determined in accordance with ASTM D 1556, MIL-STD-621, Method 106 or ASTM D 2922. When ASTM D 2922 is used, the calibration curves shall be checked and adjusted using only the sand cone method as described in ASTM D 1556 or MIL-STD-621, Method 106. When using ASTM D 2922 for wet density, ASTM D 3017 shall be used to determine the moisture content of the soil. The calibration curves furnished with the moisture gages shall also be checked along with density calibration checks as described in ASTM D 3017. The calibration checks of both the density and moisture gages shall be made at the beginning of a job, on each different type of material encountered, and at one week intervals, whichever comes first.

11.3 Compaction Equipment: Clay liner materials shall be compacted by sheepsfoot roller. Pneumatic-tired roller, steel-wheeled rollers, or other approved equipment may be used for common fills and other materials. No sheepsfoot rollers shall be used for the compaction of any material above the PVC liner. Only a light weight, track-mounted dozer shall be used to spread and compact drainage sand on the PVC liner.

11.4 Compaction Density and Moisture Requirements: Each layer shall be compacted to no less than the percentage of maximum density (ASTM D 698) and at a moisture content specified as follows:

| | ASTM D 698 Percent Maximum Density | Moisture Content (%) |
|---|---|---|
| Cover Soil | 90% | ±2% of optimum |
| Compacted Fill | 95% | ±2% of optimum |
| Clay liner | 95% | 2 to 5% above optimum |
| Sand drainage layer | 90% | Not applicable |
| Backfill sand (HWM16) | 90% | No free liquid by Paint Filter Test |
| HWM 5 treated subsoil | 90% | ±2% of optimum |

11.5 Compaction of Drainage Sand: The drainage sand shall be placed in a single lift of at least 12 inches to protect the underlying PVC liner. The drainage sand shall be compacted with a light track dozer only.

12. PROTECTIONS:

Protection of Clay Liner: Clay liner shall be protected from drying by placing the PVC liner within three calendar days of clay liner placement. During the three day period of exposure, clay liner shall be watered as needed to prevent drying and desiccation. If the PVC liner cannot be placed within three days of clay liner construction, the clay liner shall be protected by covering with PVC liner sheets. The clay liner shall not be exposed to freezing temperatures.

13. FINISHING: The surface of excavation, embankments, fills and subgrades shall be finished to a smooth and compact surface in accordance with the lines, grades, and cross sections or elevations shown. The surface shall be within 1/10 of a foot of the grades and elevations indicated, and shall be free of depressed areas where water would pond. Drainage channels shall be finished in such a manner that will result in effective drainage. Surface of areas to be turfed shall be finished to a smoothness suitable for application of turfing materials.

14. TOPSOILING: The topsoil subgrade shall be pulverized to a minimum depth of two inches by disking or plowing for the bonding of topsoil

with the subsoil. Topsoil shall then be uniformly spread, graded, and compacted to the thickness, elevations, and slopes shown, and free of surface irregularities. Topsoil shall be compacted in two lifts by one pass of a culti-packer, roller, or other approved equipment weighing 100 to 160 pounds per linear foot of roller. Topsoil shall not be placed when the subgrade is frozen, excessively wet, extremely dry, or in a condition otherwise detrimental to seeding, planting, or proper grading. The surface shall be free of materials that would hinder seeding or maintenance.

15. TESTING:

15.1 Earthwork Testing: Field tests for density and moisture content shall be performed to assure that the specified densities are being obtained in fills and backfills.

15.3 Test Results: When test results indicate, , that compaction is not as specified, the material shall be removed, replaced and recompacted to meet specification requirements, and retested as specified.

Inspections and test results shall be certified by a registered professional civil engineer of the laboratory. These certifications shall state that the tests and observations were performed by or under the direct supervision of the engineer and that the results are representative of the materials or conditions being tested.

15.4 Number of Tests: The following number of tests, if performed at the appropriate time, will be the minimum acceptable for each type of operation.

15.4.1 Clay Liner: One density and moisture content test for every 300 square yards, or fraction thereof, of each lift of fill areas.

15.4.2 Compacted Fill and Treated Subsoil One density test for every 500 square yards, or fraction thereof, of each lift of fill areas.

15.4.3 Cover Soil and Drainage Sand: One density test for every 500 square yards, or fraction thereof, of each lift of fill areas.

15.4.4 Clay Liner Material Testing: One liquid limit, plastic limit and plasticity index per 500 cubic yards of material shall be tested using ASTM D 4318.

15.4.5 Moisture Content: In the stockpile, excavation or borrow areas, a minimum of two tests per day per type of material or source of material being placed during stable weather conditions. During unstable weather, tests shall be made as dictated by local conditions and approved by the Contracting Officer.

SECTION 2G

PVC LINER

PART 1 - GENERAL

1. APPLICABLE PUBLICATIONS: The publication listed below form a part of this specification to the extent referenced.

1.1 National Sanitation Foundation (NSF) Standard:

NSF Standard 54 Flexible Membrane Liners

2. SUBMITTALS:

2.1 Manufacturer's Specifications: The Contractor shall obtain the manufacturer's specifications showing that the PVC liner material meets all requirements included in these specifications. The manufacturer's specifications shall be submitted to the Contracting Officer for approval prior to the delivery of the material.

2.2 Shop Drawings: Furnish four copies of shop drawings for the approval of the Contracting Officer and obtain such approval before proceeding with the work. These drawings shall show details of extent, sizes and termination of the PVC lining.

3. DELIVERY AND STORAGE: Materials delivered to the site shall be inspected for damage, unloaded, and stored with the minimum of handling. Materials shall not be stored directly on the ground or in the direct sunlight. During shipment and storage, the PVC liner shall be wrapped in burlap or similar heavy duty protective covering.

## PART 2 - MATERIALS

4. PVC LINER: The 30-mil PVC liner shall be material manufactured from virgin polyvinyl chloride resin specifically compounded for impermeable lining, and which have been satisfactorily demonstrated by prior use to be suitable and durable for use as impermeable lining. Complete material specifications, descriptive shop drawings, and warranties shall be provided by the manufacturer before commencing installation of PVC liner. Other 30-mil or thicker membrane liners which essentially meet all requirements for the 30-mil PVC liner in NSF Standard 54 may be substituted upon approval of the Contracting Officer.

5. FACTORY FABRICATION: Individual widths of PVC materials shall be factory fabricated into large panels. Lap joints with a minimum width of 1/2" shall be used. Panels shall be as large as can be conveniently handled on the job site and shall be fabricated as shown on the shop drawings. Factory seams shall comply with requirements set forth by NSF as indicated in Paragraph 6.

6. PHYSICAL CHARACTERISTICS: The 30-mil PVC lining materials to be used at the HWM sites shall meet the minimum requirements set forth in NSF Standard 54.

## PART 3 - EXECUTION

7. INSTALLATION LIMITATIONS: Installation of 30-mil PVC liner shall be performed by a Contractor that has previously installed a minimum of 500,000 square feet of this material or by a Contractor that has a fabricator's field representative directing the installation. The lining material shall be placed over the clay liner as indicated in such a manner as to assure minimal handling. Any portion of lining damaged

during installation shall be removed or repaired by using an additional piece of lining as specified hereinafter. No membrane material shall be placed when air termperature is less than 50°F, when it is raining, in high winds, or when there is frost on the ground.

8. FIELD JOINTS: Lap joints shall be used to seal factory fabricated panels together in the field. Lap joints shall be formed by lapping the edges of panels a minimum of 2 inches. The contact surfaces of the panels shall be wiped clean to remove all dirt, dust, or other foreign materials. Bonding adhesive shall be applied as recommended by the fabricator. Field made splices shall have a strength of 80% of the specified sheet strength.

9. REPAIRS TO PVC LINER: Any necessary repairs to the PVC liner shall be patched with the lining material itself and bonding adhesive. The bonding adhesive shall be applied as recommended by the fabricator.

10. QUALITY OF WORKMANSHIP: Any lining surface showing injury due to scuffing, penetration by foreign objects, or distress from rough subgrade shall be replaced or covered and sealed with an additional layer of PVC liner of a proper size.

11. QUALITY CONTROL: The Contractor shall provide a technical representative of the sheeting fabricator at the jobsite to ensure compliance with the fabricator's directions. The technical representative must be present when the liner installation is started and make periodic check-backs, if required. He shall instruct and observe the work, reporting unsatisfctory conditions or recommendations for improvement in procedures to the Contractor.

SECTION 2H

FILTER FABRIC

PART 1 - GENERAL

1. APPLICABLE PUBLICATIONS: The American Society for Testing and Materials (ASTM) publications listed below form a part of this specification to the extent referenced. The publications are referred to in the text by the basic designation only.

| | |
|---|---|
| D 751-79 | Testing Coated Fabrics |
| D 1682-64 (R 1975) | Breaking Load and Elongation of Textile Fabrics |

2. SUBMITTALS: The Contractor shall furnish the Contracting Officer, in duplicate, a mill certificate or affidavit from the manufacturer of the filter fabric, certifying that the fabric meets the chemical, physical, and manufacturing requirements stated in this specification.

3. DELIVERY AND STORAGE: Materials delivered to site shall be inspected for damage, unloaded, and stored with the minimum of handling. Materials shall not be stored directly on the ground or in the direct sunlight. During shipment and storage, filter fabric shall be wrapped in burlap or similar heavy duty protective covering.

## PART 2 - MATERIAL

4. FILTER FABRIC: Filter fabric shall be a pervious sheet of non-woven polypropylene filaments with a unit weight no less than six ounces per square yard and a thickness no less than 80 mils. The filter fabric shall provide an Equivalent Opening Size (EOS) no finer than the US Standard Sieve No. 100 and no coarser than the US Standard Sieve No. 40. EOS is defined as the number of the US Standard Sieve having openings closest in size to the filter fabric openings. The fabric shall have a minimum physical strength of 100 pounds per inch in any direction when tested in accordance with ASTM D 1682 using the Grab Test Method with one square inch jaws and a constant rate of travel of 12 inches per minute. Elongation at failure shall be no less than 30 percent. The fabric shall be constructed so that the filaments will retain their relative position with respect to each other. The filter fabric shall have a minimum bursting strength of 200 pounds per square inch and a minimum puncture strength of 60 pounds in accordance with ASTM D 751.

## PART 3 - EXECUTION

5. SOIL SURFACES: Surfaces to be covered with filter fabric shall be graded to obtain smooth side and bottom surfaces so that the fabric will not bridge cavities in the soil or be damaged by projecting rock.

6. PLACING FILTER FABRIC: The fabric shall be laid smooth, but not stretched on the soil, and shall be secured with temporary anchors without damaging the underlying PVC and clay liner. Overlaps shall be at least two feet and anchor pins shall be used along the overlaps.

7. OVERLAPS ON PERFORATED PIPES: One layer of filter fabric shall be wrapped around perforated collector pipes (HWM 16 cover system) to form a minimum of two-inch continuous, longitudinal overlaps. The fabric shall be secured to the pipe in such a manner that drainage sand will not migrate through fabric overlaps.

8. OVERLAPS ON GRAVEL DRAIN: One layer of filter fabric shall be wrapped around the gravel drain of the HWM 16 leachate collection system. Overlap shall be at least 18 inches and secured in such a manner that the surrounding sand will not migrate through fabric overlaps.

SECTION 2J

WASHDOWN STATION AND EQUIPMENT DECONTAMINATION

1. GENERAL: Vehicles and equipment used within the exclusion zone of HWM 5 and HWM 7 shall be decontaminated at the washdown station before leaving the site.

2. SUBMITTALS: The Contractor shall submit to the Contracting Officer shop drawings for the washdown stations. Shop drawings shall be approved prior to commencement of work.

3. WASHDOWN STATION LOCATION AND SERVICE PERIOD: The Contractor shall provide vehicle and equipment washdown stations for HWM 5 and HWM 7 as indicated. The washdown stations shall be available for service during the demolition, soil treatment and soil sampling tasks at HWM 5 and HWM 7.

4. CONSTRUCTION OF WASHDOWN STATION: The washdown station shall consist of, at a minimum, a washwater containment pit, a wash station pad, and a 30-mil PVC membrane to line the containment pit and wash pad as indicated. The PVC lining shall be as specified in SECTION: PVC LINER. The PVC liner shall be installed on the compacted smooth surfaces. The station shall be equipped with a portable pressure water sprayer, pump, hoses and nozzles necessary to wash equipment and to transfer the washdown water to disposal areas. Washdown water is to be provided by the Contractor.

5. OPERATION:

5.1 Operation During Demolition: All vehicles and equipment which made direct contact with the contaminated material, except for the cargo

area of the transportation vehicles, within the Exclusion Area of HWM 5 and HWM 7 shall be cleaned prior to leaving the site. The cleaning shall consist of scraping off soils from all contaminated parts of equipment. The cargo area of the transportation vehicles shall be cleaned only once when transportation of all contaminated material is completed.

5.2 Operation During Soil Treatment: All equipment which was used to excavate subsoil or to mix the reagent and subsoil, shall be decontaminated at the wash station prior to leaving the site. All reagent and soil shall be removed from equipment.

5.3 Operation During Soil Sampling: Drilling and sampling tools which made direct contact with the subsurface soil shall be decontaminated at the wash station by scraping and washing with pressure water. Equipment and tools which made contact with treated surface do not need decontamination.

