Internal Standards performance check ensures that GC/MS sensitivity and response are stable during each analytical run. Specific criteria include area count of –50% to +100% and retention time of ±30 seconds from the associated calibration standards.

- All criteria were met. No qualifiers were applied.

**X-Quantitation Verification**
*Form 1 and chromatograms.*
The accuracy of analytical results is verified through the calculation of several parameters. Any positive value < RL and > MDL is reported as estimated "J." The percent difference (%D) between the calculated and the reported value should be within 10%.

**Sample: NRUC1B (00092519)), 2-Butanone**

Conc. µg/kg = (Ax * Is ng * Vt mL * DF) / (Ais * RRF * Va * Ws gm * Fs)

where:
Ax is the compound area
Is is the amount of internal standard injected (ng)
Vt is the total volume of the methanol extract (mL)
DF is the dilution factor
Ais is the corresponding internal standard area
RRF is the continuing calibration average relative response factor
Va is the volume of the aliquot of the methanol extract (µL)
Ws is the weight of the sample (g)
Fs is the fraction of solid [(100-%moisure)/100]

Conc. = (28323 * 50 ng * 5 mL ) / (250673 *0.894 *1 mL* 4.6 gm * 0.77) = 9 µg/kg

Reported conc. = 9 µg/kg
%D = %
Values were within 10% difference.

**MEMORANDUM**

**TO:** Davida Trumbo

**FROM:** Kweku Acquah

**SUBJECT:** Radford Army Ammunition Plant Data Validation - Volatiles
Envirosystems Lab, SDG IT3

**DATE:** November 28, 2000

---

The purpose of this memorandum is to present the data validation report for the samples collected at the Radford Army Ammunition Plant during the August 30, 2000 sampling event. Samples were analyzed for volatile organic compounds (VOCs) using USEPA SOW method OLM 04.2 (May 1999). A total of four soil samples were validated. The sample IDs are:

**Field Sample ID:** NRUW1B NRUW1C NRUG2C NRUG2BD

Data were reviewed by Kweku Acquah and validated using a combination of method-specific criteria, laboratory SOP and the *Innovative Approaches to Data Validation for USEPA Region III* (June 1995). Parameters evaluated under data validation procedure Level M3 are presented in Table 1. Data associated with parameters in compliance with quality control specifications have not been qualified. Data associated with parameters that did not comply with quality control specifications and directly impacted project data have been qualified in accordance with USEPA Region III specifications.

**Table 1. Laboratory Performance Criteria**

| Qualified | | Parameter |
|---|---|---|
| **Yes** | **No** | |
| | X | Holding Times |
| | X | Instrument Performance Check |
| X | | Initial Calibration |
| X | | Continuing Calibration |
| X | | Blank Analysis |
| | X | System Monitoring Compounds |
| | X | Laboratory Control Sample |
| | X | Internal Standards |
| X | | Quantitation Verification |

The quality of data collected in support of this sampling activity is considered acceptable with the noted qualifications.

cc:
Eric Malarek
Project File

**RADFORD ARMY AMMUNITION PLANT**
**VALIDATION REPORT**
**VOLATILES REVIEW**
**SDG IT3**

**I-Holding Times**
*Form I.*
The objective is to ascertain the validity of results based on the holding time of the sample from time of collection to time of analysis. Holding time criteria: For soil samples preserved and cooled @ 4°C ± 2°C, the maximum holding time is 14 days from sample collection to analysis.

- Holding time criteria were met. No qualifiers were applied.

**II-Instrument Performance Check**
*Form V*
The analysis of the instrument performance check solution must be performed at the beginning of each 12-hour period during which samples are analyzed. The instrument performance check solution, bromofluorobenzene (BFB), must meet the specified ion abundance criteria.

- All criteria were met. No qualifiers were applied.

**III-Initial Calibration**
*Form VI and chromatograms.*
Compliance requirements for satisfactory instrument calibration are established to ensure that the instrument used is capable of producing acceptable qualitative and quantitative data for volatile target compounds. Initial calibration demonstrates that the instrument is capable of acceptable performance in the beginning of the analytical run and of producing a linear calibration curve. The minimum relative response factor (RRF) must be ≥ 0.05. Percent relative standard deviation (%RSD) must be ≤ 15% for each target compound and must be ≤ 30% for each calibration check compound.

- For initial calibration performed on 09/12/00 on instrument HP73F, %RSD for compounds Bromomethane (22.2%), Chloroethane (27.2%), 1,1-Dichloroethene (16.2%), Methylene Chloride (25.4%), 2-Butanone (21.9%) and 2-Hexanone (16.8%) were above the control limit. Positive values for these compounds were qualified as estimated, "J", and non-detects had no qualifiers applied.

- For initial calibration performed on 09/12/00 on instrument HP73F, %RSD for compounds Chloromethane (36.6%) and Acetone (33.3%), were grossly above the control limit (i.e > 30%). Positive values for these compounds were qualified as estimated, "J" and non-detects "UJ".

**IV-Continuing Calibration**
*Form VII and chromatograms.*
Compliance requirements for satisfactory instrument calibration are established to ensure that the instrument used is capable of producing acceptable qualitative and quantitative data for volatile target compounds. Continuing calibration establishes the 12-hour relative response factors on which the quantitations are based and checks satisfactory performance of the instrument on a day-to-day basis. The percent difference (%D) between the initial calibration RRF and the continuing calibration RRF must be within 20% for all target compounds.

**IV-Continuing Calibration (Cont.)**

- For continuing calibration performed on 09/12/00 @15:30 on instrument HP73F, %D for Chloromethane (21.6%) was above the control limit. Since this compound was a non-detect in all the samples and had been qualified "UJ" owing to an initial calibration criteria failure, no qualifiers were applied based on this outlier.

- For continuing calibration performed on 09/13/00 @10:14 on instrument HP73F, %D for compounds Chloroethane (21.7%), 2-Butanone (39.7%), 4-Methyl-2-Pentanone (26.6%), 2-Hexanone (37.1%) and 1,1,2,2-Tetrachloroethane (29.0%) were outside of the control criteria. Positive values for these compounds were qualified as estimated, "J" and non-detects had no qualifiers applied.

- For continuing calibration performed on 09/13/00 @10:14 on instrument HP73F, %D for compounds Chloromethane (50.2%), Vinyl Chloride (50.5%), and Acetone (49.0%) were grossly above the control limit (i.e >40%). Positive values for these compounds were qualified as estimated, "J" and non-detects "UJ".

**V-Blank Analysis**

*Form I, IV and chromatograms*

The purpose of blank analyses is to determine the presence and magnitude of contamination problems resulting from field and laboratory activities. A method blank analysis must be performed after the calibration standards and once every 12-hour time period beginning with the injection of BFB. No contaminants should be detected in any of the associated blanks. Positive sample results are reported and qualified "B", if the concentration of the compound in the sample is ≤ 10 times (10x) the maximum amount in any blank for the common laboratory contaminants methylene chloride, acetone and 2-butanone, or 5 times (5X) the maximum amount for other volatile target compounds. The associated rinse blank is sample number 082800R1. Table 2 summarizes the blank contamination analysis.

**TABLE 2. BLANK CONTAMINATION SUMMARY.**

| Compound / Blank Sample # | 5X Max. conc. µg/kg | 10X Max. conc. µg/kg | Samples Affected |
|---|---|---|---|
| Acetone / 082800R1 | N/A | 440 | All |

**VI-System Monitoring Compounds (Surrogates)**

*Form II and chromatograms.*

Laboratory performance on individual samples is established by means of spiking activities. The system monitoring compounds are added to all samples and blanks to measure their recovery. Percent Recoveries (%Rs) must be within the specified control limits.

Control Limits: Toluene-d8 (84-138%)
4-Bromofluorobenzene (59-113%)
1,2-Dichloroethane-d4 (70-121%)

- All criteria were met. No qualifiers were applied.

**VII-Laboratory Control Samples**
*Form III and chromatograms.*
Data for laboratory control samples are generated to determine long-term precision and accuracy of the analytical method. Laboratory control samples should be analyzed at a frequency of 1 per 20 samples or analytical batch for each matrix. Percent Recoveries (%Rs) must be within the specified control limits of 60-140%.

- All criteria were met. No qualifiers were applied.

**VIII-Internal Standards**
*Form VII and chromatograms.*
Internal Standards performance check ensures that GC/MS sensitivity and response are stable during each analytical run. Specific criteria include area count of –50% to +100% and retention time of ±30 seconds from the associated calibration standards.

- All criteria were met. No qualifiers were applied.

**IX-Quantitation Verification**
*Form 1 and chromatograms.*
The accuracy of analytical results is verified through the calculation of several parameters. Any positive value < RL and > MDL is reported as estimated "J." The percent difference (%D) between the calculated and the reported value should be within 10%.

**Sample: NRUW1B (00092529), 2-Butanone**

Conc. µg/kg = (Ax * Is ng * Vt mL * DF) / (Ais * RRF * Va * Ws gm * Fs)

where:

Ax is the compound area
Is is the amount of internal standard injected (ng)
Vt is the total volume of the methanol extract (mL)
DF is the dilution factor
Ais is the corresponding internal standard area
RRF is the continuing calibration average relative response factor
Va is the volume of the aliquot of the methanol extract (mL)
Ws is the weight of the sample (g)
Fs is the fraction of solid [(100-%moisure)/100]

Conc. = 23995*50 ng*5 mL*1/258455*0.617*1 mL*4.56 g*0.79 = 10 µg/kg

Reported conc. = 10 µg/kg
%D = 0%
Values were within 10% difference.

**MEMORANDUM**

**TO:** Davida Trumbo

**FROM:** Kweku Acquah

**SUBJECT:** Radford Army Ammunition Plant Data Validation - Volatiles
Envirosystems Lab, SDG IT5

**DATE:** November 28, 2000

---

The purpose of this memorandum is to present the data validation report for the samples collected at the Radford Army Ammunition Plant during the September 6-7, 2000 sampling events. Samples were analyzed for volatile organic compounds (VOCs) using USEPA SOW method OLM 04.2 (May 1999). A total of six soil samples were validated. The sample IDs are:

| Field Sample ID |
|---|
| MMAB3B |
| MMAW2B |
| MMAW2C |
| MMAW2CD |
| MMAU1B |
| MMAU1C |

Data were reviewed by Kweku Acquah and validated using a combination of method-specific criteria, laboratory SOP and the *Innovative Approaches to Data Validation for USEPA Region III* (June 1995.) Parameters evaluated under data validation procedure Level M3 are presented in Table 1. Data associated with parameters in compliance with quality control specifications have not been qualified. Data associated with parameters that did not comply with quality control specifications and directly impacted project data have been qualified in accordance with USEPA Region III specifications.

**Table 1. Laboratory Performance Criteria**

| Qualified | | Parameter |
|---|---|---|
| **Yes** | **No** | |
| | **X** | Holding Times |
| | **X** | Instrument Performance Check |
| | **X** | Initial Calibration |
| | **X** | Continuing Calibration |
| | **X** | Blank Analysis |
| | **X** | System Monitoring Compounds |
| | **X** | Matrix Spike/Matrix Spike Duplicate |
| | **X** | Internal Standards |
| **X** | | Quantitation Verification |

The quality of data collected in support of this sampling activity is considered acceptable with the noted qualification.

cc: Eric Malarek
Project File

RADFORD ARMY AMMUNITION PLANT
VALIDATION REPORT
VOLATILES REVIEW
SDG IT5

**I-Holding Times**

*Form I.*

The objective is to ascertain the validity of results based on the holding time of the sample from time of collection to time of analysis. Holding time criteria: For soil samples preserved and cooled @ 4°C ± 2°C, the maximum holding time is 14 days from sample collection to analysis.

- Holding time criteria were met. No qualifiers were applied.

**II-Instrument Performance Check**

*Form V*

The analysis of the instrument performance check solution must be performed at the beginning of each 12-hour period during which samples are analyzed. The instrument performance check solution, bromofluorobenzene (BFB), must meet the specified ion abundance criteria.

- All criteria were met. No qualifiers were applied.

**III-Initial Calibration**

*Form VI and chromatograms.*

Compliance requirements for satisfactory instrument calibration are established to ensure that the instrument used is capable of producing acceptable qualitative and quantitative data for volatile target compounds. Initial calibration demonstrates that the instrument is capable of acceptable performance in the beginning of the analytical run and of producing a linear calibration curve. The minimum relative response factor (RRF) must be ≥ 0.05. Percent relative standard deviation (%RSD) must be ≤ 15% for each target compound and must be ≤ 30% for each calibration check compound.

- For initial calibration performed on 09/19/00 on instrument HP73F, Acetone (18.3%) was above the control limit. Since this compound was a non-detect in all the samples, no qualifiers were applied based on this outlier.

**IV-Continuing Calibration**

*Form VII and chromatograms.*

Compliance requirements for satisfactory instrument calibration are established to ensure that the instrument used is capable of producing acceptable qualitative and quantitative data for volatile target compounds. Continuing calibration establishes the 12-hour relative response factors on which the quantitations are based and checks satisfactory performance of the instrument on a day-to-day basis. The percent difference (%D) between the initial calibration RRF and the continuing calibration RRF must be within 20% for all target compounds.

- For continuing calibration performed on 09/19/00 @15:39 on instrument HP73F, all criteria were met. No qualifiers were applied.

**V-Blank Analysis**

*Form I, IV and chromatograms*

The purpose of blank analyses is to determine the presence and magnitude of contamination problems resulting from field and laboratory activities. A method blank analysis must be performed after the calibration standards and once every 12-hour time period beginning with the injection of BFB. No contaminants should be detected in any of the associated blanks. Positive sample results are reported and qualified "B", if the concentration of the compound in the sample is ≤ 10 times (10x) the maximum amount in any blank for the common laboratory contaminants methylene chloride, acetone and 2-butnone, or 5 times (5X) the maximum amount for other volatile target compounds. The associated rinse blank is sample number 083100R4.

- There was a blank contamination of 4 µg/kg for compound 2-Hexanone (VBLKFF). Since this compound was a non-detect in all the samples, no qualifiers were applied based on this outlier.

**VI-System Monitoring Compounds (Surrogates)**

*Form II and chromatograms.*

Laboratory performance on individual samples is established by means of spiking activities. The system monitoring compounds are added to all samples and blanks to measure their recovery. Percent Recoveries (%Rs) must be within the specified control limits.

Control Limits: Toluene-d8 (84-138%)
4-Bromofluorobenzene (59-113%)
1,2-Dichloroethane-d4 (70-121%)

- All criteria were met. No qualifiers were applied.

**VII-Matrix Spike/Matrix Spike Duplicate**

*Form III and chromatograms.*

Data for Matrix Spike/Matrix Spike Duplicates are generated to determine long-term precision and accuracy of the analytical method on various matrices and to demonstrate acceptable compound recovery by the laboratory at the time of sample analysis. The percent recoveries (%Rs) and the relative percent difference (RPD) must be within the specified control limits.

- Sample MMAW2BD (00092621) was used for the MS/MSD analysis. All criteria were met. No qualifiers were applied.

**VIII-Internal Standards**

*Form VII and chromatograms.*

Internal Standards performance check ensures that GC/MS sensitivity and response are stable during each analytical run. Specific criteria include area count of –50% to +100% and retention time of ±30 seconds from the associated calibration standards.

- All criteria were met. No qualifiers were applied.

**IX-Quantitation Verification**

*Form 1 and chromatograms.*

The accuracy of analytical results is verified through the calculation of several parameters. Any positive value <RL and >MDL is reported as estimated "J." The percent Difference (%D) between the calculated and the reported value should be within 10%.

**IX-Quantitation Verification (Cont.)**

**Sample: MMAW2BMS (00092621)), Chlorobenzene**

Conc. µg/kg = (Ax * Is ng * Vt mL * DF) / (Ais * RRF * Va * Ws gm * Fs)

where:

Ax is the compound area
Is is the amount of internal standard injected (ng)
Vt is the total volume of the methanol extract (mL)
DF is the dilution factor
Ais is the corresponding internal standard area
RRF is the continuing calibration average relative response factor
Va is the volume of the aliquot of the methanol extract (µL)
Ws is the weight of the sample (g)
Fs is the fraction of solid [(100-%moisure)/100]

Conc. = (555436 * 50*5 * 1 ) / (585556 * 1.092 *1 * 5.10 *0.89) = 48 µg/kg

Reported conc. = 48 µg/kg
%D = 0%
Values were within 10% difference.

**MEMORANDUM**

**TO:** Davida Trumbo

**FROM:** Kweku Acquah

**SUBJECT:** Radford Army Ammunition Plant Data Validation - Semivolatiles
Envirosystems Lab, SDG IT2

**DATE:** November 27, 2000

---

The purpose of this memorandum is to present the data validation report for the samples collected at the Radford Army Ammunition Plant during the August 29-30, 2000 sampling events. Samples were analyzed for semivolatile organic compounds (SVOCs) using USEPA SOW method OLM 04.2 (May 1999). A total of eight soil samples were validated. The sample IDs are:

| Field Sample ID | Field Sample ID |
|---|---|
| NRUC1A | NRUL1B |
| NRUC1B | NRUW1A |
| NRUL1C | NRUG2B |
| NRUL1A | NRUG2A |

Data were reviewed by Kweku Acquah and validated using a combination of method-specific criteria, laboratory SOP and the *Innovative Approaches to Data Validation for USEPA Region III* (June 1995.). Parameters evaluated under data validation procedure Level M3 are presented in Table 1. Data associated with parameters in compliance with quality control specifications have not been qualified. Data associated with parameters that did not comply with quality control specifications and directly impacted project data have been qualified in accordance with USEPA Region III specifications.

**Table 1. Laboratory Performance Criteria**

| Qualified | | Parameter |
|---|---|---|
| **Yes** | **No** | |
| | **X** | Holding Times |
| | **X** | Instrument Performance Check |
| | **X** | Initial Calibration |
| **X** | | Continuing Calibration |
| **X** | | Blank Analysis |
| | **X** | Surrogate Spikes |
| | **X** | Matrix Spike/Matrix Spike Duplicate |
| | **X** | Internal Standards |
| **X** | | Quantitation Verification |

The quality of data collected in support of this sampling activity is considered acceptable with the noted qualifications.

cc: Eric Malarek

**SEMIVOLATILES REVIEW**
**SDG IT2**

## I-Holding Times

*Form I*

The objective is to ascertain the validity of results based on the holding time of the sample from time of collection to time of sample extraction and analysis. Holding time criteria: For semivolatile compounds in cooled (@4°C ± 2°C) soil samples, the maximum holding time is 14 days from sample collection to extraction and 40 days from extraction to analysis.

- All criteria were met and no qualifiers were applied.

## II-Instrument Performance Check

*Form V and chromatograms.*

GC/MS instrument performance checks are performed to ensure mass resolution, identification and, to some degree, sensitivity. The analysis of the instrument performance check solution must be performed at the beginning of each 12-hour period during which samples are analyzed.

- The instrument performance check, decafluorotriphenylphosphine (DFTPP), met the ion abundance criteria. No qualification was applied.

## III-Initial Calibration

*Form VI and chromatograms.*

Compliance requirements for satisfactory instrument calibration are established to ensure that the instrument used is capable of producing acceptable qualitative and quantitative data for compounds on the semivolatile target compound list (TCL). Initial calibration demonstrates that the instrument is capable of acceptable performance in the beginning of the analytical run and of producing a linear calibration curve. Minimum relative response factor (RRF) criteria must be ≥ 0.05. Initial calibration percent relative standard deviation (%RSD) must be ≤ 15% on the average for all compounds (< 30% for CCCs).

- For initial calibration performed on 09/01/00 on instrument HP73G, 2,4-Dinitrophenol (26.0%) and 4,6-Dinitro-2-methylphenol (21.0%) were above the control limit. Since these compounds were non-detects in all the samples, no qualifiers were applied based on these outliers.

## IV-Continuing Calibration

*Form VII and chromatograms.*

Compliance requirements for satisfactory instrument calibration are established to ensure that the instrument used was capable of producing acceptable qualitative and quantitative data for semivolatile target compounds. Continuing calibration standards containing both target and surrogates compounds are analyzed at the beginning of each 12-hour analysis period following the analysis of the instrument performance check and prior to the analysis of blanks and samples. The minimum relative response factors (RRF) for semivolatile target compounds and surrogates must be ≥ 0.05. The percent difference (%D) between the initial calibration RRF and the continuing calibration RRF must be within ± 20% for all target compounds.

**IV-Continuing Calibration (Cont.)**

- For continuing calibration performed on 09/12/00 @09:17 on instrument HP73G, compounds 2,2'-oxybis [1-Chloropropane] (22.6%), 2-nitroaniline (24.1%), 2,6-Dinitrotlouene (24.6%), 4,6-Dinitro-2-methylphenol (39.3%), Carbazole (20.5%), Butylbenzylphthalate (28.3%), bis(2-Ethylhexyl)phthalate (36.0%) and Di-n-octylphthalate (43.3%) were outside of the control limits. Positive values for these compounds were qualified as estimated, "J" and non-detects had no qualifiers applied.

- For continuing calibration performed on 09/12/00 @09:17 on instrument HP73G, compound 2,4-Dinitrophenol (53.0%) was grossly above the control limit. Positive values for this compound were qualified as estimated, "J" and non-detects "UJ".

- For continuing calibration performed on 09/13/00 @14:37 on instrument HP73G, compounds 2-Nitrophenol (22.2%), 2,6-Dinitrotoluene (24.1%), Di-n-butylphthalate (27.4%) and Butylbenzylphthalate (37.3%) were above the control limit. Positive values for these compounds were qualified as estimated, "J" and non-detects had no qualifiers applied.

- For continuing calibration performed on 09/13/00 @14:37 on instrument HP73G, compounds bis(2-Ethylhexyl)phthalate (50.1%) and Di-n-octylphthalate (62.4%) were grossly above the control limit. Positive values for these compounds were qualified as estimated, "J" and non-detects "UJ".

- For continuing calibration performed on 09/14/00 @17:06 on instrument HP73G, compounds 2, 2' – oxybis (1-Chloropropane) (27.9%), N-Nitroso-di-n-propylamine (21.1%), 2-Nitrophenol (23.1%), 2-Methylnaphthalene (25.3%), 2,6-Dinitrotoluene (25.0%), 2,4-Dinitrophenol (35.1%) and 4-Nitrophenol (25.2%), Di-n-butylphthalate (29.6%), Butylbenzylphthalate (39.2%), bis(2-Ethylhexyl)phthalate (57.1%) and Di-n-octylphthalate (73.8%) were outside of the control limits. Since the samples were quantitated off a previous continuing calibration, no qualifiers were applied based on these outliers.

- For continuing calibration performed on 09/15/00 @07:59 on instrument HP73G, compounds 2-Methylnaphthalene (21.3%), Hexachlorocyclopentadiene (25.2%), 2,6-Dinitrotoluene (27.2%), 2,4-Dinitrophenol (50.0%), 4,6-Dinitro-2-methylphenol (23.1%), Di-n-butylphthalate (30.3%), Butylbenzylphthalate (37.9%), bis (2-Ethylhexyl)phthalate (52.7%), and Di-n-octylphthalate (77.8%) were above the control limit. Since the samples were quantitated off a previous continuing calibration, no qualifiers were applied based on these outliers.

**V-Blank Analysis**

*Form I, IV and chromatograms*

The purpose of blank analyses is to determine the presence and magnitude of contamination problems resulting from field and laboratory activities. The criteria for evaluation of blanks apply to any blank associated with the samples. The method blank must be analyzed on each GC/MS system used to analyze that specific group or set of samples. No contaminants should be detected in any of the associated blanks. Positive sample results are reported and qualified "B", if the concentration of the compound in the sample is ≤ 10 times (10X) the maximum amount in any blank for the common phthalate contaminants, or 5 times the maximum amount for the other compounds. The associated rinse blank is sample number 082800R1. Table 2 summarizes the blank contamination analysis.

**TABLE 2. BLANK CONTAMINATION SUMMARY.**

| Compound / Blank Sample # | 10X Max. conc. µg/kg | Samples Affected |
|---|---|---|
| Di-n-butylphthalate / 082800R1 | 660 | All except NRUW1A |
| Diethylphthalate / SBLK02 | 780 | NRUC1A, NRUW1A |
| Bis(2-Ethylhexyl)phthalate / SBLK02 | 5700 | NRUC1A, NRUL1C, NRUL1A, NRUW1A, |

**VI-Surrogate Spikes**

*Form II and chromatograms.*

Laboratory performance on individual samples is evaluated through the review of surrogate spike samples. Surrogate spikes are added to all samples and blanks to measure their recovery in sample and blank matrices.

- All criteria were met. No qualifiers were applied.

**VII-Matrix Spike/Spike Duplicate**

*Form III and chromatograms.*

MS/MSD are generated to determine long-term precision and accuracy of the analytical method on various matrices and to demonstrate acceptable compound recovery by the laboratory at the time of sample analysis. Specific criteria include the analyses of matrix spike and matrix spike duplicate samples at a frequency of one MS and MSD per 20 samples of similar matrix. MS and MSD recoveries and Relative Percent Differences between MS and MSD recoveries should be within the specified limits.

- Sample NRUC1B (00092519) was used for the MS/MSD analyses. All criteria were met and no qualifiers were applied.

**VIII-Internal Standards**

*Form VIII and chromatograms.*

Internal standards performance criteria ensure that GC/MS sensitivity and response are stable during every analytical run. Internal standard area counts for samples and blanks must not vary by more than a factor of two (- 50% to + 100%) from the associated calibration standard. The retention time of the internal standards in samples and blanks must not vary by more than ± 30 seconds from the retention time of the associated calibration standard. Positive results for compounds quantitated using internal standards outside of control criteria should be qualified as estimated "J" and non-detects as "UJ".

- All criteria were met for all target compounds. No qualifiers were applied.

**IX-Quantitation Verification**

*Form 1, and chromatograms*

The accuracy of analytical results was verified through the calculation of several parameters. Any target compound below the RL and above the MDL is reported as estimated "J". Any value in excess of the upper level of the calibration range was qualified as estimated "J". Tentatively Identified Compounds were also qualified as estimated, "J".

**IX-Quantitation Verification (Cont.)**

**Sample: NRUC1A (00092518), Diethylphthalate .**

Conc. (µg/kg) =Ax * Is * Vt * DF / Ais * RRF * Ws * Fs * Vi

where:

Ax is the compound area
Is is the amount of standard injected (ng)
Vt is the volume of total extract (µL)
DF is the dilution factor
Ais is the corresponding internal standard area
RRF is the Relative Response Factor from the continuing calibration std.
Vi is the volume of extract injected (µL)
Ws is the initial weight (gm)
Fs is the fraction of solid

Conc. µg/kg = 41690*40 ng*1000 µL*1/296008*1.196*30 gm*0.86*2 µL = 91 ng/g = 91 µg/kg

Reported Value = 91 µg/kg
% Difference = %
Values were within 10% difference.

**MEMORANDUM**

**TO:** Davida Trumbo

**FROM:** Kweku Acquah

**SUBJECT:** Radford Army Ammunition Plant Data Validation - Semivolatiles
Envirosystems Lab, SDG IT3

**DATE:** November 27, 2000

---

The purpose of this memorandum is to present the data validation report for the samples collected at the Radford Army Ammunition Plant during the August 30, 2000 sampling event. Samples were analyzed for semivolatile organic compounds (SVOCs) using USEPA SOW method OLM 04.2 (May 1999). A total of five soil samples were validated. The sample IDs are:

| Field Sample ID |
|---|
| NRUW1B |
| NRUW1C |
| NRUG2C |
| NRUG2BD |
| NRUG2CD |

Data were reviewed by Kweku Acquah and validated using a combination of method-specific criteria, laboratory SOP and the *Innovative Approaches to Data Validation for USEPA Region III* (June 1995.). Parameters evaluated under data validation procedure Level M3 are presented in Table 1. Data associated with parameters in compliance with quality control specifications have not been qualified. Data associated with parameters that did not comply with quality control specifications and directly impacted project data have been qualified in accordance with USEPA Region III specifications.

**Table 1. Laboratory Performance Criteria**

| Qualified | | Parameter |
|---|---|---|
| Yes | No | |
| | X | Holding Times |
| | X | Instrument Performance Check |
| | X | Initial Calibration |
| X | | Continuing Calibration |
| X | | Blank Analysis |
| | X | Surrogate Spikes |
| | X | Internal Standards |
| X | | Quantitation Verification |

The quality of data collected in support of this sampling activity is considered acceptable with the noted qualifications.

cc: Eric Malarek
Project File

**RADFORD ARMY AMMUNITION PLANT**
**VALIDATION REPORT**
**SEMIVOLATILES REVIEW**
**SDG IT3**

## I-Holding Times

*Form I*

The objective is to ascertain the validity of results based on the holding time of the sample from time of collection to time of sample extraction and analysis. Holding time criteria: For semivolatile compounds in cooled (@4°C ± 2°C) water samples, the maximum holding time is 14 days from sample collection to extraction and 40 days from extraction to analysis.

- All criteria were met and no qualifiers were applied.

## II-Instrument Performance Check

*Form V and chromatograms.*

GC/MS instrument performance checks are performed to ensure mass resolution, identification and, to some degree, sensitivity. The analysis of the instrument performance check solution must be performed at the beginning of each 12-hour period during which samples are analyzed.

- The instrument performance check, decafluorotriphenylphosphine (DFTPP), met the ion abundance criteria. No qualification was applied.

## III-Initial Calibration

*Form VI and chromatograms.*

Compliance requirements for satisfactory instrument calibration are established to ensure that the instrument used is capable of producing acceptable qualitative and quantitative data for compounds on the semivolatile target compound list (TCL). Initial calibration demonstrates that the instrument is capable of acceptable performance in the beginning of the analytical run and of producing a linear calibration curve. The minimum relative response factor (RRF) criteria must be ≥ 0.05. Initial calibration percent relative standard deviation (%RSD) must be ≤ 15% on the average for all compounds (< 30% for CCCs).

- For initial calibration performed on 09/01/00 on instrument HP73G, %RSD for compounds 2,4-Dinitrophenol (26.0%) and 4,6-Dinitro-2-methylphenol (21.0%) were above the control limit. Since these compounds were non-detects in all the samples, no qualifiers were applied based on these outliers.

## IV-Continuing Calibration

*Form VII and chromatograms.*

Compliance requirements for satisfactory instrument calibration are established to ensure that the instrument used was capable of producing acceptable qualitative and quantitative data for semivolatile target compounds. Continuing calibration standards containing both target and surrogates compounds are analyzed at the beginning of each 12-hour analysis period following the analysis of the instrument performance check and prior to the analysis of blanks and samples. The minimum Relative Response Factors (RRF) for semivolatile target compounds and surrogates must be ≥ 0.05. The percent difference (%D) between the initial calibration RRF and the continuing calibration RRF must be within ± 20% for all target compounds.

**IV-Continuing Calibration (Cont.)**

- For continuing calibration performed on 09/13/00 @14:37 on instrument HP73G, %D for compounds 2-Nitrophenol (22.2%), 2,6-Dinitrotoluene (24.1%), Di-n-butylphthalate (27.4%) and Butylbenzylphthalate (37.3%) were above the control limit. Positive values for these compounds were qualified as estimated, "J" and non-detects had no qualifiers applied.

- For continuing calibration performed on 09/13/00 @14:37 on instrument HP73G, %D for compounds bis (2-Ethylhexyl) phthalate (50.1%) and Di-n-octylphthalate (62.4%) were grossly above the control limit. Positive values for these compounds were qualified as estimated, "J" and non-detects "UJ".

- For continuing calibration performed on 09/14/00 @17:06 on instrument HP73G, %D for compounds 2,2'-oxybis (1-Chloropropane) (27.9%), N-Nitroso-di-n-propylamine (21.1%), 2-Nitrophenol (23.1%), 2-Methylnaphthalene (25.3%), 2,6-Dinitrotoluene (25.0%), 2,4-Dinitrophenol (35.1%), 4-Nitrophenol(25.2%), Di-n-butylphthalate (29.6%), Butylbenzylphthalate (39.2%) were above the control limit. Positive values for these compounds were qualified as estimated, "J" and non-detects had no qualifiers applied.

- For continuing calibration performed on 09/14/00 @17:06 on instrument HP73G, %D for compounds bis (2-Ethylhexyl) phthalate (57.1%) and Di-n-octylphthalate (73.8%) were grossly above the control limit. Since these compounds had already been qualified "UJ" in all the samples owing to a previous continuing calibration criteria failure, no further qualification was necessary.

- For continuing calibration performed on 09/15/00 @07:59 on instrument HP73G, %D for compounds Hexachlorocyclopentadiene (25.2%), 2,6-Dinitrotoluene (27.2%), 2,4-Dinitrophenol (50.0%), 4,6-Dinitro-2-methylphenol (23.1%), Di-n-butylphthalate (30.3%), Butylbenzylphthalate (37.9%), bis (2-Ethylhexyl) phthalate (52.7%) and Di-n-octylphthalate (77.8%) were either above or grossly above the control limits. Since the samples were quantitated off a previous continuing calibration, no qualifiers were applied based on these outliers.

**V-Blank Analysis**

*Form I, IV and chromatograms*

The purpose of blank analyses is to determine the presence and magnitude of contamination problems resulting from field and laboratory activities. The criteria for evaluation of blanks apply to any blank associated with the samples. The method blank must be analyzed on each GC/MS system used to analyze that specific group or set of samples. No contaminants should be detected in any of the associated blanks. Positive sample results are reported and qualified "B", if the concentration of the compound in the sample is ≤ 10 times (10X) the maximum amount in any blank for the common phthalate contaminants, or 5 times the maximum amount for the other compounds. Table 2 summarizes the blank contamination analysis. The associated rinse blank was sample number 082800R1.

**TABLE 2. BLANK CONTAMINATION SUMMARY.**

| Compound / Blank Sample # | 10X Max. conc. µg/kg | Samples Affected |
|---|---|---|
| Di-n-butylphthalate / 082800R1 | 660 | All |
| Bis(2-Ethylhexyl)phthalate / SBLK02 | 5700 | NRUG2BD, NRUG2CD |

**VI-Surrogate Spikes**
*Form II and chromatograms.*
Laboratory performance on individual samples is evaluated through the review of surrogate spike samples. Surrogate spikes are added to all samples and blanks to measure their recovery in sample and blank matrices.

- All criteria were met and no qualifiers were applied.

**VII-Internal Standards**
*Form VIII and chromatograms.*
Internal standards performance criteria ensure that GC/MS sensitivity and response are stable during every analytical run. Internal standard area counts for samples and blanks must not vary by more than a factor of two (- 50% to + 100%) from the associated calibration standard. The retention time of the internal standards in samples and blanks must not vary by more than ± 30 seconds from the retention time of the associated calibration standard. Positive results for compounds quantitated using internal standards outside of control criteria should be qualified as estimated "J" and non-detects as "UJ".

- All criteria were met. No qualifiers were applied.

**VIII-Quantitation Verification**
*Form 1, and chromatograms*
The accuracy of analytical results was verified through the calculation of several parameters. Any target compound below the RL and above the MDL is reported as estimated "J". Any value in excess of the upper level of the calibration range was qualified as estimated "J". Tentatively Identified Compounds were also qualified as estimated, "J".

**Sample: NRUW1C (00092530), Di-n-butylphthalate**

Conc. (µg/kg) = (Ax * Is * Vt * DF) / (Ais * RRF * Ws * Fs * Vi)

where:
Ax is the compound area
Is is the amount of standard injected (ng)
Vt is the volume of total extract (µL)
DF is the dilution factor
Ais is the corresponding internal standard area
RRF is the Relative Response Factor from the continuing calibration std.
Vi is the volume of extract injected (µL)
Ws is the initial weight (gm)
Fs is the fraction of solid

Conc. µg/kg = (52169*40 ng*1000 µL*1) / (506961*1.367*30 gm*0.75*2 µL) = 67 µg/kg

Reported Value = 67 µg/kg
% Difference = 0%
Values were within 10% difference.

**MEMORANDUM**

**TO:** Davida Trumbo

**FROM:** Kweku Acquah

**SUBJECT:** Radford Army Ammunition Plant Data Validation - Semivolatiles
Envirosystems Lab, SDG IT5

**DATE:** November 27, 2000

---

The purpose of this memorandum is to present the data validation report for the samples collected at the Radford Army Ammunition Plant during the September 6-7, 2000 sampling events. Samples were analyzed for semivolatile organic compounds (SVOCs) using USEPA SOW method OLM 04.2 (May 1999). A total of eight soil samples were validated. The sample IDs are:

| Field Sample ID | Field Sample ID |
|---|---|
| MMAB3A | MMAW2CD |
| MMAB3B | MMAU1A |
| MMAW2A | MMAU1B |
| MMAW2B | MMAU1C |
| MMAW2C | |

Data were reviewed by Kweku Acquah and validated using a combination of method-specific criteria, laboratory SOP and *Innovative Approaches to Data Validation for USEPA Region III* (June 1995.). Parameters evaluated under data validation procedure Level M3 are presented in Table 1. Data associated with parameters in compliance with quality control specifications have not been qualified. Data associated with parameters that did not comply with quality control specifications and directly impacted project data have been qualified in accordance with USEPA Region III specifications.

**Table 1. Laboratory Performance Criteria**

| Qualified | | Parameter |
|---|---|---|
| Yes | No | |
| | X | Holding Times |
| | X | Instrument Performance Check |
| | X | Initial Calibration |
| X | | Continuing Calibration |
| X | | Blank Analysis |
| | X | Surrogate Spikes |
| | X | Matrix Spike/Matrix Spike Duplicate |
| | X | Internal Standards |
| X | | Quantitation Verification |

The quality of data collected in support of this sampling activity is considered acceptable with the noted qualifications.

cc: Eric Malarek

**RADFORD ARMY AMMUNITION PLANT**
**VALIDATION REPORT**
**SEMIVOLATILES REVIEW**
**SDG IT5**

## I-Holding Times

*Form I*

The objective is to ascertain the validity of results based on the holding time of the sample from time of collection to time of sample extraction and analysis. Holding time criteria: For semivolatile compounds in cooled (@4°C ± 2°C) soil samples, the maximum holding time is 14 days from sample collection to extraction and 40 days from extraction to analysis.

- The samples were analyzed 09/17-22/00. All criteria were met and no qualifiers were applied.

## II-Instrument Performance Check

*Form V and chromatograms.*

GC/MS instrument performance checks are performed to ensure mass resolution, identification and, to some degree, sensitivity. The analysis of the instrument performance check solution must be performed at the beginning of each 12-hour period during which samples are analyzed.

- The instrument performance check, decafluorotriphenylphosphine (DFTPP), met the ion abundance criteria. No qualification was applied.

## III-Initial Calibration

*Form VI and chromatograms.*

Compliance requirements for satisfactory instrument calibration are established to ensure that the instrument used is capable of producing acceptable qualitative and quantitative data for compounds on the semivolatile target compound list (TCL). Initial calibration demonstrates that the instrument is capable of acceptable performance in the beginning of the analytical run and of producing a linear calibration curve. The minimum relative response factor (RRF) criteria must be ≥ 0.05. Initial calibration percent relative standard deviation (%RSD) must be ≤ 15% on the average for all compounds (< 30% for CCCs).

- For initial calibration performed on 09/01/00 on instrument HP73G, 2,4-Dinitrophenol (26.0%) and 4,6-Dinitro-2-methylphenol (21.0%) were above the control limit. Since these compounds were non-detects in all the samples, no qualifiers were applied based on these outliers.

## IV-Continuing Calibration

*Form VII and chromatograms.*

Compliance requirements for satisfactory instrument calibration are established to ensure that the instrument used was capable of producing acceptable qualitative and quantitative data for semivolatile target compounds. Continuing calibration standards containing both target and surrogates compounds are analyzed at the beginning of each 12-hour analysis period following the analysis of the instrument performance check and prior to the analysis of blanks and samples. The minimum relative response factors (RRF) for semivolatile target compounds and surrogates must be ≥ 0.05. The percent difference (%D) between the initial calibration RRF and the continuing calibration RRF must be within ± 20% for all target compounds.

**IV-Continuing Calibration (Cont.)**

- For continuing calibration performed on 09/17/00 @15:19 on instrument HP73G, compounds Nitrobenzene (21.4%), 2-Methylnaphthalene (24.1%), 2-Nitroaniline (26.8%), 2,6-Dinitrotoluene (27.2%), 2,4-Dinitrophenol (31.3%), Di-n-butylphthalate (27.0%), Pyrene (21.5%), Butylbenzylphthalate (38.1%), bis(2-Ethylhexyl)phthalate (49.9%) and Di-n-octylphthalate (61.5%)%) were above the control limits. Positive values for these compounds were qualified as estimated, "J" and non-detects had no qualifiers applied.

- For continuing calibration performed on 09/22/00 @09:31 on instrument HP73G, %D for compounds 2,4-Dinitrophenol (58.2%), 4,6-Dinitro-2-methylphenol (45.3%) and Di-n-octylphthalate (44.0%) were grossly above the control limit (i.e > 2X CL). Positive values for these compounds were qualified as estimated, "J" and non-detects "UJ".

- For continuing calibration performed on 09/22/00 @09:31 on instrument HP73G, %D for compounds N-Nitroso-di-n-propylamine (21.6%), Hexachloroethane (21.0%), 2-Nitroaniline (31.8%), 2,6-Dinitrotoluene (24.1%), 3-Nitroaniline (21.8%), Carbazole (33.4%), Butylbenzylphthalate (28.7%) and bis(2-Ethylhexyl)phthalate (35.1%) were above the control limit. Positive values for these compounds were qualified as estimated, "J" and non-detects had no qualifiers applied.

**V-Blank Analysis**

*Form I, IV and chromatograms*

The purpose of blank analyses is to determine the presence and magnitude of contamination problems resulting from field and laboratory activities. The criteria for evaluation of blanks apply to any blank associated with the samples. The method blank must be analyzed on each GC/MS system used to analyze that specific group or set of samples. No contaminants should be detected in any of the associated blanks. Positive sample results are reported and qualified "B", if the concentration of the compound in the sample is ≤ 10 times (10X) the maximum amount in any blank for the common phthalate contaminants, or 5 times the maximum amount for the other compounds. Table 2 summarizes the blank contamination analysis. The associated rinse blank is sample number 083100R4.

**TABLE 2. BLANK CONTAMINATION SUMMARY.**

| Compound/Blank Sample # | 10X Max. conc. µg/kg | Samples Affected |
|---|---|---|
| Di-n-butylphthalate / SBLK14 | 9500 | All |
| Bis(2-Ethylhexyl)phthalate / SBLK14 | 850 | All except MMAB3B, MMAU1B |

**VI-Surrogate Spikes**

*Form II and chromatograms.*

Laboratory performance on individual samples is evaluated through the review of surrogate spike samples. Surrogate spikes are added to all samples and blanks to measure their recovery in sample and blank matrices.

- All criteria were met. No qualifiers were applied.

**VII-Matrix Spike/Spike Duplicate**

*Form III and chromatograms.*

MS/MSD are generated to determine long-term precision and accuracy of the analytical method on various matrices and to demonstrate acceptable compound recovery by the laboratory at the time of sample analysis. Specific criteria include the analyses of matrix spike and matrix spike duplicate samples at a frequency of one MS and MSD per 20 samples of similar matrix. MS and MSD recoveries and Relative Percent Differences between MS and MSD recoveries should be within the specified limits.

- Sample MMAW2B (00092621) was used for the MS/MSD analyses. All criteria were met and no qualifiers were applied.

**VIII-Internal Standards**

*Form VIII and chromatograms.*

Internal standards performance criteria ensure that GC/MS sensitivity and response are stable during every analytical run. Internal standard area counts for samples and blanks must not vary by more than a factor of two (- 50% to + 100%) from the associated calibration standard. The retention time of the internal standards in samples and blanks must not vary by more than ± 30 seconds from the retention time of the associated calibration standard. Positive results for compounds quantitated using internal standards outside of control criteria should be qualified as estimated "J" and non-detects as "UJ".

- All criteria were met for all target compounds. No qualifiers were applied.

**IX-Quantitation Verification**

*Form 1, and chromatograms*

The accuracy of analytical results was verified through the calculation of several parameters. Any target compound below the RL and above the MDL is reported as estimated "J". Any value in excess of the upper level of the calibration range was qualified as estimated "J". Tentatively Identified Compounds were also qualified as estimated, "J".

**Sample: MMAW2BMS (00092621MS), Phenol.**

Conc. (µg/kg) =(Ax * Is * Vt * DF) / (Ais * RRF * Ws * Fs * Vi)

where:

Ax is the compound area
Is is the amount of standard injected (ng)
Vt is the volume of total extract (µL)
DF is the dilution factor
Ais is the corresponding internal standard area
RRF is the Relative Response Factor from the continuing calibration std.
Ws is the initial weight (g)
Fs is the fraction of solid
Vi is the volume of extract injected (µL)

Conc. µg/kg = (902023*40 ng*1000 µL*1) / 185144*3.035*30 gm*0.89*2 µL = 1202 µg/kg

Reported Value = 1200 µg/kg
% Difference = 0.16%
Values were within 10% difference.

**Main Manufacturing Area**

**MMAB1.** Sample location MMAB1 was in the eastern portion of the Horseshoe Area, west of Magazine Storage Area 1932. It is situated on level ground, approximately 8 ft upgradient and 50 ft from a service road. The boring was positioned approximately 2 to 3 ft inside a tree stand of loblolly pines (*Pinus taeda* L.) approximately 30–40 ft tall. The circumference of a representative loblolly pine measured 3 ft 9 in. (14 in. diameter ), indicating the tree was at least 40–50 years old. A drainage ditch was located along the road that carries precipitation runoff away from the sample location.

The boring was advanced to a depth of 7.5 ft bgs. Three soil horizons (A, B, and C) were identified and sampled. One soil sample was collected from each horizon and analyzed for metals and pH: MMAB1A (0–10 in. bgs), MMAB1B (10–48 in. bgs), and MMAB1C (48–84 in. bgs).

**MMAB2.** Sample location MMAB2 was in the south-central portion of the Horseshoe Area, east of SWMU 26, approximately 100 ft from the road and 75 ft inside a white pine tree stand. The white pines (*Pinus strobus*) were approximately 50–60 ft tall with tree circumferences ranging from 4 to 6 ft (15–28 in. diameter).

The boring was advanced to a depth of 7.5 ft bgs. A and B horizons were identified and sampled. One soil sample was collected from each horizon and analyzed for metals and pH: MMAB2A (0–12 in. bgs), and MMAB2B (12–60 in. bgs). Additionally, one duplicate soil sample was collected from the B horizon and analyzed for metals and pH: MMAB2BD (12–60 in. bgs).

**MMAB3.** Sample location MMAB3 was in the south-central portion of the Horseshoe Area, east of SWMU 26; co-located within a ½-acre radius and 60 ft east of boring MMAB2. The boring was positioned approximately 75 ft inside the same white pine tree stand as MMAB2.

The boring was advanced to a depth of 7.5 ft bgs. Both the A and B soil horizons were identified and sampled. Both soil horizons were field screened for RDX and TNT. Results indicated the absence of these explosive constituents. Following screening analysis, one soil sample was collected from each horizon and analyzed for SVOCs, VOCs (B horizon), metals, and pH: MMAB3A (0–9 in. bgs), and MMAB3B (9–42 in. bgs).

**MMAB4.** Sample location MMAB4 was in the central portion of the Horseshoe Area, on top of a steep slope above SWMU 32. It was positioned approximately 50 ft south and 30 ft above Magazine 4601–2, along the downslope edge of a pine tree stand. Trees were approximately 40 ft tall, with a representative tree circumference of 3 ft 8 in. (14 in. diameter).

The boring was advanced with a hand auger to a depth of 4.42 ft bgs. Hand auger refusal occurred at 4.42 ft due to large stones and small boulders (river jack). Three soil horizons (A, B, and C) were identified and sampled. One soil sample was collected from each horizon and analyzed for metals and pH: MMAB4A (0–6 in. bgs), MMAB4B (6–51 in. bgs), and MMAB4C (51–53 in. bgs).

**MMAU1.** Sample location MMAU1 was south of the MMA, west of the main gate, on the right side of the road before Shipping and Receiving (Building 534). The boring was positioned approximately 30 ft inside a deciduous tree stand (e.g., oak, cherry, and maple) upgradient and approximately 40 ft from road. Trees were approximately 40–50 ft tall, with an average circumference of 6 ft 8 in. (26 in. diameter).

The boring was advanced to a depth of 7.5 ft bgs. Three soil horizons (A, B, and C) were identified, sampled, and field-screened for RDX and TNT. Screening results indicated the absence of these explosive constituents. Following screening analysis, one soil sample was collected from each horizon and analyzed for SVOCs, VOCs (B horizon), metals, and pH: MMAU1A (0–10 in. bgs), MMAU1B (10–52 in. bgs), MMAU1C (52–60 in. bgs).

**MMAU2.** Sample location MMAU2 was south of the MMA, west of the main gate, on the right side of the road before Shipping and Receiving (Building 534). The boring was co-located within a ½-acre radius 80 ft east of boring MMAU1.

The boring was advanced to a depth of 7.5 ft bgs. Three soil horizons (A, B, and C) were identified and sampled. One soil sample was collected from each horizon and analyzed for metals and pH: MMAU2A (0–10 in. bgs), MMAU2B (10–52 in. bgs), and MMAU2C (52–60 in. bgs).

**MMAU3.** Sample location MMAU3 was southwest of Building 7801, outside and approximately 100 ft from the MMA fence, on the western edge of the facility. The boring was positioned on top of a ridge above a dirt road in

a deciduous tree forest (e.g., tulip poplar, oak, and maple). Trees were approximately 40–50 ft tall, with a representative tree circumference of 5 ft 5 in. (21 in. diameter), indicating that the trees were approximately 65–75 years old.

The boring was advanced to a depth of 7.5 ft bgs. Three soil horizons (A, B, and C) were identified and sampled. One soil sample was collected from each horizon and analyzed for metals and pH: MMAU3A (0–9 in. bgs), MMAU3B (9–42 in. bgs), and MMAU3C (42–72). Additionally, one duplicate soil sample was collected from the B horizon and analyzed for metals and pH: MMAU3BD (9–42 in. bgs).

**MMAU4.** Sample location MMAU4 was in the eastern portion of the MMA, 70 ft south and outside of the fence surrounding Building 3904. The boring was positioned approximately 15 ft upslope of a former railroad track and 40 ft up a steep incline into a deciduous tree forest (e.g., oak and maple), where trees averaged 40–50 ft tall.

The boring was advanced with a hand auger to a depth of 6.5 ft bgs. Hand auger refusal occurred at a depth of 6.5 ft bgs due to large stones and highly compacted soil. Three soil horizons (A, B, and C) were identified and sampled. One soil sample was collected from each horizon and analyzed for metals and pH: MMAU4A (0–10 in. bgs), MMAU4B (10–58 in. bgs), and MMAU4C (58–76 in. bgs).

**MMAW1.** Sample location MMAW1 was in the northeastern portion of Horseshoe Area, approximately 65 ft north of Gate 19–C. The boring was positioned approximately 45 ft inside a pine tree forest, where trees were estimated to be 40 ft tall.

The boring was advanced to a depth of 7.5 ft bgs. Three soil horizons (A, B, and C) were identified and sampled. One soil sample was collected from each horizon and analyzed for metals and pH: MMAW1A (0–12 in. bgs), MMAW1B (12–48 in. bgs), and MMAW1C (48–72).

**MMAW2.** Sample location MMAW2 was in the north central portion of Horseshoe Area. The boring was positioned approximately 115 ft south of the road and 60 ft inside a pine and deciduous tree stand (e.g., oak and maple). Trees were approximately 40–50 ft tall with a representative pine tree circumference of 3.6 ft (14 in. diameter).

The boring was advanced to a depth of 7.5 ft bgs. Three soil horizons (A, B, and C) were identified, sampled, and field-screened for RDX and TNT. Screening results indicated the absence of these explosive constituents. Following screening analysis, one soil sample was collected from each horizon and analyzed for SVOCs, VOCs (B and C horizons), metals, and pH: MMAW2A (0–7 in. bgs), MMAW2B (7–48 in. bgs), MMAW2C (48–60 in. bgs).

A matrix spike and matrix spike duplicate (MS/MSD) sample was collected from the B horizon and analyzed for VOCs, SVOCs, metals and pH: MMAW2B (7–48 in. bgs). Additionally, a duplicate sample was collected from the C horizon and analyzed for VOCs, SVOCs, metals, and pH: MMAW2CD (48–60 in. bgs).

**MMAW3.** Sample location MMAW3 was in the north central portion of the Horseshoe Area within a ½-acre radius of boring MMAW2. The boring was positioned 51 ft south of MMAW2 and approximately 111 ft. inside a loblolly pine tree stand, 166 ft south from the roadway.

The boring was advanced to a depth of 7.5 ft bgs. Three soil horizons (A, B, and C) were identified and sampled. One soil sample was collected from each horizon and analyzed for metals and pH: MMAW3A (0–12 in. bgs), MMAW3B (12–48 in. bgs), and MMAW3C (48–60 in. bgs). Additionally, one duplicate soil sample was collected from the C horizon and analyzed for metals and pH: MMAW3CD (48–60 in. bgs).

**MMAW4.** Sample location MMAW4 was in the northwestern portion of Horseshoe Area, 50 ft north of Gate 19–1, outside the fence, and approximately 50 ft south of the New River. The boring was positioned upgradient and approximately 65 ft north of the road, along a grassy area, approximately 20 ft inside the deciduous tree (e.g., locust and maple) and brush line.

The boring was advanced to a depth of 7.5 ft bgs. Three soil horizons (A, B, and C) were identified and sampled. One soil sample was collected from each horizon and analyzed for metals and pH: MMAW4A (0–9 in. bgs), MMAW4B (9–42 in. bgs), and MMAW4C (42–72).

**New River Unit**

**NRUC1.** Sample location NRUC1 was east of Magazine 1125, on a moderate slope, upgradient and approximately 100 ft north of 12th Street. The boring was positioned in a tree stand containing pine, cedar, and deciduous (e.g., cherry) trees interspersed with grassy areas. Trees were approximately 15–30 ft tall, with a representative deciduous tree circumference of 3 ft (12 in. diameter).

The boring was advanced to a depth of 7.5 ft bgs. Both the A and B soil horizons were identified and sampled. Each soil horizon was field-screened for RDX and TNT. Screening results indicated the absence of these explosive constituents. Following screening analysis, one soil sample was collected from each horizon and analyzed for SVOCs, VOCs (B horizon), metals and pH: NRUC1A (0–11 in. bgs) and NRUC1B (11–72 in. bgs). Additionally, one MS and MSD sample was collected from the B horizon and analyzed for VOCs, SVOCs, metals, and pH: NRUC1B (11–72 in. bgs).

**NRUC2.** Sample location NRUC2 was east of Magazine 1125, on a moderate slope, upgradient and co-located within a ½-acre radius of NRUC1. The boring was positioned approximately 120 ft from the road in a tree stand containing pine, cedar, and deciduous (e.g., cherry) trees interspersed with grassy areas. Trees were approximately 15–30 ft tall, with a representative deciduous tree circumference of 3 ft (12 in. diameter).

The boring was advanced to a depth of 7.5 ft bgs. Both the A and B soil horizons were identified and sampled. One soil sample was collected from each horizon and analyzed for metals and pH: NRUC2A (0–11 in. bgs), NRUC2B (11–72 in. bgs).

**NRUC3.** Sample location NRUC3 was in the eastern portion of the NRU, adjacent to a grassy field approximately 100 ft northeast of Magazine 4603–15. The boring was positioned upgradient of Guard Road on a slight to moderate slope approximately 15 ft inside a pine tree stand. Trees were estimated to be 30–40 ft tall with a representative circumference of 3 ft 7 in. (14 in. diameter).

The boring was advanced to a depth of 1.5 ft bgs where refusal was caused by an outcrop of bedrock located near the surface. Both the A and B soil horizons were identified and sampled. One soil sample was collected from each horizon and analyzed for metals and pH: NRUC3A (0–10 in. bgs), NRUC3B (10–18 in. bgs).

**NRUC4.** Sample location NRUC4 was in the northeastern portion of the NRU, on the north side of access road near Magazine 4603–53. The boring was positioned upgradient (10°–20° slope) and approximately 100 ft from the road in a cedar tree stand interspersed with a grass. Cedar trees were estimated to range from 3 ft to 20 ft tall.

The boring was advanced to a depth of 7.5 ft bgs. Three soil horizons (A, B, and C) were identified and sampled. One soil sample was collected from each horizon and analyzed for metals and pH: NRUC4A (0–7 in. bgs), NRUC4B (7–30 in. bgs), NRUC4C (30–48 in. bgs).

**NRUG1.** Sample location NRUG1 was in the northwestern portion of the NRU between Magazines 4603–33 and 4603–34. The boring was positioned upgradient and approximately 100 ft from the road in a loblolly pine tree stand. Trees were estimated to be approximately 40 ft tall with a representative tree circumference of 4 ft 7 in. (18 in. diameter).

The boring was advanced to a depth of 8 ft bgs. Three soil horizons (A, B, and C) were identified and sampled. One soil sample was collected from each horizon and analyzed for metals and pH: NRUG1A (0–12 in. bgs), NRUG1B (12–53 in. bgs), NRUG1C (53–70 in. bgs).

**NRUG2.** Sample location NRUG2 was in the south-central portion of the NRU, west of 16th Street and north of Magazine 1604. The boring was positioned upgradient and approximately 100 ft from the road and 75 ft inside a pine tree stand. Trees were estimated to be approximately 50 ft tall with a representative tree circumference of 4 ft 7 in. (18 in. diameter).

The boring was advanced to a depth of 7.5 ft bgs. Three soil horizons (A, B, and C) were identified, sampled, and field-screened for RDX and TNT. Screening results indicated the absence of these explosive constituents. Following screening analysis, one soil sample was collected from each horizon and analyzed for SVOCs, VOCs (B and C horizon), metals, and pH: NRUG2A (0–7 in. bgs), NRUG2B (7–34 in. bgs), NRUG2C (34–57 in. bgs). Additionally, two duplicate soil samples were collected from the B and C horizon and analyzed for SVOCs, VOCs (B horizon), metals and pH: NRUG2BD (7–34 in. bgs) and NRUG2CD (34–57 in. bgs).

**NRUG3.** Sample location NRUG3 was in the south-central portion of the NRU, west of 16th Street and north of Magazine 1604. The boring was co-located within a ½-acre radius and 65 ft north of NRUG2. The boring was situated approximately 5–10 ft upgradient and 100 ft from the road and 75 ft. inside a pine tree stand. Trees were estimated to be 50 ft tall with a representative tree circumference of 4 ft 7 in. (18 in. diameter).

The boring was advanced to a depth of 7.5 ft bgs. Three soil horizons (A, B, and C) were identified and sampled. One soil sample was collected from each horizon and analyzed for metals and pH: NRUG3A (0–12 in. bgs), NRUG3B (12–35 in. bgs), NRUG3C (35–67 in. bgs).

**NRUG4.** Sample location NRUG4 was in the west-central portion of the NRU, upgradient and approximately 150 ft northeast of Truck Loading Yard No. 2. The boring was positioned 100 ft inside a pine tree stand.

The boring was advanced to a depth of 7.5 ft bgs. Three soil horizons (A, B, and C) were identified and sampled. One soil sample was collected from each horizon and analyzed for metals and pH: NRUG4A (0–6 in. bgs), NRUG4B (6–39 in. bgs), NRUG4C (39–72 in. bgs).

**NRUL1.** Sample location NRUL1 was in the southern portion of the NRU, on level ground, east of a former bagging plant. The boring was positioned approximately 100 ft north of Guard Road in a thick white pine tree stand. Trees were estimated to be 30–35 ft tall with a representative tree circumference of 2 ft 7 in. (10 in. diameter).

The boring was advanced to a depth of 7.5 ft bgs. Three soil horizons (A, B, and C) were identified, sampled, and field-screened for RDX and TNT. Screening results indicated the absence of these explosive constituents. Following screening analysis, one soil sample was collected from each horizon and analyzed for SVOCs, VOCs (B and C horizon), metals, and pH: NRUL1A (0–12 in. bgs), NRUL1B (12–42 in. bgs), NRUL1C (42–55 in. bgs).

**NRUL2.** Sample location NRUL2 was in the southern portion of the NRU, on level ground, east of a former bagging plant. The boring was co-located within a ½-acre radius and 64 ft east of NRUL1 in a thick white pine tree stand. Trees were estimated to be 30–35 ft tall with a representative tree circumference of 2 ft 7 in. (10 in. diameter).

The boring was advanced to a depth of 7.5 ft bgs. Three soil horizons (A, B, and C) were identified and sampled. One soil sample was collected from each horizon and analyzed for metals and pH: NRUL2A (0–12 in. bgs), NRUL2B (12–33 in. bgs), NRUL2C (33–60 in. bgs). Additionally, one duplicate soil sample was collected from the B horizon and analyzed for metals and pH: NRUL2BD (12–33 in. bgs).

**NRUL3.** Sample location NRUL3 was in the central portion of the NRU, approximately 200 ft southwest of Magazine 1614. The boring was positioned approximately 150 ft north and 15 ft upgradient of 14½ Street in a grassy uncut area interspersed with 15–20-ft-tall cedar trees. Average tree circumference was 10–12 in. (diameter ranging from 3 to 4 in.), indicating that trees were approximately 10–15 years old.

Macro-Core refusal occurred at 16 in. bgs after two direct push attempts within 5 ft of the initially proposed sample location because of near-surface bedrock. The sample location was moved to a new location downslope approximately 40 ft. and was advanced to a depth of 7.5 ft bgs. Three soil horizons (A, B, and C) were identified and sampled. One soil sample was collected from each horizon and analyzed for metals and pH: NRUL3A (0-9 in. bgs), NRUL3B (9–75 in. bgs), NRUL3C (75–90 in. bgs).

**NRUL4.** Sample location NRUL4 was in the northern portion of the NRU, approximately 150 ft south of Old Rock Road. The boring was positioned on a gradual slope between two deciduous trees (oak and poplar) in a predominantly grassy field. Trees were estimated to be about 35–40 ft tall.

The boring was advanced to a depth of 7.5 ft bgs. Three soil horizons (A, B, and C) were identified and sampled. One soil sample was collected from each horizon and analyzed for metals and pH: NRUL4A (0–10 in. bgs), NRUL4B (10–38 in. bgs), NRUL4C (38–60 in. bgs). Additionally, one duplicate soil sample was collected from the B horizon and analyzed for metals and pH: NRUL4BD (10–38 in. bgs).

**NRUW1.** Sample location NRUW1 was in the east-central portion of the NRU, approximately 100 ft north of 14½ Street, northwest of Magazine 1817. The boring was positioned in a flat grassy area interspersed with loblolly pine trees. Trees were estimated to be 30–40 ft tall with a representative circumference of 4 ft 3 in. (16 in. diameter).

The boring was advanced to a depth of 4.0 ft bgs. Three soil horizons (A, B, and C) were identified, sampled, and field-screened for RDX and TNT. Screening results indicated the absence of these explosive constituents. Following screening analysis, one soil sample was collected from each horizon and analyzed for SVOCs, VOCs (B and C horizon), metals, and pH: NRUW1A (0–7 in. bgs), NRUW1B (7–38 in. bgs), NRUW1C (38–48 in. bgs).

**NRUW2.** Sample location NRUW2 was in the east-central portion of the NRU, approximately 100 ft north of 14½ Street, northwest of Magazine 1817. The boring was co-located within a ½-acre radius and 60 ft east from NRUW1.

The boring was advanced to a depth of 4.5 ft bgs, where auger refusal occurred when white-gray, limestone bedrock was encountered. Three soil horizons (A, B, and C) were identified and sampled. One soil sample was collected from each horizon and analyzed for metals and pH: NRUW2A (0–9 in. bgs), NRUW2B (9–28 in. bgs), NRUW2C (28–48 in. bgs).

**NRUW3.** Sample location NRUW3 was in the northeastern portion of the NRU, approximately 40–50 ft and 10° upgradient from the road and Magazine 4603–52. The boring was positioned in a stand of several locust trees (surrounded by uncut hay fields) estimated to range from 25 to 50 ft tall, with a representative circumference of 2 ft 2 in. (8 in. diameter).

The boring was advanced to a depth of 3.8 ft bgs, where Macro-Core refusal was caused by limestone/dolomite bedrock. Three soil horizons (A, B, and C) were identified and sampled. One soil sample was collected from each horizon and analyzed for metals and pH: NRUW3A (0–10 in. bgs), NRUW3B (10–34 in. bgs), NRUW3C (34–45 in. bgs).

**NRUW4.** Sample location NRUW4 was in the south-central portion of the NRU, north of the intersection of A Avenue and 13th Street. The boring was positioned across the road, 15 ft upgradient and northeast from Magazine 1206. The boring was situated beneath an approximately 20-ft-tall black walnut tree near a stand of cedar trees estimated to be 15 ft tall, with representative tree circumferences of 2 ft 2 in. (8 in. diameter).

The boring was advanced to a depth of 8 ft bgs. Three soil horizons (A, B, and C) were identified and sampled. One soil sample was collected from each horizon and analyzed for metals and pH: NRUW4A (0–10 in. bgs), NRUW4B (10–31 in. bgs), NRUW4C (31–46 in. bgs). Additionally, one duplicate soil sample was collected from the C horizon and analyzed for metals and pH: NRUW4CD (31–46 in. bgs).

Subject: RE: FW: Ft. Ritchie OU3 - Fish Tissue Risk Assessment

Mike et al,

Sorry for the very long delay in getting back to you guys. As I see it we have three issues: (1) the use of B-qualified INORGANIC data; (2) B-qualified data and mercury in the fish tissue study; and (3) dioxin TEQ calculations and B-qualified dioxin data in the fish tissue study

Here is my take (or the Region's stance) on these issues:

(1) The issue of B-qualified data is a complicated one. Note that there are two steps during data analysis where a qualifier is added.

First, the laboratory doing the analysis puts a qualifier on the data point, then a validator puts a second qualifier on the data point. These two qualifiers mean different things and the second one ends up being the only one we are concerned with. Across all EPA regions, an inorganic chemical that is given a B-qualifier in the first round (laboratory stage) means that chemical was detected at a concentration less than the CRDL (contract-required detection limit) but more than the instrument detection limit. Blank contamination is not considered until the next stage (validation). If an inorganic chemical then gets a B-qualifier at the second, validation stage, it means that the result is not detected substantially above the level reported in the laboratory field blank. And this is where Region III differs from the REST OF THE UNITED STATES (because we have our own guidelines from OASQA...Office of Analytical Services and Quality Assurance). In Region III, we give that data point a "B", but the rest of EPA gives the data point a "U." This means that the rest of EPA automatically uses the data point in risk calculations, etc. but at 1/2 the detection limit. We, in Region III, don't generally use the data point at all, but ask for sampling to be re-done if the data set is compromised by the exclusion or "rejection" of the data point(s). In some instances, we use the data but input 1/2 the detection limit. A lot of times it won't make much difference which way you do it (as long as you don't have a LOT OF B-QUALIFIED DATA THAT YOU ARE GOING TO REJECT). There is a push by OASQA to harmonize Region III with the rest of EPA on thisone...but it is difficult. The other regions, in essence, don't know that their "U" qualified data was really "B" qualified unless they look at the original data (which is difficult to do given time contraints). And we, in Region III are really faced with whether or not to use the data, re-sample because of a compromised data set, or reject the data and use a smaller data set. You just don't know whether or not the chemical is there. In a perfect world you would always re-sample. IT decided to eliminate the B-qualified data, i.e., it was "rejected", from the background soil survey. In this instance, it is probably OK because we still have a lot of data, and only a few chemicals were "victims" of B-qualification. It should be noted though, that the OU data sets should also have their "B" qualified data "rejected" for fairness/consistency when making comparisons with the background data sets.

(2) Re: B-qualified mercury and dioxin data from the fish tissue study

Unfortunately, every mercury data point in Lake Royer fish is "B-qualified" by the validator. If these data were to be rejected, it doesn't mean that mercury isn't a COPC, it would mean that you have no mercury data. You would have to re-sample or make a management decision to not re-sample. Perhaps a good alternative would be to use the data (you could go with using 1/2 the detection limit). Note that nickel and chromium data points are also ALL B-qualified, as well as all the data points for HPCDD and TCDF. Note

also that a similar situation exists with Lake Wastler fish data. This situation is not like the one we were faced with in regards to the background soil study where there wasn't a huge compromise in choosing to reject the data. It would seem here that you would either want to use the data or re-sample

(3) Re: Dioxin TEQ calculations.

Thanks for re-checking the calculations. As stated above.you might not want to eliminate (reject) B-qualified data from this study because of mercury and the fact that all of the data for several dioxin congeners is B-qualified. I would suggest that all data be included in the risk assessment for fish at Ft. Ritchie (or re-sample).

Thanks-
Lynn Flowers

Average rank of first group = 31.9091 based on 22 values.
Average rank of second group = 21.5172 based on 29 values.
Large sample test statistic Z = -2.46313
Two-tailed probability of equaling or exceeding Z = 0.0137729
One-tailed probability of equaling or exceeding Z = 0.0068865

NOTE: 51 total observations.

[a] Key for distribution type
L = Passed lognormal distribution test.
L* = Passed both normal and lognormal distribution tests, but lognormal distribution was a better fit.
LQ = Lognormal distribution assumed since it was close to passing lognormal distribution test.
N = Passed normal distribution test.
N* = Passed both normal and lognormal distribution tests, but normal distribution was a better fit.
NQ = Normal distribution assumed since it was close to passing normal distribution test.
U = Distribution undefined (nonparametric).

[a] Key for distribution type
L = Passed lognormal distribution test.
L* = Passed both normal and lognormal distribution tests, but lognormal distribution was a better fit.
LQ = Lognormal distribution assumed since it was close to passing lognormal distribution test.
N = Passed normal distribution test.
N* = Passed both normal and lognormal distribution tests, but normal distribution was a better fit.
NQ = Normal distribution assumed since it was close to passing normal distribution test.
U = Distribution undefined (nonparametric).

[a] Key for distribution type
L = Passed lognormal distribution test.
L* = Passed both normal and lognormal distribution tests, but lognormal distribution was a better fit.
LQ = Lognormal distribution assumed since it was close to passing lognormal distribution test.
N = Passed normal distribution test.
N* = Passed both normal and lognormal distribution tests, but normal distribution was a better fit.
NQ = Normal distribution assumed since it was close to passing normal distribution test.
U = Distribution undefined (nonparametric).

[a] Key for distribution type
L = Passed lognormal distribution test.
L* = Passed both normal and lognormal distribution tests, but lognormal distribution was a better fit.
LQ = Lognormal distribution assumed since it was close to passing lognormal distribution test.
N = Passed normal distribution test.
N* = Passed both normal and lognormal distribution tests, but normal distribution was a better fit.
NQ = Normal distribution assumed since it was close to passing normal distribution test.
U = Distribution undefined (nonparametric).

[a] Key for distribution type
L = Passed lognormal distribution test.
L* = Passed both normal and lognormal distribution tests, but lognormal distribution was a better fit.
LQ = Lognormal distribution assumed since it was close to passing lognormal distribution test.
N = Passed normal distribution test.
N* = Passed both normal and lognormal distribution tests, but normal distribution was a better fit.
NQ = Normal distribution assumed since it was close to passing normal distribution test.
U = Distribution undefined (nonparametric).

[a] Key for distribution type
L = Passed lognormal distribution test.
L* = Passed both normal and lognormal distribution tests, but lognormal distribution was a better fit.
LQ = Lognormal distribution assumed since it was close to passing lognormal distribution test.
N = Passed normal distribution test.
N* = Passed both normal and lognormal distribution tests, but normal distribution was a better fit.
NQ = Normal distribution assumed since it was close to passing normal distribution test.
U = Distribution undefined (nonparametric).

## A3. Distribution List

This is a generic QA Project Plan; therefore, a distribution list will not be included. A list of organizations and persons that receive the generic QA Project Plan is maintained at Lancaster Laboratories.

## A4. Project/Task Organization

The objectives of the laboratory Quality Assurance Program are to establish procedures which will ensure that data generated in the laboratory are within acceptable limits of accuracy and precision, to ensure that quality control measures are being carried out, and to ensure accountability of the data through sample and data management procedures. To this end, a Quality Assurance Department has been established. The Quality Assurance Officer reports directly to the President of Lancaster Laboratories and has no direct responsibilities for data production, thus avoiding any conflict of interest. The Quality Assurance Officer is the responsible party for maintaining the official, approved QA project plan.

The attached organizational charts show key managerial personnel. Resumes of key individuals may be found in the *Qualifications Manual*.

The Sample Administration Group will be responsible for receiving samples, signing the external chain of custody, checking sample condition, assigning unique laboratory sample identification numbers, and initiating internal chain-of-custody forms. Sample Support personnel will be responsible for assigning storage locations, checking and adjusting preservation, homogenizing the sample as needed, and sample discard. The Bottles Group is responsible for pre-preserving bottles as required by the method, preparing trip blanks and field blanks when required, and packing the bottle kits, then sending them to the client‘s requested location.

Group leaders listed in each technical area are responsible for performing laboratory analyses, quality control as specified in the methods, instrument calibration, and technical data review. Data is reported using a computerized sample management system, which tracks sample progress through the laboratory and generates client reports when all analyses are complete. Quality control data is entered onto the same system for purposes of charting and monitoring data quality.

The Quality Assurance Department is responsible for reviewing quality control data, conducting audits in the laboratory and reporting findings to management, maintaining current copies of all analytical methods, reviewing and approving SOPs, maintaining copies of computer code used to calculate and report results, submitting blind samples to the laboratory, and ensuring that appropriate corrective action is taken when quality problems are observed.

Data package deliverables are available upon request. The Quality Assurance Department reviews a representative sampling of the deliverables for completeness and to be sure that all quality control checks were performed and met specifications. This step includes review of holding times, calibrations, instrument tuning, blank results, duplicate results, matrix spike results, surrogate results, and laboratory control samples (where applicable). Every attempt to meet specifications will be made, and any item outside of the specifications will be noted in the narrative. The laboratory will not validate data with regard to usability since this generally requires specific knowledge about the site. All data is archived according to corporate procedures.