6. CONTROL OF WASHDOWN WATER AND SEDIMENT: The washdown water and sediment shall be contained within the containment pit. The washdown water accumulating in the containment pit shall be removed by pumping. The pumped washdown water from HWM 5 shall be disposed of in the manhole to the immediate north of the impoundment. At HWM 7, the washdown water shall be pumped to SWM 9 after adjusting pH between 6 and 9. Ph shall not be less than 2 in the pit at any time.

7. REMOVAL OF WASHDOWN STATION: The washdown stations shall be removed upon completion of the first lift of backfill compaction at HWM 5 and 7. The washdown station cover soils, sediment and liner shall be disposed within the impoundment in a manner to facilitate remaining backfilling and compaction. The containment pit area shall be graded by backfilling.

SECTION 2K

CHAIN GATE AND WARNING SIGN

PART 1 - GENERAL

1. APPLICABLE PUBLICATIONS: The publications listed below form a part of this specification to the extent referenced. The publications are referred to in the text by the basic designation only.

1.1 Federal Specification (Fed. Spec.):

| | |
|---|---|
| RR-F-191G/GEN | Fencing, Wire and Post Metal (and Gates, Chain-Link Fence Fabric, and Accessories). |

1.2 American Society for Testing and Materials (ASTM) Standard:

| | |
|---|---|
| C387-83 | Packaged, Dry, Combined Materials for Mortar and Concrete |

2. PRODUCTS:

2.1 Concrete: Dry mix conforming to ASTM C387 and the minimum amount of water to produce a workable mix.

2.2 Posts, Chain Gate and Accessories: Fed. Spec. RR-F-191, zinc coated, except as modified herein. All posts shall be round pipe. The chain for the gate shall be a single galvanized chain. Accessories shall include galvanized steel clamps to be provided around the post to connect the chain.

2.3 Signs:

2.3.1 Sign Board: Sign board shall be 0.125 inch solid acrylic plastic with satin matte finish and integral permanent color. Signs shall have red background with white subsurface, helvetica medium lettering.

2.3.2 Signs shall be a minimum of 24 inches high by 48 inches wide with square edges and corners.

2.3.3 Lettering shall be all capitals and shall be a minimum of two-inch in height. Lettering shall be proportionately sized to the size of the sign. Signs shall read:

WARNING!

THIS IS A CLOSED HAZARDOUS WASTE FACILITY.
ENTRY OF UNAUTHORIZED PERSONNEL AND
VEHICLES IS PROHIBITED. CONTACT RAAP SECURITY
POLICE (639-7163) TO REPORT DAMAGE OR ACCIDENTS.

2.3.4 Signs shall be provided with connectors for attaching to the chain.

3. EXECUTION:

3.1 General: A chain gate shall be installed across the access ramp of HWM Sites 5, 7, and 16. Installation shall be in accordance with the fence manufacturer's written installation instructions except as modified herein.

3.2 Excavation: Excavation for concrete-embedded posts shall be 2 feet in diameter and 3 feet in depth. Post holes shall be cleared of loose materials. Waste excavated material shall be spread to the grade.

3.3 Post Setting: Posts shall be set plumb and in alignment. Posts shall be set in concrete bases to a depth of three feet below grade. Concrete shall be filled in the excavation and compacted so as to be free of voids and finished in a dome. Concrete shall be cured a minimum of 72 hours before any further work is done on the posts.

3.4 Chain Gate and Sign: Chain gate shall be installed in accordance with the manufacturer's recommendation. A lock shall be installed to secure the chain to the gate post. The sign shall be attached to the center of the chain.

Project Management Branch

Mr. Kevin L. Greene, Geologist
Bureau of Hazardous Waste Management
Department of Waste Management
11th Floor, Monroe Building
101 North 14th Street
Richmond, Virginia 23219

Dear Mr. Greene:

Reference your letters of February 6, 1987, and May 6, 1987, concerning Closure Plan for Hazardous Waste Management Units 5, 7, and 16, Radford Army Ammunition Plant (RAAP), Virginia.

At the request of Ms. Shelley Barker, RAAP, we have addressed your concerns raised in the referenced letters. Enclosed are our responses. We hope they are satisfactory.

If you have further concerns, please contact Ms. Shelley Barker, RAAP (SMCRA-EN), telephone 703-639-8482 or Mr. Jack Boswell, Huntsville Division (HNDED-PM), telephone 205-895-5140.

Sincerely,

5/14/87
SHEARER, E

ND FORM 7

SECTION 2D

SEDIMENT AND SUBSOIL TREATMENT

1. APPLICABLE PUBLICATIONS: The American Society for Testing and Materials (ASTM) publications listed below form a part of this specification to the extent referenced. The publications are referred to in the text by the basic designation only.

| | |
|---|---|
| D 1632-63 | Standard Method for Making and Curing Soil-Cement Compression and Flexure Test Specimens in the Laboratory. |
| D 2166-66 | Unconfined Compressive Strength of Cohesive Soil. |
| D 2216-80 | Laboratory Determination of Water (Moisture) Content of Soil, Rock and Soil-Aggregate Mixtures. |
| G 51-77 | pH of Soil for Use in Corrosion Testing. |

2. SUBMITTALS: The procedures, equipment and schedule for this work shall be submitted for approval. The submittal shall include the reagent (lime kiln dust and cement kiln dust) stock pile plan, qualifications of selected laboratory for geotechnical testing, health and safety procedures and equipment decontamination procedure. The flyash to be used as reagent will be provided by the Radford AAP.

3. REAGENT STORAGE: The Contractor shall coordinate the work schedule with the reagent supplier to minimize on-site storage of the reagent. Any storage of the reagent shall be protected from rain and wind using synthetic membrane as bottom liner and cover. On-site storage of the reagent shall not exceed 15 calendar days.

4. SUBSOIL TREATMENT:

4.1 The Contractor shall provide all necessary materials and equipment to neutralize and stabilize the subsoil and sediments in HWM 5 and HWM 7 as indicated. Equipment to be used for mixing at HWM 7 shall be capable of reaching and thoroughly mixing all areas of the lagoon from the bank. The amounts of reagent specified in paragraphs 4.2 and 4.3 are based on bench tests and engineering calculations.

4.2 Subsoil Treatment For HWM 5: The Contractor shall till the lime kiln dust into the top two feet of subsoil in 6-inch lifts and compact in accordance with SECTION: EARTHWORK. The mix ratio shall be approximately 15 pounds lime kiln dust per cubic foot of bank soil.

4.3 Sediment and Subsoil Treatment For HWM 7: Prior to initiation of sediment and subsoil treatment at HWM 7, areas with high lime concentration as indicated shall be excavated and spread over the entire lagoon area. Also, one foot of surface material from the bank slopes shall be scraped off and spread within the lagoon area. The Contractor shall mix the reagent (one part cement kiln dust and three parts flyash by weight) into the top seven feet of sediment and subsoil. The reagent mix ratio shall be approximately 82 pounds reagent per cubic foot of sediment/subsoil.

4.4 Treatment Criteria: Upon completion of the treatment, the pH of the treated soil for both HWM 5 and HWM 7 shall be between 6.0 and 12.0 and the two-week unconfined compressive strength of treated soil shall be no less than 1,500 pounds per square foot.

5. QUALITY CONTROL FOR pH: The Contractor shall perform field pH tests for treated soil in HWM 7 and HWM 5.

5.1 Quality Control Sampling: At HWM 7, the Contractor shall take bulk samples at 10 evenly distributed locations upon completion of mixing. Three ten-pound samples shall be taken at each location: one at

elevation 1,696 feet, one at elevation 1,698.5 feet, and another at elevation 1,701 feet. At HWM 5, bulk samples shall be taken at 10 evenly distributed locations. From each sampling location at HWM 5, two samples no less than three pounds each shall be taken at a depth of 6 and 18 inches below the treated soil surface. At the time of sampling, samples shall not include any unmixed reagent (lime kiln dust or cement kiln dust). Any samples containing unmixed reagent shall be rejected.

5.2 pH Testing: Each sample shall be tested for pH in accordance with ASTM G 51.

5.3 Reporting: The results of the pH testing shall be reported by individual values, average and deviations for each lagoon.

6. QUALITY CONTROL FOR COMPRESSIVE STRENGTH: The Contractor shall perform moisture content (ASTM D 2216) and unconfined compressive strength (ASTM D 2166) tests for treated soil

The Contractor shall obtain services of an approved laboratory to perform these test in accordance with SECTION: EARTHWORK

6.1 Quality Control Sampling: Samples obtained for pH testing shall be used for preparation of test specimens and no separate sampling is required.

6.2 Quality Control Testing: The initial moisture content and 14-day unconfined compressive strength of each sample shall be determined and the results shall be submitted to the Contracting Officer.

6.2.1 Two moisture content tests in accordance with ASTM D 2216 shall be conducted for each sample and the average of the two results shall be reported as the moisture content of each sample.

6.2.2 The unconfined compressive strength test specimen shall be prepared in accordance with ASTM D 1632 and cured for 14 days. The

cured specimens shall be tested in accordance with ASTM D 2166 using a controlled strain rate of one percent per minute.

6.3 Corrective Action:

6.3.1 If the average of 30 unconfined compressive strength test results is greater than 1,500 pounds per square foot and none of the individual values are less than 1,250 per square foot, the compressive strength is considered satisfactory and no corrective action is required.

6.3.2 If the average of 30 unconfined compressive strength test results is less than 1,500 pounds per square foot, corrective action small be performed.

6.3.3 If the average of 30 unconfined compressive strength test results is greater than 1,500 pounds but some individual values are less than 1,250 pounds per square foot, corrective action shall be performed for the portions with the unconfined compressive-strength less than 1,250 pounds per square foot.

SECTION 2E

SUBSOIL SAMPLING AND ANALYSIS

1. APPLICABLE PUBLICATIONS: The publications listed below form a part of this specification to the extent referenced. The publications are referred to in the text by the basic designation only.

1.1 U.S. Environmental Protection Agency (EPA) Publications:

EPA SW-846 Test Methods for Evaluating Solid Waste (Second Edition, July 1982; Revised April 1984)

1.2 American Society for Testing and Materials (ASTM) Publications:

| | |
|---|---|
| G 51-77 | pH of Soil for Use in Corrosion Testing |
| D 1586-84 | Penetration Test and Split Barrel Sampling of Soils |
| D 2488-84 | Description and Identification of Soils (Visual-Manual Procedure) |

2. SUBMITTALS: The contractor shall obtain a certificate from the analytical labatory indicating that the laboratory is approved by the USEPA to perform solid waste analysis and conforms to their quality control requirements. This certificate shall be submitted to the Contracting Officer for approval prior to sampling of soils.

3. SAMPLING: The Contractor shall sample subsoil after soil treatment at HWM 5 and HWM 7 in accordance with specifications provided herein.

3.1 Sampling Location: Three soil borings shall be drilled as shown in each of HWM 5 and HWM 7 and subsoil samples shall be collected at Elevations 1769, 1765 and 1759 for HWM 5, and Elevations 1700, 1694 and 1691 for HWM 7.

3.2 Boring and Sampling: Boring and sampling shall be performed in accordance with ASTM D 1586. At least 300 grams of soil shall be taken for each sample and placed in 500-ml size glass or plastic bottles. The split spoon sampler shall be cleaned with detergent water and a brush, then rinsed with distilled water prior to each use. Prior to sampling, sample bottles shall be prepared by the analytical laboratory in accordance with EPA SW-846 and shipped to the field. Label shall also be provided by the laboratory.

3.3 Soil pH Test: The soil pH shall be determined in the field immediately after sampling in accordance with ASTM G 51 using a pH meter with a combination-type electrode.

3.4 Boring Log: The boring logs shall be provided to document the sampling task. The information in the boring log should include: site name, boring number, drilling date, driller's name, ground surface elevation, sample depth, sample identification number, sample recovery, soil description and SPT (Standard Penetration Test) blow count. Soil description shall be in accordance with ASTM 2488.

3.5 Boring Backfilling: The borings shall be backfilled with drill cutting and compacted with drilling tools assisted by hydraulic pressure or drop hammer. No more than two feet of loose material shall be placed before each compaction.

3.6 Personnel Protection and Equipment Decontamination: Personnel protection and equipment decontamination shall be in accordance with

SECTIONS: SAFETY, HEALTH AND EMERGENCY RESPONSE REQUIREMENTS and WASH-DOWN STATION AND EQUIPMENT DECONTAMINATION.

4. SAMPLE CUSTODY:

4.1 Sample Label and Packaging:

4.1.1 Sample Label: The sample bottles shall be labeled at the time of sampling with the following information:

a. Sample site, boring number and sample elevation. This information shall constitute a unique sample identification number. For example, HWM5-B2-1765 is a sample taken from Elevation 1765 of Boring No. 2 at the HWM 5 site.

b. Date and time of collection, collector's name, sample media (water, soil, etc.) and the name of sampling organization.

4.1.2 Sample Packaging: The sample bottles shall be individually placed in plastic bags and packed with ice in a sturdy cooler type container lined with a large impermeable plastic bag. Spaces between and above the bottles shall be tightly filled with appropriate absorbent material to secure the bottles in the container during shipping and handling.

4.2 Field Sample Custody:

4.2.1 Chain-of-Custody Record: A copy of the Chain-of-Custody form shall be completed and accompany the sample from the initial sampling in the field to the laboratory until sample testing and final disposal in accordance with EPA SW-846. The field sample collector shall indicate the sample designation/location number in the space provided on the appropriate chain-of-custody form for each sample. The chain-of-custody form should be completed, secured in a water-tight plastic bag, and placed on the top of the filler material prior to sealing the container.