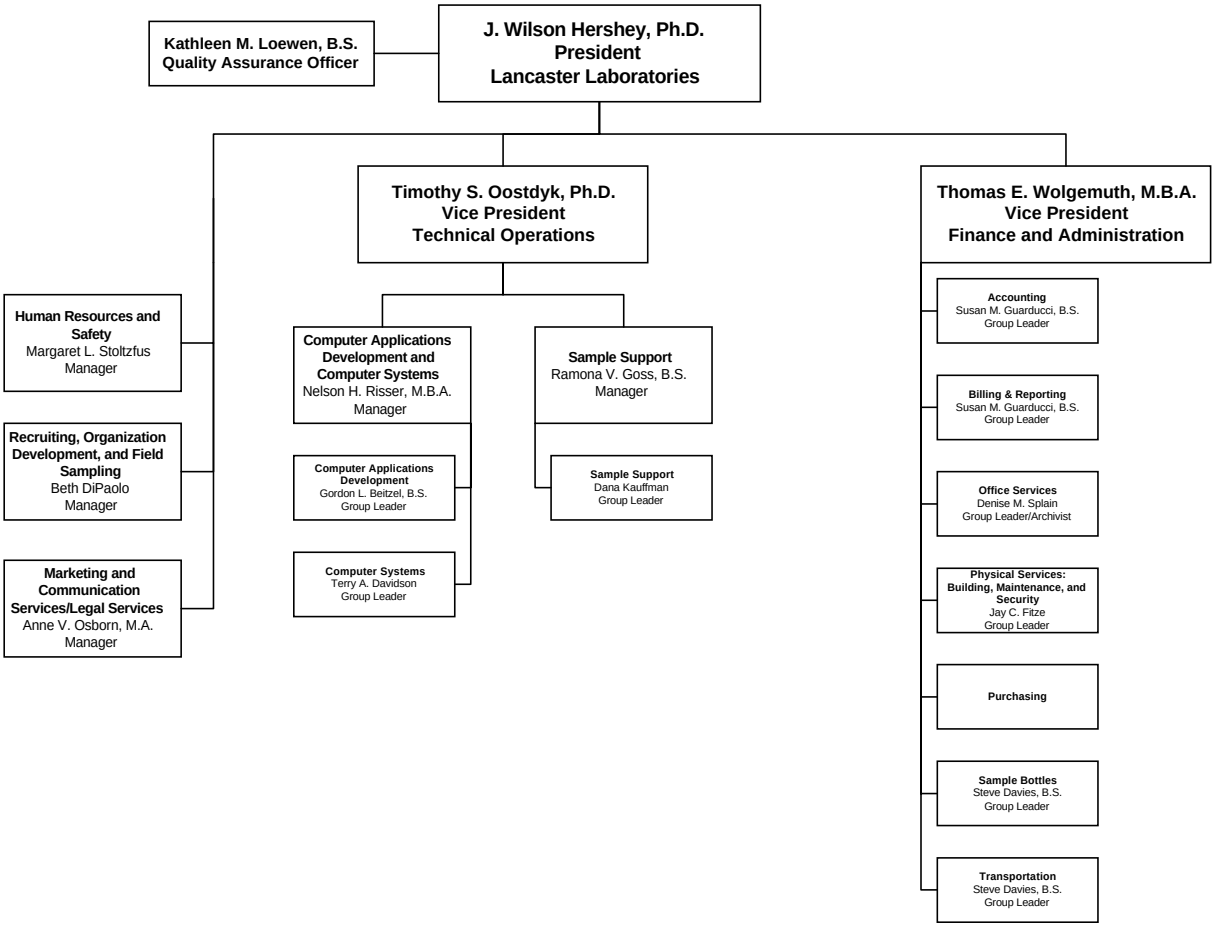
## Support Services



04/04/02

## A5. Problem Definition/Background

The purpose of this generic QA Project Plan is to provide specific quality assurance and quality control procedures involved in the generation of data of acceptable quality and completeness. This QA Project Plan provides the laboratory requirements to meet *EPA Requirements for Quality Assurance Project Plans*, EPA QA/R-5, March 2001 and EPA's *Guidance for Quality Assurance Project Plans*, EPA QA/G-5, February 1998.

The procedures in this QA Project Plan have been standardized to make them applicable to all types of environmental monitoring and measurement projects. However, under certain site-specific conditions, not all of the procedures discussed in this document may be appropriate. In such cases, it will be necessary to adapt the procedures to the specific conditions of the investigation.

The analyses in this document are representative of what the laboratory performs but are not all encompassing. It is intended to provide a client with an overview of systems and procedures at Lancaster Laboratories. It is not project or site-specific and may not address all analyses required for a particular project. If additional analytical information is necessary, arrangements can be made with Lancaster Laboratories to generate a project specific or site specific QAPP.

## A6. Project/Task Description

Tests will be performed according to the analytical methodology set forth in the *USEPA Test Methods for Evaluating Solid Waste—Physical/Chemical Methods*, *SW-846*, *3rd edition, Update III, December 1996* and *Methods for Chemical Analysis of Waters and Wastes, USEPA, 600/4-79-020.* SW-846 provides specific analytical procedures to be used and defines the specific application of these procedures. Proven instruments and techniques will be used to identify and measure the concentrations of volatiles, semivolatiles, and pesticide compounds and/or the inorganic elements. The laboratory will employ state-of-the-art GC/MS and/or GC procedures to perform all organic analysis. Inorganic analyses will be performed using graphite furnace atomic absorption spectophotometry (GFAA), inductively coupled plasma (ICP), cold vapor AA, and flame AA. Instrumental wet chemistry will be using an auto-analyzer spectrophotometer, TOC analyzer, TOX analyzer, and Ion Chromatography. Classic wet chemistry will use appropriate instrumentation. The client is responsible for providing specifics on the project site.

## A7. Quality Objectives and Criteria

Quality assurance is the overall program for assuring reliability of monitoring and measurement data. Quality control is the routine application of procedures for obtaining set standards of performance in the monitoring and measurement process. Data quality requirements are based on the intended use of the data, the measurement process, and the availability of resources. The quality of all data generated and processed during this investigation will be assessed for precision, accuracy, representativeness, comparability, and completeness. These specifications will be met through precision and accuracy criteria as specified in Element B5. Detection limits are presented in Element B4.

To ensure attainment of the quality assurance objectives and criteria, SOPs are in place detailing the requirements for the correct performance of laboratory procedures. The laboratory SOPs fall under five general categories:

1. Corporate policy

2. Quality assurance

3. Sample administration

4. General laboratory procedures

5. Analytical (i.e., methods, standard preps., instrumentation)

All SOPs are approved by the QA Department prior to implementation. The distribution of current SOPs and archiving of outdated ones are controlled by the Office Services Group through a master file. Table A7-1 provides an index of QA SOPs in place in support of the Quality Assurance objectives. These requirements are supplemented by the procedures in the laboratory and analytical SOPs.

**Table A7-1**

## A8. Specialized Training/Certification

Lancaster Laboratories has a core curriculum of training that contains the basic courses relevant to all the employees. This in part, includes teaching the quality policy, quality assurance/quality control, ethics training, chemical hygiene training, health and safety classes, and any function specific training (i.e. GC, Statistics). Much of this training is performed at Lancaster Laboratories through the Human Resources Group. The following list shows examples of course offerings:

- Laboratory Technician Program: Designed for new employees who need to develop laboratory skills or who need a refresher on laboratory basics.
- Making Quality A Science: This course introduces why quality is important, explains Lancaster Laboratories quality philosophy and processes, and shows how to apply quality thinking and techniques on the job.
- Putting Our Values to Work: This seminar is designed to introduce new employees to the Statement of Values by examining how it translates to everyday jobs and includes ethical decision making.
- Chemical Hygiene Plan: Introduces the new employee to LLI's Chemical Hygiene Plan and the OSHA Lab Standard regulation and requirements.
- CPR: This course includes CPR history, relevance of CPR, cardiovascular disease, adult one-rescuer CPR, airway obstruction, pediatric CPR, safety in CPR.
- 24-hour HAZWOPER Emergency Response: Part of a proactive safety and emergency preparedness effort, this training is provided to a core group of people and volunteers who may respond to emergencies.
- Statistical Analysis: Topics include: rounding, mean standard deviation, normal distribution, z-scores, estimate, confidence intervals, hypothesis testing, one sample t-test, F-test, two sample t-test, paired t-test, ANOVA, outlier, calibration, etc.
- Gas Chromatography: Principles in GC, separation, qualitative/quantitative analysis, hardware, software, troubleshooting techniques, and the applications for GC use at Lancaster Laboratories.
- GC/MS Basics: Review of the fundamentals for GC/MS analysis.
- HPLC: Principles and practices on HPLC and the applications at Lancaster Laboratories.

If the training can not be accomplished at Lancaster Laboratories, then the employee may have off-site training. Within each technical or support group, the employee also receives on-the-job training before performing work independently. The details of this training are noted in each departmental group's SOPs.

The analysts must perform an initial demonstration of capability before using any test method; this is reviewed and signed by the technical department's management and Quality Assurance. The analyst must also complete an annual demonstration of capability for each test method per matrix.

All training and proficiencies are documented in each employee's training records as described in SOP-QA-117, "Personnel Training Records and Curriculum Vitaes."

## A9. Documents and Records

The group leaders in each technical area are responsible for overseeing the performance of analysis, quality control as specified in the method, instrument calibration, and technical data review. There is a secondary review on 100% of all data by a supervisor or experienced analyst prior to reporting the results. The Laboratory Information Management System (LIMS) tracks sample progress through the laboratory and generates client reports. During analysis, raw data must be recorded in indelible ink in bound notebooks or on printouts from instruments and is then entered into the LIMS against sample number and analytical method. Many instruments are connected directly to the LIMS, eliminating the manual transcription. Quality control data is entered into the same system for purposes of charting and monitoring data quality. When all analyses are completed and have been verified by a supervisor or designee, the computer generates a report. The client receives a copy of the report containing the results of the analysis plus comments entered by the analyst where necessary. Copies of the reports and associated raw data are retained in secured archives.

Currently Lancaster Laboratories has over fifteen different reporting formats. Table A9-1 shows some of the formats available. Unless a specific report format is requested, the standard laboratory procedure is to report results to the limit of quantitation (LOQ) using report type 0 (see Table A9-1). However, it is possible to estimate to a value below the LOQ, if lower values are needed. Estimates are made to the reported method detection limit (MDL) which is based on annual MDL studies performed per method/matrix and instrument. An example analysis report is included in Appendix A.

The data packages are consistent with EPA CLP, NJDEP, and other state or agency formats. Custom formats are also accommodated. The data package types differ in the level of raw data and QC that would be submitted. Table A9-2 shows the formats offered and the information that can be included in a data package. Appendix A shows examples of the data package forms used for various types of methodology (i.e. GC/MS Volatiles, pesticides, etc.) The data packages are available as hard copy deliverables or a *.pdf* file on CDROM.

After the data package has been compiled, a content review and QA/QC compliance review on 100% of the data packages is performed by the Data Deliverable department or by other fully-trained staff. During the content review, the field chain of custody is compared to the reports to check the analysis performed, dates/times of collection, and sample designation. In addition to making sure data from all the appropriate departments is present, the following are also checked: method summary/reference, title page, table of contents, sample reference list, sample administration receipt documentation logs, and internal chains of custody (if required). In addition to making sure the data for all analyses are included, the following are also checked during the QA/QC compliance review: spot check results on the report against the raw data, ensure analyses performed within holding time, check quality control summary forms for compliance issues, and read the case narrative to make sure all nonconformances and anomalies are addressed.

In addition, the Quality Assurance Department reviews a representative sampling of the deliverables for completeness and to be sure that all batch quality control checks were performed and met specifications. This step includes review of holding times, calibrations, instrument tuning, blank results, duplicate results, matrix spike results, surrogate results, and laboratory control samples (where applicable). Every attempt to meet specifications will be made, and any item outside of the specifications will be noted in the case narrative. The laboratory will not validate data with regard to usability since this generally requires specific knowledge about the site.

Analytical results can be submitted to the client in various electronic formats. LLI supports more than 8 standard and over 100 custom file structures using an Oracle based data system. LLI provides electronic data deliverables (EDD) formatted in Microsoft Access (.mdb), Excel (.xls), and ASCII: “Comma Delimited,” “Tab Delimited,” and “Fixed Length.” LLI uses several industry standard formats for the electronic data, such as:

- NJDEP SRP HazSite (HZRESULT data)
- GIS/Key
- CA EDF (COELT)
- EquIS
- ERPIMS
- EPA Region 5 (EDMAN)
- TerraBase (Integrate Level 2)
- ITEMS
- Client- or Project-Specific Formats

We ensure the quality of our electronic data by providing 100 percent manual quality assurance review of all data fields for new formats and a 10 percent review thereafter. We also have an extensive EDD review.

*LLabWeb.com* allows a client to access their verified analytical results round-the-clock through Lancaster Laboratories computer system using a secure Internet browser. Only analytical results on samples that are completed and verified can be accessed by this system.

A corporate procedure is in place for documentation, error correction, and control of logbooks (SOP-QA-109, ”Laboratory Notebooks, Logbooks, and Documentation”). The Office Services Group is responsible for maintaining the document and version control of the QA project plan and SOPs. All documents are assigned a revision number and date by the Office Services Group. They record all individuals or departments that have been issued a copy of a document and track that old versions are returned when the new one is issued. They are also responsible for maintaining the archive system to securely store records from all areas of the laboratory. SOP-QA-114, ”Data Storage, Security and Archiving,” describes procedures for transferring data from the laboratories to the archives. The procedures for maintaining the archives, including record retention schedule and disposal are described in SOP-QA-136, “Archive Guidelines.” The length of time for retention of data is 10 years. The disposal of records is explained in procedure SOP-QA-135, “Disposal of Hard Copies.” All copies that are disposed of are incinerated. The Data Deliverables Group archives copies of the data packages using microfilm or equivalent. Electronic data diskette files are saved on a backup tape and stored off site for a minimum of 10 years.

**Table A9-1**
**Data Reporting Formats**

| | Negative | Exactly Zero | MDL | LOQ | Above LOQ | Limit Shown on Report |
|---|---|---|---|---|---|---|
| 0 | <LOQ | | | | Rounded result | LOQ |
| 1 | N.D. | | <LOQ | | Rounded result | LOQ |
| 2 | N.D. | | BMQL | | Rounded result | LOQ |
| 3 | N.D. | | Result with "J" Qualifier | | Rounded result | LOQ |
| 4 | N.D. | | Result with "J" Qualifier | | Rounded result | LOQ |
| 5 | Result with "J" | N.D. | Rounded result to 6 decimal places | | | LOQ |
| 6 | Result with "J" | N.D. | Rounded result to 6 decimal places | | | MDL |
| 7 | LOQ with "U" Qualifier | | Result with "J" Qualifier | | Rounded Result | LOQ |
| 8 | N.D. | | Rounded Result (no "J" Qualifier) | | | MDL |

Key:

MDL = Method Detection Limit
LOQ = Limit of Quantitation
BMQL = Below Minimum Quantitation Limit
J = Estimated Value

## Data Package Formats

**Type I, NJ Regulatory (non-CLP)**

- Title page
- Sample reference list
- Analysis request form, field chain of custody
- Sample administration receipt documentation log
- Internal chain of custody (if required)
- Method summary/references
- Analysis reports/laboratory chronicles
- Case narrative
- Quality control summary; duplicates, matrix spike, matrix spike duplicate, blank, and LCS, and surrogate recovery summary forms, GC/MS tuning summary
- Sample data; all raw sample data including instrument printouts and MDL summary form
- Standard Data; initial and continuing calibration summary forms, all raw initial and continuing calibrations and standardization data including instrument printouts
- Quality control raw data; all raw quality control sample data including printouts, preparation logs, run logs

**Type II (non-CLP)**

- Title page
- Sample reference list
- Analysis request form, field chain of custody
- Sample administration receipt documentation log
- Internal chain of custody (if required)
- Method summary/reference
- Analysis reports/laboratory chronicles
- Case narrative
- Quality control summary; duplicate, matrix spike, matrix spike duplicate, blank, LCS, and surrogate recovery forms, GC/MS tuning, initial and continuing calibration summary forms
- Sample data; all raw sample data including instrument printouts
- Quality control raw data; blank raw data, preparation logs, run logs

**Type III, NJ Reduced Deliverables (non-CLP)**

- Title page
- Sample reference list
- Analysis request form, field chain of custody
- Sample administration receipt documentation log
- Internal chain of custody (if required)
- Method summary/reference
- Analysis reports/laboratory chronicles
- Case narrative and conformance/nonconformance summary
- Quality control summary; duplicate, matrix spike, matrix spike duplicate, blank, LCS, and surrogate recovery forms, GC/MS tuning, summaries for calibration and standardization
- Sample data; MDLs, all raw sample data including instrument printouts for GC, GC/MS, and TPH only
- Quality control raw data; blank raw data for GC, GC/MS, and TPH only, preparation logs

**Type IV, Full CLP Deliverables**

- Title page
- Case narrative
- Analysis request form, field chain of custody
- Internal chain of custody (if required)
- All CLP reporting forms; QC analytical results and calibration summaries
- Sample data; all raw data including instrument printouts
- Standard Data; all raw initial and continuing calibrations and standardization data including instrument printouts
- Quality control raw data; all raw quality control sample data including printouts, preparation logs, run logs

## Table A9-2 – Continued
Data Package Formats

**Type V, Reduced CLP Deliverables**

- Title page
- Case narrative
- Analysis request form, field chain of custody
- Internal chain of custody (if required)
- All CLP reporting forms; QC analytical results and calibration summaries
- Sample raw data; all raw sample data including instrument printouts for organics only
- Quality control raw data; blank raw data for organics only, preparation logs

**Type VI, Raw Data Only**

- Title page
- Sample raw data; all raw sample data including instrument printouts
- Quality control summary; blank raw data
- Standard raw data; LCS raw data

# GROUP B

# MEASUREMENT/DATA ACQUISITION

## B1. Sampling Process Design

In order for meaningful analytical data to be produced, the samples analyzed must be representative of the system from which they are drawn. It is the responsibility of the client to ensure that the samples are collected according to accepted or standard sampling methods. The client should evaluate the number, location, and type of samples to be collected. The appropriate number and frequency of field QC samples should also be determined by the client.

For non-standard matrices such as fish, worms, biota, large concrete or wood chunks, or other assorted waste, a discussion should take place with the laboratory to identify special handling requirements and confirm method performance for the particular matrix.

## B2. Sampling Methods

The sampling methods should be selected by the client with regard to the intended application of the data.

The laboratory will provide the appropriate sample containers, required preservative, chain-of-custody forms, shipping containers, labels, and seals for the sampling. Trip blanks will be prepared by the laboratory and accompany sample containers at the project required frequency. Analyte free water will also be provided for field blanks. Temperature blanks will be included for monitoring cooler temperature upon receipt of the samples back at the laboratory. Pre-cleaned containers, with vendor supplied traceability documentation are available upon request. Because the laboratory does not stock this type of traceable container, 2 weeks prior notice is required.

Before use each lot of preservative used with sample containers is documented and checked for contaminants. The appropriate bottle will be preserved with the new preservative and filled with deionized water to represent a sample. A similar container (that does not contain preservative) will be filled with deionized water to be used as a blank check. Analysis results are documented and reviewed for each preservative lot number.

A list of containers, preservatives, and holding times follows in Table B2-1.

**Table B2-1**
Sample Containers, Preservatives, and
Holding Times for Aqueous and Solid Samples

| Fraction | Vol. Req. (mL)<br>Wt. Req. (g) | Container<br>P=Plastic<br>G=Glass | Preservation[a] | Holding Time[d] From Date of Collection<br>Water | Soil |

[a]pH Adjustment with acid/base is performed on water samples only.

[b]Sodium thiosulfate needed for chlorinated water samples

[c]Due to the inaccurate recovery of 2-chloroethyl vinyl ether in the presence of HCl, Halocarbon samples analyzed for this compound should not be preserved.

[d]Samples will be analyzed as soon as possible after collection. The times listed are the maximum times that samples will be held before analysis and still be considered valid.

[e]Analysis 40 days from extraction.

[f]This is for soils not sampled by Method 5035. For Method 5035, see below.

[g]Holding time is 48 hours from time of collection for unpreserved samples.

NOTE: For volatiles analysis, the container should be filled completely, with no headspace. All sample containers, preservatives, and mailers will be supplied at no additional charge upon request, except for the special containers with traceability documentation. There is an additional charge for this type of container.

Method 5035
Containers for sampling soils for volatile organic compounds

| Analysis Level | Option # | EnCore™ Sampler | Methanol Preserved 40-mL Vial | Unpreserved Container for Moisture | Travel Blank |
|---|---|---|---|---|---|
| Low | A | 3 (7*) | — | 1 | Water |
| High | B | 1 (3*) | — | 1 | Water |
| | C | — | 1 (3*) | 1 | Methanol |

*Total number of sampled containers needed for background/MS/MSD analyses. Because only one analysis will come from each container, additional samples must be collected for matrix spikes/matrix spike duplicate analyses or other quality control analyses. The number of containers for MS/MSD samples is listed above. The holding time from collection to preservation is 48 hours. The holding time for analysis is 14 days from preservation.

## B3. Sampling Handling and Custody Requirements

Samples are unpacked and inspected in the sample receipt area. At this time, the samples are examined for breakage and agreement with the associated client paperwork. The cooler temperatures will be checked upon receipt and recorded. As the samples are unpacked, the sample label information will be compared to the chain-of-custody record and any discrepancies or missing information will be documented. If necessary, the cooler will be closed and placed in cold storage until instructions and resolution of any discrepancies are received from the client.

A member of our Sample Administration Group will act as sample custodian for the project. To ensure accountability of our results, a unique identification number is assigned to each sample as soon as possible after receipt at the laboratory. Upon entry into our LIMS and assignment of the seven digit sample number, labels are generated, along with an Acknowledgement summarizing samples entered and the analyses scheduled. When samples requiring preservation by either acid or base are received at the laboratory, the pH will be measured and documented, with the exception of samples designated for volatile analysis, which are checked at the time of analysis. Samples requiring refrigeration will be stored at 2° to 4°C. The use of our computer system in tracking samples (by the Lancaster Labs sample number assignment) will control custody of the sample from receipt until the time of its disposal. The security system on our laboratory building allows us to designate the entire facility as a secure area since all exterior doors are either locked or attended. Therefore, hand-to-hand chain of custody is not part of our routine procedure, but is available upon request. If requested, hand-to-hand chain of custody will be provided as per attached SOP-QA-104, "Chain-of-Custody Documentation." The laboratory chain of custody will begin with the preparation of bottles. The procedures for sample log-in, storage, and chain-of-custody documentation are detailed in the QA standard operating procedures included in Element B3 (SOP-QA-102, SOP-QA-103, and SOP-QA-104). Examples of sample labels and a custody seal are shown in Figure B3-1.

**QUALITY ASSURANCE OPERATIONS MANUAL**
**Sample Log-In**

**Purpose:**

In order to provide accountability of our results, protect client confidentiality, and to prevent sample loss/mix-up, a continuous and unique Lancaster Laboratories (LL) identification number is assigned to each sample upon laboratory receipt.

**Scope:**

This SOP will cover the procedure used to log client samples into the computerized sample management system (CSMS) after receipt. The Sample Administration Group is responsible for laboratory sample log-in. Sample Administration has procedures to define this sample entry process.

This procedure applies only to samples, which are logged into and tracked by the CSMS. There are only a few cases where samples may not be tracked using the CSMS. These include samples which will be stored for a long period of time prior to analysis, (e.g., stability storage) or for special project samples that could be reported in a narrative research and development style report instead of our usual analytical reports. Written procedures for tracking samples not entered into the CSMS need to be developed by the technical department responsible for the project or analysis of those samples.

**Personnel Training and Qualifications:**

Training in sample log-in is performed in accordance with Sample Administration training procedures.

**Procedure:**

1. All samples received for testing shall be delivered to the Sample Administration Department immediately upon arrival at the laboratory.

2. The Sample Administration Department will be responsible for unpacking and organizing the samples.

3. Client correspondence relating to the samples shall also be transferred to the Sample Administration Department. This may include purchase orders, quotations, letters, phone logs, and Incoming Sample Activity Records (ISARs).

4. Personnel of the Sample Administration Group shall log the samples into the CSMS as soon as practical after receipt. Samples awaiting log-in are stored in temporary holding areas, at required temperature, to maintain the sample integrity. At the time of entry the computer will assign a unique Lancaster Laboratories' identification number to each sample. Samples can be received at the laboratory 7 days a week, 24 hours a day, 365 days of the year. Samples should be logged in on the same day as they are received, but there could be the following exceptions:

    a. Samples received on a holiday will not be logged-in until the next normal workday. Samples received from 6 p.m. on Saturday through 11 p.m. on Sunday will be logged-in Sunday evening by third shift Sample Administration personnel.

    b. Samples submitted by clients, which do not identify the type of testing to be performed, or with unclear or incomplete paperwork documentation. Every effort will be made to contact the client on the same day of sample receipt. In this situation, the samples will be tracked in a hold database. The group of samples will be assigned a hold number. This database is maintained by the Sample Administration Group.

If same day sample log-in is not possible, all specified and appropriate storage requirements will be observed (e.g., refrigeration).

5. Upon assignment of a sample number, the CSMS will generate a label, which shall be attached to the sample container. Every effort will be made as to not obscure the client label. The information on the sample label will include the LL sample number, the client name, the storage location, the analyses requested, a bottle code indicating container and preservative type, if applicable, a unique bar code (used for samples stored in Automated Sample Retrieval and Storage System locations [ASRS]), and any applicable notes to laboratory personnel.

6. Preservation, homogenization, and subsampling, if necessary, will be the responsibility of the Sample Support Group, or the testing laboratory. SOPs are in place within the group to define these procedures. A list of preservatives required for routine environmental analyses may be found in the *Environmental Schedule of Services*. A preservation, sulfate, and chlorine check shall be performed immediately after sample log-in for all applicable environmental samples.

7. After all above steps are performed, as required, samples shall be stored in an assigned storage location, taken to the laboratory for testing, or may temporarily be stored in SA until technical center picks up samples.

8. The next working morning, after sample log-in, a copy of an entry acknowledgment will print from the CSMS. The acknowledgment is a hard copy record of the sample entry. It will summarize the LL sample number, the sample(s) submitted in an entry group, the test(s) to be performed, the client requesting the work, the account to be billed for the work, and the unique sample identifications assigned by the client. This acknowledgment is mailed to the client to confirm sample receipt and entry.

9. Another copy of the sample acknowledgment will print and be designated as the laboratory copy. This acknowledgment, in addition to client paperwork, will be audited by three levels of personnel after the entry process:

   a. **Sample Administration** will audit to assure that the entry corresponds to all entry documentation including client supplied paperwork and/or quotations.

   b. **Client Services** will audit to assure the entry is reflective of client documentation and that additional client/project requirements were communicated and taken into consideration. They will also verify that account and billing information is accurate.

   c. **Technical centers** will assure appropriate preparation and analysis set-up steps have been added to the entry. They will also verify that project and technical requirements have been taken into consideration from a technical point of view.

      Some technical groups may choose to audit incoming client sample requirements using alternative means such as an internal scheduling program or a database that cross-checks the analyses entered against established technical criteria. Any system used to perform technical review of incoming client requirements must be documented

   Each reviewer will initial the top of the SA file copy of the acknowledgment to document their review. Additional copies of this acknowledgment can be made for laboratory personnel.

10. The LL sample number assigned to each sample shall be used to identify the sample in all laboratory records, including laboratory notebooks, instrument printouts, and laboratory final reports. The sample number will also be used to identify all additional containers of the sample, which may be created during sample preparation and analysis. This will include subsamples, extracts, and digests.

**QUALITY ASSURANCE OPERATIONS MANUAL**
**Sample Storage and Discard**

**Cross References:**

The following procedures are cross-referenced in this document:

1. SOP-PS-014," Controlled Substance Handling and Recordkeeping Procedures."
2. SOP-QA-104, "Internal Chain-of-Custody Documentation."
3. SOP-QA-109, "Laboratory Notebooks, Logbooks, and Documentation."

**Purpose:**

Sample integrity can be compromised by improper storage conditions. The objective of this procedure is to prevent sample deterioration and mix-up prior to analysis. The computerized sample management system (CSMS) is used to assign storage locations to assist in the orderly storage of samples. Systems are also in place to ensure organized retrieval of samples for analysis and discard/return to client at an appropriate date.

**Scope:**

This procedure applies to all Lancaster Laboratories business units. The content of this procedure will describe general systems that are in place for sample storage, retrieval, return, and discard. Additional procedures within each division describe the specific storage operations and requirements of each business unit. This procedure does not address the storage and monitoring of samples stored in stability chambers. These procedures are described in the PS series of SOPs. Handling of controlled substance samples is described in SOP-PS-014.

**Safety Precautions:**

Refer to the corporate *Chemical Hygiene Plan* which provides safety information. Contact your supervisor if you have questions or concerns about a sample.

**Personnel Training and Qualifications:**

Personnel who handle client samples must be familiar with the requirements of this procedure, as well as any applicable division specific procedures.

**Procedure:**

A. Sample storage and transfer

1. Sample Administration will gather information into the CSMS at the time of sample entry about the approximate size of samples to be received in a group and the type of storage they require (e.g., refrigerator, freezer, or room temperature).

2. The CSMS will assign the storage location and record the length of time the samples must be retained after the analysis report has been issued.

3. Samples will be stored in the assigned storage location, when not in the laboratory area.

4. In the event that a sample location change is needed, a sample custodian or sample administrator will access the appropriate CSMS program and choose a new location. After a successful change in location has occurred, the new location will be written on each Lancaster Laboratories sample label, or a new label will be reprinted and adhered to the sample. The sample will then be transferred to the new storage location.

5. Analysts requiring the use of a sample may determine its location by referring to a departmental sample status sheet, CSMS, or SA entry paperwork.

6. To prevent unnecessary deterioration of the samples, the contents needed for analysis shall be removed and the sample returned to storage with a minimum of delay.

B. Security of storage areas

There are varying degrees of additional security requirements for storage areas, which are in addition to the building security. This additional security may be driven by various regulatory agencies or client requirements. The following are different levels of security which are in place at the laboratory.

1. Samples may be located in an individual laboratory area which is not locked. No additional security is required, in addition to the existing building security. Samples may only be removed from and returned to these locations by an analyst working in that area. Care shall be exercised in returning the samples to their appropriate location.

2. Locked storage areas are also available. Access to these storage areas is limited to analysts who are responsible for testing the samples that are stored there. These areas are locked when the laboratories are unattended; access is available only to members of the department where they are located. Again, care shall be exercised in returning the sample to its appropriate location.

3. Controlled access areas are attended by a sample custodian and are large areas used by more than one group. Samples stored in controlled access areas are coordinated by the sample custodian assigned to the area. Only appropriate personnel may access this controlled area. After analysis, samples are returned to this storage center and placed in their designated storage location.

Pharmaceutical samples are stored in a controlled access area, which is maintained by the Pharmaceutical Division. Environmental samples are stored in a separate controlled access area and are tracked by an automated sample retrieval storage system (ASRS). Samples are barcoded in and out of this system to track retrieval, return, and disposal.

4. Forensic storage areas are locked and admission to these areas is permitted only to sample custodians. Most of the samples stored in these areas require chain-of-custody documentation as outlined in SOP-QA-104. Samples may not be removed from this area without signing a chain-of-custody form. A chain-of-custody record may also be kept for samples, at the request of the client, even if the samples are not for forensic purposes.

C. Sample discard

1. When the retention time for sample storage has expired, a discard list will be generated from the CSMS. The retention dates are based upon client requirements or defaulted to a given number of days past the date when the final analysis report is generated, if no client requirement is given.

2. These samples will be removed from their assigned storage area by a sample custodian or analyst, and either disposed of or returned to the client.

3. Hazardous samples shall either be returned to clients, decontaminated, or disposed of at the direction of supervisory and/or Health and Safety personnel.

D. Storage conditions

1. The temperature of each sample storage location requiring a temperature control should be checked during each normal working day by an assigned person responsible for the sample storage area. This information shall be recorded.

2. Temperature documentation can be recorded on logs posted on the outside of the unit or by computerized recording devices or chart recorders.

3. The following temperature ranges need to be maintained within storage units, unless otherwise specified.

| | Refrigerator Storage | Freezer Storage | Room Temperature |
|---|---|---|---|
| Environmental Division | 2° to 4°C | -10° to -20°C | NA |
| Pharmaceutical Division | 2° to 8°C | -10° to -20°C | 15° to 30°C |

**NOTE:** Storage conditions of -40° ± 10°C and -80° ± 10°C are also available.

4. If the temperature recorded does not fall within these ranges, corrective action must be taken, as per divisional policy.

5. Temperature monitoring documentation shall be recorded in ink and changes shall be made in accordance with the error correction procedure outlined in SOP-QA-109.

6. Temperature records must be reviewed by a second qualified person and this information must be permanently archived.

7. In the event that additional storage areas are needed as "overflow" storage, systems must be put into place before samples can be stored. These areas must also be monitored for acceptable storage conditions.

8. If a client requests storage conditions which are outside the temperature ranges defined above, arrangements will be made to accommodate the request, if possible.

**Revision Log:**

**QUALITY ASSURANCE OPERATIONS MANUAL**

**Internal Chain-of-Custody Documentation**

**Cross References:**

The following procedures/forms are cross-referenced in this document:

1. SOP-QA-102, "Sample Log-In."
2. SOP-QA-109, "Laboratory Notebooks, Logbooks and Documentation."
3. Form 2016, "Secure Storage Chain of Custody Original Sample."
4. Form 2102, "Analysis Request/Environmental Services Chain of Custody."
5. Form 2174, "Sample Administration Receipt Documentation Log."
6. Form 2231, "Secure Storage Chain of Custody, Metals."
7. Form 2365, "Master List of Chain of Custodies."
8. Form 2667, "Sample Storage, Off-Shift Entry Logbook."

**Purpose:**

In order to demonstrate reliability of data which may be used as evidence in a legal case, required by a regulatory agency, or required by a client, an accurate written record tracing the possession of samples must be maintained from the time they are received at the laboratory until the last requested analysis is verified. The purpose of a chain of custody (COC) is to ensure traceability of samples while they are in the possession of the laboratory.

**Scope:**

This procedure describes the initiating and maintaining of COC documentation for samples that require this level of traceability. It applies to all business units of Lancaster Laboratories when a client or regulatory agency requests an accurate written record tracing the possession of samples from the time they are received at the laboratory until the last requested analysis is verified. This procedure also applies to samples, especially environmental samples, which may be used as evidence in a legal case.

The first section of this procedure summarizes the COC requirements for pharmaceutical samples. The second section summarizes the requirements for environmental COC samples.

**Definition:**

A sample is in custody if it is in any one of the following states:

1. In actual physical possession.
2. In view after being in physical possession.
3. Locked up so no one can tamper with it.
4. In a secured area, restricted to authorized personnel (e.g., in the ASRS system, pharmaceutical samples storage area).

**Personnel Training & Qualifications:**

Training for this procedure consists of reading this SOP. Supervisory review of all COC documentation should be done until the trainer is satisfied that proficiency has been achieved. Training of all laboratory personnel is the responsibility of the group leader. Documentation that this training has been completed must be kept in the training records.

**Procedure:**

A. Pharmaceutical procedure

1. General overview

a. Chain-of-custody documentation shall be kept upon the request of a client or regulatory agency. As with all analytical data, it is **extremely** important that this documentation be filled out completely and accurately with every sample transfer. **Everyone who handles the COC has the responsibility to check for documentation compliance to the point of their acquisition**. If changes need to be made to the form, they shall be made in accordance with the error correction procedure addressed in SOP-QA-109. It is the responsibility of the person who made an error in documentation to correct the error.

b. For pharmaceutical samples, internal COC documentation will begin when samples are received at the laboratory.

c. A member of the Sample Administration Group will receive and unpack the samples. They will sign the client paperwork that accompanies the samples, if provided. If the samples were picked up by our Transportation Department, the driver must also sign applicable paperwork to relinquish the samples to Sample Administration.

d. The Sample Administration Group will track the custody of samples between receipt and entry into the computerized sample management system (CSMS) on Form 2174 (Figure 2). The client's sample designation will be used for identification purposes until a unique Lancaster Laboratories number is assigned.

e. Samples will be entered into the CSMS as described in SOP-QA-102.

f. After entry, samples are released by the Sample Administration Group to be stored in other areas of the laboratory (e.g., pharmaceutical specific storage areas). During this time, they may be accessed by several people in that area. Each of these people must note the specific sample numbers in their custody in addition to date, time, and reason for removal from storage. Chain-of-custody transfer documentation is recorded on Form 2016, which is given as Figure 3 of this procedure.

2. Documentation of custody changes

a. An example of how to document changes in sample custody is shown in Figure 3, (Form 2016) of this procedure. Each change of sample custody must be accurately documented in a consistent format. Entries documenting change of custody will use the following format:

Signature: First initial, full last name, employee number
Date: Month/day/year
Time: Documented as military time
Ink: Black ink is preferred, red ink and pencil are not acceptable

b. When sample(s) are released from storage, they must be signed out by the analyst receiving them. The analyst must note the sample number(s) taken, the date and time received, and a note as to the reason why they were removed from storage (reason for change of custody).

c. When an analyst returns sample(s) to storage, they must note the sample number(s) being returned in addition to time of return.

d. If the custody of sample(s) is passed from one analyst to another, the following must be noted: the sample number(s) transferred, the reason for the transfer, in addition to the time and date of transfer. It is the responsibility of the analyst now in possession of the samples to ensure they are returned to the storage area.

e. Each specific test that an analyst performs, in conjunction with the associated sample number(s), must be accurately documented by the analysts in the Reason for Change of Custody column before the samples are returned to the sample storage area.

3. Additional COC issues

a. Chain-of-custody paperwork will remain with and accompany sample containers at all times. **Note:** COC paperwork may be kept in a nearby location when samples are stored in a location not conducive to paper storage (i.e., refrigerator or freezer).

b. When sample analysis is complete, samples shall be returned to the storage area, in conjunction with the COC form.

c. Original COC documentation will be maintained at the laboratory and filed in the sample storage area. COC documentation will be overchecked in conjunction with the sample data before a copy is sent to the client. The copy could either accompany the samples as they are returned to the client or it could be included within a client data package.

d. All personnel who handle sample containers shall make every attempt to ensure that all changes of custody are accurately and completely documented. **Disciplinary action may be taken for employees who fail to comply with these important requirements**.

B. Environmental procedure

1. Initiation of COC documentation

a. Chain-of-custody documentation shall be kept upon the request of the client or for any samples which are known to be involved in a legal dispute. As with all analytical data, it is **extremely** important that this documentation is filled out completely and accurately with every sample transfer. **Everyone who handles the COC has the responsibility to check for documentation compliance to the point of their acquisition.** If changes need to be made to the form, they shall be made in accordance to the error correction procedure addressed in SOP-QA-109. It will be the responsibility of the person who made an error in documentation to correct the error.

b. If requested by the client, the COC documentation will begin with the preparation of sampling containers. Form 2102 (Figure 1) will be initiated by the person packing the bottle order for shipment to the client. If the delivery of containers is via Lancaster Laboratories Transportation Department, the driver shall sign the form when they relinquish the bottles to the client. Drivers must also sign COC forms when they pick up samples for analysis.

c. When samples arrive at the laboratory for analysis, a member of the Sample Administration group will receive them and sign the external COC form that accompanies the samples, if provided. If the samples were picked up by our Transportation Department, the driver must sign the COC to relinquish the samples to Sample Administration.

d. The Sample Administration group will track the custody of samples between receipt and entry into the CSMS on Form 2174 (Figure 2). The client's sample designation will be used for identification purposes until a unique Lancaster Laboratories number is assigned.

e. Samples will be entered into the Sample Management System as described in SOP-QA-102. Sample Administration will enter an analysis number for "Laboratory Chain of Custody" if requested. A lab note will print to inform analysts of the need for COC documentation. This note will also be automatically added to the sample labels.

2. Creating the internal COC

a. Sample Administration personnel shall initiate an internal Laboratory Chain of Custody form (Figure 3) at the time of sample entry for each type of container in the sample group. Form 2365 will be initiated for each sample group at the time of entry (Figure 4). The samples will then be relinquished to a sample custodian who will store the samples in an assigned secure location. This change of custody from sample entry to storage shall be documented on the chain, as well as any interim exchanges for rush analysis, preservation, homogenization, or temporary storage in the SA HOLD. The internal COC forms will then accompany the samples from storage to the laboratory for analysis.

b. If samples need to be checked out from the Sample Administration Group before Lancaster Laboratories numbers have been assigned to them, SA will be responsible for starting a COC form. They will note the available header information, the samples being relinquished (documented by the client sample designation), and the reason for transfer.

c. After sample entry, the original copy of the external client COC/analysis request form will be filed with Accounts Receivable, to be returned to the client with their invoice. Other copies of the external form will stay within SA to be filed within the client's paperwork file.

3. Documentation of custody changes

   a. An example of how to document changes in sample custody is shown in Figures 3 and 5. Each change of sample custody must be accurately documented in a consistent format. All signatures documenting changes of custody will use the following format:

      Signatures: First initial, full last name, employee number
      Date: Month/day/year
      Time: Documented as military time
      Ink: Black ink is preferred, red ink and pencil are not acceptable

      (1) When Sample Support releases samples to an analyst they must:

      Note the sample number(s) released and sign the "Released By" column of the chain.

      (2) When an analyst receives samples from Sample Support they must:

      Sign the "Received By" column, note the date and time samples are received, and note the reason why they are taking the samples (reason for change of custody).

      (3) When an analyst returns samples to Sample Support they must:

      Note all sample numbers being returned, sign the Released By column, and note time and date of return.

(4) When Sample Support receives samples from an analyst they must:

Sign the Received By column and note the reason for sample transfer.

b. Sample handling should be kept to a minimum. Analysts requiring use of a sample will requisition it through the computer requisition program. During the hours when Sample Support is manned by sample custodians, a custodian will receive the computerized requisition and remove the sample from storage. The custodian will ensure that the bottle type listed on the COC form matches the bottle type being distributed. **It will be the shared responsibility of the analyst and sample custodian to ensure that forms are signed, dated, and reason for sample transfer are recorded with each change of custody, as directed by Item (3)a. above.**

c. Each specific test that an analyst performed in conjunction with the associated sample number(s) must be accurately documented by the analyst before the samples are returned to a sample custodian in the sample storage area.

d. When an analyst requires the use of samples when a sample custodian will not be on duty, they must requisition samples earlier in the day or on the previous day. These samples and associated COCs will be pulled by a sample custodian and placed in the locked Main Storage area. The sample custodian will note on the COC the change in transfer to the Main Storage in addition to the time, date, and the sample numbers. When an analyst picks up the sample from Main Storage, they will need to contact the security person on duty to unlock the Main Storage unit. The analyst will need to fill out Form 2667 (Figure 6) which will be located by the entrance to the Main Storage unit to document entry into the storage unit (security will co-sign as a witness). Once the notebook

is signed, the analyst may enter and retrieve their samples. The analyst picking up the samples will document the specific samples being checked out. The security person will sign in the Released By column. The analyst will sign the Received By column, note the time, date, and reason for transfer. When the analyst returns the samples to the Main Storage, security must be contacted. The logbook must be signed by the analyst and security, the analyst must sign the Released By column, and security must sign the Received By column indicating the time, date, and reason for transfer (e.g., Main Storage).

e. The following changes of custody will be handled in the following manner:

(1) Documentation is required for all shift changes. Signatures involving transfers from one shift to another shall be the responsibility of the analyst who originally acquired the samples from Sample Support.

(2) Occasionally, a sample container will be needed for analysis by an analyst in a department while it is in the custody of an analyst in another department. It will be the responsibility of the first person who received the sample to note on the COC the specific sample numbers requested by the second person and to sign the Released By column. The second person will sign the Received By column and note the time, date, and reason for sample transfer. After the second person is finished with the sample, the sample will be returned back to the first person or to the Sample Storage area.

(3) In situations where a sample group must be split between departments working on different analyses, a supplemental COC must be initiated by the Sample Support Group. The supplemental chain will be used to accompany that portion of the

sample group which is needed by a second department, when another department has part of the sample group and the COC for the entire group. This supplemental COC will be created only when absolutely necessary to minimize paperwork and confusion. This chain must also be documented on the master list of chains initiated for the sample group.

(4) If COC samples are stored in other areas of the laboratory or in a specific department, they must be stored in a secured area. When samples are taken from a departmental storage area, the Released By column of the COC is documented as "department XX storage." If samples are returned to this area when complete, the Received By column will be noted as department XX storage.

4. Additional COC issues

a. Analysts in possession of samples shall remove the aliquot required for their analysis and return the samples to the Sample Support Group with a minimum of delay. During this time of possession, samples must fall under the definition of sample custody.

b. If additional containers of the sample are created (e.g., subsamples, extracts, distillates, leachates, digests, etc.), then additional COC form must be created by the department if they do not document this information on the original COC form. This form will be marked with the container type and will be initiated to accompany the new sample container. Each department in the lab has specifically designed COC forms that will be used if new containers are created, (see Figure 5 for an example). All changes of custody involving handling of new containers in the department (e.g., analysis, storage, vials on

instruments, etc.) will be documented on the departmental specific COC form or on the original COC form. Any specific handling or documentation requirements for departmental chains can be described in a departmental SOP.

5. Completion of the process

   a. After sample analysis, samples shall be returned to the Sample Support Group as soon as possible. Original COC forms shall also be returned with the samples and this change of custody noted. At this time, it will be the responsibility of the Sample Support Group to review the COC forms to ensure that all documentation on the forms is complete before they file the forms in their area. Sample custodians will not return a sample to its assigned storage location without signing the accompanying chain and performing this completeness check. All chains should either end with a note of "All Sample Consumed," "Discard," or "Storage" for the final reason of transfer.

   b. All completed COC forms for the original sample containers will be retained in files within Sample Support. The Data Package Group will retrieve these forms so a copy can be included in the data package. (**Note**: For those employees who collect COC forms for data packages; if you find a completed COC form in your area that does not get a data package, please send that COC form to the project manager for that account. The project manager will determine whether copies of the COCs get sent to the client with the reports or whether the originals will be archived at Lancaster Laboratories. The project manager will then forward the original COC forms to the Data Package Department for archiving). All departmental created COC forms will be collected by the department's data package group so a copy can be included in the data package. These forms will not be returned to the Sample Support

Group since these sample containers will not be returned to the Sample Support Group. The original copy of all COC forms will be retained on file by the laboratory.

c. All personnel who handle sample containers shall make every attempt to ensure that all changes of custody are accurately and completely documented. **Disciplinary action may be taken for employees who fail to comply with these important requirements.**

d. In the event that a signature or other information is inadvertently not recorded on a COC form, then Sample Support, Data Package Groups, in conjunction with the technical groups, shall determine what information is missing. This can be performed by checking computer requisition records, raw data, or the Sample Support work schedule. The responsible party shall add the missing information or make the necessary correction at the bottom of the COC form, in addition to noting the situation that caused the error in documentation. The person making this note needs to sign and date the information using the current date. Any errors in COC documentation that cause noncompliances must be noted in the case narrative of the sample data package. Examples of specific cases are on file in the Data Package Department.

**Revision Log:**

Initiated Date: 03/87

| Ver. # | Effective Date | Change |
|---|---|---|
| 00 | 12/01/95 | Previous Issue |
| 01 | 03/14/97 | Major changes are as follows:<br>• Training section added.<br>• Examples of SA Receipt Documentation Log and Metals Locked Storage COC updated.<br>• Section E.1., Option to end chain with "All Sample Consumed" added. |
| 02 | 09/02/97 | Major changes are as follows:<br>• Incorporated specific Procedure section for Food, Animal Health, and Pharmaceutical procedures.<br>• Expanded upon the scope of the procedure. |
| 03 | 06/01/99 | Major changes are as follows:<br>• Deleted Figure 6 - no longer being used.<br>• Added "sign-out" logbook to procedure for weekend and off hours sample retrieval.<br>• COC forms revised to state "Secure" storage.<br>• Added example of weekend and off-hours sign-out logbook page.<br>• Added instructions on how to handle COCs that don't get a data package. |
| 04 | 08/02/99 | Major changes are as follows:<br>• Clarify that paperwork may be filed separately if samples are stored under conditions not conducive to paper storage.<br>• Change SA HOLD to Main Storage<br>• Updated Figure 3 to replace SA HOLD to Main Storage |

**Figure 1 - Continued**

## DIRECTIONS FOR COMPLETING THIS FORM

**(1) Client:** Your company's name
**Acct. #:** Your account number with Lancaster Laboratories
**Project Name/#:** The way your company refers to the work involved with these samples. You may want to include project location as part of the description.
**PWSID:** Potable Water Source ID#
**Project Manager:** The person at your company responsible for overseeing the project
**P.O.#:** Your company's purchase order number
**Sampler:** The name of the person who collected the samples
**Quote #:** The reference number that appears on your quote (if Lancaster Laboratories gave you a number)
**State where sample was collected:** Please indicate where the sample was taken, e.g., PA, NJ, etc.

**(2) Sample Identification:** The unique sample description you want to appear on the analytical report
**Date Collected/Time Collected:** When the sample was collected

**(3) Grab:** Check here if sample was taken at one time from a single spot.
**Composite:** Check here if samples were taken from more than one spot, or periodically, and combined to make one sample.

**(4) Matrix:** Check the type of sample you are submitting. If it is a water sample, please indicate if it is a potable water or if it is an NPDES sample.
**Number of Containers:** Indicate the total number of containers for each sampling point.

**(5) Analyses Requested:** Write the name of each analysis (or an abbreviation of it) here, and use the **catalog number** that appears at the beginning of each line in the *Schedule of Services*. Be sure to indicate which analyses are to be performed on which samples.

**(6) Remarks:** List special instructions about the sample here (e.g., hazardous elements, high levels of analyte, etc.). The space can also be used (if needed) for listing additional analyses.

**(7) Turnaround Time Requested:** Circle **Normal** if you want routine TAT, which is usually within 10-15 days. If you need your results faster, call ahead to schedule **Rush** work.

**Rush Results Requested by:** Circle **Fax** or **Phone** and include the number.

**(8) Data Package Options:** Call our Client Services Group (717-656-2300) if you have questions about these choices.
**SDG Complete?** Indicate **Yes** if this is a complete sample delivery group or **No** if you will be submitting additional samples to be included in the same data package.
**Note:** We need to have one quality control (QC) sample for every 20 samples you send, if you are requesting site-specific QC. Please give us this sample in triplicate volume and identify it by writing "QC" in the **Remarks** column.
The internal chain of custody is a hand-to-hand documentation recording a sample's movement throughout the company. We routinely start a chain of custody for data package samples unless we are told otherwise. There is a **$25 per sample** charge for the chain-of-custody documentation.

**(9) Relinquished by/Received by:** The form must be signed each time the sample changes hands. We can supply chain-of-custody seals for the outside of your packages if you require them.

Thank you for using Lancaster Laboratories.
Please call our Client Services Group (717-656-2300) if you have any questions about completing this form.

## B4. Analytical Methods Requirements

The analytical procedures to be used for organics and inorganics are those described in the *USEPA SW-846 3rd Edition, Update III, 1996,* and *Methods for the Chemical Analysis of Waters and Wastes, USEPA, 600/4-79-020* for the preparation and analysis of water, sediment, and soil for the client specified compounds. Copies of the analytical procedures are located in the laboratory and available for use by analysts. Copies of analytical methods are available upon request. Quantitation and detection limits for the following methods are noted in Tables B4-2 through B4-22. These are evaluated annually and are subject to change, as per the guidelines given in 40 CFR Part 136 Appendix C.

### Inorganic Analysis

Metals by Inductively Coupled Plasma (ICP) – This is a technique for the simultaneous determination of elements in solution after acid digestion. The basis of the method is the measurement of atomic emission by an optical spectroscopic technique. Characteristic atomic line emission spectra are produced by excitation of the sample in a radio frequency inductively coupled plasma. Method 6010B, See Table B4-1 for list of elements and prep methods.

Metals by Graphite Furnace Atomic Absorption (GFAA) – This is a method of analysis designed to detect trace amounts of the analyte through electrothermal atomization. Samples are digested before analysis. The graphite furnace AA spectrophotometer heats the sample within a graphite tube using an electrical current (i.e. flameless furnace) and measures the absorption of specific metallic elements at discrete wavelengths. Methods listed in Table B4-1.

Mercury by Cold Vapor Atomic Absorption – Organic mercury compounds are oxidized and the mercury is reduced to the elemental state and aerated from solution in a closed system. The mercury vapor passes through a cell positioned in the light path of a spectrophotometer and absorbance (peak height) is measured. Method 7470A/7471A.

Metals by Flame Atomic Absorption – This method is also suited to metals analysis. A solution of the sample to be analyzed is sprayed into a flame which generates sufficient heat to decompose the sample into its constituent atoms directly in the optical path. The difference in light intensity is measured at specific wavelengths using a spectrophotometer. Methods listed in Table B4-1

**Micellaneous Wet Chemistry**

Moisture – A known sample weight is placed in a drying oven maintained at 103° to 105°C for 8 to 24 hours. The sample is reweighed after drying and this value is divided by the original weight. The result is used to calculate analytical concentration on a dry-weight basis. Method 160.3 (modified).

Cyanide, total – Distillation of the sample releases the cyanide from cyanide complexes as HCN. The liberated HCN and simple cyanides are converted to cyanogen chloride by reaction with chloramine T. This reacts with pyridine and barbituric acid reagent to give a red colored complex. The absorbance is read at 570 nm and is compared to a standard curve using an automated spectrophotometer. Method 9012A.

Phenolics, total – This method is based on automated distillation of phenol and the subsequent reaction with 4-aminoantipyrine in basic buffer to produce a red colored complex. The absorbance is read at 505 nm and is compared to a standard curve using an autotomated spectrophotometer. Method 9066.

Sulfide, total – The sample is acidified and a known excess of iodine is added. The iodine reacts with sulfide in acid solution, oxidizing sulfide to sulfur. The excess iodine is back-titrated with sodium thiosulfate. Method 9034 (modified).

Total Petroleum Hydrocarbons – Samples are extracted with freon and the resulting solution is treated with silica gel to remove fatty acids and other polar compounds. The remaining nonpolar compounds are designated as petroleum hydrocarbons and are quantitatively measured using Fourier transform infrared spectroscopy (FTIR). Method 418.1 (modified for soils).

Oil and Grease – For HEM a one liter sample is serially extracted with n-hexane in a separatory funnel. The solvent is evaporated from the extract, and the residual HEM is weighed. For SGT-HEM a one liter sample is serially extracted with n-hexane in a separatory funnel. The extract is mixed with silica gel, filtered through sodium sulfate, the solvent evaporated from the extract, and the residual SGT-HEM is weighed. Method 1664A.

Total Organic Carbon (TOC) – Following acidification, the sample is purged with nitrogen to remove inorganic carbon. Persulfate is injected to oxidize organic carbon to carbon dioxide which is detected by IR. Method 9060.

Total Organic Halogen (TOX) – Organic halogen is adsorbed onto an activated carbon column and combusted in an oxygen furnace. The resulting hydrogen halide gases are collected in an acetic acid buffer. The halides are titrated microcoulometrically through the generation of Ag+ ions. Method 9020B.

Total Nitrite/Nitrate – Using an autoanalyzer, the sample is passed through a column containing granulated copper-cadmium to reduce nitrate to nitrite. The nitrite ion reacts with sulfanilamide to yield a diazo compound which couples with N-1-naphylethylenediamine dihydrochloride to form a soluble, highly colored dye. The absorbance is read at 520 nm and compared to a standard curve. Method 353.2.

**Organic Analysis**

Volatiles by GC/MS – This method determines the concentration of volatile (purgeable) organics. The analysis is based on purging the volatiles onto a Tenax/silica gel trap, desorbing the volatiles onto a gas chromatographic column which separates them and identifying the separated components with a mass spectrometer. Method 8260B/5030B/5035.

Semivolatiles by GC/MS – This method determines the concentration of semivolatile organic compounds that are separated into an organic solvent and are amenable to gas chromatography. The method involves solvent extraction of the sample to isolate analytes and GC/MS analysis to determine semivolatile compounds present in the sample. Method 8270C/3550B/3510C.

Volatiles by GC – This method determines the concentration of volatile (purgeable) organic compounds. The analysis is based on purging the volatiles from the sample onto an appropriate sorbent trap and desorbing the volatiles onto a gas chromatographic column. Using an appropriate temperature program, the compounds are separated by the column and both qualitative and quantitative detection is achieved with a photoionization and/or electrolytic conductivity detector. Method 8021B/5030B/5035. Non-halogenated organics are analyzed by flame ionization detectors. Method 8015B/5030B/5035.

TPH-GRO – This method determines the concentration of gasoline range organics (2-methylpentane to 1,2,4-trimethylbenzene). The analysis is based on purging the volatiles from the sample onto an appropriate sorbent trap and desorbing the volatiles onto a gas chromatographic column. Using an appropriate temperature program, the compounds are separated by the column and both qualitative and quantitative detection is achieved with a flame ionization detector. BTEX may be determined simultaneously on systems equipped with a photoionization detector in tandem with the FID. Method 8015B/5030B/5035.

TPH-DRO – This method determines the concentration of diesel range organics (C-10 to C-28 hydrocarbons). The procedure includes solvent extraction of the sample and analysis of the extract on a gas chromatograph/flame ionization detector (GC/FID) using a megabore capillary column. Method API "Method for Determination of Diesel Range Organics," Revision 2, 02/05/95; or California Department of Health Services LUFT Task Force TPH Analysis-Diesel Method, 10/18/89, Method 8015B/5030B/5035.

Pesticides, PCBs, & Herbicides – These methods determine the concentration of organochloride pesticides, polychlorinated biphenyls, herbicides, and organophosphate pesticides. The procedures include solvent extraction of the sample, analysis of the extract on a gas chromatograph/electron capture detector (GC/EC) using a capillary column, and confirmation on a GC/EC using a second capillary column. A nitrogen-phosphorus detector is used for organophosphates. If the compound concentration is sufficient, confirmation may be performed on GC/MS upon request. Pesticides methods 8081A/3550B/3510C and 8141A/3550B/3510C. PCBs Method 8082/3550B/3510C. Herbicides Method 8151A/3550B.

PAHs by HPLC – The sample aliquot is extracted with methylene chloride. The extract is filtered (soils), dried, concentrated by evaporation and exchanged into acetonitrile. The extract is analyzed by reverse-phase HPLC with both UV and fluorescence detectors. Methods 8310/3550B/3510C.

**Table B4-1**
Inorganic Analytical Method Numbers

| | ICP | GFAA | Flame AA | Cold Vapor |
|---|---|---|---|---|
| Aluminum | 6010B/3005A/3010/3050B | | 7020/3005A/3010/3050B | |

[1]Analyzed by Trace ICP

[2]Analyzed by Cold Vapor

[3]Analyzed by GFAA

[4]Analyzed by automated spectrophotometer

*Specific quantitation limits are highly matrix dependent. The quantitation limits listed herein are provided for guidance and may not always be achievable.

**Quantitation limits listed for soil/sediment are based on wet weight. The quantitation limits calculated by the laboratory for soil/sediment, calculated on a dry-weight basis, will be higher.

The laboratory routinely reports at the limit of quantitation (LOQ) but can estimate down to the MDL when requested by the client. Values reported below the LOQ are reported with a J-flag and are defined as estimated values.

LOQs and MDLs are evaluated annually and subject to change.

Mercury is analyzed by Cold Vapor

Except for cyanide, sulfide, and mercury, all other elements analyzed by ICP.

Cyanide is analyzed by method 9021A, using the automated spectrophotometer.

Sulfide is analyzed by 9034 (modified) , titrimetric analysis.

*Specific quantitation limits are highly matrix dependent. The quantitation limits listed herein are provided for guidance and may not always be achievable.

**Quantitation limits listed for soil/sediment are based on wet weight. The quantitation limits calculated by the laboratory for soil/sediment, calculated on a dry-weight basis will be higher.

The laboratory routinely reports at the limit of quantitation (LOQ) but can estimate down to the MDL when requested by the client. Values reported below the LOQ are reported with a J-flag and are defined as estimated values.

LOQ and MDLs are evaluated annually and subject to change.

Appendix IX Volatile Compounds by GC/MS (8260B)

| Compound | Waters | | Soils** | |
|---|---|---|---|---|
| | LOQ* (µg/L) | MDL (µg/L) | LOQ* (µg/kg) | MDL (µg/kg) |
| Trichloroethene | 5. | 1. | 5. | 1. |
| Dibromochloromethane | 5. | 1. | 5. | 1. |
| 1,1,2-Trichloroethane | 5. | 1. | 5. | 1. |
| 1,2-Dibromoethane | 5. | 1. | 5. | 1. |
| *cis*-1,2-Dichloroethene | 5. | 1. | 5. | 2. |
| Benzene | 5. | 1. | 5. | 1. |
| *cis*-1,3-Dichloropropene | 5. | 1. | 5. | 1. |
| Methyl methacrylate | 5. | 1. | 5. | 1. |
| 1,1,1,2-Tetrachloroethane | 5. | 1. | 5. | 1. |
| Bromoform | 5. | 1. | 5. | 1. |
| *trans*-1,4-Dichloro-2-butene | 100. | 15. | 100. | 10. |
| 1,2,3-Trichloropropane | 5. | 1. | 5. | 1. |
| 2-Hexanone | 10. | 3. | 50. | 3. |
| 4-Methyl-2-pentanone | 10. | 3. | 50. | 3. |
| Tetrachloroethene | 5. | 1. | 5. | 1. |
| 1,1,2,2-Tetrachloroethane | 5. | 1. | 5. | 1. |
| Toluene | 5. | 1. | 5. | 1. |
| Ethyl methacrylate | 5. | 1. | 5. | 1. |
| Chlorobenzene | 5. | 1. | 5. | 1. |
| Pentachloroethane | 10. | 1. | 10. | 1. |
| Ethylbenzene | 5. | 1. | 5. | 1. |
| 1,2-Dibromo-3-chloropropane | 100. | 2. | 100. | 2. |
| Styrene | 5. | 1. | 5. | 1. |
| Xylenes (total) | 5. | 1. | 5. | 1. |

For samples preserved with 1 + 1 HCl to pH <2, low recovery of acid labile compounds is likely to occur.

*Specific quantitation limits are highly matrix dependent. The quantitation limits listed herein are provided for guidance and may not always be achievable.

**Quantitation limits listed for soil/sediment are based on wet weight. The quantitation limits calculated by the laboratory for soil/sediment, calculated on a dry-weight basis will be higher.

The laboratory routinely reports at the limit of quantitation (LOQ) but can estimate down to the MDL when requested by the client if a valid mass spectrum is obtained. Values reported below the LOQ are reported with a J-flag and are defined as estimated values.

LOQ and MDL are evaluated annually and subject to change.

**Quantitation limits listed for soil/sediment are based on wet weight. The quantitation limits calculated by the laboratory for soil/sediment, calculated on a dry-weight basis will be higher.

The laboratory routinely reports at the limit of quantitation (LOQ) but can estimate down to the MDL when requested by the client if a valid mass spectrum is obtained. Values reported below the LOQ are reported with a J-flag and are defined as estimated values.

[1]N-Nitrosodiphenylamine decomposes in the GC inlet forming diphenylamine. The result reported for N-Nitrosodiphenylamine represents the combined total of both compounds.

[2]Aramite and a,a-dimethyl-1-phenethylamine can be determined upon request.

[3]3-methylphenol and 4-methylphenol cannot be resolved under this analysis. The combined total of both compounds is reported as 4-methylphenol.

[4]1,2-Diphenylhydrazine cannot be distinguished from azobenzene, therefore, the value reported represents the combined total of both.

LOQ and MDLs are evaluated annually and subject to change.

**Table B4-16**
TPH GRO/DRO by GC (8015B)

| Compound | Waters | | Soils** | |
|---|---|---|---|---|
| | LOQ* (mg/L) | MDL (mg/L) | LOQ* (mg/kg) | MDL (mg/kg) |
| TPH-GRO | 0.05 | 0.02 | 1. | 0.2 |
| TPH-DRO | 0.1 | 0.1 | 7. | 4. |

NOTE: MDLs listed are higher than determined MDLs. This is because the method sums the total detectable area under the chromatographic plot in region of interest, instead of actual fuel peak area as the respective fuel.

*Specific quantitation limits are highly matrix dependent. The quantitation limits listed herein are provided for guidance and may not always be achievable.

**Quantitation limits listed for soil/sediment are based on wet weight. The quantitation limits calculated by the laboratory for soil/sediment, calculated on a dry-weight basis will be higher.

The laboratory routinely reports at the limit of quantitation (LOQ) but can estimate down to the MDL when requested by the client. Values reported below the LOQ are reported with a J-flag and are defined as estimated values.

LOQ and MDLs are evaluated annually and subject to change.

LOQ and MDLs are evaluated annually and subject to change.

## B5. Quality Control

The particular types and frequencies of quality control checks analyzed with each sample are defined in *USEPA SW-846 3rd Edition, Update III, 1996*, and *Methods for the Chemical Analysis of Waters and Wastes, USEPA, 600/4-79-020*. The quality control checks routinely performed during sample analysis include blanks, laboratory control samples, surrogates, duplicates, internal standards, and matrix spikes. In addition to these checks, some inorganic analyses employ serial dilutions and interference check samples.

Blanks (method, preparation) – Blanks are an analytical control consisting of a volume of deionized, distilled laboratory water for water samples, or a purified solid matrix for soil/sediment samples. (Metals use a digested reagent blank with soils.) They are treated with the same reagents, internal standards, and surrogate standards and carried through the entire analytical procedure. The blank is used to define the level of laboratory background contamination.

Laboratory Control Samples or Reference materials – Aqueous and solid control samples of known composition are analyzed using the same sample preparation, reagents, and analytical methods employed for the sample. These materials may be purchased from NIST or commercial supply houses either as neat compounds or as solutions with certified concentrations, or prepared in the technical department. The accuracy and quality of the purchased standards are documented on certificates provided by the supply houses. Certificates are maintained on file in the laboratory. The accuracy information determined from reference materials and laboratory control samples is valuable because variables specific to sample matrix are eliminated. The acceptance criteria for this type of quality control is either dictated by the agency from whom the material is obtained or by statistical analysis of past information generated in the technical department. A LCS is analyzed with every batch to demonstrate accuracy of the procedure and process control.

Surrogates (used for organic analysis only) – Each sample, matrix spike, matrix spike duplicate, and blank are spiked with surrogate compounds prior to purging and extraction in order to monitor preparation and analysis. Surrogates are used to evaluate analytical efficiency by measuring recovery. The recovery data is compared to method stipulated or statistically generated limits.

Duplicates (matrix spike duplicate - organics and inorganics; duplicate-inorganics) – A second aliquot of a matrix/sample is analyzed at the same time as the original sample in order to determine the precision of the method. The relative percent difference (RPD) between the two determinations is calculated and compared to values prescribed by EPA or determined statistical analysis of the past information generated in the technical department.

Internal Standards (used for GC/MS and some GC analysis) – Internal standards are compounds added to every standard, blank, matrix spike, matrix spike duplicate, and sample at a known concentration, prior to analysis. Comparison of the peak areas of the internal standards are used for internal standard quantitation as well as to determine when changes in the instrument response will adversely affect quantification of target compounds.

Matrix Spikes – Matrix spiked samples are samples fortified with a target analyte and subjected to the entire analytical procedure. The recovery of the analyte(s) is calculated and indicates the appropriateness of the method for the matrix. Matrix spike duplicates is the analysis of a pair of fortified samples from the same source. The matrix spike duplicates yields precision and accuracy information. The acceptance criteria for percent recovery on spike samples in prescribed by EPA or determined statistical analysis of the past information generated in the technical department.

Serial Dilutions (used for inorganics GFAA and ICP only) – If the analyte concentration is sufficiently high, an analysis of a five-fold dilution must agree within 10% of the original determination. If the dilution analysis is not within 10%, a chemical or physical interference effect should be suspected.

Interference Check Sample (ICP) – To verify interelement and background correction factors a solution containing both interfering and analyte elements of known concentration is analyzed at the beginning and end of each analysis run or a minimum of twice per 8 hours.

Second Source Check – A second source check is analyzed using either the LCS or an ICV (Initial Calibration Verification). The second source is a standard that is made from a solution or neat purchased from a different vendor than that used for the calibration standards. For some organic custom mixes, the same vendor but a different lot and preparation is used. This ensures that potential problems with a vendor supply would be evident in the analysis. Some areas of the lab may use the continuing calibration verification standards as a second source from the initial calibration.

The results of all quality control samples are entered into the LIMS in the same way as the results of client samples. The computer is programmed to compare the individual values with the acceptance limits (statistically determined or method specified) and inform the analyst if the results of the quality control tests are in or out of specification. If the results are not within the acceptance criteria, corrective action suitable to the situation must be taken. This may include, but is not limited to, checking calculations, examining other quality control analyzed with the same batch of samples, qualifying results with a comment stating the observed deviation, and reanalysis of the samples in the batch. In addition, computerized reports on the results for all quality control analyses including mean and standard deviation are generated monthly. These are used by the Quality Assurance Department to check for trends that may indicate method bias. Control charts are plotted via computer and may be accessed at any time by all analysts.

The following tables list the specific QC used for each method and the applicable QC windows. These windows are generated statistically and are subject to change. Statistical limits are determined for recovery and RPD data using historical data (minimum of 20 data points) and applying a 99% confidence interval around the mean. The limits are generated every 6 months for SW-846 methods and annually for other methods, and updated as needed. The tables list the full list of analytes for a method. Sublists (TCL, PPL, etc.) may be reported based on the clients requirements. See Element B4 for the particular analytes associated with a regulatory list.

**Table B5-1**
Quality Control
Metals

| Type | Acceptance Limits (%) WATERS SOILS | Frequency | Corrective Action |
|---|---|---|---|
| **Matrix Spikes:** | See Table B5-2 | Each group of samples of similar matrix/level (≤20) each method | Analyze post-digestion spike sample |
| **Matrix Spike Duplicate (RPD):** | ±20% RPD | Each group of samples of similar matrix/level (≤20) each method | Analyze post-digestion spike sample if not already run for MS, flag the data |
| **Duplicates (RPD):** | ±20% RPD for sample values ≥5× LOQ | Each group of samples of similar matrix/level (≤20) each method | Flag the data |
| **Blanks:**<br>Initial Calibration (ICB)<br>Continuing Calibration (CCB) | ***ICP:***<br><3× IDL or blank <1/10 conc. of action level and samples not ±10% of action level<br>***AA:***<br><LOQ | Each wavelength immediately after calibration verification at 10% frequency or every 2 hours (beginning and end of run min.) | Correct problem, recalibrate, and rerun |
| Preparation Blank | ≤LOQ<br>>LOQ then lowest conc. in sample must be 20× blank concentration | Each SDG or batch (≤20 samples) | Redigest and reanalyze blank and associated samples if sample result <20× blank result |
| **Serial Dilutions (ICP & GFAA only):** | Within ±10% of the original determination | Each group (≤20) of similar matrix/level | Flag the data |
| **Interference Check Sample (ICP only):** | ±20% of the true value for the analytes | Each wavelength after Initial Calibration Verification at beginning and end of the run or min. of 2× per 8 hour | Recalibrate the instrument |
| **Laboratory Control Sample:** | See Table B5-2 | Each SDG or batch (≤20 samples), each method | Redigest and reanalyze LCS and associated samples |

**Table B5-1 – Continued**
Quality Control
Metals

| Type | Acceptance Limits (%) WATERS SOILS | Frequency | Corrective Action |
|---|---|---|---|
| **Post Digestion Spike:** | **ICP:** 75% to 125% **AA:** 85% to 115% | When matrix spikes are outside 80% to 120% range | Flag the data |
| **Analytical Spike** | 85-115% | one per 20 field samples | See Table B5-3 |

Acceptance limits are based on statistical evaluation of laboratory data and are subject to change.
This criteria is for TAL, PPL, and Appendix IX metals

**Table B5-2**

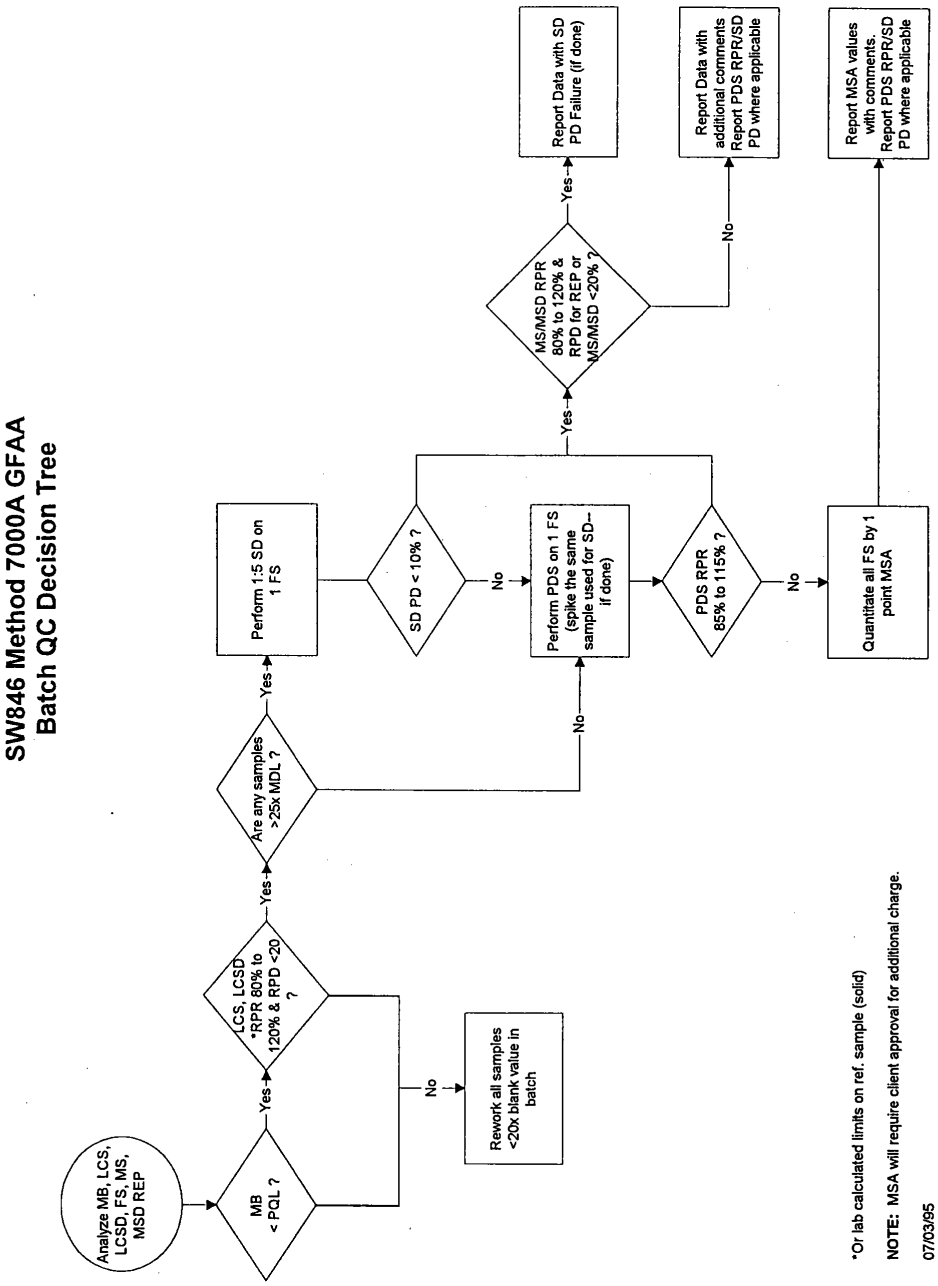
| Zinc | 94-112 | 75-125 | 86-111 | 75-125 |
| Cyanide, total | 90-110 | 90-110 | 61-122 | 75-125 |

[1] Analyzed by GFAA
[2] Analyzed by Cold Vapor
Acceptance limits are based on statistical evaluation of laboratory data and are subject to change.
The acceptance limits above pertain to the TAL, PPL and Appendix IX lists.