4.2.2 Identification Control: Each sample container shall be assigned a unique identification number by the laboratory. This number shall be recorded on the chain-of-custody record and marked with indelible ink on the outside of the container.

4.2.3 Security of Samples During Transportation: The shipping container shall be closed and a seal affixed to the latch. This seal must be broken to open the container, and subsequently indicates tampering if the seal is broken before receipt at the laboratory. The laboratory shall notify the shipper if tampering is apparent.

4.3 Laboratory Sample Custody: The sample collector shall notify the laboratory of upcoming transfer of samples to the laboratory. This notification shall include information concerning the number and type of samples to be shipped as well as the anticipated date of arrival. The laboratory sample custody program shall meet the following criteria:

4.3.1 The laboratory should have a sample custodian who is responsible for maintaining custody of the samples and for maintaining all associated records documenting that custody.

4.3.2 Upon receipt of the samples, the custodian shall check the original chain-of-custody documents and compare them with the labeled contents of each sample container for correctness and traceability. The sample custodian signs the chain-of-custody record and records the date and time received.

4.3.3 In the event of discrepant documentation, the laboratory shall immediately contact the sample collector as part of the corrective action process. A qualitative assessment of each sample container should be performed to note any anomalies, such as broken or leaking bottles. This assessment shall be recorded as part of the incoming chain-of-custody procedure.

4.3.4 The samples shall be stored in a secured area at a temperature of approximately 4°C until analyses are to commence.

4.3.5 A completed chain-of-custody form shall accompany the laboratory report and will become a permanent part of the project records.

4.3.6 Samples should be disposed in accordance with the standard laboratory sample disposal procedure.

5. ANALYTICAL METHODS: The soil samples shall be analyzed for the metals listed below and in accordance with EPA Methods as provided in EPA SW-846.

| Metal | EPA Methods |
|---|---|
| Arsenic | 7060, 7061 |
| Barium | 7080 |
| Cadmium | 7130 |
| Chromium (Total) | 7190 |
| Lead | 7420 |
| Mercury | 7470 |
| Selenium | 7740, 7741 |
| Silver | 7760,7761 |

6. QUALITY CONTROL FOR METAL ANALYSIS: One set of quality control analysis shall be made for each of two sites. The quality control analysis shall include one duplicate analysis, a reagent blank, and a spiked sample. Each of these quality control samples shall be prepared in the same manner as the sample. The blank concentration shall be less than two times the detection limit for the metal. The percentage recovery of each metal in the spiked sample should be between 90% and 110% for all metals except mercury. The recovery range for mercury analyses is 80% to 120%. The relative percentage difference for the analysis of replicate samples is calculated. A Relative Percentage Deviation for duplicate samples is expected to be equal to or less than 10% of the larger observed concentration.

## Data Validation Report. All soil results in mg/kg/dry weight basis.

**Alliant-Hazardous Waste Management Unit 5 and 7** **Event Date: February 17-18, 2004**

| Sample ID | Analyte | Laboratory Result Q | Validated Result Q | LOQ | Validation Notes |
|---|---|---|---|---|---|

**Definitions:**

**U-** Denotes the analyte was analyzed for, but was not detected at or above the laboratory limit of quantitation (LOQ).
**J-** Denotes an estimated value. See sample specific note presented on data validation report table for further explanation.
**UJ-** The LOQ should be considered estimated. See sample specific note presented on data validation report table for further explanation.
**R-** Denotes sample result was rejected. See sample specific note presented on data validation report table for further explanation.
**Q-** Denotes Data Qualifier.
**B-** Denotes result detected <LOQ and result estimated. This is a laboratory data qualifier.

NOTE (1): The table summaries all detected results and results which required qualification based on data validation.
All results reported on a dryweight basis.
See laboratory report for definition of laboratory result qualifiers, if needed.
NOTE (2): Soil sampling event performed on February 17-18 and March 24, 2004. March 24, 2004 includes trichloroethene verification event for 5GP-21 (14')

## SW-846 METHODS 8081A VOLATILE DATA REVIEW SUMMARY

Draper Aden Associates (DAA) performed a limited review of the analytical results for the March 24, 2004 soil sampling event at hazardous waste management units 5 and 7, Radford Army Ammunition Plant (RAAP)/Alliant Ammunition and Powder Company, Montgomery County, Virginia. Soil samples were collected from locations 5GP-17 (15'), 5GP-18 (13'), 5GP-19 (15'), 5GP-20 (14'), 5GP-21 (14'), 5GP-22 (14'), 5GP-23 (14'), 5GP-24 (14'), 7GP-17 (11'), 7GP-18 (14'), 7GP-19 (14'), 7GP-20 (14.5'), 7GP-21 (13.5'), 7GP-22 (13'), 7GP-23 (12.5'), and 7 GP-24 (14'). All soil samples were analyzed for twenty-eight (28) pesticides and polychlorinated biphenyls (PCBs) per USEPA Methods 8081A.

Lancaster Laboratories (Lancaster) of Lancaster, Pennsylvania performed the analyses. On behalf of RAAP, Lancaster submitted results to DAA in a final certificate of analysis, which included sample analytical results as well as relevant documentation to validate and verify the results.

The evaluation of Lancaster's compliance with Method 8081A and validation of the results was based on a limited review of the following items: quality control (QC) deliverables package, QC history documentation, case narrative, technical holding time and preservation requirements, extraction procedures, instrument calibrations, blank analysis, surrogate spike recoveries, retention time, matrix spike (MS/MSD) analyses, laboratory control samples (LCS), and internal standards requirements, where applicable. A review of all transcriptions from instrument data to sample summary sheets was performed. Specific representative calculations were performed. The following information is intended to summarize data review results and any observed significant deviations from method and/or contractual requirements.

The laboratory received the samples on ice and in good condition with custody seals intact. All technical holding time criteria were met. All sample extraction and analysis holding time criteria were met. All preservation criteria were met.

### *Method 8081A*

The original certificate of analysis for Method 8081A was complete in its presentation and the data were of acceptable quality. The data set exhibited the laboratory's ability to achieve the reported limit of quantitation (LOQ) for each target parameter, as outlined by the method detection limit study.

All QC history documentation and QC check sample criteria were met. All initial calibration, calibration verification, breakdown check, blank, surrogate, retention time, MS/MSD and LCS criteria were met.

Sample results were reviewed for transcription errors from the instrument data to the laboratory report and no errors were noted. Deviations from specific quality assurance and quality control criteria that were identified during the review process are summarized below.

Sample analysis by Method 8081A included PCBs. A five-point initial calibration was not performed for all detected aroclors; also, the LCS and MS/MSD samples were not spiked with PCBs. All PCB results were qualified as estimated due to limited availability of quality control data.

All sample results were reported on a dry-weight basis. All samples were florisil cleaned. To obtain a final result within the instrument calibration range, sample dilutions were required, where appropriate.

All sample and field sample duplicate (5GP-22 (14') and 7GP-22(13')) results met relative percent difference criteria for all target analytes except gamma chlordane in 5GP-22(14') which was qualified as estimated.

Target parameters reported above the LOQ remain as reported by the laboratory, except where noted above. All sample results unaffected by the data validation process and/or detected less than their corresponding LOQs were validated and reported as "U" (i.e., not detected above the LOQ). Refer to the attached table titled "Data Validation Report" for a summary of results which required data validation.

**SW-846 METHOD 8081A (ORGANOCHLORINE PESTICIDES/PCBs)**
**GC DATA VALIDATION FOR SOILS**

**Sample ID:** 5GP-17 (15'), 5GP-18 (13'), 5GP-19 (15'), 5GP-20 (14'), 5GP-21 (14'), 5GP-22 (14'), 5GP-23 (14'), 5GP-24 (14'), 7GP-17 (11'), 7GP-18 (14'), 7GP-19 (14'), 7GP-20 (14.5'), 7GP-21 (13.5'), 7GP-22 (13'), 7GP-23 (12.5'), and 7 GP-24 (14').

**QC Samples:** 5GP-20 (14'), 7GP-20 (14.5') Matrix spike/Matrix spike duplicate, Extraction Blank, LCS, Field Dups: 5GP-22-22 (14'), 7GP-22-22 (13')

**Laboratory:** Lancaster Laboratories, Lancaster, PA, SDG: RAV03/RAV04

***Comments: Method 8081A involves the extraction of samples usingSW-846 Method 3550B-ultrasonic extraction. Target parameters are separated and quantified by GC using electron capture detection (ECD). All samples were florisil cleaned.***

## A. QC DELIVERABLES PACKAGE:

| | | |
|---|---|---|
| 1. | Was case narrative present and signed by a laboratory representative? | ☑ YES ☐ NO |
| 2. | Was the Chain of Custody present and signed by a laboratory representative? | ☑ YES ☐ NO |
| 3. | Were sample results included for all sample locations? | ☑ YES ☐ NO |
| 4. | Did the laboratory parameter list correspond to project specific parameter list? | ☑ YES ☐ NO |
| 5. | Were the LOQs reported on sample summary sheets supported by the MDL study? | ☑ YES ☐ NO |
| 6. | Did the electronic deliverable list the correct LOQs? | ☑ YES ☐ NO |

**Comments:** All QC deliverables requirements were met.

## B. INSTRUMENT QC HISTORY DOCUMENTATION CRITERIA:

| | | |
|---|---|---|
| 1. | Was the specific extraction method specified? | ☑ YES ☐ NO |
| 2. | Was documentation of DDT/Endrin breakdown study provided? | ☑ YES ☐ NO |
| 3. | Were instrument specific LODs for the target parameters provided? | ☑ YES ☐ NO |
| 4. | Were instrument specific LOQs for the target parameters provided? | ☑ YES ☐ NO |
| 5. | Were instrument specific working ranges for target parameters specified? | ☑ YES ☐ NO |
| 6. | Were sample analysis log sheets provided? | ☑ YES ☐ NO |
| 7. | Were chromatograms and integration reports provided? | ☑ YES ☐ NO |

**Comments:** All instrument QC history criteria were met.

## C. CHECK SAMPLE CRITERIA:
*(Initial Demonstration of Capability)*

1. Was the check sample data obtained from the instrument that was used for analysis? ☑YES ☐ NO
2. Did the check sample contain all required target parameters? ☑ YES ☐ NO
3. Were the check samples analyzed in quadruplicate? ☑ YES ☐ NO
4. Were the average recoveries of the target parameters in the check samples reported? ☑ YES ☐ NO
5. Were the standard deviations for the recoveries of target parameters quadruplicated and reported? ☑ YES ☐ NO

**Comments:** All check sample criteria were met.

## D. TECHNICAL HOLDING TIME AND PRESERVATION CRITERIA:

1. Was the 14-day sample collection to extraction holding time met? ☑ YES ☐ NO
2. Was the 40-day extraction to analysis holding time met? ☑ YES ☐ NO
3. Were the samples received at 4°C (± 2°C)? ☑ YES ☐ NO

**Comments:** All preservation criteria were met. All sample extraction and analysis holding time criteria were met.

## E. INITIAL GC CALIBRATION CRITERIA:

1. Were all target parameters included in the ICAL? ☑ YES ☐ NO
2. Was a minimum five-point calibration analyzed prior to analysis? ☑YES ☐ NO
3. Calibration type used by laboratory: *External.*
4. Was the % Relative Standard Deviation (%RSD) for all target parameter CFs <20% over the established working range? ☑ YES ☐ NO
5. State the Quantitation Method used by the laboratory: *Calibration Factor.*
6. List target parameters with a % RSD >20% over the established working range: *None.*
   Note: Up to 2 target parameters may exceed the 20% criteria, but must be <30%.
7. Was the lowest concentration calibration standard at or below the LOQ, MCL, regulatory compliance or action limit? ☑ YES ☐ NO
8. Were calibration standards dropped to meet calibration criteria? ☑NA☐YES☐ NO

**Comments:** For most aroclors, there was only a one point calibration. All other initial calibration criteria were met.

**F. DDT / ENDRIN BREAKDOWN CHECK CRITERIA:**

1. Was a 4,4'-DDT and Endrin standard analyzed every 12-hours? ☑ YES ☐ NO
2. For every 12-hours, was 4,4'-DDE, 4,4'-DDD, Endrin Ketone or Endrin Aldehyde present which indicated breakdown? ☑ YES ☐ NO
3. Was the calculated % breakdown less than 15%? ☐ NA ☑ YES ☐ NO
   If no, corrective action must be taken before proceeding with analysis.