**Figure B5-1**



SW846 Method 7000A GFAA
Batch QC Decision Tree
Analyze MB, LCS, LCSD, FS, MS, MSD REP
MB < PQL ?
Yes
No
Rework all samples <20x blank value in batch
LCS, LCSD *RPR 80% to 120% & RPD <20 ?
Yes
Are any samples >25x MDL ?
Yes
No
Perform 1:5 SD on 1 FS
SD PD < 10% ?
No
Perform PDS on 1 FS (spike the same sample used for SD– if done)
PDS RPR 85% to 115% ?
No
Quantitate all FS by 1 point MSA
Report MSA values with comments. Report PDS RPR/SD PD where applicable
Yes
MS/MSD RPR 80% to 120% & RPD for REP or MS/MSD <20% ?
Yes
Report Data with SD PD Failure (if done)
No
Report Data with additional comments Report PDS RPR/SD PD where applicable
*Or lab calculated limits on ref. sample (solid)
NOTE: MSA will require client approval for additional charge.
07/03/95

**Table B5-3**
Quality Control
Miscellaneous Chemistry

| Parameter | Acceptance Limits | Frequency | Corrective Action |
|---|---|---|---|
| **Moisture:** | | | |
| LCS/LCSD: | See Table B5-4 | Each group (≤20) of samples | Batch is repeated |
| Duplicate: | ≤11% | Each group (≤20) of samples | Ensure that LCS meets acceptance criteria, Flag the data |
| **Cyanide, total:** | | | |
| Blanks: | | | |
| CCB: | ≤LOQ | after initial calibration | Repeat calibration |
| PB: | ≤LOQ | Each group (≤20) of samples | Batch is repeated |
| LCS/LCSD | See Table B5-4 | Each group (≤20) of samples, ≤20% | Batch is repeated |
| MS/MSD: | See Table B5-4 | Each group (≤20) of samples, ≤20% | Post digestion spike is performed, Flag the data |
| Duplicates: | ≤20% | every 10 samples | Ensure that LCS meets acceptance criteria, Flag the data |
| **Phenolics, total:** | | | |
| Blanks: | ≤LOQ | Each group (≤20) of samples | Batch is repeated |
| LCS/LCSD: | See Table B5-4 | Each group (≤20) of samples, ≤20% RPD | Batch is repeated |
| MS/MSD: | See Table B5-4 | Every 10 samples | Ensure that LCS meets acceptance criteria, Flag the data |
| Duplicates: | ≤20% | Every 10 samples | Ensure that LCS meets acceptance criteria, Flag the data |

**Table B5-3 – Continued**
Quality Control
Miscellaneous Chemistry

| Parameter | Acceptance Limits | Frequency | Corrective Action |
|---|---|---|---|
| **Sulfide, total:** | | | |
| Blanks: | ≤LOQ | Each group (≤20) of samples | Batch is repeated |
| LCS/LCSD: | See Table B5-4 | Each group (≤20) of samples | Batch is repeated |
| MS/MSD: | See Table B5-4 | Each group (≤20) of samples | Ensure that LCS meets acceptance criteria, Flag the data |
| Duplicate: | ≤10% | Each group (≤20) of samples | Ensure that LCS meets acceptance criteria, Flag the data |
| **TPH (418.1)** | | | |
| Blanks: | ≤LOQ | Each group (≤20) of samples | Batch is repeated |
| LCS/LCSD: | See Table B5-4 | Each group (≤20) of samples | Batch is repeated |
| MS/MSD: | See Table B5-4 | Each group (≤20) of samples | Ensure that LCS meets acceptance criteria, Flag the data |
| Duplicates | ≤34% wastewater<br>≤21% solid waste | Each group (≤20) of samples | Ensure that LCS meets acceptance criteria, Flag the data |
| **Oil and Grease (1664A)** | | | |
| Blanks: | ≤LOQ | 1 per batch of 20 | Batch is repeated |
| LCS/LCSD: | See Table B5-4 | 1 per batch of 20 | Batch is repeated |
| MS/MSD: | See Table B5-4 | 1 per batch of 20 | Ensure that LCS meets acceptance criteria, Flag the data |
| Duplicates**:** | ≤24% | 1 per batch of 20 | Ensure that LCS meets acceptance criteria, Flag the data |

Quality Control
TPH-GRO by GC (8015B)

| Type | Acceptance Limits(%) WATERS | SOILS | Frequency | Corrective Action |
|---|---|---|---|---|
| **Surrogate:** Trifluorotoluene (FID) | 65-137 | 48-132 | Each sample, MS/MSD, blank and LCS | Results would not be reported if the surrogate recovery is outside the limits unless matrix related problems are evident |
| **Matrix Spike:** Gasoline standard | 74-132 | 54-100 | Each group of (≤20) samples of similar matrix/level | Analyze LCS |
| **Laboratory Control Sample** Gasoline standard | 76 - 132 | 72 - 112 | Each group (≤20) of samples per matrix/level | Reanalyze LCS and associated samples |
| **Matrix Spike Duplicate (RPD):** Gasoline standard | ≤30% for waters and soils | | Each group (≤20) of samples per matrix/level | Evaluated by analyst in relation to other QC results |
| **Blanks:** | ≤LOQ | | At least one per 20 samples | Reanalyze blank and associated samples if blank is outside limits |

Acceptance limits are based on statistical evaluation of laboratory data and are subject to change.

**Table B5-14**
Quality Control
TPH-DRO by GC (8015B)

| Type | Acceptance Limits(%) WATERS | SOILS | Frequency | Corrective Action |
|---|---|---|---|---|
| **Surrogate:** *o*-Terphenyl | 55 - 158 | 46 - 154 | Added to each sample, MS/MSD, blank, LCS/LCSD during the extraction phase | Surrogate must be in spec unless matrix related problems are evident. If matrix related problems are evident, report results and comments in case narrative. |
| **Matrix Spike:** #2 Fuel Oil | 41-145 | 35-174 | Each group (≤20) of samples per matrix/level | Reinject , if still out of spec, evaluate for matrix effect. If matrix effect, accept based on LCS data. If no matrix effect, repeat batch. |
| **Laboratory Control Sample:** #2 Fuel Oil | 53-126 | 72-138 | Each group ≤20 of samples per matrix/level | Reinject , if still out of spec, repeat batch. |
| **Laboratory Control Duplicates (RPD):** #2 Fuel Oil | ≤20% for waters and soils | | Each group (≤20) of samples per matrix/level | Evaluated by analyst in relationship to other QC results |
| **Blanks:** | ≤LOQ | | Once per case or extraction group (≤20) of samples, each matrix, level, instrument | Inject a solvent blank first, to be sure the analytical system is clean then reinject the blank itself. If the reinjected blank is acceptable, any samples extracted with this blank should be reinjected, if they contain the analyte, which was present in the blank. If the reinjected blank is unacceptable, any affected samples must be re-extracted. |

Acceptance limits are based on statistical evaluation of laboratory data and are subject to change.

## B6. Instrument/Equipment Testing, Inspection, and Maintenance Requirements

Conditions of the laboratory equipment and instrumentation can have a marked effect on the accuracy and precision of analysis. In order to ensure timely production of data and prevent/address potential malfunctions, Lancaster Laboratories schedules routine preventive maintenance of instruments based on manufacturer's recommendations. Maintenance of the laboratory instruments is the responsibility of the technical group using the equipment in conjunction with our in-house Equipment Maintenance Group. A schedule of routinely performed instrument maintenance tasks is attached as Table B6-1. All preventive maintenance, as well as maintenance performed as corrective action, is recorded in instrument logs. Equipment/Instrumentation is assigned unique designations to allow tracking of the piece of equipment within laboratory documentation. This allows the laboratory to substantiate the instrument condition during the time it was used for testing.

Critical spare parts are kept in supply at the laboratory by the Equipment Maintenance Group. Most items not kept in stock at the laboratory are available through overnight delivery from the manufacturer. In addition, Lancaster Labs maintains multiple numbers of most of the critical instruments used in our laboratory operations. A recent equipment inventory may be found in the *Quality Manual*. Because we are a large laboratory with redundant capacity, the problems of instrument downtime are minimized.

**Table B6-1**
Preventive Maintenance Schedule

| Instrument | Preventive Maintenance | Frequency |
|---|---|---|
| GC/MS | Change septum | Weekly or AN* |
| | Check fans | Monthly |
| | Check cool flow | Monthly |
| | Clean source | Bimonthly or AN |
| | Change oil in vacuum pump | Semiannually |
| | Change oil in turbo pump | Semiannually |
| GC Volatiles | Check propanol level | Semiweekly or AN |
| | Check all flows | Prior to calib. or AN |
| | Conductivity detector maintenance: | AN |
| | Clean cell | AN |
| | Change reaction tube | AN |
| | Change Teflon line | AN |
| | Change resin | AN |
| | Replace trap | AN |
| | Column maintenance | AN |
| | Change PID lamp | AN |
| | Precalibration instrument settings check | Prior to each calibration |
| GC | Septum change | Each run |
| | Column maintenance | AN |
| | Clean detector | AN |
| | Vacuum filters | Semiannually |
| | Leak check ECDs | Semiannually |
| Flame AA | Rinse burner head, chamber and trap | AN: Min. Weekly |
| | Clean nebulizer | Weekly |
| | Inspect tubing and O-rings | Monthly |
| | Replace lamp | AN |
| GFAA | Inspect/clean furnace head and lenses | Daily |
| | Check rinse bottle & drain | Daily |
| | Clean windows | Weekly |
| | Clean air intakes | Monthly |
| | Check Cool-Flow water level | Monthly |
| | Inspect sample introduction capillary | AN |
| | Inspect graphite tube | AN |
| | Adjust/replace electrodes/shroud | AN |
| | Clean Cool-Flow | AN |

Preventive Maintenance Schedule

| Instrument | Preventive Maintenance | Frequency |
|---|---|---|
| Cold Vapor AA | Replace pump tubing | AN: Min. weekly |
| | Lubricate pump head | Monthly |
| | Lubricate autosampler | Weekly |
| | Inspect optical cell and windows | Monthly |
| | Clean | AN |
| ICP | Replace pump winding | Daily |
| | Lubricate autosampler | Daily |
| | Check tubing to torch | Daily |
| | Vacuum instrument airfilters and air intakes | Monthly |
| | Check water filter, replace if needed | Quarterly |
| | Examine vacuum pump | Quarterly |
| | Change vacuum pump oil | Quarterly |
| | Clean optics and lenses | Semiannually |
| | Examine, clean, lubricate moving parts on autosampler | Semiannually |
| | Clean Torch and injector tip | AN |
| | Clean nebulizer and spray chamber | AN |
| | Check fan filters, clean if needed | AN |
| | Check cool flow, clean if needed | AN |
| Infrared Spectrometer (FTIR) | Check on-demand diagnostics | Weekly |
| | Change dessicant | AN |
| HPLC | Pump lubrication | Annually |
| | Check pump seals | Annually |
| | Check valves cleaned or rebuilt | AN |
| | Detector maintenance: | AN |
| | Bulb replacement and adjustment | |
| | Flow cell cleaning | |
| | Routine column maintenance | AN |
| | Replace Teflon lines | AN |
| | Autosampler septa replacement | AN |
| | In-line filter sonication/cleaning | AN |
| | System passivation | AN |
| | PCRS pump lubrication | AN |

**Table B6-1 – Continued**
Preventive Maintenance Schedule

| Instrument | Preventive Maintenance | Frequency |
|---|---|---|
| Total Organic Carbon Analyzer | Check IR zero | AN |
| | Check for leaks | AN |
| | Check acid pump calib. | Bimonthly |
| | Check persulfate pump calibration | Bimonthly |
| | Inspect 6-port rotary valve | AN |
| | Inspect sample pump head | AN |
| | Wash molecular sieve | AN |
| | Check sample loop calibration | Monthly |
| | Clean gas permeation tube | AN |
| | Inspect digestion vessel O-rings | AN |
| | Check activated carbon scrubber | AN |
| | Dust back and clean circuit boards | AN |
| | Check IR cell | AN |
| Total Organic Halogen Analyzer | Polish counter electrode | Daily |
| | Polish sensor electrode | Daily |
| | Clean loaders and pistons | Weekly |
| Autoanalyzer spectrophotometer | Clean sample probe | AN |
| | Clean proportioning pump | AN |
| | Inspect pump tubing, replace if worn | AN |
| | Clean wash receptacles | Monthly |

* AN means as needed. Any of these items may be performed more frequently if response during operation indicates this is necessary.

## B7. Instrument Calibration and Frequency

All measuring and testing equipment having an effect on the accuracy or validity of calibrations and tests will be calibrated and/or verified on an on-going and routine basis. Procedures for initial calibration and continuing calibration verification are in place for all instruments within the laboratory. The calibrations generally involve checking instrument response to standards (standardization) for each target compound to be analyzed. The source and accuracy of standards used for this purpose are integral to obtaining the best quality data. Standards used at Lancaster Laboratories are purchased from commercial supply houses either as neat compounds or as solutions with certified concentrations. The accuracy and quality of these purchased standards is verified through documentation provided by these commercial sources. Most solutions and all neat materials require subsequent dilution to an appropriate working range. All dilutions performed are documented and the resulting solution is checked by obtaining the instrument response of the new solution and comparing with the response to the solution currently in use. Any discrepancies between the responses are investigated and resolved before the new solution is used. Each standard is assigned a code that allows traceability to the original components. The standard container is marked with the code, name of solution, concentration, date prepared, expiration date, and the initials of the preparer. Shelf life and storage conditions for standards are included in the standard operating procedures and old standards are replaced before their expiration date.

Each instrument is calibrated with a given frequency using one or more concentrations of the standard solution. As analysis proceeds, the calibration is checked for any unacceptable change in instrument response. If the calibration check verifies the initial response, the analysis proceeds. If the calibration check indicates that a significant change in instrument response has occurred, then a new calibration is initiated. If necessary, maintenance may be performed before the recalibration.

Some instrumentation calibration involves the comparison of an instrument reading to a physical standard with a known certified value such as balance/weights or comparison against other instrumentation/apparatus such as NIST thermometer.

Calibration records are usually kept in the form of raw data with the other instrument printouts. In cases where no data system is used, calibration data is manually recorded in notebooks. Any maintenance or repair is also recorded in a notebook. The information that is recorded either in the notebooks or on the instrument printout includes the date, instrument ID, employee name and/or identification number, and concentration or code number of standard.

The frequency of calibration and calibration verification, number of concentrations analyzed, and acceptance criteria for each of the instruments to be used are listed in Table B7-1. In addition to checking the instrument response to target compounds, the GC/MS units are checked to ensure that standard mass spectral abundance criteria are met. Before each calibration, instruments used for volatile compound analysis are tuned using bromofluorobenzene (BFB) and instruments used for semivolatile analysis are tuned using decafluorotriphenylphosphine (DFTPP). The key ions and their abundance criteria are listed in Table B7-2.

**Table B7-1**
Instrument Calibration and Frequency

| | *Initial Calibration* | | | *Continuing Calibration Verification* | | |
|---|---|---|---|---|---|---|
| Instrument | Frequency | # Std Conc. | Acceptance Criteria | Frequency | # Std Conc. | Acceptance Criteria |
| GC/MS Volatiles* | After C-cal fails | 6 | RF for SPCCs >0.300 for chlorobenzene, and 1,1,2,2-tetrachloroethane, and >0.100 for 1,1-dichloroethene, bromoform, and chloromethane<br>CCCs ≤30% | Every 12 hours | 1 | RF for SPCCs >0.300 for chlorobenzene, and 1,1,2,2-tetrachloroethane , and >0.100 for 1,1-dichloroethene, bromoform, and chloromethane<br>%Drift for CCCs ≤20 |

| TOX Analyzer | Daily | 1 | ±5% recovery for standards | Every 8 samples | 1 | 95-105% recovery |
| Balance | Daily | 4 | Top-loading balance ±.5%<br>Analytical balances ± .1% for weights >.1 g<br>.05 g ± .5%<br>.02 g ± 1.0%<br>.01 g ± 2.0%<br>.005 g ± 2.0% | N/A | N/A | N/A |

*All compounds with %RSD >15 must use first or second order regression fit of the six calibration points. Alternatively, if average of the %RSD of all compounds in calibration standard is ≤15%, the AVG RF can be used for all compounds.

Abbreviations

# Std Conc. – The number of standard concentrations used

SPCCs – System performance check compounds

CCCs – Calibration check compounds

RF – Response factor

%RSD – Percent relative standard deviation

CCV – Continuing calibration verification

CVAA – Cold vapor atomic absorption spectrophotometer

HPLC – High Performance Liquid Chromatography

ICP – Inductively coupled plasma spectrophotometer; ICP run also includes interelement correction check standard (beginning and end of run)

GFAA – Graphite furnace atomic absorption spectrophotometer

| 443 | 17% to 23% of mass 442 |

## B8. Inspection/Acceptance Requirements for Supplies and Consumables

Analytical results can be affected by the type and quality of reagents, standards, and equipment. Time and effort could be lost if the reagents, standards, and equipment do not meet the specifications required for the method. Therefore, the specifications and/or requirements for reagents, standards, and equipment necessary to perform the testing methods are included in the analytical SOPs. Each technical department evaluates the reagents, standards and equipment they receive for acceptance and use in specific procedures. There are SOPs in place for procurement of supplies, and acceptance/evaluation of reagents and standards.

Sample bottles and vials provided to clients are purchased pre-cleaned to meet EPA specifications and guidelines for sample containers. Each lot of preservative purchased is analyzed for quality (signs of contamination) before being added to a sample container.

The deionized water system utilized by Lancaster Laboratories generates water meeting ASTM D1193-91, Type II water criteria and the USEPA Manual for the Certification of Laboratories Analyzing Drinking Water requirements. Appropriate testing is performed to monitor the system. The requirements for the DI system are documented in a laboratory SOP.

## B9. Data Acquisition Requirements (Non-Direct Measurements)

The data acquired from the analytical procedures will be assessed for precision, accuracy, representativeness, comparability, and completeness (PARCCs). These specifications will be met through precision and accuracy criteria as specified in Element B5 and MDLs in Element B4.

Precision – Precision is determined by measuring the agreement among individual measurements of the same property, under similar conditions. The laboratory objective is to equal or exceed the precision demonstrated for the applied analytical method on comparable samples. The degree of agreement is expressed as the relative percent difference (RPD%). Evaluation of the RPD% is based on statistical evaluation of past lab data or guidelines within the methods for organic and inorganic analyses. External evaluation of precision is accomplished by analysis of standard reference material and interlaboratory performance data.

Accuracy – Accuracy is a measure of the closeness of an individual measurement to the true or expected value. Analyzing a reference material of known concentration or reanalyzing a sample which has been spiked with a known concentration/amount is a way to determine accuracy. Accuracy is expressed as a percent recovery (%R). Evaluation of the %R is based on statistical evaluation of past lab data or guidelines within the methods for organic and inorganic analyses.

Representativeness – Representativeness expresses the degree to which data accurately represents the media and conditions being measured. The representativeness of the data from the sampling site will depend on the sampling procedure. Sample collection is the responsibility of the client. Samples will be homogenized, if required, as part of the laboratory sample preparation. By comparing the quality control data for the samples against other data for similar samples analyzed at the same time, representativeness can be determined for this objective.

Comparability – Comparability conveys the confidence with which one set of data can be compared to another. The analytical results can be compared to other laboratories by using traceable standards, standard methodology, and consistent

reporting units. The Laboratory Quality Assurance Program documents internal performance, and the interlaboratory studies document performance compared to other laboratories.

Completeness – Completeness is a measure of the quantity of valid data acquired from a measurement process compared to the amount that was expected to be acquired under the measurement conditions. The completeness of an analysis can be documented by including in the data deliverables sufficient information to allow the data user to assess the quality of the results. Additional information will be stored in the laboratory's archives, both hard copy and magnetic tape. SOPs are in place to provide traceability of all reported results.

Uncertainty – (ISO 17025) "All uncertainty components which are of importance in a given situation shall be taken into account using appropriate methods of analysis." (5.4.6.3) This means the laboratory must determine the uncertainty contribution of all steps in the testing process such as equipment, calibration, standards, reagents, preparation, cleanups, etc. Since, in most methods, the laboratory control sample (LCS) goes through the entire process of preparation to analysis; all factors that would contribute to uncertainty will be evident through the LCS results. LCS are performed with every batch of samples where appropriate for the method.

## B10. Data Management

At a minimum data management is initiated when Lancaster Laboratories receives the samples from the client. In many instances, client-communicated requirements for bottleware and analyses are documented on an Incoming Sample Activity Report (ISAR) prior to sample receipt. This communication helps ensure that analysis and reporting meet the client needs. Sample information and requested analyses are entered into the Laboratory Information Management System (LIMS) where it can be accessed by all laboratory personnel. The entry is based on the ISAR and the client's COC. After entry, labels are printed for each container and an Acknowledgement is printed for the client. This will show exactly what was entered for the client's samples.

The flow of data from the time the samples enter the laboratory until the data is reported is summarized in Table B10-1. Raw analytical data generated in the laboratories is collected on printouts from the instruments and associated data system or manually in bound notebooks. All data is tracked by a unique seven-digit sample number assignment. Analysts review data as it is generated to determine that the instruments and methods are performing within specifications. This review includes calibration checks, surrogate recoveries, blank checks, retention time reproducibility, and other QC checks described in Elements B4, B5, and B7. If any problems are noted during the analytical run and/or at completion, corrective action is taken and documented.

Any data recorded manually is collected in bound notebooks and recorded in indelible ink, as described in Element A9. Procedures are in place for handling erroneous entries and all changes are dated, initialed, and explained. All data is uploaded automatically or manually entered into the LIMS. The LIMS is programmed to accept and track the results of quality control samples including blanks, surrogates, recoveries, duplicates, controls, and reference materials. The LIMS is programmed with the acceptance criteria for each QC type and if results are outside specifications, then a message is displayed to the analyst. Data

obtained from instrument printouts are dated and contain the signature and/or identification of the analyst responsible for the generation. The LIMS also produces control charts and statistics, which are reviewed by QA staff for trends that may indicate problems with the analytical data.

Computer technology is an integral part of laboratory operations including analytical instrumentation and central corporate functions. The laboratory makes extensive use of computers for business applications, technical operations, and the QA program. The Information Technology (IT) group support hardware and software applications at all levels as their primary function. Although some commercial software has been adapted to the laboratory operation, a larger portion is custom programmed by the IT group. The System Development Life Cycle (SDLC) approach is utilized and hardware and software are evaluated for appropriate functionality, accuracy, and security. Changes to systems and testing are documented. As part of QA's routine traceability audits, the electronic records are reviewed.

The principle criteria used to validate data will be the acceptance criteria described in Elements B4, B5, and B7 and protocols specified in laboratory SOPs. Following review, interpretation, and data reduction by the analyst, data is transferred to the LIMS by direct data upload from the analytical data system or manually. This system stores client information, sample results, and QC results. Element D1 describes the data deliverables validation performed by the laboratory.

Project files are created per client/project and contain chain-of-custody records, analysis requirements, and laboratory acknowledgments that document samples received, laboratory sample number assignment, and analyses requested. Raw data is filed per batch number assignment and laboratory sample number that correlates to the sample receipt documents. When the project is complete, all documentation is archived for 10 years in a locked storage area.

**Table B10-1**
Sample and Data Flow

| Action | Personnel Involved |
|---|---|
| Sample received at Lancaster Labs<br>• Unpacked and reconciled against the client paper work or Chain of Custody<br>• SA Documentation log completed | Sample Administration |
| Sample is entered into sample management system<br>• Lab ID number assigned<br>• Analyses entered<br>• Chain of custody started<br>• Storage location assigned<br>• Electronic record of sample number<br>• Labels generated<br>• Acknowledgement printed (record of samples received and analysis entered) | Sample Administration |
| Sample stored in assigned location (refrigerator, freezer, etc)<br>• Electronic record of sample #, bottle code, and location | Sample Support |
| Acknowledgment sent to client | Sample Administration |
| Sample removed from storage for analysis<br>• Electronic requisition of sample number by bottle code<br>• Necessary aliquot taken<br>• Sample returned to storage | Technical Personnel |
| Analysis is performed according to selected analytical method<br>• Raw data recorded<br>• Reviewed<br>• Transferred to computer by chemist or technician* (This is tracked by the unique sample number and batch number.) | Technical Personnel |
| Computer performs calculations as programmed according to methods | Data Processing |
| Second chemist or supervisor verifies raw data | Technical Personnel |
| Data package deliverables are assembled | Data Package Group |
| Data packages are reviewed prior to sending to client | QA, Data Package Personnel, and Laboratory Management |
| Data packages are microfilmed or scanned onto CDROM<br>Hard copy of batch raw data is archived<br>Electronic files are backed up and archived | Data Package Personnel, Office Services |

* Analyses requiring the chemist's interpretation may involve manual data reduction before entry into the computer.

Each analytical run is reviewed by a chemist for completeness and accuracy before interpretation and data reduction. The following calculations are used to reduce raw data to reportable results.

***Semivolatiles and Volatiles by GC/MS Calculations:***

GC/MS calculation used by the data system to determine concentration in extract for semivolatiles or in the sample itself for volatiles:

$$Q = (Ax)(Is) / (Als)(RRF)(Vi)$$

Where:

| | | |
|---|---|---|
| Ax | = | Peak area |
| Ais | = | Internal standard peak area |
| Is | = | Amount of internal standard injected (ng) |
| RRF | = | Relative response factor |
| Vi | = | Volume of extract injected (L) or volume sample purged (mL) |

The extract concentration is further reduced by considering the initial sample weight or volume and the final extract volume:

$$Concentration = (Q)(D)(F)(1000) / IV \ (or \ IW)$$

Where:

| | | |
|---|---|---|
| Q | = | Concentration determined by the data system (mg/L) |
| D | = | Dilution factor if needed |
| F | = | Final extract volume (mL) |
| IW | = | Initial sample weight (g) |
| IV | = | Initial sample volument (mL) |

Results are reported in µg/L for water samples and µg/kg for solid samples. Soil samples are reported on a dry-weight basis. The results are reported on Lancaster Labs Analysis Report Forms shown in Appendix A.

***Volatiles by GC and Petroleum Analysis Calculations:***

For volatiles by GC and petroleum analysis, a calibration is performed with a minimum of five levels using either an internal standard calibration or external calibration.

A. Internal standard calibration

$$CF = \frac{(Ax)(Cis)}{(Ais)(Cx)} \quad or \quad CF = \frac{(Hx)(Cis)}{(His)(Cx)}$$

Where:

Ax = Peak area of the compound to be measured in that level of the initial calibration

Hx = Height area of the compound to be measured in that level of the initial calibration

Ais = Peak area of the internal standard

His = Height are of the internal standard

Cis = Concentration of the internal standard.

Cx = Concentration of the compound spiked into that level

$$\overline{CF} = \frac{\sum all\ CF\ in\ the\ initial\ calibration}{n}$$

Where:

n = Number of levels in the initial calibration

$$Concentration = \frac{(Ax)(Cis)}{(Ais)(\overline{CF})} \times DF \quad or \quad \frac{(Hx)(Cis)}{(His)(\overline{CF})} \times DF$$

Where:

Ax = Peak area of the compound to be measured
Hx = Height area of the compound to be measured
Ais = Peak area of the internal standard
His = Height area of the internal standard
Cis = Concentration of the internal standard.
$\overline{CF}$ = Average calibration factor
DF = Dilution factor or preparation factor

B. External calibration

$$CF = \frac{Ax}{CF} \times DF \quad or \quad \frac{Hx}{\overline{CF}} \times DF$$

$$Concentration = \frac{Ax}{\overline{CF}} \times DF \quad or \quad \frac{Hx}{\overline{CF}} \times DF$$

Where all parameters are defined in A above.

Results are reported in µg/L for water samples and mg/kg for solid samples. Soil samples are reported on a dry-weight basis. Results are reported on Lancaster Labs Analysis Report Forms shown in Appendix A.

***Herbicides and Organophosphate Pesticides***

For herbicides and organophosphate pesticides, an internal standard calibration is used. The results are calculated from the curve when the individual analyte %RSD is >20% and the average of all analyte %RSDs is also >20%. Otherwise, the results are calculated using the average response factor.

A. Curve

$$Sample\ Concentration, \mu g\ /\ kg\ or\ \mu g\ /\ L = Extract\ Concentration \times \frac{DF \times FV}{IW\ (or\ IV)}$$

Where:

Extract Concentration =(peak ht. - y-intercept)/slope

FV = Final volume
IW = Initial weight (g)
IV = Initial volume (mL)
DF = Dilution Factor
AF = Additional preparation factors

B. Average response factor

$$Extract\ Conc., mg/L = \frac{Pk\ Ht\ in\ sample}{ARF} \times \frac{Int\ std\ ht\ in\ L3\ std}{Int\ std\ ht\ in\ sample}$$

Where:

ARF = Average Response Factor [(RF Calib1 + ... + RF Calib 5)/5]
RF = Peak height/conc. in standard

Results are reported as µg/L for water samples and µg/kg for solid samples. Soil samples are reported on a dry weight basis. Results are reported on Lancaster Labs Analysis Report Forms shown in Appendix A.

***PAHs by HPLC and Pesticide/PCB Calculations:***

The results for the PAHs by HPLC and pesticide/PCBs analyses are calculated using external standard. The pesticides/PCBs results are calculated from the curve when the individual analyte %RSD is >20% and the average of all analyte %RSDs is also >20%. Otherwise, the results are calculated using the average response factor.

$$\frac{Pk\ Ht \times FV \times DF \times AF}{ARF \times IV\ (or\ IW)} = Concentration\ (mg/L\ or\ \mu g/kg)$$

Where:

| | | |
|---|---|---|
| Pk Ht | = | Peak height found in sample |
| ARF | = | Average response factor [(RFCalib1 + …+ RFCalib5)/5] |
| FV | = | Final volume of sample extract (mL) |
| DF | = | Dilution factor (where applicable) |
| IV | = | Initial volume of sample extracted (mL) |
| IW | = | Initial weight of the sample extracted (g) |
| AF | = | Additional factor |

If a curve is used, then $\frac{\text{Pk Ht}}{\text{ARF}}$ is replaced by the following in the preceding equation:

$$\frac{Pk\ Ht \quad - \quad y - intercept}{slope}$$

Results are reported as μg/L for water samples and μg/kg for solid samples. Soil samples are reported on dry weight basis. Results are reported on Lancaster Labs Analysis Report Forms shown in Appendix A.

***TPH-GRO and TPH-DRO Calculations:***

For TPH-GRO and TPH-DRO, an external calibration procedure of at least five levels of standards is used. The resulting point-to-point calibration curve is used by the data system to calculate analyte concentrations. The equations that the data system uses for calculating analyte concentrations are shown below:

$$Concentration = (Ax/ARF) \times (DF)$$

Where:

Ax = Total peak area in region defined as analyte
DF = Dilution factor
ARF = Average response factor from the calibration curve, calculated as shown below:

$$ARF = \frac{[(As1/Qs1) + (As2/Qs2) + (As3/Qs3) + (As4/Qs4) + (As5/Qs5) + ... (Asn/Qsn)]}{n}$$

Where:

As# = Analyte peak sum area for all components of calibration level #
Qs# = Analyte concentration sum for all components of calibration level #
n = Number of calibration levels

For DRO, the concentration determined is then multiplied by F/IV (or IW) to account for the sample preparation.

Where:

F = Final extract volume (mL)
IV = Initial sample volume (mL)
IW = Initial sample weight (g)

Results are reported in mg/L for water samples and in mg/kg for solid samples. Soil samples are reported on a dry-weight basis. Results are reported on Lancaster Labs Analysis Report Forms shown in Appendix A.

***Inorganic Calculations:***

The results for inorganic analyses are calculated using the following equation:

$$Concentration = (A)\ (D)\ (E)\ /\ IV\ (or\ IW)$$

Where:

| | | |
|---|---|---|
| A | = | The concentration determined by AA, ICP, or FTIR using calibration data programmed into the instrument (mg/L) |
| D | = | Dilution factor if needed |
| E | = | Final extract volume (mL) |
| IW | = | Initial sample weight (g) |
| IV | = | Initial sample volume (mL) |

Results are usually reported in mg/L for water samples and in mg/kg for solid samples. Alternate units are available upon request. Soil samples are reported on a dry weight basis. The results are reported on Lancaster Labs Analysis Report Forms shown in Appendix A.

# GROUP C

# ASSESSMENT AND OVERSIGHT

## C1. Assessments and Response Actions

Whenever any of the data generated falls outside of the established acceptance criteria outlined for instrument tune and calibration (Element B7) and internal QC (Element B5), the cause of this irregularity must be investigated, corrected, and documented. The documentation will be used to prevent a recurrence of the problem and to inform management of the situation.

If the results are not within acceptance criteria, the appropriate corrective action will be initiated. This may include, but is not limited to, checking calculations and instrument performance, reanalysis of the associated samples, examining other QC analyzed with the same batch of samples, and qualifying results with a comment stating the observed deviation.

A standard operating procedure is in place, which outlines the procedures to be followed when quality control data for an analysis falls outside of previously established acceptance limits. All batch QC data is entered into the computerized QC system promptly after its generation and evaluated for compliance. When the QC (blanks, check standards, continuing calibration verification, LCS/LCSD, etc) is noncompliant then corrective action is needed.

The Quality Assurance Department reviews monthly summaries of the quality control data entered onto the computerized sample management system by analysts. Control charts and statistics are reviewed for trends that may indicate problems with the analytical data. In this way, small problems are identified before they have any significant impact on laboratory results.

System audits are conducted on each department at Lancaster Laboratories by members of the Quality Assurance Department to ensure compliance with laboratory procedures and assist in identifying and correcting deficiencies. The audits include checks on methodology, reagent preparation, equipment calibration and maintenance, quality control results, and training of personnel. These audits may entail observation of procedures in process or a review of records to demonstrate traceability and compliance with all documented record keeping procedures. The QA Department will then issue a written report to management and the department that summarizes the audit. The department must respond in

writing to the audit report within 30 days of report receipt. The response must address the corrective action that needs to be taken along with an expected completion date. Audit results and the corresponding response are communicated to laboratory personnel and management. Follow-up audits verify that proper corrective action has been implemented.

Audits by outside organizations including clients, regulatory personnel, and the USEPA are permitted by arrangement with the Quality Assurance Department.

Performance audits consist of both intralaboratory and interlaboratory check samples. QC samples from commercial suppliers are analyzed quarterly to assess laboratory accuracy including a double blind program. The Laboratory also participates in a number of interlaboratory performance evaluation studies, which involve analysis of samples with concentrations of analytes that are known to the sponsoring organization, but unknown to the laboratory. Inorganics, pesticide/herbicides, trihalomethanes, volatile organic compounds, semivolatile organic compounds, and traditional wet chemistry analyses are analyzed by Lancaster Labs for studies conducted by the New York Department of Health and private vendors (WS, WP, solid and hazardous waste). Lancaster Labs has participated in the USEPA Contract Laboratory Program, which provides laboratory analysis in support of the Superfund program. Part of maintaining this contract includes analysis of quarterly blind samples. Representative results from some of these studies are in Figure C1-2.

When performance evaluation studies are identified as out of specification or when a nonconformance is due to a repetitive laboratory error, system failures, or observable trend, an Investigation and Corrective Action Report (ICAR) is issued. An example of an ICAR form is in Figure C1-1. The QA Department will circulate all completed Investigation and Corrective Action forms to the appropriate management.

Annually the QA Department itself is audited for compliance with corporate and departmental procedures, and meeting regulatory requirements. In a separate event, the laboratory Executive Group reviews the previous year’s activities and documentation to evaluate the effectiveness of the quality system and its implementation/adequacy for the operation.