**Comments:** All DDT/Endrin breakdown criteria were met.

**G. CALIBRATION VERIFICATION CRITERIA:**

1. Was a calibration verification (CV) standard performed once every 12-hours? ☑ YES ☐ NO
2. Did target parameter responses have a % Difference (%D) within ± 15%? ☑ YES ☐ NO
   If no, was a new calibration curve prepared? *No.*
3. Was a mid-concentration standard analyzed after each group of 20 samples (10 recommended) and at the end of the analytical sequence? ☑YES ☐ NO
4. Were all target parameters and surrogates included in the CV? ☑ YES ☐ NO

**Comments:** All calibration verification criteria were met.

**H. BLANK CRITERIA:**

1. Was a blank analyzed prior to the batch samples? ☑ YES ☐ NO
2. Was a blank analyzed after 20 batch samples? ☐ NA ☑ YES ☐ NO
3. Was an extraction blank analyzed with the batch samples? ☑ YES ☐ NO
4 Was a trip blank analyzed per analytical batch? ☑ YES ☐ NO
5. List target parameters identified in the blanks: *None.*

**Comments:** All blank criteria were met.

**I. SURROGATE CRITERIA:**

1. Were all samples, standards, blanks, and checks spiked with at least 2 surrogate parameters for dual column analysis? ☑ YES ☐ NO
2. List surrogate used and laboratory's surrogate % recovery range criteria:
   tetrachloro-xylene (TCMX): 40%-130%
   decachlorobiphenyl (DCBP): 40%-130%
3. List samples whose surrogate % recoveries were not within the laboratory range: *None*

**Comments:** All surrogate recovery criteria were met.

**J. RETENTION TIME CRITERIA:**

1. Were the daily Retention Time (RT) windows reported? ☑ YES ☐ NO

**Comments:** All retention time criteria were met.

**K. MATRIX SPIKE/ MATRIX SPIKE DUPLICATE CRITERIA:**

1. Was a MS/MSD analyzed per sample batch or every 20 samples, whichever may occur first? ☑ YES ☐ NO
2. Did the MS/MSD contain required target parameters? See comment section
3. Was the MS/MSD analyzed on the specific project matrix? ☑ YES ☐ NO
4. List laboratory's matrix spike % recovery range criteria: *40%-130%, select analytes*
5. List matrix spike target parameters not within the recovery range criteria: None
6. Was a LCS analyzed to address failed matrix spike criteria? ☑ NA ☐ YES ☐ NO
7. Did the LCS for the failed matrix spike parameter(s) fall within the recovery range criteria and was the problem identified as matrix interference? ☑ NA ☐ YES ☐ NO
8. Were any parameters flagged as estimated concentrations? ☐ YES ☑ NO
9. List parameters flagged as estimated concentrations:

**Comments:** QC samples were not spiked with PCBs. All PCB results were qualified as estimated due to insufficient quality control data. All other matrix spike criteria were met.

**L. LABORATORY CONTROL SAMPLE (LCS) CRITERIA:**

1. Was a LCS included in the sample analysis? ☑ YES ☐ NO
2. Did the LCS contain all required target parameters?*select analytes* ☑ YES ☐ NO
3. List the LCS parameters and the laboratory's recovery range criteria. *See certificate of analysis.*
4. List the LCS parameters not within the recovery range criteria. *None.*

**Comments:** The LCS was not spiked with PCBs. All PCB results were qualified as estimated due to insufficient quality control data. All other LCS data were met.

**M. TARGET PARAMETER IDENTIFICATION:**

1. Were the reported parameters within the retention time windows? ☑ YES ☐ NO

| | | |
|---|---|---|
| 2. | Were retention time shifts observed when compared with the last calibration verification? | ☐ YES ☑ NO |
| 3. | Were all reported parameters confirmed? | ☑ YES ☐ NO |
| 4. | Did the initial analysis of any sample have a concentration of a target parameter which exceeded the instrument calibration range? | ☑ NA ☐ YES ☐ NO |
| 5. | Were sample dilutions required? | ☑ YES ☐ NO |
| 6. | Were all parameter concentrations that were recorded on the sample quantitation reports accurately transferred to the sample summary sheets? | ☑ YES ☐ NO |

**Comments:** All target parameter identification criteria were met. All QC criteria for both columns were met. If RPDs > 40% between the primary and confirmation columns occurred, the lower result was reported due to possible interference.

## N. DAA CORRECTIVE ACTION TAKEN AND GENERAL COMMENTS:

**Comments:** No corrective action was taken.

## LIMITATIONS AND REFERENCES:

Draper Aden Associates conducted a limited data validation for the above noted data set using summary tables and raw data provided by the analyzing laboratory. Data evaluation was conducted in general accordance with SW-846 Method requirements (Test Methods for Evaluating Solid Wastes - Physical and Chemical Methods, USEPA SW-846, 3rd edition - Final Update I, II/IIA and III) and CLP data validation guidelines (USEPA Contract Laboratory Program National Functional Guidelines for Organic Data Review, October 1999). Validation of this data set is limited to the items detailed in this report.

## METHODS 8260B AND 8270C ORGANIC DATA REVIEW SUMMARY

Draper Aden Associates (DAA) performed a limited review of the analytical results for the February 17-18 and March 24, 2004 soil sampling event at hazardous waste management units 5 and 7, Radford Army Ammunition Plant (RAAP)/Alliant Ammunition and Powder Company, Montgomery County, Virginia. Soil samples were collected from locations 5GP-17 (15'), 5GP-18 (13'), 5GP-19 (15'), 5GP-20 (14'), 5GP-21 (14'), 5GP-22 (14'), 5GP-23 (14'), 5GP-24 (14'), 7GP-17 (11'), 7GP-18 (14'), 7GP-19 (14'), 7GP-20 (14.5'), 7GP-21 (13.5'), 7GP-22 (13'), 7GP-23 (12.5'), and 7 GP-24 (14'). For the February 17-18, 2004 event, all soil samples were analyzed for 34 (thirty-four) volatile analytes by Method 8260B. For the March 24, 2004 event all samples were analyzed for 64 (sixty-four) semivolatile analytes according to Method 8270C. As well, sample 5GP-21 (14') and the field duplicate 5GP21-21 (14') were analyzed for trichloroethene only.

Lancaster Laboratories (Lancaster) of Lancaster, Pennsylvania performed the GC/MS analyses. Lancaster Laboratories submitted results to DAA in a final certificate of analysis, which included sample analytical results as well as relevant documentation to validate and verify the results.

The evaluation of Lancaster's compliance with Methods 8260B and 8270C and validation of the results was based on a limited review of the following items: QC deliverables package, QC history documentation, case narrative, technical holding time and preservation requirements, instrument performance (tune) check, instrument calibrations, blank analysis, surrogate spike recoveries, matrix spike and matrix spike duplicate (MS/MSD) analyses, laboratory control sample (LCS) data, and internal standard requirements. A review of all transcriptions from instrument data to sample summary sheets was performed. Specific representative calculations were performed on select samples. The following information is intended to summarize data review results and any observed significant deviations from method and/or contractual requirements.

### *Method 8260B*

The original certificate of analysis for Method 8260B appeared complete in its presentation and the data were of acceptable quality. The data set demonstrated the laboratory's ability to achieve the reported LOQ, as outlined by the initial calibration data and the method detection limit study data. The first calibration level was less than the reported LOQ in all cases.

All sample holding time criteria, QC history documentation, instrument performance check (tuning) criteria, initial calibration, calibration verification, blank, surrogate, MS/MSD, LCS and internal standard requirements were met, except where noted below. All sample results were reviewed for transcription errors from the instrument data to the laboratory report and no errors

were noted. Deviations from specific quality assurance/quality control (QA/QC) criteria that were identified during the data review process are discussed below.

All calibration verification criteria were met except for 2-butanone, 2-hexanone, and 4-methyl-2-pentanone exceeded validation guidelines for percent drift/difference. Results for these analytes, where appropriate, were qualified as estimated.

All target analyte identification and quantitation requirements were met. Target analytes reported at or above the LOQ remain as reported by the laboratory except for acetone. All detected acetone results were qualified as estimated due to potential contamination from the sodium bisulfate sample preservation.

Trichloroethene was reported above the LOQ (February 17-18, 2004 sampling event) in sample 5GP-21. A verification sampling event at 5GP-21 was performed on the March 24, 2004. The sample and its field duplicate, 5GP21-21, were analyzed for trichloroethene only. For the verification sampling event, all sample holding time criteria, QC history documentation, instrument performance check (tuning) criteria, initial calibration, blank, and internal standard requirements were met As well, reported results were similar to historical data. However, relative percent difference criteria were not met and the trichloroethene results were qualified as estimated.

All results were reported on a dry weight basis. All sample results unaffected by the data validation process and less than their corresponding LOQs were validated and reported as "U." Refer to the attached table titled "Data Validation Report" for a summary of results which required data validation.

***Method 8270C***

The original certificate of analysis for Method 8270C was complete and the data were of acceptable quality. The data set demonstrated the laboratory's ability to achieve the reported LOQ, as outlined by the initial calibration data as well as the method detection limit study data.

QC history documentation were provided. Sample preservation, instrument performance check (tuning), initial calibration, calibration verification, blank, surrogate, MS/MSD, LCS and internal standard requirements were met, except where noted below. All sample results were reviewed for transcription errors from the instrument data to the laboratory report and no errors were noted. Deviations from specific QA/QC criteria were identified during the data review process and noted below.

Di-n-butylphalate was detected in the laboratory blank for Unit 7. Detected results less than the LOQ for di-n-butylphalate were attributed to laboratory contamination and validated accordingly.

All target analyte identification and quantitation requirements were met.

All sample and field sample duplicate (5GP-22 (14') and 7GP-22(13')) results met relative percent difference criteria for all target analytes except bis(2-ethylhexyl)phthalate (7GP-22(13')) which was qualified as estimated.

All results were reported on a dry weight basis. All sample results unaffected by the data validation process and greater than their corresponding LOQs remain as reported by Lancaster Laboratories. All sample results less than their corresponding LOQs were validated and reported as "U." Refer to the attached table titled "Data Validation Report" for a summary of results which required data validation.

## SW-846 METHOD 8260B (GC/MS) VOLATILE ORGANIC DATA VALIDATION

**Sample ID:** 5GP-17 (15'), 5GP-18 (13'), 5GP-19 (15'), 5GP-20 (14'), 5GP-21 (14'), 5GP-22 (14'), 5GP-23 (14'), 5GP-24 (14'), 7GP-17 (11'), 7GP-18 (14'), 7GP-19 (14'), 7GP-20 (14.5'), 7GP-21 (13.5'), 7GP-22 (13'), 7GP-23 (12.5'), 7 GP-24 (14').

**QC Samples:** 5GP-20 (14')MS, MSD, LCS, Method Blank, Field Dup: 5GP-22-22
7GP-20 (14.5')MS, MSD, LCS, Method Blank, Field Dup: 7GP-22-22
Field Dup: 5-GP-21-21 (March 24, 2004 Event)

**Laboratory:** Lancaster Laboratories, Lancaster PA;
SDG RAV01/RAV02-February 17-18, 2004 Sampling Event
SDG RAV03-March 24, 2004 Sampling Event-Trichloroethane only

***Comment:*** *Method 8260B uses a purge and trap system to remove volatile organic target analytes from a 5 gram soil sample (SW-846 5035). Analytes are separated and quantified using a capillary column GC/MS.*

### A. QC DELIVERABLES PACKAGE:

1. Was the case narrative present/signed by a lab representative? ☑ YES ☐ NO
2. Was the Chain of Custody present and signed by a laboratory representative? ☑ YES ☐ NO
3. Were the sample results included for all sample locations? ☑ YES ☐ NO
4. Did the laboratory analyte list correspond to the project specific analyte list? ☑ YES ☐ NO
5. Were all analyte LOQs reported on sample summary sheets in agreement with the instrument specific MDL study? ☑ NA ☐ YES ☐ NO

**Comments:** All QC deliverables package requirements were met. All LOQs are supported by an acceptable MDL study. Note target analyte list from SOW OLM03.2.

### B. QC HISTORY DOCUMENTATION CRITERIA:

1. Was an instrument specific MDL study provided, which included LOD and LOQ values for all target analytes? ☑ YES ☐ NO
2. Was the instrument specific working range for each target analyte specified? ☑ YES ☐ NO
3. Was initial demonstration of capability (IDOC) data provided for each target analyte? ☑ YES ☐ NO

**Comments:** QC history documentation criteria were met. MDL study is laboratory specific. Laboratory submitted IDOC data as an addendum.

## C. TECHNICAL HOLDING TIME AND PRESERVATION CRITERIA:

1. Was the 14-day sample collection to analysis holding time met? ☑ YES ☐ NO
2. Were the samples received at 4°C (± 2°C)? ☑ YES ☐ NO
3. Was the pH of each sample adjusted to < 2 with HCl? ☑ NA ☐ YES ☐ NO

**Comments:** All sample holding time criteria were met.

## D. GC/MS INSTRUMENT PERFORMANCE (TUNING) CHECK CRITERIA:

1. Was analysis of the instrument performance check solution performed at the beginning of each 12-hour period during which standards or samples were analyzed? ☑ YES ☐ NO
2. Was there documentation of the injection of 5-50 ng bromofluorobenzene (BFB)? ☑ YES ☐ NO
3. Were all ion abundance criteria met? ☑ YES ☐ NO
4. Were calibration, blank, and sample analyses performed within 12 hours of tuning? ☑ YES ☐ NO

**Comments:** All instrument performance check criteria were met.

## E. INITIAL GC/MS CALIBRATION CRITERIA:

***SW-846 Criteria:***

1. Was the internal standard (IS) which was selected for target analyte RF calculation the IS which had the closest retention time? ☑ YES ☐ NO
2. Were all target analytes included in the ICAL? ☑ YES ☐ NO
3. Did all ICALs consist of a minimum of 5 calibration levels? ☑ YES ☐ NO
4. Was the lowest concentration calibration standard at or below the associated MCL, regulatory compliance, or action limit? ☑ NA ☐ YES ☐ NO
4. Was the calibration curve developed using the same purge volume used for sample analysis? ☑ YES ☐ NO
6. Were 8260B SPCC criteria met? ☑ YES ☐ NO
   - chloromethane (0.100)
   - 1,1-dichloroethane (0.100)
   - bromoform (0.100)
   - 1,1,2,2-tetrachloroethane (0.300)
   - chlorobenzene (0.300)
7. Were 8260B CCC criteria met? (%RSD ≤ 30%) ☑ YES ☐ NO
   - 1,1-dichloroethene
   - chloroform
   - 1,2-dichloropropane

- toluene
- ethylbenzene
- vinyl chloride

8. Was each target analyte %RSD ≤ 15%? ☐ YES ☑ NO
9. Was the correlation coefficient >0.99 for target analytes with ≥15 % RSD? ☐ NA ☑ YES ☐ NO

***Method Validation Performance Criteria:***

1. Did target analytes and surrogates have % RSDs ≤ 15% and >0.99 correlation coefficient? ☐NA ☑ YES ☐ NO
(Evaluate RRFs < 0.05 for potential problems.)

**Comments:** All initial calibration criteria were met.

## F. CALIBRATION VERIFICATION CRITERIA:

***SW-846 Criteria:***

1. Was a calibration verification analyzed at the beginning of each 12-hour period following the analysis of the instrument performance check and prior to analysis of the method blank and samples? The calibration verification may be part of the ICAL or analyzed independently during another 12-hour analysis period. ☑ YES ☐ NO
2. Were 8260B SPCC criteria met? ☑ YES ☐ NO
   - chloromethane (0.100)
   - 1,1-dichloroethane (0.100)
   - bromoform (0.100)
   - 1,1,2,2-tetrachloroethane (0.300)
   - chlorobenzene (0.300)
3. Were 8260B CCC criteria met?
(%Drift or % Difference (%D) within ± 20%) ☑ YES ☐ NO
   - 1,1-dichloroethene
   - chloroform
   - 1,2-dichloropropane
   - toluene
   - ethylbenzene
   - vinyl chloride

***Method Validation Performance Criteria:***

1. Did all target analytes and system monitoring analytes (surrogates) have the % D within ± 25.0%? ☑ YES ☐ NO
(Evaluate RRFs < 0.05 for potential problems.)

If "NO", list analytes that exceed these criteria:

***DAA Contractual Requirements:***

1. Did all target analytes and system monitoring analytes (surrogates) have % Ds within ± 25.0%? ☑ YES ☐ NO
2. Three analytes may fail to meet maximum % D as long as the % D is within ± 40.0% ☑ YES ☐ NO
   Did the calibration verification meet this criteria?

**Comments:** All calibration verification criteria were met.

## G. BLANK CRITERIA:

1. Was a method blank analyzed after the calibration standards, prior to sample analysis, and once for every 12-hour period beginning with the injection of BFB? ☑ YES ☐ NO
2. Was a trip blank analyzed with this sample batch? ☑ YES ☐ NO
3. Were the trip blanks and method blanks interference free? ☑ YES ☐ NO
4. List target analytes detected in the blanks:
5. Was the level of blank contamination less than 5% of the MCL associated with the analyte? ☑ NA YES ☐ NO
6. Did any samples contain high concentrations of VOCs in excess of the linear range of the calibration curve? ☐ YES ☑ NO
7. Were one or more blanks analyzed following the high concentration sample to prevent cross contamination? ☑ NA ☐ YES ☐ NO

**Comments:** All blank criteria were met.

## H. SURROGATE CRITERIA:

***SW-846 Criteria:***

1. Were the following surrogates used? ☑ YES ☐ NO
   - dibromofluoromethane ( 80%-120%)
   - 4-bromofluorobenzene (74%-121%)
   - toluene-$d_8$ (81%-117%)
   - 1,2-dichloroethane-$d_4$ (80%-120%)
2. Were recoveries within the specified ranges? ☑ YES ☐ NO
   If "NO", corrective action is required. Flagging of the data as estimated is not acceptable until corrective action has been attempted.
3. Were samples with surrogates outside the QC window reanalyzed as required? ☑ NA ☐ YES ☐ NO

**Comments:** All surrogate criteria were met.

## I. MATRIX SPIKE, MATRIX SPIKE DUPLICATE CRITERIA:

(MS/MSD Requirements - CLP Guidelines)

| *Analyte* | *% R Water* | *RPD Water* |
|---|---|---|
| 1,1-dichloroethene | 61-145 | 14 |
| trichloroethene | 71-120 | 14 |
| benzene | 76-127 | 11 |
| toluene | 76-125 | 13 |
| chlorobenzene | 75-130 | 13 |

1. Was a matrix spike and matrix spike duplicate (MS/MSD) analyzed per sample batch or every 20 samples, whichever may occur first? ☑ YES ☐ NO
2. Did the MS/MSD contain additional target analytes? ☑ YES ☐ NO
3. Was the MS/MSD analyzed on the specific project matrix? ☑ YES ☐ NO
4. List MS analytes not within laboratory recovery ranges: *none*
5. Was a LCS analyzed to address failed MS criteria? ☑ NA ☐ YES ☐ NO
6. Did the LCS for the failed MS analyte(s) fall within the acceptable recovery ranges and was the problem identified as matrix interference ☑ NA ☐ YES ☐ NO
7. Were any analytes flagged as estimated concentrations? ☐ NA ☐ YES ☑ NO
8. List analytes flagged as estimated concentrations: *none*

**Comments:** All MS/MSD criteria were met.

## J. LABORATORY CONTROL SAMPLE (LCS) CRITERIA:

1. Was a LCS included in the sample analysis? ☑ YES ☐ NO
2. Did the LCS contain all required target analytes? ☑ YES ☐ NO
3. List the LCS analytes and the laboratory's acceptable recovery range. *See volatile certificate of analysis.*
4. List the LCS analytes that exceeded the acceptable recovery range. *None.*

**Comments:** All LCS criteria were met.

## K. INTERNAL STANDARDS CRITERIA:

1. Were the following internal standards used? ☑ YES ☐ NO
   - fluorobenzene
   - chlorobenzene-$d_5$
   - 1,4-dichlorobenzene-$d_4$
2. Were internal standard areas within - 50% to + 100% of the last calibration verification? ☑ YES ☐ NO

3. Were internal standard retention times within ± 30 seconds of the last calibration verification? ☑ YES ☐ NO
4. Were samples failing items 2. and/or 3. above reanalyzed as required by the method? ☑ NA ☐ YES ☐ NO

**Comments:** All internal standard criteria were met.

## L. TARGET ANALYTE IDENTIFICATION:

1. Were the RRTs of the reported analytes within ± 0.06 RRT units of the standard RRT? ☐ NA ☑ YES ☐ NO
2. Check the sample spectra against the laboratory standard spectra to see that the following criteria were met:
   - Did characteristic ions maximize in the same scan or within one scan of each other? ☐ NA ☑ YES ☐ NO
   - Were all characteristic ions present in the standard spectra present in the sample spectra for analytes detected above the LOQ? ☑ NA ☐ YES ☐ NO
   - Were the relative intensities of the ions between the standard and sample spectra within ± 30 %? ☐ NA ☑ YES ☐ NO
3. Were all reported analytes confirmed? ☐ NA ☑ YES ☐ NO

**Comments:** All target analyte identification criteria were met.

## M. TARGET ANALYTE QUANTITATION:

- If the %RSD of a analyte was 15% or less, then the average relative response factor should have been used for quantitation.
- If the %RSD of a analyte was greater than 15%, then the quantitation should be based on a calibration curve using the first or higher order regression fit of the five calibration points (6 calibration points for 2nd order).

1. List the detected analytes whose %RSD was >15%: *none*
   a. Was the quantitation based on a linear regression fit? ☑ NA ☐ YES ☐ NO
   b. Was the curve forced through the origin? ☑ NA ☐ YES ☐ NO
2. Did the initial analysis of any sample have a target analyte concentration that exceeded the initial calibration range? ☐ NA ☐ YES ☑ NO
   -If so, was the sample reanalyzed at a higher dilution? ☑ NA ☐ YES ☐ NO
3. Were the analyte concentrations that were recorded on the raw sample quantitation reports accurately transferred to the sample summary sheets? ☑ YES ☐ NO

**Comments:** All target analyte quantitation criteria were met.

**N. LIBRARY SEARCHES:**

**Comments:** Library searches were not requested with this data set.

**O. DAA CORRECTIVE ACTION TAKEN AND GENERAL COMMENTS:**

**Comments:** No corrective action was required.

## SW-846 METHOD 8270C (GC/MS) SEMIVOLATILE ORGANIC DATA VALIDATION

**Sample ID:** 5GP-17 (15'), 5GP-18 (13'), 5GP-19 (15'), 5GP-20 (14'), 5GP-21 (14'), 5GP-22 (14'), 5GP-23 (14'), 5GP-24 (14'), 7GP-17 (11'), 7GP-18 (14'), 7GP-19 (14'), 7GP-20 (14.5'), 7GP-21 (13.5'), 7GP-22 (13'), 7GP-23 (12.5'), 7 GP-24 (14').

**QC Samples:** 5GP-20 (14')MS, MSD, LCS, Method Blank, Field Dup: 5GP-22-22
7GP-20(14.5')MS/MSD, LCS, Method Blank, Field Dup 7GP-22-22

**Laboratory:** Lancaster Laboratories, Lancaster PA; SDG RAV03/RAV04

***Comment:*** *Semivolatile (a.k.a, base/neutral and acid extractables) analysis involves sample preparation using SW-846 Method 3550B-ultrasonic extraction. The semivolatile extracts are concentrated through evaporation. Target analytes are separated and quantified using capillary column GC/MS.*

### A. QC DELIVERABLES PACKAGE:

1. Was the case narrative present and signed by a laboratory representative? ☑ YES ☐ NO
2. Was the Chain of Custody present and signed by a laboratory representative? ☑ YES ☐ NO
3. Were the sample results included for all sample locations? ☑ YES ☐ NO
4. Did the laboratory analyte list correspond to the project specific analyte list? ☑ YES ☐ NO
5. Were all analyte LOQs reported on sample summary sheets in agreement with the instrument specific MDL study? ☑NA☐ YES ☐NO

**Comments:** All QC deliverables package criteria were met.

### B. QC HISTORY DOCUMENTATION CRITERIA:

1. Were the instrument specific LODs for target analytes provided? ☑ YES ☐ NO
2. Were the instrument specific LOQs for target analytes provided? ☑ YES ☐ NO
3. Was the instrument specific calibration range for each target analyte specified? ☑ YES ☐ NO
4. Was initial demonstration of capability data provided for all target analytes? ☑ YES ☐ NO

**Comments:** All QC history documentation criteria were met.

## C. TECHNICAL HOLDING TIME AND PRESERVATION CRITERIA:

1. Was the 14-day sample collection to extraction holding time met? ☑ YES ☐ NO
2. Was the 40-day extraction to analysis holding time met? ☑ YES ☐ NO
3. Were the samples received at 4°C (± 2°C)? ☑ YES ☐ NO

**Comments:** The sample collection to extraction and extraction to analysis holding times were met. All preservation criteria were met.

## D. GC/MS INSTRUMENT PERFORMANCE CHECK CRITERIA:
***(Tuning, Injection Port And Column Performance)***

1. Was analysis of the instrument performance check solution performed at the beginning of each 12-hour period of standard and/or sample analysis? ☑ YES ☐ NO
2. Was there documentation of the injection of 50 ng of DFTPP? ☑ YES ☐ NO
3. Were all ion abundance criteria met? ☑ YES ☐ NO
4. Was the injection port inertness verified by analysis of 4,4'-DDT? ☑ YES ☐ NO
   - If no, does associated data require qualification? ☑ NA ☐ YES ☐ NO
   - Was the injection port inertness check acceptable? ☐ NA ☑ YES ☐ NO
5. Was column performance checked through the analysis of peak tailing of pentachlorophenol and benzidine? ☑ YES ☐ NO
   - If no, does associated data require qualification? ☑ NA ☐ YES ☐ NO
   - Was column performance check acceptable? ☐ NA ☑ YES ☐ NO

**Comments:** All GC/MS instrument performance check criteria were met.

## E. INITIAL GC/MS CALIBRATION CRITERIA:
***SW-846 Criteria:***

1. Were the initial calibrations (ICAL) and any directly associated blanks and samples analyzed within 12-hours of the associated instrument performance (tune) check? ☑ YES ☐ NO
2. Were quantitation ions, used and listed on data, randomly checked against primary quantitation ions as required by Method 8270C and the RFP? ☑ YES ☐ NO
3. Were all target analytes included in the ICAL? ☑ YES ☐ NO
4. Did the ICAL consist of a minimum of 5 calibration levels? ☑ YES ☐ NO
5. Was the lowest concentration calibration standard at or below the associated MCL, regulatory compliance, or action limit? ☑ YES ☐ NO
6. Were calibration levels removed from the curve that would

negatively impact the data integrity? ☐ YES ☑ NO

7. Were 8270C SPCC criteria met?
(Relative Response Factor-average(RRF) ≥ 0.050) ☐ NA ☑ YES ☐ NO
   - N-nitroso-di-n-propylamine
   - Hexachlorocyclopentadiene
   - 2,4-Dinitrophenol
   - 4-nitrophenol

8. Were 8270C B/N Fraction analyte criteria met?
( % Relative Standard Deviation (%RSD) ≤ 30%) ☐ NA ☑ YES ☐ NO
   - acenaphthene
   - 1,4-dichlorobenzene
   - hexachlorobutadiene
   - N-nitrosodiphenylamine
   - Di-n-octyl phthalate
   - fluoranthene
   - benzo(a)pyrene

9. Were 8270C Acid Fraction analyte criteria met?
( % Relative Standard Deviation (%RSD) ≤ 30%) ☐ NA ☑ YES ☐ NO
   - 4-chloro-3-methylphenol
   - 2,4-dichlorophenol
   - 2-nitrophenol
   - phenol
   - pentachlorophenol
   - 2,4,6-trichlorophenol

10. Was each target analyte %RSD ≤ 15%?
(with the exception of SPCC/CCC compounds) ☐ NA ☑ YES ☐ NO

11. Was the correlation coefficient or coefficient of determination >0.99 for target analytes with ≥ 15 % RSD
(with the exception of SPCC/CCC compounds)? ☑ NA ☐ YES ☐ NO

***Method Validation Performance Criteria:***

1. Did target analytes and surrogates (with the exception of SPCC/ CCC compounds)that have % RSDs ≥ 15% have >0.99 correlation coefficient or coefficient of determination? ☐ NA ☑ YES ☐ NO
(Evaluate RRFs < 0.05 for potential problems.)