# Figure C1-1

No. _____

**Investigation and Corrective Action Report (ICAR)**

**Part I** – Description of the Problem (Attach additional pages, if needed, in addition to supporting documentation.)

1. Date of issue:
2. LL sample number(s) involved:
3. Nature of the problem (describe in detail):

Initiated by: _____

**Part II** - The Investigation (Attach additional pages, if needed, in addition to supporting documentation.)

1. Steps taken to investigate the problem:

2. Explanation of probable cause(s):

3. Steps taken to prevent future occurrence (describe in detail and use corrective action check boxes below):

Corrective action(s): Check the appropriate box and attach supporting documentation

- ☐ Employee(s) retrained. (Attach proof of training)
- ☐ Employee(s) reread SOP, OMC, EQV, etc. (Attach copy of updated training record form)
- ☐ Other measures taken (Attach memo or equivalent proof)
- ☐ Further investigation needed from additional areas. (Include proof of the transfer of information)
- ☐ Additional information added to method reference – Pharm. option only (Attach proof)

4. Must investigation be complete before reporting further data to clients? Yes No

5. In addition to the samples listed above, would any additional data already reported to clients be affected by this problem? Yes No If yes, please explain:

Investigator(s): ..... Date: _____

Departmental Review*: ..... Date: _____
(*Group Leader or above, must be someone other than the investigator)

Quality Assurance: ..... Date: _____

Return to QA by: ..... Date: _____

## C2. Reports To Management

Reports of quality status from the Quality Assurance Department to management are made frequently and in various forms. All results from internal or external performance evaluation samples are circulated to management along with corrective action responses. A report of each audit performed is prepared and copied to management. Monthly summaries of data obtained from analysis of quality control check samples are generated via the computerized sample management system. These summaries include mean and standard deviation to aid in assessment of data accuracy and precision. Documentation summarizing problems that require investigation and corrective action are completed by group leaders and circulated to management. Through these channels, laboratory management is kept apprised of QA/QC activities.

Any problems or unusual observations that occur during the analysis of samples for a specific project will be listed on the laboratory report and/or in the case narrative delivered with the data package. The items often discussed in this manner include samples with surrogate recovery outside of the acceptance criteria and samples with matrix problems requiring dilution and causing increased detection limits. Where applicable, any corrective action attempted or performed to address the problem will also be presented.

Monthly and quarterly reports are sent to management which provide them with the quality status on each technical and support department. The reports detail areas of improvement, observable trends, ICAR summaries, MDL/statistical window status, and a summary of client/agency issues.

The laboratory will contact the client for direction regarding major problems. Such as, but not limited to: samples listed on the chain of custody but missing from the shipping container, samples which arrive broken or are accidentally broken in the laboratory, and samples with severe matrix problems. The client will be contacted if it is necessary to change any item in the original approved project plan.

# GROUP D

# DATA VALIDATION AND USABILITY

## D1. Data Review, Verification, and Validation

As stated in Element B10, following review, interpretation, and data reduction by the analyst, the data is transferred into the Laboratory Sample Management System by direct upload from the analytical data system or manually. This system stores the client information, sample results, and QC results. A security system is in place to control access of laboratory personnel and to provide an audit trail for information changes.

The data is again reviewed by the group leader or another analyst whose function is to provide an independent review before data is verified on the sample management system. The person performing the verification step reviews all data including quality control information before verifying the data. Any errors identified and corrected during the review process are documented and addressed with appropriate personnel to ensure generation of quality data.

If data package deliverables have been requested, the laboratory will complete the appropriate forms (see Appendix A) summarizing the quality control information, and transfer copies of all raw data (instrument printouts, spectra, chromatograms, laboratory notebooks, etc.) to the Data Packages Group. This group will combine the information from the various analytical groups and the analytical reports from the Laboratory Sample Management System into one package in the client requested format. This package is reviewed for quality, compliance, and conformance to SOPs and QC requirements. Any analytical problems are discussed in the case narrative, which is also included with the data package deliverables.

The validation of the data for quality assurance includes spot checking raw data versus the final report, checking that all pertinent raw data is included and does refer to the samples analyzed, review of all QC results for conformance with the method, and review of the case narrative for description of any unusual occurrences during analysis. This validation is performed using techniques similar to those used by the Sample Management Office for the USEPA's Contract Laboratory Program.

The validation performed by the laboratory does not address usability of the data, which usually requires some knowledge of the site. The laboratory will make every attempt to meet requirements of the project, thus reducing the need to assess usability of the data.

## D2. Verification and Validation Methods

Lancaster Laboratories has procedures in place to verify that instrumental computers and the computerized sample management system perform at the required accuracy, traceability and security for reporting verified data. Element D1 describes this process in more detail. Knowledge of the site and sampling methods are necessary to assess usability. Therefore, overall data validation and assessment of data usability is the responsibility of the client. Lancaster Laboratories will evaluate the analytical data to verify that method and/or project requirements have been met.

## D3. Reconciliation with User Requirements

Data quality requirements are based on the measurement process and the intended use of the data. Lancaster Laboratories evaluates the QC data generated by the following data quality objectives.

Precision – Precision refers to the reproducibility of a method when it is repeated on a second aliquot of the same sample. The degree of agreement is expressed as the relative percent difference (RPD). The RPD will be calculated according to the following equation:

$$RPD = \frac{\left| D_2 - D_1 \right|}{(D_1 + D_2) / 2} \times 100$$

Where:

$D_1$ = First sample value
$D_2$ = Second sample value (Duplicate)

Duplicates will be run on at least 5% of the samples and matrix spike duplicates are used for organics analyses. Acceptance criteria are detailed in Element B5. All quality control sample results are entered into the computer and compared with acceptance limits. In addition, there is a monthly review of values on the computer QC system. Data obtained from quality control samples is entered onto our computer system that charts the data and calculates a mean and standard deviation on a monthly basis. The Quality Assurance Department then reviews this data for trends, which may indicate analytical problems. The control charts are graphical methods for monitoring precision and bias over time.

Accuracy – Accuracy refers to the agreement between the amount of a compound measured by the test method and the amount present. Accuracy is usually expressed as a percent recovery (R). Recoveries will be calculated according to the following equations:

$$Surrogate\ \%\ Recovery\ = Qd/Qa\ \times 100$$

Where:

Qd = Quantity determined by analysis
Qa = Quantity added to sample

$$Matrix\ Spike\ \%\ Recovery = \left(SSR\ -\ SR\right) / SA \times 100$$

Where:

SSR = Spiked sample results
SR = Sample results
SA = Spike added

$$Laboratory\ Control\ Sample\ \%\ Recovery = LCS\ found\ /\ LCS\ true \times 100$$

Surrogate standards are added to each sample analyzed for organics. Spikes and laboratory control samples will be run on at least 5% of the samples (each batch or SDG, ≤20 samples). Refer to Element B5 for acceptance criteria for accuracy. The computer is programmed to compare the individual values with the acceptance limits and inform the analyst if the results meet specifications. If the results are not within the acceptance criteria, corrective action suitable to the situation will be taken. This may include, but is not limited to, checking calculations and instrument performance, reanalysis of the associated samples, examining other QC analyzed with the same batch of samples, and qualifying results with documentation of any QC problems in the case narrative.

Commercial quality control materials are run at least quarterly to ensure accuracy of the analytical procedure. Repetitive analysis of a reference material will also yield precision data. Accuracy information determined from reference materials is valuable because variables specific to sample matrix are eliminated.
The QC program is capable of charting data for surrogates, spikes, control materials, and reference materials. The Quality Assurance Department reviews these charts in association with the monthly trend report for any indication of possible problems (i.e., shift in the mean and standard deviation).

Completeness – Completeness is the percentage of valid data acquired from a measurement system compared to the amount of valid measurements that were planned to be collected. The objective is analysis of all samples submitted intact, and to ensure that sufficient sample weight/volume is available should the initial analysis not meet acceptance criteria. The laboratory's sample management system will assign a unique identification number to the sample which tracks and controls movement of samples from the time of receipt until disposal. All data generated will be recorded referencing the corresponding sample identification number. The completeness of an analysis can be documented by including in the data deliverables sufficient information to allow the data user to assess the quality of the results. This information will include, but is not limited to, summaries of QC data and sample results, chromatograms, spectra, and instrument tune and calibration data. Additional information will be stored in the laboratory's archives, both hard copy and electronic.

$$Completeness = \frac{Number\ of\ valid\ measurements}{Total\ measurements\ needed} \times 100$$

Method Detection Limit – It is important to ascertain the limit of quantitation that can be achieved by a given method, particularly when the method is commonly used to determine trace levels of analyte. The Environmental Protection Agency has set forth one method for determining method detection limits (MDLs) from which limits of quantitation (LOQs) can be extrapolated. MDLs are evaluated on an annual basis. MDL is defined as follows for all measurements:

$$MDL = t_{(n-1,\ 1-a\ =\ 0.99)} x s$$

Where:

MDL = Method detection limit

s = Standard deviation of the replicate analyses

$t_{(n-1,1-a = 0.99)}$ = Students' t-value for a one-sided 99% confidence level and a standard deviation estimate with n-1 degrees of freedom

**Definitions:**

Calculated Method Detection Limit – The calculated method detection limit is defined as the minimum concentration of a substance that can be measured and reported with 99% confidence that the analyte concentration is greater than zero. It is determined from analysis, on a given instrument, of a sample in a given matrix containing the analyte.

Reported Method detection limit (MDL) – The reported MDL is defined as the highest of all calculated MDLs obtained from all instruments used for a particular method/matrix. This can be the actual value or a default value set above the calculated values.

Limit of quantitation (LOQ) – The limit of quantitation is defined as the level above which quantitative results may be obtained with a specified degree of confidence. The Lancaster Laboratories' policy is to set quantitation limits at a value at least 3x the MDL.

COVER PAGE - INORGANIC ANALYSES DATA PACKAGE

Lab Name: LANCASTER_LABORATORIES___

SDG No.: _____

| Client Sample ID. | Lab Sample ID. |
|---|---|
| | |

Were ICP interelement corrections applied ? Yes/No YES

Were ICP background corrections applied ? Yes/No YES
If yes - were raw data generated before application of background corrections ? Yes/No NO_

LEGEND:

U = Below MDL B = Below LOQ

FLAGS: (indicate matrix interference)
- N = Matrix Spike OOS
- * = Duplicate OOS
- W = Method F Analytical Spike Recovery <85% or > 115% when the sample conc. is <50% of the spike conc.
- S = Analysis Determined by MSA
- + = MSA Correlation Coefficient < 0.995
- E = Matrix Effects exist as proven by Serial Dilution or Spiked Dilution
- M = Duplicate Injection Precision not met

Presence of FLAGS does not invalidate data

METHODS:
- A = Flame Atomic Absorption
- P = Inductively Coupled Plasma
- F = Graphite Furnace
- AS = Hydride Generation
- CV = Cold Vapor
- NR = Not Required

TERMS:
- MDL = Method Detection Limit
- LOQ = Limit Of Quantitation
- OOS = Out of Specification
- MSA = Method of Standard Addition

I certify that this data package is technically accurate and complete. Release of the data contained in this data package has been authorized by the Laboratory Manager or the Manager's designee, as verified by the following signature.

## A3. Distribution List

This is a generic QA Project Plan; therefore, a distribution list will not be included. A list of organizations and persons that receive the generic QA Project Plan is maintained at Lancaster Laboratories.

## A4. Project/Task Organization

The objectives of the laboratory Quality Assurance Program are to establish procedures which will ensure that data generated in the laboratory are within acceptable limits of accuracy and precision, to ensure that quality control measures are being carried out, and to ensure accountability of the data through sample and data management procedures. To this end, a Quality Assurance Department has been established. The Quality Assurance Officer reports directly to the President of Lancaster Laboratories and has no direct responsibilities for data production, thus avoiding any conflict of interest. The Quality Assurance Officer is the responsible party for maintaining the official, approved QA project plan.

The attached organizational charts show key managerial personnel. Resumes of key individuals may be found in the *Qualifications Manual*.

The Sample Administration Group will be responsible for receiving samples, signing the external chain of custody, checking sample condition, assigning unique laboratory sample identification numbers, and initiating internal chain-of-custody forms. Sample Support personnel will be responsible for assigning storage locations, checking and adjusting preservation, homogenizing the sample as needed, and sample discard. The Bottles Group is responsible for pre-preserving bottles as required by the method, preparing trip blanks and field blanks when required, and packing the bottle kits, then sending them to the client‘s requested location.

Group leaders listed in each technical area are responsible for performing laboratory analyses, quality control as specified in the methods, instrument calibration, and technical data review. Data is reported using a computerized sample management system, which tracks sample progress through the laboratory and generates client reports when all analyses are complete. Quality control data is entered onto the same system for purposes of charting and monitoring data quality.

The Quality Assurance Department is responsible for reviewing quality control data, conducting audits in the laboratory and reporting findings to management, maintaining current copies of all analytical methods, reviewing and approving SOPs, maintaining copies of computer code used to calculate and report results, submitting blind samples to the laboratory, and ensuring that appropriate corrective action is taken when quality problems are observed.

Data package deliverables are available upon request. The Quality Assurance Department reviews a representative sampling of the deliverables for completeness and to be sure that all quality control checks were performed and met specifications. This step includes review of holding times, calibrations, instrument tuning, blank results, duplicate results, matrix spike results, surrogate results, and laboratory control samples (where applicable). Every attempt to meet specifications will be made, and any item outside of the specifications will be noted in the narrative. The laboratory will not validate data with regard to usability since this generally requires specific knowledge about the site. All data is archived according to corporate procedures.

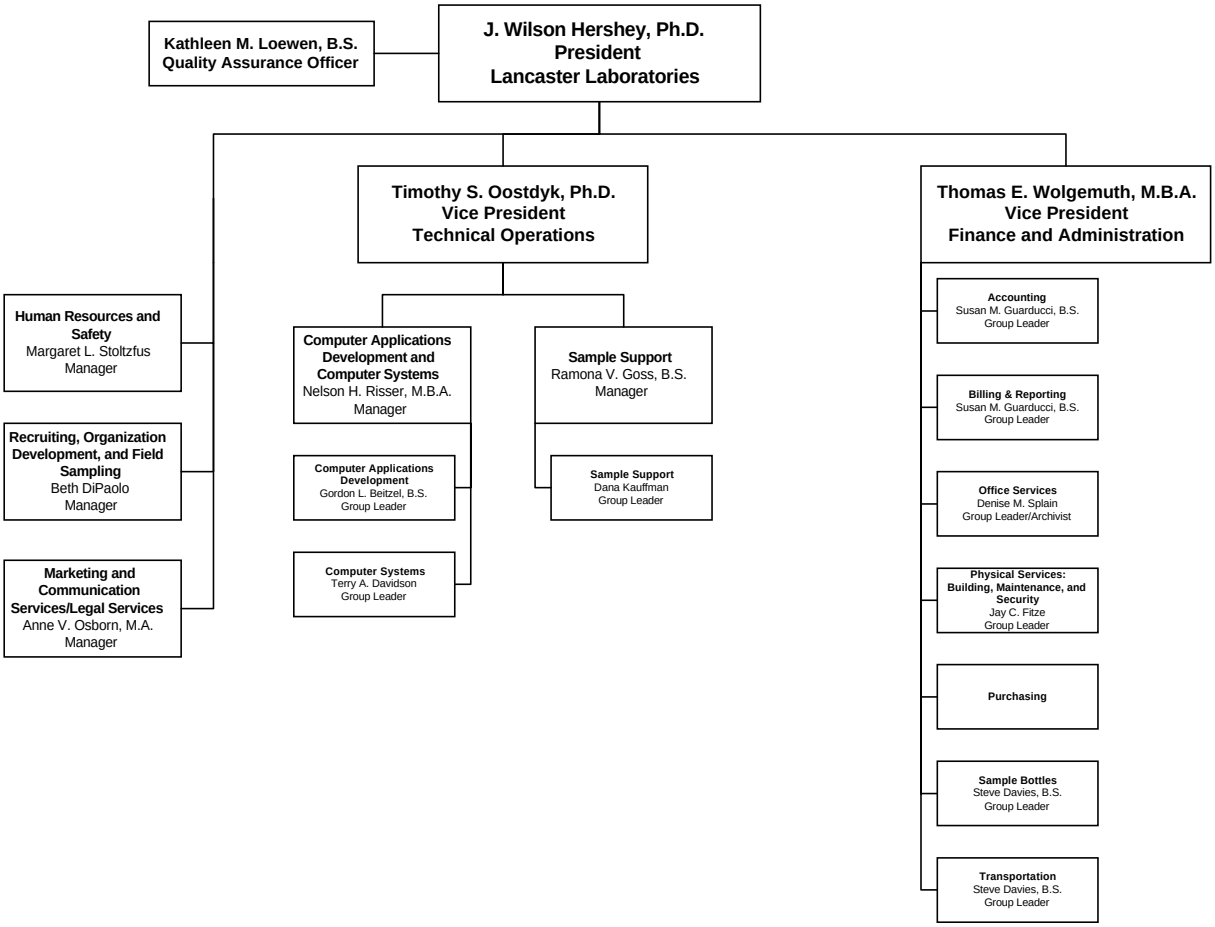
04/04/02

## Support Services



04/04/02

## A5. Problem Definition/Background

The purpose of this generic QA Project Plan is to provide specific quality assurance and quality control procedures involved in the generation of data of acceptable quality and completeness. This QA Project Plan provides the laboratory requirements to meet *EPA Requirements for Quality Assurance Project Plans*, EPA QA/R-5, March 2001 and EPA's *Guidance for Quality Assurance Project Plans*, EPA QA/G-5, February 1998.

The procedures in this QA Project Plan have been standardized to make them applicable to all types of environmental monitoring and measurement projects. However, under certain site-specific conditions, not all of the procedures discussed in this document may be appropriate. In such cases, it will be necessary to adapt the procedures to the specific conditions of the investigation.

The analyses in this document are representative of what the laboratory performs but are not all encompassing. It is intended to provide a client with an overview of systems and procedures at Lancaster Laboratories. It is not project or site-specific and may not address all analyses required for a particular project. If additional analytical information is necessary, arrangements can be made with Lancaster Laboratories to generate a project specific or site specific QAPP.

## A6. Project/Task Description

Tests will be performed according to the analytical methodology set forth in the *USEPA Test Methods for Evaluating Solid Waste—Physical/Chemical Methods*, *SW-846*, *3rd edition, Update III, December 1996* and *Methods for Chemical Analysis of Waters and Wastes, USEPA, 600/4-79-020.* SW-846 provides specific analytical procedures to be used and defines the specific application of these procedures. Proven instruments and techniques will be used to identify and measure the concentrations of volatiles, semivolatiles, and pesticide compounds and/or the inorganic elements. The laboratory will employ state-of-the-art GC/MS and/or GC procedures to perform all organic analysis. Inorganic analyses will be performed using graphite furnace atomic absorption spectophotometry (GFAA), inductively coupled plasma (ICP), cold vapor AA, and flame AA. Instrumental wet chemistry will be using an auto-analyzer spectrophotometer, TOC analyzer, TOX analyzer, and Ion Chromatography. Classic wet chemistry will use appropriate instrumentation. The client is responsible for providing specifics on the project site.

## A7. Quality Objectives and Criteria

Quality assurance is the overall program for assuring reliability of monitoring and measurement data. Quality control is the routine application of procedures for obtaining set standards of performance in the monitoring and measurement process. Data quality requirements are based on the intended use of the data, the measurement process, and the availability of resources. The quality of all data generated and processed during this investigation will be assessed for precision, accuracy, representativeness, comparability, and completeness. These specifications will be met through precision and accuracy criteria as specified in Element B5. Detection limits are presented in Element B4.

To ensure attainment of the quality assurance objectives and criteria, SOPs are in place detailing the requirements for the correct performance of laboratory procedures. The laboratory SOPs fall under five general categories:

1. Corporate policy

2. Quality assurance

3. Sample administration

4. General laboratory procedures

5. Analytical (i.e., methods, standard preps., instrumentation)

All SOPs are approved by the QA Department prior to implementation. The distribution of current SOPs and archiving of outdated ones are controlled by the Office Services Group through a master file. Table A7-1 provides an index of QA SOPs in place in support of the Quality Assurance objectives. These requirements are supplemented by the procedures in the laboratory and analytical SOPs.

## A8. Specialized Training/Certification

Lancaster Laboratories has a core curriculum of training that contains the basic courses relevant to all the employees. This in part, includes teaching the quality policy, quality assurance/quality control, ethics training, chemical hygiene training, health and safety classes, and any function specific training (i.e. GC, Statistics). Much of this training is performed at Lancaster Laboratories through the Human Resources Group. The following list shows examples of course offerings:

- Laboratory Technician Program: Designed for new employees who need to develop laboratory skills or who need a refresher on laboratory basics.
- Making Quality A Science: This course introduces why quality is important, explains Lancaster Laboratories quality philosophy and processes, and shows how to apply quality thinking and techniques on the job.
- Putting Our Values to Work: This seminar is designed to introduce new employees to the Statement of Values by examining how it translates to everyday jobs and includes ethical decision making.
- Chemical Hygiene Plan: Introduces the new employee to LLI's Chemical Hygiene Plan and the OSHA Lab Standard regulation and requirements.
- CPR: This course includes CPR history, relevance of CPR, cardiovascular disease, adult one-rescuer CPR, airway obstruction, pediatric CPR, safety in CPR.
- 24-hour HAZWOPER Emergency Response: Part of a proactive safety and emergency preparedness effort, this training is provided to a core group of people and volunteers who may respond to emergencies.
- Statistical Analysis: Topics include: rounding, mean standard deviation, normal distribution, z-scores, estimate, confidence intervals, hypothesis testing, one sample t-test, F-test, two sample t-test, paired t-test, ANOVA, outlier, calibration, etc.
- Gas Chromatography: Principles in GC, separation, qualitative/quantitative analysis, hardware, software, troubleshooting techniques, and the applications for GC use at Lancaster Laboratories.
- GC/MS Basics: Review of the fundamentals for GC/MS analysis.
- HPLC: Principles and practices on HPLC and the applications at Lancaster Laboratories.

If the training can not be accomplished at Lancaster Laboratories, then the employee may have off-site training. Within each technical or support group, the employee also receives on-the-job training before performing work independently. The details of this training are noted in each departmental group's SOPs.

The analysts must perform an initial demonstration of capability before using any test method; this is reviewed and signed by the technical department's management and Quality Assurance. The analyst must also complete an annual demonstration of capability for each test method per matrix.

All training and proficiencies are documented in each employee's training records as described in SOP-QA-117, "Personnel Training Records and Curriculum Vitae."

## A9. Documents and Records

The group leaders in each technical area are responsible for overseeing the performance of analysis, quality control as specified in the method, instrument calibration, and technical data review. There is a secondary review on 100% of all data by a supervisor or experienced analyst prior to reporting the results. The Laboratory Information Management System (LIMS) tracks sample progress through the laboratory and generates client reports. During analysis, raw data must be recorded in indelible ink in bound notebooks or on printouts from instruments and is then entered into the LIMS against sample number and analytical method. Many instruments are connected directly to the LIMS, eliminating the manual transcription. Quality control data is entered into the same system for purposes of charting and monitoring data quality. When all analyses are completed and have been verified by a supervisor or designee, the computer generates a report. The client receives a copy of the report containing the results of the analysis plus comments entered by the analyst where necessary. Copies of the reports and associated raw data are retained in secured archives.

Currently Lancaster Laboratories has over fifteen different reporting formats. Table A9-1 shows some of the formats available. Unless a specific report format is requested, the standard laboratory procedure is to report results to the limit of quantitation (LOQ) using report type 0 (see Table A9-1). However, it is possible to estimate to a value below the LOQ, if lower values are needed. Estimates are made to the reported method detection limit (MDL) which is based on annual MDL studies performed per method/matrix and instrument. An example analysis report is included in Appendix A.

The data packages are consistent with EPA CLP, NJDEP, and other state or agency formats. Custom formats are also accommodated. The data package types differ in the level of raw data and QC that would be submitted. Table A9-2 shows the formats offered and the information that can be included in a data package. Appendix A shows examples of the data package forms used for various types of methodology (i.e. GC/MS Volatiles, pesticides, etc.) The data packages are available as hard copy deliverables or a *.pdf* file on CDROM.

After the data package has been compiled, a content review and QA/QC compliance review on 100% of the data packages is performed by the Data Deliverable department or by other fully-trained staff. During the content review, the field chain of custody is compared to the reports to check the analysis performed, dates/times of collection, and sample designation. In addition to making sure data from all the appropriate departments is present, the following are also checked: method summary/reference, title page, table of contents, sample reference list, sample administration receipt documentation logs, and internal chains of custody (if required). In addition to making sure the data for all analyses are included, the following are also checked during the QA/QC compliance review: spot check results on the report against the raw data, ensure analyses performed within holding time, check quality control summary forms for compliance issues, and read the case narrative to make sure all nonconformances and anomalies are addressed.

In addition, the Quality Assurance Department reviews a representative sampling of the deliverables for completeness and to be sure that all batch quality control checks were performed and met specifications. This step includes review of holding times, calibrations, instrument tuning, blank results, duplicate results, matrix spike results, surrogate results, and laboratory control samples (where applicable). Every attempt to meet specifications will be made, and any item outside of the specifications will be noted in the case narrative. The laboratory will not validate data with regard to usability since this generally requires specific knowledge about the site.

Analytical results can be submitted to the client in various electronic formats. LLI supports more than 8 standard and over 100 custom file structures using an Oracle based data system. LLI provides electronic data deliverables (EDD) formatted in Microsoft Access (.mdb), Excel (.xls), and ASCII: “Comma Delimited,” “Tab Delimited,” and “Fixed Length.” LLI uses several industry standard formats for the electronic data, such as:

- NJDEP SRP HazSite (HZRESULT data)
- GIS/Key
- CA EDF (COELT)
- EquIS
- ERPIMS
- EPA Region 5 (EDMAN)
- TerraBase (Integrate Level 2)
- ITEMS
- Client- or Project-Specific Formats

We ensure the quality of our electronic data by providing 100 percent manual quality assurance review of all data fields for new formats and a 10 percent review thereafter. We also have an extensive EDD review.

*LLabWeb.com* allows a client to access their verified analytical results round-the-clock through Lancaster Laboratories computer system using a secure Internet browser. Only analytical results on samples that are completed and verified can be accessed by this system.

A corporate procedure is in place for documentation, error correction, and control of logbooks (SOP-QA-109, ”Laboratory Notebooks, Logbooks, and Documentation”). The Office Services Group is responsible for maintaining the document and version control of the QA project plan and SOPs. All documents are assigned a revision number and date by the Office Services Group. They record all individuals or departments that have been issued a copy of a document and track that old versions are returned when the new one is issued. They are also responsible for maintaining the archive system to securely store records from all areas of the laboratory. SOP-QA-114, ”Data Storage, Security and Archiving,” describes procedures for transferring data from the laboratories to the archives. The procedures for maintaining the archives, including record retention schedule and disposal are described in SOP-QA-136, “Archive Guidelines.” The length of time for retention of data is 10 years. The disposal of records is explained in procedure SOP-QA-135, “Disposal of Hard Copies.” All copies that are disposed of are incinerated. The Data Deliverables Group archives copies of the data packages using microfilm or equivalent. Electronic data diskette files are saved on a backup tape and stored off site for a minimum of 10 years.

**Table A9-1**
**Data Reporting Formats**

| | Negative | Exactly Zero | MDL | LOQ | Above LOQ | Limit Shown on Report |
|---|---|---|---|---|---|---|
| 0 | <LOQ | | | | Rounded result | LOQ |
| 1 | N.D. | | <LOQ | | Rounded result | LOQ |
| 2 | N.D. | | BMQL | | Rounded result | LOQ |
| 3 | N.D. | | Result with "J" Qualifier | | Rounded result | LOQ |
| 4 | N.D. | | Result with "J" Qualifier | | Rounded result | LOQ |
| 5 | Result with "J" | N.D. | Rounded result to 6 decimal places | | | LOQ |
| 6 | Result with "J" | N.D. | Rounded result to 6 decimal places | | | MDL |
| 7 | LOQ with "U" Qualifier | | Result with "J" Qualifier | | Rounded Result | LOQ |
| 8 | N.D. | | Rounded Result (no "J" Qualifier) | | | MDL |

Key:

MDL = Method Detection Limit
LOQ = Limit of Quantitation
BMQL = Below Minimum Quantitation Limit
J = Estimated Value

# Table A9-2
## Data Package Formats

**Type I, NJ Regulatory (non-CLP)**

- Title page
- Sample reference list
- Analysis request form, field chain of custody
- Sample administration receipt documentation log
- Internal chain of custody (if required)
- Method summary/references
- Analysis reports/laboratory chronicles
- Case narrative
- Quality control summary; duplicates, matrix spike, matrix spike duplicate, blank, and LCS, and surrogate recovery summary forms, GC/MS tuning summary
- Sample data; all raw sample data including instrument printouts and MDL summary form
- Standard Data; initial and continuing calibration summary forms, all raw initial and continuing calibrations and standardization data including instrument printouts
- Quality control raw data; all raw quality control sample data including printouts, preparation logs, run logs

**Type II (non-CLP)**

- Title page
- Sample reference list
- Analysis request form, field chain of custody
- Sample administration receipt documentation log
- Internal chain of custody (if required)
- Method summary/reference
- Analysis reports/laboratory chronicles
- Case narrative
- Quality control summary; duplicate, matrix spike, matrix spike duplicate, blank, LCS, and surrogate recovery forms, GC/MS tuning, initial and continuing calibration summary forms
- Sample data; all raw sample data including instrument printouts
- Quality control raw data; blank raw data, preparation logs, run logs

**Type III, NJ Reduced Deliverables (non-CLP)**

- Title page
- Sample reference list
- Analysis request form, field chain of custody
- Sample administration receipt documentation log
- Internal chain of custody (if required)
- Method summary/reference
- Analysis reports/laboratory chronicles
- Case narrative and conformance/nonconformance summary
- Quality control summary; duplicate, matrix spike, matrix spike duplicate, blank, LCS, and surrogate recovery forms, GC/MS tuning, summaries for calibration and standardization
- Sample data; MDLs, all raw sample data including instrument printouts for GC, GC/MS, and TPH only
- Quality control raw data; blank raw data for GC, GC/MS, and TPH only, preparation logs

**Type IV, Full CLP Deliverables**

- Title page
- Case narrative
- Analysis request form, field chain of custody
- Internal chain of custody (if required)
- All CLP reporting forms; QC analytical results and calibration summaries
- Sample data; all raw data including instrument printouts
- Standard Data; all raw initial and continuing calibrations and standardization data including instrument printouts
- Quality control raw data; all raw quality control sample data including printouts, preparation logs, run logs

## Table A9-2 – Continued
Data Package Formats

**Type V, Reduced CLP Deliverables**

- Title page
- Case narrative
- Analysis request form, field chain of custody
- Internal chain of custody (if required)
- All CLP reporting forms; QC analytical results and calibration summaries
- Sample raw data; all raw sample data including instrument printouts for organics only
- Quality control raw data; blank raw data for organics only, preparation logs

**Type VI, Raw Data Only**

- Title page
- Sample raw data; all raw sample data including instrument printouts
- Quality control summary; blank raw data
- Standard raw data; LCS raw data

# GROUP B

# MEASUREMENT/DATA ACQUISITION

## B1. Sampling Process Design

In order for meaningful analytical data to be produced, the samples analyzed must be representative of the system from which they are drawn. It is the responsibility of the client to ensure that the samples are collected according to accepted or standard sampling methods. The client should evaluate the number, location, and type of samples to be collected. The appropriate number and frequency of field QC samples should also be determined by the client.

For non-standard matrices such as fish, worms, biota, large concrete or wood chunks, or other assorted waste, a discussion should take place with the laboratory to identify special handling requirements and confirm method performance for the particular matrix.

## B2. Sampling Methods

The sampling methods should be selected by the client with regard to the intended application of the data.

The laboratory will provide the appropriate sample containers, required preservative, chain-of-custody forms, shipping containers, labels, and seals for the sampling. Trip blanks will be prepared by the laboratory and accompany sample containers at the project required frequency. Analyte free water will also be provided for field blanks. Temperature blanks will be included for monitoring cooler temperature upon receipt of the samples back at the laboratory. Pre-cleaned containers, with vendor supplied traceability documentation are available upon request. Because the laboratory does not stock this type of traceable container, 2 weeks prior notice is required.

Before use each lot of preservative used with sample containers is documented and checked for contaminants. The appropriate bottle will be preserved with the new preservative and filled with deionized water to represent a sample. A similar container (that does not contain preservative) will be filled with deionized water to be used as a blank check. Analysis results are documented and reviewed for each preservative lot number.

A list of containers, preservatives, and holding times follows in Table B2-1.

**Table B2-1**
Sample Containers, Preservatives, and
Holding Times for Aqueous and Solid Samples

| Fraction | Vol. Req. (mL)<br>Wt. Req. (g) | Container<br>P=Plastic<br>G=Glass | Preservation[a] | Holding Time[d] From Date of Collection<br>Water | Soil |
|---|---|---|---|---|---|
| Volatiles | 3 × 40 mL<br>100 g[f] | G | Cool, 4°C[b] pH <2 w/HCl | 14 Days | 14 |
| Pesticides | 2 × 1000 mL<br>100 g | G | Cool, 4° C[b] | 7 Days to extraction[e] | 14 |
| Herbicides | 2 × 1000 mL<br>100 g | G | Cool, 4° C[b] | 7 Days to extraction[e] | 14 |
| Halocarbons<br>(Volatiles by GC) | 3 × 40 mL<br>100 g[f] | G | Cool, 4° C[b] pH <2 w/ HCl[c] | 14 Days | 14 |
| Aromatics<br>(Volatiles by GC) | 3 × 40 mL<br>100 g[f] | G | Cool, 4° C[b] pH <2 w/ HCl | 14 Days | 14 |
| Semivolatiles<br>(Acid/Base Neutrals) | 2 × 1000 mL<br>100 g | G | Cool, 4° C[b] | 7 Days to extraction[e] | 14 |
| PAHs (HPLC) | 2 × 1000 mL<br>100 g | G | Cool, 4°C $Na_2S_2O_3$ | 7 Days to extraction[e] | 14 |
| Metals | 100 mL<br>100 g | P,G | $HNO_3$ to pH <2 | 6 Months<br>Hg 28 days | 6 |
| Cyanide | 500 mL<br>100 g | P,G | Cool, 4°C NaOH to pH >12<br>ascorbic acid | 14 Days | 14 |
| Sulfide | 500 mL<br>100 g | G | Cool, 4°C (NaOH, ZnAC<br>Waters Only) | 7 Days | 7 |
| Phenol | 1000 mL<br>100 g | G | Cool, 4°C $H_2SO_4$ to pH <2 | 28 Days | 28 |
| TPH | 2 × 1000 mL<br>100 g | G | Cool, 4°C pH <2 w/ HCl | 7 Days | 14 |
| TPH-GRO | 3 × 40 mL<br>100 g | G | Cool, 4°C pH <2 w/ HCl | 7 Days | 14 |
| TPH-DRO | 2 × 1000 mL<br>200 g | G | Cool, 4°C <2 with HCl | 14 Days to extraction[e] | 14 |
| TOX | 4 × 250 mL<br>50 g | G | Cool, 4°C $H_2SO_4$ to pH <2<br>$Na_2SO_3$ | 28 Days | N/A |
| TOC | 125 mL<br>20 g | G | Cool, 4°C $H_2SO_4$ to pH <2 | 28 Days | 28 |
| Total Nitrite/Nitrate | 120 mL | P,G | Cool, 4°C $H_2SO_4$ to pH <2 | 28 Days[g] | N/A |

[a]pH Adjustment with acid/base is performed on water samples only.

[b]Sodium thiosulfate needed for chlorinated water samples

[c]Due to the inaccurate recovery of 2-chloroethyl vinyl ether in the presence of HCl, Halocarbon samples analyzed for this compound should not be preserved.

[d]Samples will be analyzed as soon as possible after collection. The times listed are the maximum times that samples will be held before analysis and still be considered valid.

[e]Analysis 40 days from extraction.

[f]This is for soils not sampled by Method 5035. For Method 5035, see below.

[g]Holding time is 48 hours from time of collection for unpreserved samples.

NOTE: For volatiles analysis, the container should be filled completely, with no headspace. All sample containers, preservatives, and mailers will be supplied at no additional charge upon request, except for the special containers with traceability documentation. There is an additional charge for this type of container.

Method 5035
Containers for sampling soils for volatile organic compounds

| Analysis Level | Option # | EnCore™ Sampler | Methanol Preserved 40-mL Vial | Unpreserved Container for Moisture | Travel Blank |
|---|---|---|---|---|---|
| Low | A | 3 (7*) | — | 1 | Water |
| High | B | 1 (3*) | — | 1 | Water |
| | C | — | 1 (3*) | 1 | Methanol |

*Total number of sampled containers needed for background/MS/MSD analyses. Because only one analysis will come from each container, additional samples must be collected for matrix spikes/matrix spike duplicate analyses or other quality control analyses. The number of containers for MS/MSD samples is listed above. The holding time from collection to preservation is 48 hours. The holding time for analysis is 14 days from preservation.

## B3. Sampling Handling and Custody Requirements

Samples are unpacked and inspected in the sample receipt area. At this time, the samples are examined for breakage and agreement with the associated client paperwork. The cooler temperatures will be checked upon receipt and recorded. As the samples are unpacked, the sample label information will be compared to the chain-of-custody record and any discrepancies or missing information will be documented. If necessary, the cooler will be closed and placed in cold storage until instructions and resolution of any discrepancies are received from the client.

A member of our Sample Administration Group will act as sample custodian for the project. To ensure accountability of our results, a unique identification number is assigned to each sample as soon as possible after receipt at the laboratory. Upon entry into our LIMS and assignment of the seven digit sample number, labels are generated, along with an Acknowledgement summarizing samples entered and the analyses scheduled. When samples requiring preservation by either acid or base are received at the laboratory, the pH will be measured and documented, with the exception of samples designated for volatile analysis, which are checked at the time of analysis. Samples requiring refrigeration will be stored at 2° to 4°C. The use of our computer system in tracking samples (by the Lancaster Labs sample number assignment) will control custody of the sample from receipt until the time of its disposal. The security system on our laboratory building allows us to designate the entire facility as a secure area since all exterior doors are either locked or attended. Therefore, hand-to-hand chain of custody is not part of our routine procedure, but is available upon request. If requested, hand-to-hand chain of custody will be provided as per attached SOP-QA-104, "Chain-of-Custody Documentation." The laboratory chain of custody will begin with the preparation of bottles. The procedures for sample log-in, storage, and chain-of-custody documentation are detailed in the QA standard operating procedures included in Element B3 (SOP-QA-102, SOP-QA-103, and SOP-QA-104). Examples of sample labels and a custody seal are shown in Figure B3-1.