**Comments:** All initial calibration criteria were met.

## F. CALIBRATION VERIFICATION CRITERIA:

***SW-846 Criteria:***

1. Was a calibration verification analyzed at the beginning of each 12-hour period following the analysis of the instrument

performance check and prior to analysis of the method blank and samples? The calibration verification may be part of the ICAL or run independently on another 12-hour analysis period. ☑ YES ☐ NO

2. Were 8270C SPCC criteria met? (Relative Response Factor (RRF) ≥ 0.050) ☑ YES ☐ NO
3. Were all 13 8270C CCC criteria met? (%D within ± 20%) ☑ YES ☐ NO

***Method Validation Performance Criteria:***

1. Did all target analytes and system monitoring analytes (surrogates) have % Ds within ± 25.0%? ☑ YES ☐ NO
(Evaluate RRFs < 0.05 for potential problems.)
If "NO", list analytes that exceed this criterion:

***DAA Contractual Requirements:***

1. Did all target analytes and system monitoring analytes (surrogates) have % Ds within ± 25.0%? ☑ YES ☐ NO
2. Five analytes, in each standard mix, may fail to meet maximum % D as long the % D is within ± 40.0%
Did calibration verification meet this criteria? ☑ YES ☐ NO

**Comments**: All calibration verification criteria were met.

## G. BLANK CRITERIA:

1. Was a method/extraction blank analyzed on each GC/MS system used for sample analysis? ☑ YES ☐ NO
2. Was a trip blank analyzed with this sample batch? ☐ YES ☑ NO
2. Were the blank samples interference free? ☐ YES ☑ NO
3. Was the level of blank contamination less than 5% of the MCL? ☑ YES ☐ NO
5. List target analytes detected in the blanks:
*di-n-butylphthalate*

**Comments:** All blank criteria were met with the exception of di-n-butylphthalate in the Unit 7 samples. Bis-2-ethylhexylphthalate was detected in several samples. Laboratory contamination was suspected, but not confirm for this common laboratory contaminant.

## H. SURROGATE CRITERIA:

1. Were the following surrogates used? ☑ YES ☐ NO
   - phenol - $d_6$ (24%-113%)
   - 2-fluorophenol (25%-121%)
   - 2,4,6-tribromophenol (19%-122%)
   - nitrobenzene – $d_8$ (23%-120%)
   - 2-fluorobiphenyl (25%-121%)
   - p-terphenyl - $d_{14}$ (18%-137%)
2. Were recoveries within the specified ranges? ☑ YES ☐ NO
3. Were any two base/neutral or acid surrogates out of specification or did any one base/neutral or acid extractable surrogate have a recovery of less than 10%? ☐YES ☑ NO
   If yes, was a reextraction and reanalysis performed to confirm that the non-compliance was due to sample matrix effects rather than laboratory deficiencies? ☑ NA ☐ YES ☐ NO

**Comments:** All surrogate requirements were met.

## I. MATRIX SPIKE/ MATRIX SPIKE DUPLICATE CRITERIA:

(MS/MSD Requirements - CLP Guidelines)

| Analyte | % R Water | % RPD Water |
|---|---|---|
| Phenol | 12-110 | 42 |
| 2-Chlorophenol | 27-123 | 40 |
| N-Nitroso-di-n-propylamine | 41-116 | 38 |
| 4-Chloro-3-methylphenol | 23-97 | 42 |
| Acenaphthene | 46-118 | 31 |
| 4-Nitrophenol | 10-80 | 50 |
| 2,4-Dinitrotoluene | 24-96 | 38 |
| Pyrene | 26-127 | 31 |

1. Was a matrix spike and matrix spike duplicate (MS/MSD) analyzed per sample batch or every 20 samples, whichever may occur first? ☑ YES ☐ NO
2. Did the MS/MSD spike contain additional target analytes? ☑ YES ☐ NO
3. Was the MS/MSD analyzed on the specific project matrix? ☑ YES ☐ NO
4. List MS/MSD target analytes not within acceptable laboratory recovery ranges: *none*
5. Was a LCS analyzed to address failed matrix spike criteria? ☑ NA ☐ YES ☐ NO
6. Did the LCS for the failed matrix spike analyte(s) fall within the acceptable recovery ranges and was the problem identified as matrix interference? ☑ NA ☐ YES ☐ NO

7. Were any analytes flagged as estimated concentrations? ☐ YES ☑ NO
8. List analytes flagged as estimated concentrations: *none*

**Comments:** All MS/MSD requirements were met.

## J. LABORATORY CONTROL SAMPLE (LCS) CRITERIA:

1. Was a LCS included in the sample analysis? ☑ YES ☐ NO
2. Did the LCS contain all required target analytes? ☑ YES ☐ NO
3. List the LCS target analytes and laboratory recovery range.
   *See semivolatile certificate of analysis.*
4. List the LCS analytes which exceeded the acceptable recovery range: *none*

**Comments:** All LCS criteria were met.

## K. INTERNAL STANDARDS CRITERIA:

1. Were the following internal standards used? ☑ YES ☐ NO
   - 1,4-Dichlorobenzene-$d_4$
   - Naphthalene-$d_8$
   - Acenapththene-$d_{10}$
   - Phenanthrene-$d_{10}$
   - Chrysene-$d_{12}$
   - Perylene-$d_{12}$
2. Were internal standard areas within ± 50% of last calibration verification? ☑ YES ☐ NO
3. Were internal standard retention times within ± 30 seconds of last calibration verification? ☑ YES ☐ NO

**Comments:** All internal standard criteria were met.

## L. TARGET ANALYTE IDENTIFICATION:

1. Were the RRTs of the reported analytes within ± 0.06 RRT units of the standard RRT? ☐ NA ☑YES ☐ NO
2. Check the sample spectra against the laboratory standard spectra to see that the following criteria were met:
   - Did characteristic ions maximize in the same scan or within one scan of each other? ☐ NA ☑YES ☐ NO
   - Were all characteristic ions present in the standard spectra present in the sample spectra for analytes detected above the LOQ? ☐ NA ☑YES ☐ NO
   - Were the relative intensities of the ions between the

standard and sample spectra within ± 30 %? ☐ NA ☑YES ☐ NO

3. Were all reported analytes confirmed? ☐NA ☑YES ☐ NO

**Comments:** All target analyte identification requirements were met.

## M. TARGET ANALYTE QUANTITATION:

- If the %RSD of a analyte was 15% or less, then the average relative response factor should have been used for quantitation.
- If the %RSD of a analyte was greater than 15%, then the quantitation should be based on a calibration curve using the first or higher order regression fit of the five calibration points (6 calibration points for 2nd order).

1. List the analytes detected above the LOQ whose %RSD was >15%: *none*
   a. Was the subsequent quantitation based on a linear regression fit? ☑ NA ☐YES ☐ NO
   b. Was the curve forced through the origin? ☑ NA ☐YES ☐ NO
2. Did the initial analysis of any sample have a concentration of a target analyte that exceeded the initial calibration range? ☐ YES ☑ NO
   -If so, was the sample reanalyzed at a higher dilution? ☑ NA ☐ YES ☐ NO
3. Were the analyte concentrations that were recorded on the raw sample quantitation reports accurately transferred to the sample summary sheets? ☑ YES ☐ NO

**Comments:** Target analyte quantitation criteria were met.

## N. LIBRARY SEARCHES:

**Comments:** Library searches were not requested with this data set.

## O. DAA CORRECTIVE ACTION TAKEN AND GENERAL COMMENTS:

**Comments:** No corrective action was required.

**LIMITATIONS AND REFERENCES:**

Draper Aden Associates conducted data validation of the above noted data set using summary tables and raw data provided by the analyzing laboratory. Data validation was conducted in general accordance with SW-846 Method requirements (Test Methods for Evaluating Solid Wastes - Physical and Chemical Methods, USEPA SW-846, 3rd edition - Final Update I, II/IIA and III) and CLP data validation guidelines (USEPA Contract Laboratory Program National Functional Guidelines for Organic Data Review, October, 1999). Validation of this data set is limited to the items detailed in this report.

## SW-846 INORGANIC DATA REVIEW SUMMARY

Draper Aden Associates (DAA) performed a limited review of the analytical results for the February 17-18, 2004 soil sampling event at hazardous waste management units 5 and 7, Radford Army Ammunition Plant (RAAP)/Alliant Ammunition and Powder Company, Montgomery County, Virginia. Soil samples were collected from locations 5GP-17 (15'), 5GP-18 (13'), 5GP-19 (15'), 5GP-20 (14'), 5GP-21 (14'), 5GP-22 (14'), 5GP-23 (14'), 5GP-24 (14'), 7GP-17 (11'), 7GP-18 (14'), 7GP-19 (14'), 7GP-20 (14.5'), 7GP-21 (13.5'), 7GP-22 (13'), 7GP-23 (12.5'), and 7GP-24 (14').

All samples were analyzed for twenty-two metal target analytes per SW-846 Method 6010B, mercury per SW-846 7471A and cyanide per SW-846 9012A. Inductively coupled plasma (ICP), cold vapor atomic absorption (CVAA) and colorimetric were the techniques on which the individual analytical methods for each of the inorganics were based.

Soil samples were collected and submitted to the laboratory for analysis of the following metals: ICP Method 6010B (aluminum, antimony, arsenic, barium, beryllium, cadmium, calcium, chromium, cobalt, copper, iron, lead, magnesium, manganese, nickel, potassium, selenium, silver, sodium, thallium, vanadium and zinc), Method 7471A (mercury) and Method 9012A (total cyanide).

Severn Trent Laboratories (STL) of North Canton, Ohio performed the inorganic analyses. STL submitted results to Draper Aden Associates in a final certificate of analysis which included sample analytical results as well as relevant documentation to verify and validate the results.

The evaluation of STL's compliance with inorganic analytical methods and validation of results presented here are based upon a limited review of QA/QC information including chain of custody, case narrative, holding time, preservation procedures, standards, spike analysis on sample matrix (S), blank samples analyses (method, calibration and other blanks), and duplicate analyses (SD) results. Review was limited to summary sheets provided by the laboratory, unless a notable discrepancy in the data package required review of the raw data. A summary of data review results and any observed deviations is provided below.

STL received the samples on ice and in good condition. All technical holding time criteria were met.

***Method 6010B***

The original certificate of analysis appeared complete in its presentation and the data were of acceptable quality. The data set exhibited the laboratory's ability to achieve the reported

limit of quantitation (LOQ) for each target parameter, as outlined by the method detection limit study.

All instrument calibration and calibration verification criteria were met. Blank samples, calibration standards, pre-digestion spikes and duplicates were analyzed as required. All laboratory control samples, pre-digestion spikes and duplicates were recovered within control limits, except where noted below. Duplicate sample results exhibited acceptable precision, where applicable. All LOQ standards exhibited acceptable recovery. Deviations from specific quality control criteria that were identified and noted during the data review process are summarized below.

The associated blanks were not interference free; however, data qualification was necessary for only beryllium, and thallium. Detected results less than the LOQ and less than five times the blank concentration for beryllium and thallium were attributed to laboratory contamination and validated accordingly, where applicable. All sample results greater than the LOQ, but less than five times the blank concentration were considered influenced by contamination and the results qualified and reported as "UA."

Antimony recovered low in the matrix spike and matrix spike duplicate sample and all results for these target parameters were qualified as estimated and should be considered biased low.

The sample and field sample duplicate (5GP-22 (14') and 7GP-22(13')) met relative percent difference criteria for all target analytes except selenium (7GP-22(13')) which was qualified as estimated.

The laboratory presented all results in mg/kg on a dry weight basis. Except where noted above, all sample results remain as reported by the laboratory. All results unaffected by the data validation process and/or detected less than their corresponding LOQs were validated and reported as "U." Refer to the attached table titled "Data Validation Report" for a summary of results which required data validation.

***Methods 7471A (CVAA/ 9012A(Colorimetric)***

The original certificate of analysis appeared complete in its presentation and the data were of acceptable quality. The data set exhibited the laboratory's ability to achieve the reported LOQ for mercury and cyanide, as outlined by the method detection limit study.

All instrument calibration and calibration verification criteria were met. Blank samples, LCS samples, pre-digestion spikes and spike duplicates were analyzed as required. All blank criteria were met. Laboratory spike and spike duplicate sample results exhibited acceptable precision, where applicable. All laboratory control samples, pre-digestion spikes and duplicates

were recovered within control limits. No deviations from specific quality control criteria were identified during the data review process.

The laboratory presented all results in mg/kg on a dry weight basis. All results remain as reported by the laboratory. All results unaffected by the data validation process and/or detected less than their corresponding LOQs were validated and reported as "U."

## INORGANIC DATA EVALUATION
## FOR ICP SW-846 METHOD 6010B-SOIL

**Sample ID:** 5GP-17 (15'), 5GP-18 (13'), 5GP-19 (15'), 5GP-20 (14'), 5GP-21 (14'), 5GP-22 (14'), 5GP-23 (14'), 5GP-24 (14'), 7GP-17 (11'), 7GP-18 (14'), 7GP-19 (14'), 7GP-20 (14.5'), 7GP-21 (13.5'), 7GP-22 (13'), 7GP-23 (12.5'), 7GP-24 (14')

**QC Samples:** Lab blanks, Pre-digestion spikes, Duplicates, ICS, LCS, etc.

- Matrix spike/duplicate-5GP-20(14')
- Matrix spike/duplicate-7GP-20(14')
- Field Duplicates-5GP-22 (14'); 5GP-22-22 (14')
- Field Duplicates-7GP-22 (13'); 7GP-22-22 (13')

**Laboratory:** STL, North Canton, OH; SDG A4B190299

Does Laboratory analyte list correspond to analyte list requested by DAA? _X_ yes ___ no

"☑" denotes items reviewed. See Data Validation Summary for additional comments.

### A. QC DOCUMENTATION CRITERIA

☑ Specific LODs for all target analytes
☑ Specific LOQs for all target analytes

### B. TECHNICAL HOLDING TIMES AND PRESERVATION REQUIREMENTS:

☑ 6 month holding time

### C. INSTRUMENT CALIBRATION CRITERIA:

☑ 1 calibration blank and at least 1 standard

### D. INITIAL AND CONTINUING CALIBRATION VERIFICATION CRITERIA:

☑ 10 sample frequency
☑ Use of calibration blank and check standard
☑ %R within 90-110% range

### E. BLANK SAMPLES ANALYSES CRITERIA:

☑ Method/Other Lab Blanks (check only if analyzed)

☑ Interference free
☑ CCB 10 sample frequency

**F. INTERFERENCE CHECK SAMPLES (ICS) CRITERIA:**

☑ ICS (80-120%)

**G. DUPLICATE ANALYSES CRITERIA:**

☑ One spike/sample duplicate per batch of samples
☑ %RPD ± 20% for spike/ sample values greater than 5 X LOQ
☑ {spike/sample ± LOQ} when spike/sample values are less than 5 X LOQ

**H. SPIKED SAMPLES ANALYSES /LCS CRITERIA:**

☑ %R within 75-125% range/ 80-120%

**I. SAMPLE RESULTS CRITERIA:**

☑ Samples fall within ICP linear concentration ranges

**J. Revisions:** No revisions were required. Prep method 3050B

DAA conducted a limited data validation of the above noted data set using the data package provided by the analyzing laboratory. Data evaluation was conducted using SW-846 (Test Methods for Evaluating Solid Waste-Physical/Chemical Methods, USEPA, SW-846, 3rd Edition-Final Update I, II/IIA and III) method requirements and CLP data validation guidelines (USEPA Contract Laboratory Program National Functional Guidelines for Inorganic Data Review, July 2002). Validation of this data set is limited to review of items detailed in this data review report.

Does Laboratory analyte list correspond to analyte list requested by DAA? √yes ___no

"☑" denotes items reviewed. See Data Validation Summary for additional comments.

### A. QC DOCUMENTATION CRITERIA

☑ Specific LOD/LOQ for mercury?

### B. METHOD INFORMATION DOCUMENTATION

☑ All target parameters analyzed by requested methods?

### C. TECHNICAL HOLDING TIMES AND PRESERVATION REQUIREMENTS:

☑ 28 Day holding time
☑ Cool 4°C

### D. INSTRUMENT CALIBRATION CRITERIA:

☑ 1 calibration blank and 5 standards
☑ Instrument calibrated for every analytical sequence for every method

### E. INITIAL AND CONTINUING CALIBRATION VERIFICATION CRITERIA:

☑ 10 sample frequency for CCV
☑ %R within 90-110% range

**F. BLANK SAMPLES ANALYSES CRITERIA:**

- ☑ Method/other laboratory blanks (check only if analyzed)
- ☑ Interference free
- ☑ CCB 10 sample frequency

**G. DUPLICATE ANALYSES CRITERIA:**

- ☑ One spike/sample duplicate per batch of samples
- ☑ %RPD ± 20% for spike/sample values greater than 5 X LOQ
- ☑ {spike/sample ± LOQ} when spike/sample values are less than 5 X LOQ

**H. SPIKED SAMPLES ANALYSES/LCS CRITERIA:**

- ☑ Pre-digestion matrix spikes for all analytes
- ☑ %R within 75-125% range/80-120%

**I. SAMPLE RESULTS CRITERIA:**

- ☑ Samples fall within calibration concentration range

**J. Revisions:** No revisions were required.

DAA conducted a limited data validation of the above noted data set using the data package provided by the analyzing laboratory. # METHODOLOGY SUMMARY/REFERENCE

## *1163 GC/MS Volatiles Water Preparation*

An undiluted aliquot of the water sample is purged and the volatile compounds are collected on a sorbent trap that is subsequently desorbed onto a gas chromatographic column.

Reference: Test Methods for Evaluating Solid Waste, SW-846, Method 5030B, Revision 2, December 1996.

**********

## *6292 TCL by 8260 (soil)*

The sample or extract of the sample is analyzed by purge and trap GC/MS.

Reference: Test Methods for Evaluating Solid Waste, SW-846, Method 8260B, Revision 2, December 1996

**********

## *3636 TCLP Volatiles (leachate)*

The zero headspace extracted sample is purged and the volatile compounds are collected on a sorbent trap which is subsequently desorbed onto the GC/MS system for chromatographic and mass spectral analysis.

Reference: Test Methods for Evaluating Solid Waste SW-846, Method 8260B, Revision 2, December 1996

**********

## *0371 ICP Metals (water/soil)*

The solution resulting from the metals digestion is analyzed by ICP.

Reference: Test Methods for Evaluating Solid Waste SW-846, Method 6010B, December 1996

## 0259 Mercury (water)

The solution resulting from the mercury digestion is analyzed by Cold Vapor AA.

Reference: Test Methods for Evaluating Solid Waste
SW-846, Method 7470A, September 1994

**********

## 5713 Mercury Digestion (water, SW-846)

The sample is heated at 95 C with nitric acid, sulfuric acid, potassium persulfate, and potassium permanganate. Excess potassium permanganate is reduced with sodium chloride/hydroxylamine hydrochloride. Mercuric ions are reduced to mercury metal using stannous chloride.

Reference: Test Methods for Evaluating Solid Waste
SW-846, Method 7470A, September 1994

**********

## 5705 Metals Digestion (water, total, SW-846)

The sample is digested with nitric and hydrochloric acids.

Reference: Test Methods for Evaluating Solid Waste
SW-846, Method 3010A, July 1992

**********

## 0816 Water Sample Herbicide Extraction

The water sample is hydrolyzed, acidified and solvent extracted. The acids are converted to methyl esters using derivatization. Florisil cleanup is used to minimize interference.

Reference: Test Methods for Evaluating Solid Wastes,
SW-846, Method 8151A, December 1996

**********

## 0817 Water Sample Pesticide Extraction

Pesticides are extracted from the water with methylene chloride. The extract is then dried and concentrated. If necessary, florisil cleanup is used to minimize interferences.

Reference: Test Methods for Evaluating Solid Wastes,
SW-846, Method 3510C, December 1996

## 0949/4731 TCLP Semivolatiles

The sample is leached by the TCLP method. The leachate is then solvent extracted and analyzed by GC/MS.

Reference: Test Methods for Evaluating Solid Waste
SW-846, Method 8270C, December 1996

**********

## 1123 Cyanide (reactivity) SW-846 Interim Method (water/solid)

The sample is acidified with sulfuric acid in a closed system. The hydrogen cyanide gas is trapped in a sodium hydroxide solution and quantitatively analyzed using an automated colorimetric procedure. Prep # is 1121.

Reference: Test Methods for Evaluating Solid Waste
SW-846, Method 9012A modified, December 1996

**********

## 0946 TCLP Zero Headspace Extraction

For liquid wastes (containing <0.5% solids), the TCLP volatile extract is defined as the filtrate resulting from filtration of the waste in a zero headspace extractor through a 0.6 to 0.8 um glass fiber filter.

For wastes containing >0.5% solids (and free standing liquid), the waste is filtered through a glass fiber filter in a zero headspace extractor into a Tedlar bag. The solid portion is then extracted for 18 hours with extraction fluid 1 (pH of 4.93 +0.05) at a volume 20 times the weight of the solid. Following the extraction, the leachate is filtered through a glass fiber filter into the Tedlar bag containing the initial filtrate and these filtrates are combined for the final leachate.

For waste not containing any free standing liquid, the sample is extracted with a volume of extraction fluid 1 at a volume 20 times the sample weight for 18 hours in a zero headspace extractor. The extract is then filtered into zero headspace vials and the leachate is defined as the filtrate.

Reference: Test Methods for Evaluating Solid Waste1
SW-846, Method 1311, July 1992

## 0947 TCLP Non-volatile Extraction

For the liquid wastes (containing <0.5% solids), the TCLP non-volatile extract is defined as the filtrate resulting from filtration of the waste through a 0.6 to 0.8 um glass fiber filter.

For wastes containing >0.5% solids (and free standing liquid), the waste is filtered through a glass fiber filter and the filtrate is stored for later use. The solid portion is then evaluated for buffering capacity and extracted for 18 hours with the appropriate extraction fluid (pH of 4.93 +0.05 or pH of 2.88 +0.05) at a volume 20 times the weight of the solid. Following the extraction, the leachate is filtered through a glass fiber filter and the final and initial filtrates are combined.

For waste not containing any free standing liquid, the sample is extracted with a volume of the appropriate extraction fluid at a volume 20 times the sample weight for 18 hours. The extract is then filtered and the leachate is defined as the filtrate.

Reference: Test Methods for Evaluating Solid Waste
SW-846, Method 1311, July 1992

**********

## 0496 Corrosivity (water/solids)

Determination of corrosivity is based on the pH value.

Reference: Test Methods for Evaluating Solid Waste
SW-846, Chapter 7, September 1994

**********

## 0542 Ignitability (solid)

Ignitability is determined empirically by exposing the sample to air, water, and friction. The vapors of the sample are then exposed to a flame using a closed cup apparatus.

Reference: 40 CFR, Part 261.21

**********

## 0111 Moisture (solid)

A well mixed sample is placed in a tared container and dried to constant weight in an oven at 103-105C. The decrease in weight is the total moisture.

Reference: Methods for Chemical Analysis of Water and
Wastes USEPA 600/4-79-020, Method 160.3 (modified)

## 0118 Moisture (solid)

This value reflects the background moisture value. It is used to calculate dry weight reports for matrix spike and matrix spike duplicate samples.

Reference: See background sample moisture method reference

**********

## 0121 Moisture Duplicate (solid)

This analysis is required to check the precision of the moisture analysis. The value is not used in report calculations.

Reference: See background sample moisture method reference

**********

## 1121 Reactivity Prep (water/solid)

The sample is acidified to pH 2, and gases are collected in a scrubber containing sodium hydroxide. This is followed by analysis for sulfide and/or cyanide content.

Reference: Test Methods for Evaluating Solid Waste
SW-846, Chapter 7.3, December 1996

**********

## 1122 Sulfide (Reactivity)

Excess iodine is added to a portion of the scrubber solution which contains sodium hydroxide. The iodine oxidizes the sulfide to sulfur under acidic conditions. The excess iodine is back titrated with sodium thiosulfate.

Reference: Test Methods for Evaluating Solid Waste
SW-846, Chapter 7 and Method 9034

**********

## 0394 pH (solids)

The activity of hydrogen ions in the sample is measured on a 1:1 slurry of sample and deionized water using a glass electrode and a reference electrode.

Reference: Test Methods for Evaluating Solid Waste
SW-846, Method 9045C, (modified) September 1994

## *0950 TCLP Pesticides (leachate)*

The leachate sample is solvent extracted and quantitatively analyzed by gas chromatography with an electron capture detector.

Reference: Test Methods for Evaluating Solid Wastes, SW-846, Method 8081A, December 1996

**********

## *0952 TCLP Herbicides (leachate)*

The leachate sample is hydrolyzed, acidified, solvent extracted and converted to the methyl esters. The resulting extract is quantitatively analyzed by gas chromatography with an electron capture detector.