**QUALITY ASSURANCE OPERATIONS MANUAL**
**Sample Log-In**

**Purpose:**

In order to provide accountability of our results, protect client confidentiality, and to prevent sample loss/mix-up, a continuous and unique Lancaster Laboratories (LL) identification number is assigned to each sample upon laboratory receipt.

**Scope:**

This SOP will cover the procedure used to log client samples into the computerized sample management system (CSMS) after receipt. The Sample Administration Group is responsible for laboratory sample log-in. Sample Administration has procedures to define this sample entry process.

This procedure applies only to samples, which are logged into and tracked by the CSMS. There are only a few cases where samples may not be tracked using the CSMS. These include samples which will be stored for a long period of time prior to analysis, (e.g., stability storage) or for special project samples that could be reported in a narrative research and development style report instead of our usual analytical reports. Written procedures for tracking samples not entered into the CSMS need to be developed by the technical department responsible for the project or analysis of those samples.

**Personnel Training and Qualifications:**

Training in sample log-in is performed in accordance with Sample Administration training procedures.

**Procedure:**

1. All samples received for testing shall be delivered to the Sample Administration Department immediately upon arrival at the laboratory.

2. The Sample Administration Department will be responsible for unpacking and organizing the samples.

3. Client correspondence relating to the samples shall also be transferred to the Sample Administration Department. This may include purchase orders, quotations, letters, phone logs, and Incoming Sample Activity Records (ISARs).

4. Personnel of the Sample Administration Group shall log the samples into the CSMS as soon as practical after receipt. Samples awaiting log-in are stored in temporary holding areas, at required temperature, to maintain the sample integrity. At the time of entry the computer will assign a unique Lancaster Laboratories' identification number to each sample. Samples can be received at the laboratory 7 days a week, 24 hours a day, 365 days of the year. Samples should be logged in on the same day as they are received, but there could be the following exceptions:

    a. Samples received on a holiday will not be logged-in until the next normal workday. Samples received from 6 p.m. on Saturday through 11 p.m. on Sunday will be logged-in Sunday evening by third shift Sample Administration personnel.

    b. Samples submitted by clients, which do not identify the type of testing to be performed, or with unclear or incomplete paperwork documentation. Every effort will be made to contact the client on the same day of sample receipt. In this situation, the samples will be tracked in a hold database. The group of samples will be assigned a hold number. This database is maintained by the Sample Administration Group.

If same day sample log-in is not possible, all specified and appropriate storage requirements will be observed (e.g., refrigeration).

5. Upon assignment of a sample number, the CSMS will generate a label, which shall be attached to the sample container. Every effort will be made as to not obscure the client label. The information on the sample label will include the LL sample number, the client name, the storage location, the analyses requested, a bottle code indicating container and preservative type, if applicable, a unique bar code (used for samples stored in Automated Sample Retrieval and Storage System locations [ASRS]), and any applicable notes to laboratory personnel.

6. Preservation, homogenization, and subsampling, if necessary, will be the responsibility of the Sample Support Group, or the testing laboratory. SOPs are in place within the group to define these procedures. A list of preservatives required for routine environmental analyses may be found in the *Environmental Schedule of Services*. A preservation, sulfate, and chlorine check shall be performed immediately after sample log-in for all applicable environmental samples.

7. After all above steps are performed, as required, samples shall be stored in an assigned storage location, taken to the laboratory for testing, or may temporarily be stored in SA until technical center picks up samples.

8. The next working morning, after sample log-in, a copy of an entry acknowledgment will print from the CSMS. The acknowledgment is a hard copy record of the sample entry. It will summarize the LL sample number, the sample(s) submitted in an entry group, the test(s) to be performed, the client requesting the work, the account to be billed for the work, and the unique sample identifications assigned by the client. This acknowledgment is mailed to the client to confirm sample receipt and entry.

9. Another copy of the sample acknowledgment will print and be designated as the laboratory copy. This acknowledgment, in addition to client paperwork, will be audited by three levels of personnel after the entry process:

   a. **Sample Administration** will audit to assure that the entry corresponds to all entry documentation including client supplied paperwork and/or quotations.

   b. **Client Services** will audit to assure the entry is reflective of client documentation and that additional client/project requirements were communicated and taken into consideration. They will also verify that account and billing information is accurate.

   c. **Technical centers** will assure appropriate preparation and analysis set-up steps have been added to the entry. They will also verify that project and technical requirements have been taken into consideration from a technical point of view.

      Some technical groups may choose to audit incoming client sample requirements using alternative means such as an internal scheduling program or a database that cross-checks the analyses entered against established technical criteria. Any system used to perform technical review of incoming client requirements must be documented

   Each reviewer will initial the top of the SA file copy of the acknowledgment to document their review. Additional copies of this acknowledgment can be made for laboratory personnel.

10. The LL sample number assigned to each sample shall be used to identify the sample in all laboratory records, including laboratory notebooks, instrument printouts, and laboratory final reports. The sample number will also be used to identify all additional containers of the sample, which may be created during sample preparation and analysis. This will include subsamples, extracts, and digests.

**Revision Log:**

Initiated Date: 03/87

| Ver. # | Effective Date | Change |
|---|---|---|
| 00 | 02/15/96 | Previous issue |
| 01 | 03/14/97 | Major changes are as follows:<br>• Expanded upon the scope of the procedure<br>• Added section about printing and auditing of the sample entry acknowledgment<br>• Added Personnel Training and Qualification section<br>• Removed specifics on how to document preservation checks |

**QUALITY ASSURANCE OPERATIONS MANUAL**
**Sample Storage and Discard**

**Cross References:**

The following procedures are cross-referenced in this document:

1. SOP-PS-014," Controlled Substance Handling and Recordkeeping Procedures."
2. SOP-QA-104, "Internal Chain-of-Custody Documentation."
3. SOP-QA-109, "Laboratory Notebooks, Logbooks, and Documentation."

**Purpose:**

Sample integrity can be compromised by improper storage conditions. The objective of this procedure is to prevent sample deterioration and mix-up prior to analysis. The computerized sample management system (CSMS) is used to assign storage locations to assist in the orderly storage of samples. Systems are also in place to ensure organized retrieval of samples for analysis and discard/return to client at an appropriate date.

**Scope:**

This procedure applies to all Lancaster Laboratories business units. The content of this procedure will describe general systems that are in place for sample storage, retrieval, return, and discard. Additional procedures within each division describe the specific storage operations and requirements of each business unit. This procedure does not address the storage and monitoring of samples stored in stability chambers. These procedures are described in the PS series of SOPs. Handling of controlled substance samples is described in SOP-PS-014.

**Safety Precautions:**

Refer to the corporate *Chemical Hygiene Plan* which provides safety information. Contact your supervisor if you have questions or concerns about a sample.

**Personnel Training and Qualifications:**

Personnel who handle client samples must be familiar with the requirements of this procedure, as well as any applicable division specific procedures.

**Procedure:**

A. Sample storage and transfer

1. Sample Administration will gather information into the CSMS at the time of sample entry about the approximate size of samples to be received in a group and the type of storage they require (e.g., refrigerator, freezer, or room temperature).

2. The CSMS will assign the storage location and record the length of time the samples must be retained after the analysis report has been issued.

3. Samples will be stored in the assigned storage location, when not in the laboratory area.

4. In the event that a sample location change is needed, a sample custodian or sample administrator will access the appropriate CSMS program and choose a new location. After a successful change in location has occurred, the new location will be written on each Lancaster Laboratories sample label, or a new label will be reprinted and adhered to the sample. The sample will then be transferred to the new storage location.

5. Analysts requiring the use of a sample may determine its location by referring to a departmental sample status sheet, CSMS, or SA entry paperwork.

6. To prevent unnecessary deterioration of the samples, the contents needed for analysis shall be removed and the sample returned to storage with a minimum of delay.

B. Security of storage areas

There are varying degrees of additional security requirements for storage areas, which are in addition to the building security. This additional security may be driven by various regulatory agencies or client requirements. The following are different levels of security which are in place at the laboratory.

1. Samples may be located in an individual laboratory area which is not locked. No additional security is required, in addition to the existing building security. Samples may only be removed from and returned to these locations by an analyst working in that area. Care shall be exercised in returning the samples to their appropriate location.

2. Locked storage areas are also available. Access to these storage areas is limited to analysts who are responsible for testing the samples that are stored there. These areas are locked when the laboratories are unattended; access is available only to members of the department where they are located. Again, care shall be exercised in returning the sample to its appropriate location.

3. Controlled access areas are attended by a sample custodian and are large areas used by more than one group. Samples stored in controlled access areas are coordinated by the sample custodian assigned to the area. Only appropriate personnel may access this controlled area. After analysis, samples are returned to this storage center and placed in their designated storage location.

Pharmaceutical samples are stored in a controlled access area, which is maintained by the Pharmaceutical Division. Environmental samples are stored in a separate controlled access area and are tracked by an automated sample retrieval storage system (ASRS). Samples are barcoded in and out of this system to track retrieval, return, and disposal.

4. Forensic storage areas are locked and admission to these areas is permitted only to sample custodians. Most of the samples stored in these areas require chain-of-custody documentation as outlined in SOP-QA-104. Samples may not be removed from this area without signing a chain-of-custody form. A chain-of-custody record may also be kept for samples, at the request of the client, even if the samples are not for forensic purposes.

C. Sample discard

1. When the retention time for sample storage has expired, a discard list will be generated from the CSMS. The retention dates are based upon client requirements or defaulted to a given number of days past the date when the final analysis report is generated, if no client requirement is given.

2. These samples will be removed from their assigned storage area by a sample custodian or analyst, and either disposed of or returned to the client.

3. Hazardous samples shall either be returned to clients, decontaminated, or disposed of at the direction of supervisory and/or Health and Safety personnel.

D. Storage conditions

1. The temperature of each sample storage location requiring a temperature control should be checked during each normal working day by an assigned person responsible for the sample storage area. This information shall be recorded.

2. Temperature documentation can be recorded on logs posted on the outside of the unit or by computerized recording devices or chart recorders.

3. The following temperature ranges need to be maintained within storage units, unless otherwise specified.

| | Refrigerator Storage | Freezer Storage | Room Temperature |
|---|---|---|---|
| Environmental Division | 2° to 4°C | -10° to -20°C | NA |
| Pharmaceutical Division | 2° to 8°C | -10° to -20°C | 15° to 30°C |

**NOTE:** Storage conditions of -40° ± 10°C and -80° ± 10°C are also available.

4. If the temperature recorded does not fall within these ranges, corrective action must be taken, as per divisional policy.

5. Temperature monitoring documentation shall be recorded in ink and changes shall be made in accordance with the error correction procedure outlined in SOP-QA-109.

6. Temperature records must be reviewed by a second qualified person and this information must be permanently archived.

7. In the event that additional storage areas are needed as "overflow" storage, systems must be put into place before samples can be stored. These areas must also be monitored for acceptable storage conditions.

8. If a client requests storage conditions which are outside the temperature ranges defined above, arrangements will be made to accommodate the request, if possible.

**Revision Log:**

Initiated Date: 03/87

| Ver. # | Effective Date | Change |
|---|---|---|
| 00 | 10/01/96 | Previous Issue |
| 01 | 09/02/97 | Major changes are as follows:<br>• Expanded upon Scope, Purpose, and Procedure to include Pharmaceutical Sciences and Animal Health<br>• Added Personnel Training and Qualifications section<br>• Broke Procedure section down into sample storage and transfer, security of storage areas, sample discard, and storage conditions<br>• Incorporated Procedural Amendment #1<br>• Clarified the scope of this procedure does not apply to the storage of samples in our stability chambers or the storage of controlled substances |
| 02 | 04/01/99 | Major changes are as follows:<br>• Scope – deleted specific SBUs; reworded for clarity<br>• Procedure – deleted animal health; added clarification; deleted step 5; updated chart<br>• Added signature lines for SBU Directors |

**QUALITY ASSURANCE OPERATIONS MANUAL**

**Internal Chain-of-Custody Documentation**

**Cross References:**

The following procedures/forms are cross-referenced in this document:

1. SOP-QA-102, "Sample Log-In."
2. SOP-QA-109, "Laboratory Notebooks, Logbooks and Documentation."
3. Form 2016, "Secure Storage Chain of Custody Original Sample."
4. Form 2102, "Analysis Request/Environmental Services Chain of Custody."
5. Form 2174, "Sample Administration Receipt Documentation Log."
6. Form 2231, "Secure Storage Chain of Custody, Metals."
7. Form 2365, "Master List of Chain of Custodies."
8. Form 2667, "Sample Storage, Off-Shift Entry Logbook."

**Purpose:**

In order to demonstrate reliability of data which may be used as evidence in a legal case, required by a regulatory agency, or required by a client, an accurate written record tracing the possession of samples must be maintained from the time they are received at the laboratory until the last requested analysis is verified. The purpose of a chain of custody (COC) is to ensure traceability of samples while they are in the possession of the laboratory.

**Scope:**

This procedure describes the initiating and maintaining of COC documentation for samples that require this level of traceability. It applies to all business units of Lancaster Laboratories when a client or regulatory agency requests an accurate written record tracing the possession of samples from the time they are received at the laboratory until the last requested analysis is verified. This procedure also applies to samples, especially environmental samples, which may be used as evidence in a legal case.

The first section of this procedure summarizes the COC requirements for pharmaceutical samples. The second section summarizes the requirements for environmental COC samples.

**Definition:**

A sample is in custody if it is in any one of the following states:

1. In actual physical possession.
2. In view after being in physical possession.
3. Locked up so no one can tamper with it.
4. In a secured area, restricted to authorized personnel (e.g., in the ASRS system, pharmaceutical samples storage area).

**Personnel Training & Qualifications:**

Training for this procedure consists of reading this SOP. Supervisory review of all COC documentation should be done until the trainer is satisfied that proficiency has been achieved. Training of all laboratory personnel is the responsibility of the group leader. Documentation that this training has been completed must be kept in the training records.

**Procedure:**

A. Pharmaceutical procedure

1. General overview

a. Chain-of-custody documentation shall be kept upon the request of a client or regulatory agency. As with all analytical data, it is **extremely** important that this documentation be filled out completely and accurately with every sample transfer. **Everyone who handles the COC has the responsibility to check for documentation compliance to the point of their acquisition**. If changes need to be made to the form, they shall be made in accordance with the error correction procedure addressed in SOP-QA-109. It is the responsibility of the person who made an error in documentation to correct the error.

b. For pharmaceutical samples, internal COC documentation will begin when samples are received at the laboratory.

c. A member of the Sample Administration Group will receive and unpack the samples. They will sign the client paperwork that accompanies the samples, if provided. If the samples were picked up by our Transportation Department, the driver must also sign applicable paperwork to relinquish the samples to Sample Administration.

d. The Sample Administration Group will track the custody of samples between receipt and entry into the computerized sample management system (CSMS) on Form 2174 (Figure 2). The client's sample designation will be used for identification purposes until a unique Lancaster Laboratories number is assigned.

e. Samples will be entered into the CSMS as described in SOP-QA-102.

f. After entry, samples are released by the Sample Administration Group to be stored in other areas of the laboratory (e.g., pharmaceutical specific storage areas). During this time, they may be accessed by several people in that area. Each of these people must note the specific sample numbers in their custody in addition to date, time, and reason for removal from storage. Chain-of-custody transfer documentation is recorded on Form 2016, which is given as Figure 3 of this procedure.

2. Documentation of custody changes

a. An example of how to document changes in sample custody is shown in Figure 3, (Form 2016) of this procedure. Each change of sample custody must be accurately documented in a consistent format. Entries documenting change of custody will use the following format:

Signature: First initial, full last name, employee number
Date: Month/day/year
Time: Documented as military time
Ink: Black ink is preferred, red ink and pencil are not acceptable

b. When sample(s) are released from storage, they must be signed out by the analyst receiving them. The analyst must note the sample number(s) taken, the date and time received, and a note as to the reason why they were removed from storage (reason for change of custody).

c. When an analyst returns sample(s) to storage, they must note the sample number(s) being returned in addition to time of return.

d. If the custody of sample(s) is passed from one analyst to another, the following must be noted: the sample number(s) transferred, the reason for the transfer, in addition to the time and date of transfer. It is the responsibility of the analyst now in possession of the samples to ensure they are returned to the storage area.

e. Each specific test that an analyst performs, in conjunction with the associated sample number(s), must be accurately documented by the analysts in the Reason for Change of Custody column before the samples are returned to the sample storage area.

3. Additional COC issues

a. Chain-of-custody paperwork will remain with and accompany sample containers at all times. **Note:** COC paperwork may be kept in a nearby location when samples are stored in a location not conducive to paper storage (i.e., refrigerator or freezer).

b. When sample analysis is complete, samples shall be returned to the storage area, in conjunction with the COC form.

c. Original COC documentation will be maintained at the laboratory and filed in the sample storage area. COC documentation will be overchecked in conjunction with the sample data before a copy is sent to the client. The copy could either accompany the samples as they are returned to the client or it could be included within a client data package.

d. All personnel who handle sample containers shall make every attempt to ensure that all changes of custody are accurately and completely documented. **Disciplinary action may be taken for employees who fail to comply with these important requirements**.

B. Environmental procedure

1. Initiation of COC documentation

a. Chain-of-custody documentation shall be kept upon the request of the client or for any samples which are known to be involved in a legal dispute. As with all analytical data, it is **extremely** important that this documentation is filled out completely and accurately with every sample transfer. **Everyone who handles the COC has the responsibility to check for documentation compliance to the point of their acquisition.** If changes need to be made to the form, they shall be made in accordance to the error correction procedure addressed in SOP-QA-109. It will be the responsibility of the person who made an error in documentation to correct the error.

b. If requested by the client, the COC documentation will begin with the preparation of sampling containers. Form 2102 (Figure 1) will be initiated by the person packing the bottle order for shipment to the client. If the delivery of containers is via Lancaster Laboratories Transportation Department, the driver shall sign the form when they relinquish the bottles to the client. Drivers must also sign COC forms when they pick up samples for analysis.

c. When samples arrive at the laboratory for analysis, a member of the Sample Administration group will receive them and sign the external COC form that accompanies the samples, if provided. If the samples were picked up by our Transportation Department, the driver must sign the COC to relinquish the samples to Sample Administration.

d. The Sample Administration group will track the custody of samples between receipt and entry into the CSMS on Form 2174 (Figure 2). The client's sample designation will be used for identification purposes until a unique Lancaster Laboratories number is assigned.

e. Samples will be entered into the Sample Management System as described in SOP-QA-102. Sample Administration will enter an analysis number for "Laboratory Chain of Custody" if requested. A lab note will print to inform analysts of the need for COC documentation. This note will also be automatically added to the sample labels.

2. Creating the internal COC

a. Sample Administration personnel shall initiate an internal Laboratory Chain of Custody form (Figure 3) at the time of sample entry for each type of container in the sample group. Form 2365 will be initiated for each sample group at the time of entry (Figure 4). The samples will then be relinquished to a sample custodian who will store the samples in an assigned secure location. This change of custody from sample entry to storage shall be documented on the chain, as well as any interim exchanges for rush analysis, preservation, homogenization, or temporary storage in the SA HOLD. The internal COC forms will then accompany the samples from storage to the laboratory for analysis.

b. If samples need to be checked out from the Sample Administration Group before Lancaster Laboratories numbers have been assigned to them, SA will be responsible for starting a COC form. They will note the available header information, the samples being relinquished (documented by the client sample designation), and the reason for transfer.

c. After sample entry, the original copy of the external client COC/analysis request form will be filed with Accounts Receivable, to be returned to the client with their invoice. Other copies of the external form will stay within SA to be filed within the client's paperwork file.

3. Documentation of custody changes

   a. An example of how to document changes in sample custody is shown in Figures 3 and 5. Each change of sample custody must be accurately documented in a consistent format. All signatures documenting changes of custody will use the following format:

      Signatures: First initial, full last name, employee number
      Date: Month/day/year
      Time: Documented as military time
      Ink: Black ink is preferred, red ink and pencil are not acceptable

      (1) When Sample Support releases samples to an analyst they must:

      Note the sample number(s) released and sign the "Released By" column of the chain.

      (2) When an analyst receives samples from Sample Support they must:

      Sign the "Received By" column, note the date and time samples are received, and note the reason why they are taking the samples (reason for change of custody).

      (3) When an analyst returns samples to Sample Support they must:

      Note all sample numbers being returned, sign the Released By column, and note time and date of return.

(4) When Sample Support receives samples from an analyst they must:

Sign the Received By column and note the reason for sample transfer.

b. Sample handling should be kept to a minimum. Analysts requiring use of a sample will requisition it through the computer requisition program. During the hours when Sample Support is manned by sample custodians, a custodian will receive the computerized requisition and remove the sample from storage. The custodian will ensure that the bottle type listed on the COC form matches the bottle type being distributed. **It will be the shared responsibility of the analyst and sample custodian to ensure that forms are signed, dated, and reason for sample transfer are recorded with each change of custody, as directed by Item (3)a. above.**

c. Each specific test that an analyst performed in conjunction with the associated sample number(s) must be accurately documented by the analyst before the samples are returned to a sample custodian in the sample storage area.

d. When an analyst requires the use of samples when a sample custodian will not be on duty, they must requisition samples earlier in the day or on the previous day. These samples and associated COCs will be pulled by a sample custodian and placed in the locked Main Storage area. The sample custodian will note on the COC the change in transfer to the Main Storage in addition to the time, date, and the sample numbers. When an analyst picks up the sample from Main Storage, they will need to contact the security person on duty to unlock the Main Storage unit. The analyst will need to fill out Form 2667 (Figure 6) which will be located by the entrance to the Main Storage unit to document entry into the storage unit (security will co-sign as a witness). Once the notebook

is signed, the analyst may enter and retrieve their samples. The analyst picking up the samples will document the specific samples being checked out. The security person will sign in the Released By column. The analyst will sign the Received By column, note the time, date, and reason for transfer. When the analyst returns the samples to the Main Storage, security must be contacted. The logbook must be signed by the analyst and security, the analyst must sign the Released By column, and security must sign the Received By column indicating the time, date, and reason for transfer (e.g., Main Storage).

e. The following changes of custody will be handled in the following manner:

(1) Documentation is required for all shift changes. Signatures involving transfers from one shift to another shall be the responsibility of the analyst who originally acquired the samples from Sample Support.

(2) Occasionally, a sample container will be needed for analysis by an analyst in a department while it is in the custody of an analyst in another department. It will be the responsibility of the first person who received the sample to note on the COC the specific sample numbers requested by the second person and to sign the Released By column. The second person will sign the Received By column and note the time, date, and reason for sample transfer. After the second person is finished with the sample, the sample will be returned back to the first person or to the Sample Storage area.

(3) In situations where a sample group must be split between departments working on different analyses, a supplemental COC must be initiated by the Sample Support Group. The supplemental chain will be used to accompany that portion of the

sample group which is needed by a second department, when another department has part of the sample group and the COC for the entire group. This supplemental COC will be created only when absolutely necessary to minimize paperwork and confusion. This chain must also be documented on the master list of chains initiated for the sample group.

(4) If COC samples are stored in other areas of the laboratory or in a specific department, they must be stored in a secured area. When samples are taken from a departmental storage area, the Released By column of the COC is documented as "department XX storage." If samples are returned to this area when complete, the Received By column will be noted as department XX storage.

4. Additional COC issues

a. Analysts in possession of samples shall remove the aliquot required for their analysis and return the samples to the Sample Support Group with a minimum of delay. During this time of possession, samples must fall under the definition of sample custody.

b. If additional containers of the sample are created (e.g., subsamples, extracts, distillates, leachates, digests, etc.), then additional COC form must be created by the department if they do not document this information on the original COC form. This form will be marked with the container type and will be initiated to accompany the new sample container. Each department in the lab has specifically designed COC forms that will be used if new containers are created, (see Figure 5 for an example). All changes of custody involving handling of new containers in the department (e.g., analysis, storage, vials on

instruments, etc.) will be documented on the departmental specific COC form or on the original COC form. Any specific handling or documentation requirements for departmental chains can be described in a departmental SOP.

5. Completion of the process

   a. After sample analysis, samples shall be returned to the Sample Support Group as soon as possible. Original COC forms shall also be returned with the samples and this change of custody noted. At this time, it will be the responsibility of the Sample Support Group to review the COC forms to ensure that all documentation on the forms is complete before they file the forms in their area. Sample custodians will not return a sample to its assigned storage location without signing the accompanying chain and performing this completeness check. All chains should either end with a note of "All Sample Consumed," "Discard," or "Storage" for the final reason of transfer.

   b. All completed COC forms for the original sample containers will be retained in files within Sample Support. The Data Package Group will retrieve these forms so a copy can be included in the data package. (**Note**: For those employees who collect COC forms for data packages; if you find a completed COC form in your area that does not get a data package, please send that COC form to the project manager for that account. The project manager will determine whether copies of the COCs get sent to the client with the reports or whether the originals will be archived at Lancaster Laboratories. The project manager will then forward the original COC forms to the Data Package Department for archiving). All departmental created COC forms will be collected by the department's data package group so a copy can be included in the data package. These forms will not be returned to the Sample Support

Group since these sample containers will not be returned to the Sample Support Group. The original copy of all COC forms will be retained on file by the laboratory.

c. All personnel who handle sample containers shall make every attempt to ensure that all changes of custody are accurately and completely documented. **Disciplinary action may be taken for employees who fail to comply with these important requirements.**

d. In the event that a signature or other information is inadvertently not recorded on a COC form, then Sample Support, Data Package Groups, in conjunction with the technical groups, shall determine what information is missing. This can be performed by checking computer requisition records, raw data, or the Sample Support work schedule. The responsible party shall add the missing information or make the necessary correction at the bottom of the COC form, in addition to noting the situation that caused the error in documentation. The person making this note needs to sign and date the information using the current date. Any errors in COC documentation that cause noncompliances must be noted in the case narrative of the sample data package. Examples of specific cases are on file in the Data Package Department.

**Revision Log:**

Initiated Date: 03/87

| Ver. # | Effective Date | Change |
|---|---|---|
| 00 | 12/01/95 | Previous Issue |
| 01 | 03/14/97 | Major changes are as follows:<br>• Training section added.<br>• Examples of SA Receipt Documentation Log and Metals Locked Storage COC updated.<br>• Section E.1., Option to end chain with "All Sample Consumed" added. |
| 02 | 09/02/97 | Major changes are as follows:<br>• Incorporated specific Procedure section for Food, Animal Health, and Pharmaceutical procedures.<br>• Expanded upon the scope of the procedure. |
| 03 | 06/01/99 | Major changes are as follows:<br>• Deleted Figure 6 - no longer being used.<br>• Added "sign-out" logbook to procedure for weekend and off hours sample retrieval.<br>• COC forms revised to state "Secure" storage.<br>• Added example of weekend and off-hours sign-out logbook page.<br>• Added instructions on how to handle COCs that don't get a data package. |
| 04 | 08/02/99 | Major changes are as follows:<br>• Clarify that paperwork may be filed separately if samples are stored under conditions not conducive to paper storage.<br>• Change SA HOLD to Main Storage<br>• Updated Figure 3 to replace SA HOLD to Main Storage |

**COMPANY CONFIDENTIAL**

**Figure 1 - Continued**

## DIRECTIONS FOR COMPLETING THIS FORM

**(1) Client:** Your company's name
**Acct. #:** Your account number with Lancaster Laboratories
**Project Name/#:** The way your company refers to the work involved with these samples. You may want to include project location as part of the description.
**PWSID:** Potable Water Source ID#
**Project Manager:** The person at your company responsible for overseeing the project
**P.O.#:** Your company's purchase order number
**Sampler:** The name of the person who collected the samples
**Quote #:** The reference number that appears on your quote (if Lancaster Laboratories gave you a number)
**State where sample was collected:** Please indicate where the sample was taken, e.g., PA, NJ, etc.

**(2) Sample Identification:** The unique sample description you want to appear on the analytical report
**Date Collected/Time Collected:** When the sample was collected

**(3) Grab:** Check here if sample was taken at one time from a single spot.
**Composite:** Check here if samples were taken from more than one spot, or periodically, and combined to make one sample.

**(4) Matrix:** Check the type of sample you are submitting. If it is a water sample, please indicate if it is a potable water or if it is an NPDES sample.
**Number of Containers:** Indicate the total number of containers for each sampling point.

**(5) Analyses Requested:** Write the name of each analysis (or an abbreviation of it) here, and use the **catalog number** that appears at the beginning of each line in the *Schedule of Services*. Be sure to indicate which analyses are to be performed on which samples.

**(6) Remarks:** List special instructions about the sample here (e.g., hazardous elements, high levels of analyte, etc.). The space can also be used (if needed) for listing additional analyses.

**(7) Turnaround Time Requested:** Circle **Normal** if you want routine TAT, which is usually within 10-15 days. If you need your results faster, call ahead to schedule **Rush** work.

**Rush Results Requested by:** Circle **Fax** or **Phone** and include the number.

**(8) Data Package Options:** Call our Client Services Group (717-656-2300) if you have questions about these choices.
**SDG Complete?** Indicate **Yes** if this is a complete sample delivery group or **No** if you will be submitting additional samples to be included in the same data package.
**Note:** We need to have one quality control (QC) sample for every 20 samples you send, if you are requesting site-specific QC. Please give us this sample in triplicate volume and identify it by writing "QC" in the **Remarks** column.
The internal chain of custody is a hand-to-hand documentation recording a sample's movement throughout the company. We routinely start a chain of custody for data package samples unless we are told otherwise. There is a **$25 per sample** charge for the chain-of-custody documentation.

**(9) Relinquished by/Received by:** The form must be signed each time the sample changes hands. We can supply chain-of-custody seals for the outside of your packages if you require them.

Thank you for using Lancaster Laboratories.
Please call our Client Services Group (717-656-2300) if you have any questions about completing this form.

## B4. Analytical Methods Requirements

The analytical procedures to be used for organics and inorganics are those described in the *USEPA SW-846 3rd Edition, Update III, 1996,* and *Methods for the Chemical Analysis of Waters and Wastes, USEPA, 600/4-79-020* for the preparation and analysis of water, sediment, and soil for the client specified compounds. Copies of the analytical procedures are located in the laboratory and available for use by analysts. Copies of analytical methods are available upon request. Quantitation and detection limits for the following methods are noted in Tables B4-2 through B4-22. These are evaluated annually and are subject to change, as per the guidelines given in 40 CFR Part 136 Appendix C.

### Inorganic Analysis

Metals by Inductively Coupled Plasma (ICP) – This is a technique for the simultaneous determination of elements in solution after acid digestion. The basis of the method is the measurement of atomic emission by an optical spectroscopic technique. Characteristic atomic line emission spectra are produced by excitation of the sample in a radio frequency inductively coupled plasma. Method 6010B, See Table B4-1 for list of elements and prep methods.

Metals by Graphite Furnace Atomic Absorption (GFAA) – This is a method of analysis designed to detect trace amounts of the analyte through electrothermal atomization. Samples are digested before analysis. The graphite furnace AA spectrophotometer heats the sample within a graphite tube using an electrical current (i.e. flameless furnace) and measures the absorption of specific metallic elements at discrete wavelengths. Methods listed in Table B4-1.

Mercury by Cold Vapor Atomic Absorption – Organic mercury compounds are oxidized and the mercury is reduced to the elemental state and aerated from solution in a closed system. The mercury vapor passes through a cell positioned in the light path of a spectrophotometer and absorbance (peak height) is measured. Method 7470A/7471A.

Metals by Flame Atomic Absorption – This method is also suited to metals analysis. A solution of the sample to be analyzed is sprayed into a flame which generates sufficient heat to decompose the sample into its constituent atoms directly in the optical path. The difference in light intensity is measured at specific wavelengths using a spectrophotometer. Methods listed in Table B4-1

**Micellaneous Wet Chemistry**

Moisture – A known sample weight is placed in a drying oven maintained at 103° to 105°C for 8 to 24 hours. The sample is reweighed after drying and this value is divided by the original weight. The result is used to calculate analytical concentration on a dry-weight basis. Method 160.3 (modified).

Cyanide, total – Distillation of the sample releases the cyanide from cyanide complexes as HCN. The liberated HCN and simple cyanides are converted to cyanogen chloride by reaction with chloramine T. This reacts with pyridine and barbituric acid reagent to give a red colored complex. The absorbance is read at 570 nm and is compared to a standard curve using an automated spectrophotometer. Method 9012A.

Phenolics, total – This method is based on automated distillation of phenol and the subsequent reaction with 4-aminoantipyrine in basic buffer to produce a red colored complex. The absorbance is read at 505 nm and is compared to a standard curve using an autotomated spectrophotometer. Method 9066.

Sulfide, total – The sample is acidified and a known excess of iodine is added. The iodine reacts with sulfide in acid solution, oxidizing sulfide to sulfur. The excess iodine is back-titrated with sodium thiosulfate. Method 9034 (modified).

Total Petroleum Hydrocarbons – Samples are extracted with freon and the resulting solution is treated with silica gel to remove fatty acids and other polar compounds. The remaining nonpolar compounds are designated as petroleum hydrocarbons and are quantitatively measured using Fourier transform infrared spectroscopy (FTIR). Method 418.1 (modified for soils).

Oil and Grease – For HEM a one liter sample is serially extracted with n-hexane in a separatory funnel. The solvent is evaporated from the extract, and the residual HEM is weighed. For SGT-HEM a one liter sample is serially extracted with n-hexane in a separatory funnel. The extract is mixed with silica gel, filtered through sodium sulfate, the solvent evaporated from the extract, and the residual SGT-HEM is weighed. Method 1664A.

Total Organic Carbon (TOC) – Following acidification, the sample is purged with nitrogen to remove inorganic carbon. Persulfate is injected to oxidize organic carbon to carbon dioxide which is detected by IR. Method 9060.

Total Organic Halogen (TOX) – Organic halogen is adsorbed onto an activated carbon column and combusted in an oxygen furnace. The resulting hydrogen halide gases are collected in an acetic acid buffer. The halides are titrated microcoulometrically through the generation of Ag+ ions. Method 9020B.

Total Nitrite/Nitrate – Using an autoanalyzer, the sample is passed through a column containing granulated copper-cadmium to reduce nitrate to nitrite. The nitrite ion reacts with sulfanilamide to yield a diazo compound which couples with N-1-naphylethylenediamine dihydrochloride to form a soluble, highly colored dye. The absorbance is read at 520 nm and compared to a standard curve. Method 353.2.

**Organic Analysis**

Volatiles by GC/MS – This method determines the concentration of volatile (purgeable) organics. The analysis is based on purging the volatiles onto a Tenax/silica gel trap, desorbing the volatiles onto a gas chromatographic column which separates them and identifying the separated components with a mass spectrometer. Method 8260B/5030B/5035.

Semivolatiles by GC/MS – This method determines the concentration of semivolatile organic compounds that are separated into an organic solvent and are amenable to gas chromatography. The method involves solvent extraction of the sample to isolate analytes and GC/MS analysis to determine semivolatile compounds present in the sample. Method 8270C/3550B/3510C.

Volatiles by GC – This method determines the concentration of volatile (purgeable) organic compounds. The analysis is based on purging the volatiles from the sample onto an appropriate sorbent trap and desorbing the volatiles onto a gas chromatographic column. Using an appropriate temperature program, the compounds are separated by the column and both qualitative and quantitative detection is achieved with a photoionization and/or electrolytic conductivity detector. Method 8021B/5030B/5035. Non-halogenated organics are analyzed by flame ionization detectors. Method 8015B/5030B/5035.

TPH-GRO – This method determines the concentration of gasoline range organics (2-methylpentane to 1,2,4-trimethylbenzene). The analysis is based on purging the volatiles from the sample onto an appropriate sorbent trap and desorbing the volatiles onto a gas chromatographic column. Using an appropriate temperature program, the compounds are separated by the column and both qualitative and quantitative detection is achieved with a flame ionization detector. BTEX may be determined simultaneously on systems equipped with a photoionization detector in tandem with the FID. Method 8015B/5030B/5035.

TPH-DRO – This method determines the concentration of diesel range organics (C-10 to C-28 hydrocarbons). The procedure includes solvent extraction of the sample and analysis of the extract on a gas chromatograph/flame ionization detector (GC/FID) using a megabore capillary column. Method API "Method for Determination of Diesel Range Organics," Revision 2, 02/05/95; or California Department of Health Services LUFT Task Force TPH Analysis-Diesel Method, 10/18/89, Method 8015B/5030B/5035.

Pesticides, PCBs, & Herbicides – These methods determine the concentration of organochloride pesticides, polychlorinated biphenyls, herbicides, and organophosphate pesticides. The procedures include solvent extraction of the sample, analysis of the extract on a gas chromatograph/electron capture detector (GC/EC) using a capillary column, and confirmation on a GC/EC using a second capillary column. A nitrogen-phosphorus detector is used for organophosphates. If the compound concentration is sufficient, confirmation may be performed on GC/MS upon request. Pesticides methods 8081A/3550B/3510C and 8141A/3550B/3510C. PCBs Method 8082/3550B/3510C. Herbicides Method 8151A/3550B.