Reference: Test Methods for Evaluating Solid Wastes, SW-846, Method 8151A, December 1996

|---|---|---|---|---|---|---|---|
| 00259 | Mercury | 7439-97-6 | N.D. | 0.00016 | 0.00020 | mg/l | 1 |

The metal analyses were performed on a non-volatile leachate prepared according to the procedure specified in SW-846, Chapter 7.4 (Revision 3, December, 1994). A sample is considered to have failed the Toxicity Characteristic (TC) test and is considered a hazardous waste if any of the metal concentrations (mg/l) in the leachate exceed the following maxima (100 times the Primary Drinking Water Standards):

| | | | | | | | |
|---|---|---|---|---|---|---|---|
| Arsenic | 5.0 | Cadmium | 1.0 | Lead | 5.0 | Selenium | 1.0 |
| Barium | 100.0 | Chromium | 5.0 | Mercury | 0.2 | Silver | 5.0 |

| 01978 | Toxaphene | 8001-35-2 | N.D. | 0.0015 | 0.0050 | mg/l | 1 |

The pesticide/herbicide analyses were performed on a non-volatile toxicity characteristic leachate of the submitted waste. The leachate was prepared according to the procedure specified in the March 29 and the June 29, 1990 Federal Registers.
A sample is considered to have failed the Toxicity Characteristic (TC) test and is therefore considered a hazardous waste if any of the contaminant concentrations (mg/l) in the leachate exceed the following maxima:

| | | | |
|---|---|---|---|
| Chlordane | 0.03 | Methoxychlor | 10.0 |
| Endrin | 0.02 | Toxaphene | 0.5 |
| Heptachlor (and epoxide) | 0.008 | 2,4-D | 10.0 |

| 03334 | Hexachlorobenzene | 118-74-1 | N.D. | 0.002 | 0.020 | mg/l | 1 |
| 03335 | Pentachlorophenol | 87-86-5 | N.D. | 0.006 | 0.050 | mg/l | 1 |

The semivolatile analyses were performed on a non-volatile toxicity characteristic leachate of the submitted waste. The leachate was prepared according to the procedure specified in SW-846, Chapter 7.4 (Revision 3, 12/94). If the TCLP extract contains any one of the Toxicity Characteristic (TC) constituents in an amount equal to or exceeding the concentrations specified in 40 CFR part 261.24, the waste possesses the characteristic of toxicity and is a hazardous waste. These limits are listed below in mg/L. Other limits may apply for analyses performed under other regulations.

| | | | |
|---|---|---|---|
| Total Methylphenols | 200.0 | Nitrobenzene | 2.0 |
| 1,4-Dichlorobenzene | 7.5 | Pentachlorophenol | 100.0 |
| 2,4-Dinitrotoluene | 0.13 | Pyridine | 5.0 |
| Hexachlorobenzene | 0.13 | 2,4,5-Trichlorophenol | 400.0 |
| Hexachlorobutadiene | 0.5 | 2,4,6-Trichlorophenol | 2.0 |

*=This limit was used in the evaluation of the final result

## SAMPLE PREPARATION:

The soil samples were collected in the field using EnCore™ samplers. Once submitted to Lancaster Laboratories, the samples were transferred into the appropriate pre-weighed containers and were re-weighed to determine the weight of the sample. Since an approximate amount of sample is collected in the field, the dilution factors may vary from sample to sample.

The weights for several samples were found to be outside the SW-846 Method 5035 requirement of 4.5g to 5.5g (EnCore™ sampler) when these samples were re-weighed at the laboratory. Please see the Vial Preparation sheets following the QC Raw Data section for more information.

No other problems were encountered during the sample preparation for the VOA fraction.

## ANALYSIS:

The method used for analysis was EPA SW846 Method 8260B.

All field samples for TCLP were analyzed at a twenty times dilution due to the leachate matrix and the action reporting limits of the TCLP.

No other problems were encountered during the analysis of these samples.

## QUALITY CONTROL and NONCONFORMANCE SUMMARY:

Only client requested compounds are addressed in this narrative.

All QC was within specifications.

## DATA INTERPRETATION:

No further interpretation is necessary for the data submitted.

Case Narrative reviewed and approved by:

Richard S. Rodgers Date 3/2/04

Lancaster Laboratories
Quantitation Report GC/MS Volatiles 4219009

File: /chem/HP09193.i/04feb20a.b/xf18s02.d
Sample: 5GPTM;4219009;2;0;;;
Injected At:20-FEB-2004 12:31
Calibration Time: 16-FEB-2004 09:47
Target Method: X8260SL.m
Blank Reference: xf20b01.d
Sublist: 6292

Sample Concentration Formula: On-Column Amount * (Vt/Ws)
Batch:X040511AA
Analyst:LCM01518
Instrument ID:HP09193.i
Standard Reference: xf20c01.d
Prep Factor:1.00
Units: ug/Kg

Matrix: SOIL
Level: Low
Sample Wt./Vol.: 5.0000 g (Ws)
Volume Purged: 5.0 ml (Vt)

| Target Compounds | I.S. Ref. | RT | (+/-RRT) | QIon | Area | Conc. (on column) | Conc. (in sample) | Blank Conc. | Qual. | Reporting Limit | LOQ |

/chem/HP09193.i/04feb16a.b/xf16i01.d

Average areas and retention times from above standards are used for compa

Current Continuing Calibration Standard:

/chem/HP09193.i/04feb20a.b/xf20c01.d

RT Summary

| Internal Standard Name | File ID: xf20c01.d | ICAL RT | In Spec |
|---|---|---|---|
| t-Butyl Alcohol-d10 | 4.505 | 4.498 | Yes |
| Fluorobenzene | 7.958 | 7.951 | Yes |
| Chlorobenzene-d5 | 11.347 | 11.343 | Yes |
| 1,4-Dichlorobenzene-d4 | 13.201 | 13.201 | Yes |

A "No" indicates the retention time is greater than 30 seconds from the average RT.

Area Summary

| Internal Standard Name | File ID: xf20c01.d | ICAL Area | Low Limit | High Limit | In Spec |
|---|---|---|---|---|---|
| t-Butyl Alcohol-d10 | 135522 | 129614 | 64807 | 259228 | Yes |
| Fluorobenzene | 1266290 | 1393795 | 696898 | 2787590 | Yes |
| Chlorobenzene-d5 | 1000818 | 1045027 | 522514 | 2090054 | Yes |
| 1,4-Dichlorobenzene-d4 | 570512 | 582773 | 291386 | 1165546 | Yes |

A "No" indicates the internal standard area is outside acceptable QC limits.

/chem/HP07159.i/04feb02b.b/nf02i10.d

Average areas and retention times from above standards are used for compa

Current Continuing Calibration Standard:

/chem/HP07159.i/04feb24b.b/nf24c03.d

RT Summary

| Internal Standard Name | File ID: nf24c03.d | ICAL RT | In Spec |
|---|---|---|---|
| Fluorobenzene | 7.970 | 7.975 | Yes |
| Chlorobenzene-d5 | 11.349 | 11.355 | Yes |
| 1,4-Dichlorobenzene-d4 | 13.200 | 13.205 | Yes |

A "No" indicates the retention time is greater than 30 seconds from the average RT.

Area Summary

| Internal Standard Name | File ID: nf24c03.d | ICAL Area | Low Limit | High Limit | In Spec |
|---|---|---|---|---|---|
| Fluorobenzene | 1037153 | 1041751 | 520876 | 2083502 | Yes |
| Chlorobenzene-d5 | 814583 | 812951 | 406476 | 1625902 | Yes |
| 1,4-Dichlorobenzene-d4 | 443611 | 456044 | 228022 | 912088 | Yes |

A "No" indicates the internal standard area is outside acceptable QC limits.

# Semivolatiles by GC/MS Data

# Case Narrative
# Conformance/Nonconformance
# Summary

CASE NARRATIVE

**Client: Draper Aden Associates, Inc.**
**SDG #: RAV01**

LANCASTER LABORATORIES
SEMIVOLATILES BY GC/MS

**SAMPLE NUMBER(S) :**

| LL #'s | Sample Code | Matrix Water | Comments |
|---|---|---|---|
| 4219006 | UN5NV | X | |

**LABORATORY SUBMITTED QC:**

| | | | |
|---|---|---|---|
| SBLKWC055 | SBLKWC055M | X | Method Blank |
| 4219022 | UN7NV | X | Unspiked |
| 4219022 | UN7NVMS | X | Matrix Spike |
| 4219022 | UN7NVMSD | X | Matrix Spike Dup |
| 055WCLCS | 055WCLCSM | X | Lab Control Sample |

**SAMPLE PREPARATION:**

All samples were leached by SW-846 Method 1311 and extracted according to SW-846 Method 3510C.

Due to insufficient sample, only 330 mls were used in the extractions of UN7NV, UN7NVMS and UN7NVMSD.

No other problems were encountered during the extraction of these samples.

**ANALYSIS:**

The method used for analysis was SW-846 8270C.

**Case Narrative (continued)**
**SDG#: RAV01**

All samples were analyzed for the semivolatile TCLP (toxicity characteristic leaching procedure) compounds.

3-Methylphenol and 4-methylphenol cannot be resolved under the chromatographic conditions used for sample analysis. The 4-methylphenol value is a combination of results from both compounds.

No problems were encountered during the analysis of these samples.

**QUALITY CONTROL AND NONCONFORMANCE SUMMARY:**

All QC was within specifications.

**DATA INTERPRETATION:**

Only non-conformances for client requested compounds are addressed in this case narrative.

No further interpretation is necessary for the data submitted.

Case Narrative Reviewed and Approved by:

Christina M. Ratchford for CJN Date: 3-3-04
Charles J. Neslund
Group Leader, GC/MS Semivolatiles

+ %RSD is less than or equal to 15%; however, value rounds to 15.

4,6-Dinitro-2-methylphenol and 4-Nitrophenol are at 10 ng/ul in the 5 standard.
Benzoic acid, Pentachlorophenol and 2,4-Dinitrophenol are at 15 ng/ul in the 5 standard.
Benzidine Levels in the 5,15,30,50,80,120 standards are 15,45,90,150,240,360 ng/ul, respectively.
Benzoic acid, Pentachlorophenol and 2,4-Dinitrophenol are at 15 ng/ul, 30 ng/ul,40 ng/ul in the 5 ,15, 30 standards.

| | | | | |

### A. Sample Preparation:

Florisil cleanup was used to minimize interferences. No other problems were encountered with the preparation of the samples.

### B. Analysis:

The analysis was performed using the following runs:

- 1C13051, 1C13051B, 2C13051, 2C13051B

No problems were encountered. All continuing calibration data are within method specifications since if any individual target analytes have a %D value outside the 15% criteria, then the average %D value of the standard is within the 15% criteria.

An SW-846 method update was performed using the initial calibration files from 1C13051 and the calibration name was changed to 2C13051.

### C. Quality Control:

All reported surrogates are within the QC limits.

The matrix spike data are within the QC limits.

The LCS data are within the QC limits.

### D. Data Interpretation:

The method blank was evaluated to the MDL. Values between the MDL and the LOQ are reported with a "J" qualifier.

No further interpretation is needed.

Lancaster Laboratories

**Data codes:**

Detected analytes are reported using the higher of the two column results in accordance with the method. Data with analytes showing disparity >40% are further evaluated for reporting based on chromatographic appearance. The analytes will be coded with a comment number on the data sheet. The comments are explained below:

- 1569 - A disparity of >40% between the primary and confirmatory analysis occurred. Due to suspected interference, the lower result was reported.
- 1570 - A disparity of >40% between the primary and confirmatory analysis occurred. Since no chromatographic anomalies were apparent, the higher result was reported.

Data that indicates that manual integration was required would include the following codes:
1 = missed peak and 2 = improper baseline. The peaks that have been manually changed are indicated with an "M" on the raw data.

Calibration File Name: **C:\CPWIN\DATA1\2C13051.CAL** Version = 2
External standard calibration
Standard injection volume = 1
No sample weight correction
Area reject threshold = 0
Reference peak area reject threshold = 50
Amount units = PPB
29 components with 5 levels each

## 1 TCX

Retention time = 4.173 min., Search window = 0.030 min.
Low alarm amount = 0, High alarm amount = 0.1
Group number = 0, Component constant = 0
No retention time reference component
Single peak quantification by height

| Level | Amount | Height | Height/Amt | Source | Date and time |
|---|---|---|---|---|---|
| 1 | 3.850 | 15862.4 | 4120.112 | Manual | 2/23/2004 10:21: |
| 2 | 19.240 | 74307.4 | 3862.131 | Manual | 2/23/2004 10:21: |

| 5 | 76.960 | 276229.3 | 3589.258 | Manual | 2/23/2004 10:21: |

Calibration formula: Y = 3797.324 X
Fit type = Avg CF with equal weighting, forced to origin
Coefficient of determination = 0.9926, Average error = 4.08%
Average CF = 3797.3240 with RSD = 5.45%

## 2 HCB

Retention time = 4.743 min., Search window = 0.030 min.
Low alarm amount = 0, High alarm amount = 0.1
Group number = 0, Component constant = 0
No retention time reference component
Single peak quantification by height

| Level | Amount | Height | Height/Amt | Source | Date and time |
|---|---|---|---|---|---|
| 1 | 1.000 | 7251.9 | 7251.88 | Manual | 2/23/2004 10:21: |
| 2 | 2.500 | 17209.4 | 6883.772 | Manual | 2/23/2004 10:21: |
| 3 | 5.000 | 33107.6 | 6621.524 | Manual | 2/23/2004 10:21: |

Instrument ID: CP13--H6722B Injected On: 2/20/2004 2:54:03 PM

Column ID: RTX-CLPII, 30M X 0.32MM X 0.25UM

Oven Parameters: 140C HOLD 1MIN; 10C/MIN TO 200; 50C/MIN TO 28(Volume Inj: 1N

Detector A Parameters:
Threshold: 2 Width: 0.01 Area Reject: 0
Calibration Type: External Quantitation: Height

Detector B Parameters:
Threshold: 2 Width: 0.02 Area Reject: 0
Calibration Type: External Quantiation: Height

Sample Weight: 1 Dilution Factor: 1
Analyst: 120