PAHs by HPLC – The sample aliquot is extracted with methylene chloride. The extract is filtered (soils), dried, concentrated by evaporation and exchanged into acetonitrile. The extract is analyzed by reverse-phase HPLC with both UV and fluorescence detectors. Methods 8310/3550B/3510C.

[1]Analyzed by Trace ICP

[2]Analyzed by Cold Vapor

[3]Analyzed by GFAA

[4]Analyzed by automated spectrophotometer

*Specific quantitation limits are highly matrix dependent. The quantitation limits listed herein are provided for guidance and may not always be achievable.

**Quantitation limits listed for soil/sediment are based on wet weight. The quantitation limits calculated by the laboratory for soil/sediment, calculated on a dry-weight basis, will be higher.

The laboratory routinely reports at the limit of quantitation (LOQ) but can estimate down to the MDL when requested by the client. Values reported below the LOQ are reported with a J-flag and are defined as estimated values.

LOQs and MDLs are evaluated annually and subject to change.

*Specific quantitation limits are highly matrix dependent. The quantitation limits listed herein are provided for guidance and may not always be achievable.

**Quantitation limits listed for soil/sediment are based on wet weight. The quantitation limits calculated by the laboratory for soil/sediment, calculated on a dry-weight basis will be higher.

The laboratory routinely reports at the limit of quantitation (LOQ) but can estimate down to the MDL when requested by the client if a valid mass spectrum is obtained. Values reported below the LOQ are reported with a J-flag and are defined as estimated values.

LOQ and MDLs are evaluated annually and subject to change.

| *o*,*o*,*o*-Triethyl phosphorothioate | 10. | 2. | 330. | 67. |
| 1,3,5-Trinitrobenzene | 20. | 3. | 670. | 170. |

*Specific quantitation limits are highly matrix dependent. The quantitation limits listed herein are provided for guidance and may not always be achievable.

**Quantitation limits listed for soil/sediment are based on wet weight. The quantitation limits calculated by the laboratory for soil/sediment, calculated on a dry-weight basis will be higher.

The laboratory routinely reports at the limit of quantitation (LOQ) but can estimate down to the MDL when requested by the client if a valid mass spectrum is obtained. Values reported below the LOQ are reported with a J-flag and are defined as estimated values.

[1]N-Nitrosodiphenylamine decomposes in the GC inlet forming diphenylamine. The result reported for N-Nitrosodiphenylamine represents the combined total of both compounds.

[2]Aramite and a,a-dimethyl-1-phenethylamine can be determined upon request.

[3]3-methylphenol and 4-methylphenol cannot be resolved under this analysis. The combined total of both compounds is reported as 4-methylphenol.

[4]1,2-Diphenylhydrazine cannot be distinguished from azobenzene, therefore, the value reported represents the combined total of both.

LOQ and MDLs are evaluated annually and subject to change.

*Specific quantitation limits are highly matrix dependent. The quantitation limits listed herein are provided for guidance and may not always be achievable.

**Quantitation limits listed for soil/sediment are based on wet weight. The quantitation limits calculated by the laboratory for soil/sediment, calculated on a dry-weight basis will be higher.

The laboratory routinely reports at the limit of quantitation (LOQ) but can estimate down to the MDL when requested by the client if a valid mass spectrum is obtained. Values reported below the LOQ are reported with a J-flag and are defined as estimated values.

[1]n-Nitrosodiphenylamine decomposes in the GC inlet forming diphenylamine. The result reported for n-Nitrosodiphenylamine represents the combined total of both compounds.

LOQ and MDLs are evaluated annually and subject to change.

*Specific quantitation limits are highly matrix dependent. The quantitation limits listed herein are provided for guidance and may not always be achievable.

**Quantitation limits listed for soil/sediment are based on wet weight. The quantitation limits calculated by the laboratory for soil/sediment, calculated on a dry-weight basis will be higher.

The laboratory routinely reports at the limit of quantitation (LOQ) but can estimate down to the MDL when requested by the client. Values reported below the LOQ are reported with a J-flag and are defined as estimated values.

LOQ and MDLs are evaluated annually and subject to change.

**Table B4-15**
Petroleum Analysis by GC (8021B)

| Compound | Waters | | Soils** | |
|---|---|---|---|---|
| | LOQ* (mg/L) | MDL (mg/L) | LOQ* (mg/kg) | MDL (mg/kg) |
| Benzene | 1. | 0.2 | 5. | 2. |
| Toluene | 1. | 0.2 | 5. | 2. |
| Ethylbenzene | 1. | 0.2 | 5. | 2. |
| Total Xylene | 3. | 0.6 | 15. | 5. |
| Methyl t-butyl ether | 1. | 0.3 | 20. | 5. |
| Napthalene | 5. | 1. | 20. | 5. |

*Specific quantitation limits are highly matrix dependent. The quantitation limits listed herein are provided for guidance and my not always be achievable.

**Quantitation limits listed for soil/sediment are based on wet weight. The quantitation limits calculated by the alboratory for soil/sediment, calculated on a dry-weight basis will be higher.

The laboratory routinely reports at the limit of quantitation (LOQ) but can estimate down to the MDL when requested by the client. Values reported below the LOQ are reported with a J-flag and are defined as estimated values.

LOQ and MDLs are evaluated annually and subject to change.

**Table B4-16**
TPH GRO/DRO by GC (8015B)

| Compound | Waters | | Soils** | |
|---|---|---|---|---|
| | LOQ* (mg/L) | MDL (mg/L) | LOQ* (mg/kg) | MDL (mg/kg) |
| TPH-GRO | 0.05 | 0.02 | 1. | 0.2 |
| TPH-DRO | 0.1 | 0.1 | 7. | 4. |

NOTE: MDLs listed are higher than determined MDLs. This is because the method sums the total detectable area under the chromatographic plot in region of interest, instead of actual fuel peak area as the respective fuel.

*Specific quantitation limits are highly matrix dependent. The quantitation limits listed herein are provided for guidance and may not always be achievable.

**Quantitation limits listed for soil/sediment are based on wet weight. The quantitation limits calculated by the laboratory for soil/sediment, calculated on a dry-weight basis will be higher.

The laboratory routinely reports at the limit of quantitation (LOQ) but can estimate down to the MDL when requested by the client. Values reported below the LOQ are reported with a J-flag and are defined as estimated values.

LOQ and MDLs are evaluated annually and subject to change.

| Pyrene | .8 | .17 | 27. | 2.5 |

*Specific quantitation limits are highly matrix dependent. The quantitation limits listed herein are provided for guidance and may not always be achievable.

**Quantitation limits listed for soil/sediment are based on wet weight. The quantitation limits calculated by the laboratory for soil/sediment, calculated on a dry-weight basis will be higher.

The laboratory routinely reports at the limit of quantitation (LOQ) but can estimate down to the MDL when requested by the client. Values reported below the LOQ are reported with a J-flag and are defined as estimated values.

LOQ and MDLs are evaluated annually and subject to change.

## B5. Quality Control

The particular types and frequencies of quality control checks analyzed with each sample are defined in *USEPA SW-846 3rd Edition, Update III, 1996*, and *Methods for the Chemical Analysis of Waters and Wastes, USEPA, 600/4-79-020*. The quality control checks routinely performed during sample analysis include blanks, laboratory control samples, surrogates, duplicates, internal standards, and matrix spikes. In addition to these checks, some inorganic analyses employ serial dilutions and interference check samples.

Blanks (method, preparation) – Blanks are an analytical control consisting of a volume of deionized, distilled laboratory water for water samples, or a purified solid matrix for soil/sediment samples. (Metals use a digested reagent blank with soils.) They are treated with the same reagents, internal standards, and surrogate standards and carried through the entire analytical procedure. The blank is used to define the level of laboratory background contamination.

Laboratory Control Samples or Reference materials – Aqueous and solid control samples of known composition are analyzed using the same sample preparation, reagents, and analytical methods employed for the sample. These materials may be purchased from NIST or commercial supply houses either as neat compounds or as solutions with certified concentrations, or prepared in the technical department. The accuracy and quality of the purchased standards are documented on certificates provided by the supply houses. Certificates are maintained on file in the laboratory. The accuracy information determined from reference materials and laboratory control samples is valuable because variables specific to sample matrix are eliminated. The acceptance criteria for this type of quality control is either dictated by the agency from whom the material is obtained or by statistical analysis of past information generated in the technical department. A LCS is analyzed with every batch to demonstrate accuracy of the procedure and process control.

Surrogates (used for organic analysis only) – Each sample, matrix spike, matrix spike duplicate, and blank are spiked with surrogate compounds prior to purging and extraction in order to monitor preparation and analysis. Surrogates are used to evaluate analytical efficiency by measuring recovery. The recovery data is compared to method stipulated or statistically generated limits.

Duplicates (matrix spike duplicate - organics and inorganics; duplicate-inorganics) – A second aliquot of a matrix/sample is analyzed at the same time as the original sample in order to determine the precision of the method. The relative percent difference (RPD) between the two determinations is calculated and compared to values prescribed by EPA or determined statistical analysis of the past information generated in the technical department.

Internal Standards (used for GC/MS and some GC analysis) – Internal standards are compounds added to every standard, blank, matrix spike, matrix spike duplicate, and sample at a known concentration, prior to analysis. Comparison of the peak areas of the internal standards are used for internal standard quantitation as well as to determine when changes in the instrument response will adversely affect quantification of target compounds.

Matrix Spikes – Matrix spiked samples are samples fortified with a target analyte and subjected to the entire analytical procedure. The recovery of the analyte(s) is calculated and indicates the appropriateness of the method for the matrix. Matrix spike duplicates is the analysis of a pair of fortified samples from the same source. The matrix spike duplicates yields precision and accuracy information. The acceptance criteria for percent recovery on spike samples in prescribed by EPA or determined statistical analysis of the past information generated in the technical department.

Serial Dilutions (used for inorganics GFAA and ICP only) – If the analyte concentration is sufficiently high, an analysis of a five-fold dilution must agree within 10% of the original determination. If the dilution analysis is not within 10%, a chemical or physical interference effect should be suspected.

Interference Check Sample (ICP) – To verify interelement and background correction factors a solution containing both interfering and analyte elements of known concentration is analyzed at the beginning and end of each analysis run or a minimum of twice per 8 hours.

Second Source Check – A second source check is analyzed using either the LCS or an ICV (Initial Calibration Verification). The second source is a standard that is made from a solution or neat purchased from a different vendor than that used for the calibration standards. For some organic custom mixes, the same vendor but a different lot and preparation is used. This ensures that potential problems with a vendor supply would be evident in the analysis. Some areas of the lab may use the continuing calibration verification standards as a second source from the initial calibration.

The results of all quality control samples are entered into the LIMS in the same way as the results of client samples. The computer is programmed to compare the individual values with the acceptance limits (statistically determined or method specified) and inform the analyst if the results of the quality control tests are in or out of specification. If the results are not within the acceptance criteria, corrective action suitable to the situation must be taken. This may include, but is not limited to, checking calculations, examining other quality control analyzed with the same batch of samples, qualifying results with a comment stating the observed deviation, and reanalysis of the samples in the batch. In addition, computerized reports on the results for all quality control analyses including mean and standard deviation are generated monthly. These are used by the Quality Assurance Department to check for trends that may indicate method bias. Control charts are plotted via computer and may be accessed at any time by all analysts.

The following tables list the specific QC used for each method and the applicable QC windows. These windows are generated statistically and are subject to change. Statistical limits are determined for recovery and RPD data using historical data (minimum of 20 data points) and applying a 99% confidence interval around the mean. The limits are generated every 6 months for SW-846 methods and annually for other methods, and updated as needed. The tables list the full list of analytes for a method. Sublists (TCL, PPL, etc.) may be reported based on the clients requirements. See Element B4 for the particular analytes associated with a regulatory list.

**Table B5-1**
Quality Control
Inorganics

| Type | Acceptance Limits (%) WATERS SOILS | Frequency | Corrective Action |
|---|---|---|---|
| **Matrix Spikes:** | See Table B5-2 | Each group of samples of similar matrix/level (≤20) each method | Analyze post-digestion spike sample |
| **Matrix Spike Duplicate (RPD):** | ±20% RPD | Each group of samples of similar matrix/level (≤20) each method | Analyze post-digestion spike sample if not already run for MS, flag the data |
| **Duplicates (RPD):** | ±20% RPD for sample values ≥5× LOQ | Each group of samples of similar matrix/level (≤20) each method | Flag the data |
| **Blanks:**<br>Initial Calibration (ICB)<br>Continuing Calibration (CCB) | ***ICP:***<br><3× IDL or blank <1/10 conc. of action level and samples not ±10% of action level<br>***AA:***<br><LOQ | Each wavelength immediately after calibration verification at 10% frequency or every 2 hours (beginning and end of run min.) | Correct problem, recalibrate, and rerun |
| Preparation Blank | ≤LOQ<br>>LOQ then lowest conc. in sample must be 20× blank concentration | Each SDG or batch (≤20 samples) | Redigest and reanalyze blank and associated samples if sample result <20× blank result |
| **Serial Dilutions (ICP & GFAA only):** | Within ±10% of the original determination | Each group (≤20) of similar matrix/level | Flag the data |
| **Interference Check Sample (ICP only):** | ±20% of the true value for the analytes | Each wavelength after Initial Calibration Verification at beginning and end of the run or min. of 2× per 8 hour | Recalibrate the instrument |
| **Laboratory Control Sample:** | See Table B5-2 | Each SDG or batch (≤20 samples), each method | Redigest and reanalyze LCS and associated samples |

SW846 Method 7000A GFAA
Batch QC Decision Tree
Analyze MB, LCS, LCSD, FS, MS, MSD REP
MB < PQL ?
Yes
No
Rework all samples <20x blank value in batch
LCS, LCSD *RPR 80% to 120% & RPD <20 ?
Yes
Are any samples >25x MDL ?
Yes
No
Perform 1:5 SD on 1 FS
SD PD < 10% ?
No
Perform PDS on 1 FS (spike the same sample used for SD-- if done)
PDS RPR 85% to 115% ?
No
Quantitate all FS by 1 point MSA
Report MSA values with comments. Report PDS RPR/SD PD where applicable
Yes
MS/MSD RPR 80% to 120% & RPD for REP or MS/MSD <20% ?
No
Report Data with additional comments Report PDS RPR/SD PD where applicable
Yes
Report Data with SD PD Failure (if done)
*Or lab calculated limits on ref. sample (solid)
NOTE: MSA will require client approval for additional charge.

**Table B5-10 – Continued**
Statistical Acceptance Limits for
Volatiles Halocarbons and Aromatics by GC (8021B)

| Compound Name | Water | | Soils | |
|---|---|---|---|---|
| | LCS/LCSD% | MS/MSD% | LCS/LCSD% | MS/MSD% |
| Tetrachloroethene | 76-123 | 72-129 | 69-103 | 66-94 |
| Toluene (PID) | 84-112 | 76-120 | 81-115 | 72-99 |
| *trans*-1,3-Dichloropropene | 83-122 | 81-123 | 77-117 | 73-108 |
| Trichloroethene (PID) | 82-110 | 65-130 | 72-115 | 66-95 |
| Trichlorofluoromethane | 51-125 | 52-127 | 42-115 | 40-95 |
| Vinyl Chloride | 53-137 | 49-142 | 48-115 | 47-95 |
| Xylene (total) | 85-115 | 80-121 | 83-115 | 73-105 |

Acceptance limits are based on statistical evaluation of laboratory data and are subject to change.

**Table B5-11**
Quality Control
Petroleum Analysis by GC (8021B)

| Type | Acceptance Limits (%) WATERS | SOILS | Frequency | Corrective Action |
|---|---|---|---|---|
| **Surrogate:** <br> ααα-Trifluorotoluene | 72 –134 | 68-122 | Each sample, MS, MSD, LCS, and blank | Reanalyze sample if outside limits; if reanalysis confirms original, document on report and/or case narrative |
| **Matrix Spike:** <br> Spike all compounds of interest | See Table B5-12 | | Each group (≤20) of samples per matrix/level | Run LCS for compounds outside of acceptance limits |
| **Laboratory Control Sample:** <br> Spike all compounds of interest | See Table B5-12 | | Each group (≤20) of samples per matrix/level | Reanalyze LCS and associated samples for compounds outside acceptance limits |
| **Matrix Spike Duplicates (RPD):** | ≤30% for waters and soils | | Each group (≤20) of samples per matrix/level | Evaluated by an analyst in relationship to other QC results |
| **Blanks** | ≤LOQ for all compounds | | At least one per 20 samples | Reanalyze blank and associated samples if blank is outside limits |
| **Internal Standards:** <br> 1-Chloro-3-fluorobenzene | -50% to +100% if internal standard area | | Each sample, MS, MSD, LCS, and blank analyzed on the PID | Reanalyze samples; if reanalysis confirms original, document on report or case narrative. In cases where matrix is elevating the ISTD recover, a dilution is performed to bring ISTD within specifications. |

Acceptance limits are based on statistical evaluation of laboratory data and are subject to change.

## B6. Instrument/Equipment Testing, Inspection, and Maintenance Requirements

Conditions of the laboratory equipment and instrumentation can have a marked effect on the accuracy and precision of analysis. In order to ensure timely production of data and prevent/address potential malfunctions, Lancaster Laboratories schedules routine preventive maintenance of instruments based on manufacturer's recommendations. Maintenance of the laboratory instruments is the responsibility of the technical group using the equipment in conjunction with our in-house Equipment Maintenance Group. A schedule of routinely performed instrument maintenance tasks is attached as Table B6-1. All preventive maintenance, as well as maintenance performed as corrective action, is recorded in instrument logs. Equipment/Instrumentation is assigned unique designations to allow tracking of the piece of equipment within laboratory documentation. This allows the laboratory to substantiate the instrument condition during the time it was used for testing.

Critical spare parts are kept in supply at the laboratory by the Equipment Maintenance Group. Most items not kept in stock at the laboratory are available through overnight delivery from the manufacturer. In addition, Lancaster Labs maintains multiple numbers of most of the critical instruments used in our laboratory operations. A recent equipment inventory may be found in the *Quality Manual*. Because we are a large laboratory with redundant capacity, the problems of instrument downtime are minimized.

**Table B6-1**
Preventive Maintenance Schedule

| Instrument | Preventive Maintenance | Frequency |
|---|---|---|
| GC/MS | Change septum | AN*: Min. weekly |
| | Check fans | Monthly |
| | Check cool flow | Monthly |
| | Clean source | Bimonthly or AN |
| | Change oil in diffusion pump | Annually |
| | Change oil in rough pump | Annually |
| GC Volatiles | Check propanol level | AN: Min. semiweekly |
| | Check all flows | Prior to calib. or AN |
| | Conductivity detector maintenance: | AN |
| | Clean cell | AN |
| | Change reaction tube | AN |
| | Change Teflon line | AN |
| | Change resin | AN |
| | Replace trap | AN |
| | Column maintenance | AN |
| | Change PID lamp | AN |
| | Precalibration instrument settings check | Prior to each calibration |
| GC | Septum change | Each run |
| | Column maintenance | AN |
| | Clean detector | AN |
| | Vacuum filters | Semiannually |
| | Leak check ECDs | Semiannually |
| Flame AA | Rinse burner head, chamber and trap | AN: Min. Weekly |
| | Clean nebulizer | Weekly |
| | Inspect tubing and O-rings | Monthly |
| | Replace lamp | AN |
| GFAA | Inspect/clean furnace head and lenses | Daily |
| | Check rinse bottle & drain | Daily |
| | Clean windows | Weekly |
| | Clean air intakes | Monthly |
| | Check Cool-Flow water level | Monthly |
| | Inspect sample introduction capillary | AN |
| | Inspect graphite tube | AN |
| | Adjust/replace electrodes/shroud | AN |
| | Clean Cool-Flow | AN |

**Table B6-1 – Continued**
Preventive Maintenance Schedule

| Instrument | Preventive Maintenance | Frequency |
|---|---|---|
| Cold Vapor AA | Replace pump tubing | AN: Min. weekly |
| | Lubricate pump head | Monthly |
| | Lubricate autosampler | Weekly |
| | Inspect optical cell and windows | Monthly |
| | Clean | AN |
| ICP | Replace pump winding | Daily |
| | Lubricate autosampler | Daily |
| | Check tubing to torch | Daily |
| | Vacuum instrument airfilters and air intakes | Monthly |
| | Check water filter, replace if needed | Quarterly |
| | Examine vacuum pump | Quarterly |
| | Change vacuum pump oil | Quarterly |
| | Clean optics and lenses | Semiannually |
| | Examine, clean, lubricate moving parts on autosampler | Semiannually |
| | Clean Torch and injector tip | AN |
| | Clean nebulizer and spray chamber | AN |
| | Check fan filters, clean if needed | AN |
| | Check cool flow, clean if needed | AN |
| Infrared Spectrometer (FTIR) | Check on-demand diagnostics | Weekly |
| | Change dessicant | AN |
| HPLC | Pump lubrication | Annually |
| | Check pump seals | Annually |
| | Check valves cleaned or rebuilt | AN |
| | Detector maintenance: | AN |
| | Bulb replacement and adjustment | |
| | Flow cell cleaning | |
| | Routine column maintenance | AN |
| | Replace Teflon lines | AN |
| | Autosampler septa replacement | AN |
| | In-line filter sonication/cleaning | AN |
| | System passivation | AN |
| | PCRS pump lubrication | AN |

**Table B6-1 – Continued**
Preventive Maintenance Schedule

| Instrument | Preventive Maintenance | Frequency |
|---|---|---|
| Total Organic Carbon Analyzer | Check IR zero | AN |
| | Check for leaks | AN |
| | Check acid pump calib. | Bimonthly |
| | Check persulfate pump calibration | Bimonthly |
| | Inspect 6-port rotary valve | AN |
| | Inspect sample pump head | AN |
| | Wash molecular sieve | AN |
| | Check sample loop calibration | Monthly |
| | Clean gas permeation tube | AN |
| | Inspect digestion vessel O-rings | AN |
| | Check activated carbon scrubber | AN |
| | Dust back and clean circuit boards | AN |
| | Check IR cell | AN |
| Total Organic Halogen Analyzer | Polish counter electrode | Daily |
| | Polish sensor electrode | Daily |
| | Clean loaders and pistons | Weekly |
| Autoanalyzer spectrophotometer | Clean sample probe | AN |
| | Clean proportioning pump | AN |
| | Inspect pump tubing, replace if worn | AN |
| | Clean wash receptacles | Monthly |

* AN means as needed. Any of these items may be performed more frequently if response during operation indicates this is necessary.

## B7. Instrument Calibration and Frequency

All measuring and testing equipment having an effect on the accuracy or validity of calibrations and tests will be calibrated and/or verified on an on-going and routine basis. Procedures for initial calibration and continuing calibration verification are in place for all instruments within the laboratory. The calibrations generally involve checking instrument response to standards (standardization) for each target compound to be analyzed. The source and accuracy of standards used for this purpose are integral to obtaining the best quality data. Standards used at Lancaster Laboratories are purchased from commercial supply houses either as neat compounds or as solutions with certified concentrations. The accuracy and quality of these purchased standards is verified through documentation provided by these commercial sources. Most solutions and all neat materials require subsequent dilution to an appropriate working range. All dilutions performed are documented and the resulting solution is checked by obtaining the instrument response of the new solution and comparing with the response to the solution currently in use. Any discrepancies between the responses are investigated and resolved before the new solution is used. Each standard is assigned a code that allows traceability to the original components. The standard container is marked with the code, name of solution, concentration, date prepared, expiration date, and the initials of the preparer. Shelf life and storage conditions for standards are included in the standard operating procedures and old standards are replaced before their expiration date.

Each instrument is calibrated with a given frequency using one or more concentrations of the standard solution. As analysis proceeds, the calibration is checked for any unacceptable change in instrument response. If the calibration check verifies the initial response, the analysis proceeds. If the calibration check indicates that a significant change in instrument response has occurred, then a new calibration is initiated. If necessary, maintenance may be performed before the recalibration.

Some instrumentation calibration involves the comparison of an instrument reading to a physical standard with a known certified value such as balance/weights or comparison against other instrumentation/apparatus such as NIST thermometer.

Calibration records are usually kept in the form of raw data with the other instrument printouts. In cases where no data system is used, calibration data is manually recorded in notebooks. Any maintenance or repair is also recorded in a notebook. The information that is recorded either in the notebooks or on the instrument printout includes the date, instrument ID, employee name and/or identification number, and concentration or code number of standard.

The frequency of calibration and calibration verification, number of concentrations analyzed, and acceptance criteria for each of the instruments to be used are listed in Table B7-1. In addition to checking the instrument response to target compounds, the GC/MS units are checked to ensure that standard mass spectral abundance criteria are met. Before each calibration, instruments used for volatile compound analysis are tuned using bromofluorobenzene (BFB) and instruments used for semivolatile analysis are tuned using decafluorotriphenylphosphine (DFTPP). The key ions and their abundance criteria are listed in Table B7-2.

**Table B7-1**
Instrument Calibration and Frequency

| | *Initial Calibration* | | | *Continuing Calibration Verification* | | |
|---|---|---|---|---|---|---|
| Instrument | Frequency | # Std Conc. | Acceptance Criteria | Frequency | # Std Conc. | Acceptance Criteria |
| GC/MS Volatiles* | After C-cal fails | 6 | RF for SPCCs >0.300 for chlorobenzene, and 1,1,2,2-tetrachloroethane, and >0.100 for 1,1-dichloroethene, bromoform, and chloromethane<br>CCCs ≤30% | Every 12 hours | 1 | RF for SPCCs >0.300 for chlorobenzene, and 1,1,2,2-tetrachloroethane , and >0.100 for 1,1-dichloroethene, bromoform, and chloromethane<br>%Drift for CCCs ≤20 |
| GC/MS Semivolatiles* | After C-cal fails | 6 | RF for SPCC's ≥0.050<br>%RSD for CCC's ≤30% | Every 12 hours | 1 | RF for SPCCs ≥0.050<br>%Drift for CCCs ≤20 |
| GC VOA Halocarbons and/or Aromatics | After C-cal fails | At least 5 | %RSD of <20% for individual compounds or for average of all compounds | Every 12 hours, or every 10 samples | 1 | %Drift ± 15% for individual compounds or average of all compounds |
| GC Pesticides and Herbicides (DDT/Endrin degradation applies to method 8081A only) | Each new run<br>After C-cal fails | 5 | ≤20% RSD of RFs of initial calibration to use avg. RF, otherwise use curve fit. Degradation for DDT, endrin 15%<br>Alternatively, if the average of the %RSDs of all compounds in the calibration standard is ≤20%, then the AVG RF can be used for all compounds. | Every 20 samples or 12 hours | 1 | ≤15% difference for individual analytes, from initial response for quantitation or<br>A CCV is also compliant if the average RPD for all compounds in the CCV standard is ≤15%.<br>DDT/Endrin degradation check every 12 hours or 20 injections |
| HPLC PAHs | Each new run or after C-cal fails | 5 | ≤20% RSD of RFs of initial calibration to use average RF, otherwise use curve fit<br>Alternatively, if the average of the %RSDs of all compounds in the calibration standard is ≤20%, then the AVG RF can be used for all compounds. | Every 10 samples | 1 | ≤15% difference for individual anlaytes, from initial response for quantitation or<br>A CCV is also compliant if the average RPD for all compounds in the CCV standard is ≤15%. |
| GC TPH-GRO | After C-cal fails | At least 5 | %RSD of <20% otherwise use calibration curve | Every 12 hours or every 10 samples | 1 | %Drift ±15% |
| GC TPH-DRO | After C-cal fails | 5 | % RSD of <20% for average RF otherwise use calibration curve | Every 10 samples | 1 | %Drift ±15% |
| ICP | Each new run | 1 | Independent calibration verification within ±10%, standards <5%RSD | Every 10 samples | 1 | Same as initial |

## Table B7-1 – Continued

Instrument Calibration and Frequency

| | *Initial Calibration* | | | *Continuing Calibration Verification* | | |
|---|---|---|---|---|---|---|
| Instrument | Frequency | # Std Conc. | Acceptance Criteria | Frequency | # Std Conc. | Acceptance Criteria |
| CVAA | Each new run | 5 | Independent calibration verification within ±10%<br>Correlation coefficient >0.995 | Every 10 samples | 1 | ± 20% of true value |
| GFAA | Each new run | 5 | Independent calibration verification within ±10%<br>Correlation coefficient >0.995 | Every 10 samples | 1 | ± 20% of true value |
| Flame AA | Each new run | 5 | Independent calibration verification within ±10%<br>Correlation coefficient >0.995 | Every 10 samples | 1 | ± 20% of true value |
| Autoanalyzer | Daily | 6 | Correlation coefficient >0.995 | Every 10 samples | 1 | ± 10% of true value |
| Infrared Spectrophotometer (FTIR) | Monthly | 7 | Correlation coefficient >0.995 | Every 10 samples | 1 | ± 10% of true value |
| TOC Analyzer | Weekly | 5 | ±10% @ STD | Every 10 samples | 1 | ± 10% of true value |
| TOX Analyzer | Each batch | 4 | ±5% @ STD | Every 8 samples | 1 | ± 10% of true value |
| Balance | Daily | 4 | Top-loading balance ±.5%<br>Analytical balances ± .1% for weights >.1 g<br>.05 g ± .5%<br>.02 g ± 1.0%<br>.01 g ± 2.0%<br>.005 g ± 2.0% | N/A | N/A | N/A |

*All compounds with %RSD >15 must use first or second order regression fit of the six calibration points. Alternatively, if average of the %RSD of all compounds in calibration standard is ≤15%, the AVG RF can be used for all compounds.

Abbreviations

# Std Conc. – The number of standard concentrations used

SPCCs – System performance check compounds

CCCs – Calibration check compounds

RF – Response factor

%RSD – Percent relative standard deviation

CCV – Continuing calibration verification

CVAA – Cold vapor atomic absorption spectrophotometer

HPLC – High Performance Liquid Chromatography

ICP – Inductively coupled plasma spectrophotometer; ICP run also includes interelement correction check standard (beginning and end of run)

GFAA – Graphite furnace atomic absorption spectrophotometer

**Table B7-2**
Mass and Ion Abundance Criteria

| *BFB Key Ions* | *Abundance Criteria* |
|---|---|
| 50 | 15% to 40% of mass 95 |
| 75 | 30% to 60% of mass 95 |
| 95 | Base peak, 100% relative abundance |
| 96 | 5% to 9% of mass 95 |
| 173 | Less than 2% of mass 174 |
| 174 | Greater than 50% of mass 95 |
| 175 | 5% to 9% of mass 174 |
| 176 | Greater than 95% but less than 101% of mass 174 |
| 177 | 5% to 9% of mass 176 |
| *DFTPP Key Ions* | *Abundance Criteria* |
| 51 | 30% to 60% of mass 198 |
| 68 | Less than 2% of mass 69 |
| 70 | Less than 2% of mass 69 |
| 127 | 40% to 60% of mass 198 |
| 197 | Less than 1% of mass 198 |
| 198 | Base peak, 100% relative abundance |
| 199 | 5% to 9% of mass 198 |
| 275 | 10% to 30% of mass 198 |
| 365 | Greater than 1% of mass 198 |
| 441 | Present but less than mass 443 |
| 442 | Greater than 40% of mass 198 |
| 443 | 17% to 23% of mass 442 |

## B8. Inspection/Acceptance Requirements for Supplies and Consumables

Analytical results can be affected by the type and quality of reagents, standards, and equipment. Time and effort could be lost if the reagents, standards, and equipment do not meet the specifications required for the method. Therefore, the specifications and/or requirements for reagents, standards, and equipment necessary to perform the testing methods are included in the analytical SOPs. Each technical department evaluates the reagents, standards and equipment they receive for acceptance and use in specific procedures. There are SOPs in place for procurement of supplies, and acceptance/evaluation of reagents and standards.

Sample bottles and vials provided to clients are purchased pre-cleaned to meet EPA specifications and guidelines for sample containers. Each lot of preservative purchased is analyzed for quality (signs of contamination) before being added to a sample container.

The deionized water system utilized by Lancaster Laboratories generates water meeting ASTM D1193-91, Type II water criteria and the USEPA Manual for the Certification of Laboratories Analyzing Drinking Water requirements. Appropriate testing is performed to monitor the system. The requirements for the DI system are documented in a laboratory SOP.

## B9. Data Acquisition Requirements (Non-Direct Measurements)

The data acquired from the analytical procedures will be assessed for precision, accuracy, representativeness, comparability, and completeness (PARCCs). These specifications will be met through precision and accuracy criteria as specified in Element B5 and MDLs in Element B4.

Precision – Precision is determined by measuring the agreement among individual measurements of the same property, under similar conditions. The laboratory objective is to equal or exceed the precision demonstrated for the applied analytical method on comparable samples. The degree of agreement is expressed as the relative percent difference (RPD%). Evaluation of the RPD% is based on statistical evaluation of past lab data or guidelines within the methods for organic and inorganic analyses. External evaluation of precision is accomplished by analysis of standard reference material and interlaboratory performance data.

Accuracy – Accuracy is a measure of the closeness of an individual measurement to the true or expected value. Analyzing a reference material of known concentration or reanalyzing a sample which has been spiked with a known concentration/amount is a way to determine accuracy. Accuracy is expressed as a percent recovery (%R). Evaluation of the %R is based on statistical evaluation of past lab data or guidelines within the methods for organic and inorganic analyses.

Representativeness – Representativeness expresses the degree to which data accurately represents the media and conditions being measured. The representativeness of the data from the sampling site will depend on the sampling procedure. Sample collection is the responsibility of the client. Samples will be homogenized, if required, as part of the laboratory sample preparation. By comparing the quality control data for the samples against other data for similar samples analyzed at the same time, representativeness can be determined for this objective.

Comparability – Comparability conveys the confidence with which one set of data can be compared to another. The analytical results can be compared to other laboratories by using traceable standards, standard methodology, and consistent

reporting units. The Laboratory Quality Assurance Program documents internal performance, and the interlaboratory studies document performance compared to other laboratories.

Completeness – Completeness is a measure of the quantity of valid data acquired from a measurement process compared to the amount that was expected to be acquired under the measurement conditions. The completeness of an analysis can be documented by including in the data deliverables sufficient information to allow the data user to assess the quality of the results. Additional information will be stored in the laboratory's archives, both hard copy and magnetic tape. SOPs are in place to provide traceability of all reported results.

Uncertainty – (ISO 17025) "All uncertainty components which are of importance in a given situation shall be taken into account using appropriate methods of analysis." (5.4.6.3) This means the laboratory must determine the uncertainty contribution of all steps in the testing process such as equipment, calibration, standards, reagents, preparation, cleanups, etc. Since, in most methods, the laboratory control sample (LCS) goes through the entire process of preparation to analysis; all factors that would contribute to uncertainty will be evident through the LCS results. LCS are performed with every batch of samples where appropriate for the method.

## B10. Data Management

At a minimum data management is initiated when Lancaster Laboratories receives the samples from the client. In many instances, client-communicated requirements for bottleware and analyses are documented on an Incoming Sample Activity Report (ISAR) prior to sample receipt. This communication helps ensure that analysis and reporting meet the client needs. Sample information and requested analyses are entered into the Laboratory Information Management System (LIMS) where it can be accessed by all laboratory personnel. The entry is based on the ISAR and the client's COC. After entry, labels are printed for each container and an Acknowledgement is printed for the client. This will show exactly what was entered for the client's samples.

The flow of data from the time the samples enter the laboratory until the data is reported is summarized in Table B10-1. Raw analytical data generated in the laboratories is collected on printouts from the instruments and associated data system or manually in bound notebooks. All data is tracked by a unique seven-digit sample number assignment. Analysts review data as it is generated to determine that the instruments and methods are performing within specifications. This review includes calibration checks, surrogate recoveries, blank checks, retention time reproducibility, and other QC checks described in Elements B4, B5, and B7. If any problems are noted during the analytical run and/or at completion, corrective action is taken and documented.

Any data recorded manually is collected in bound notebooks and recorded in indelible ink, as described in Element A9. Procedures are in place for handling erroneous entries and all changes are dated, initialed, and explained. All data is uploaded automatically or manually entered into the LIMS. The LIMS is programmed to accept and track the results of quality control samples including blanks, surrogates, recoveries, duplicates, controls, and reference materials. The LIMS is programmed with the acceptance criteria for each QC type and if results are outside specifications, then a message is displayed to the analyst. Data

obtained from instrument printouts are dated and contain the signature and/or identification of the analyst responsible for the generation. The LIMS also produces control charts and statistics, which are reviewed by QA staff for trends that may indicate problems with the analytical data.

Computer technology is an integral part of laboratory operations including analytical instrumentation and central corporate functions. The laboratory makes extensive use of computers for business applications, technical operations, and the QA program. The Information Technology (IT) group support hardware and software applications at all levels as their primary function. Although some commercial software has been adapted to the laboratory operation, a larger portion is custom programmed by the IT group. The System Development Life Cycle (SDLC) approach is utilized and hardware and software are evaluated for appropriate functionality, accuracy, and security. Changes to systems and testing are documented. As part of QA's routine traceability audits, the electronic records are reviewed.

The principle criteria used to validate data will be the acceptance criteria described in Elements B4, B5, and B7 and protocols specified in laboratory SOPs. Following review, interpretation, and data reduction by the analyst, data is transferred to the LIMS by direct data upload from the analytical data system or manually. This system stores client information, sample results, and QC results. Element D1 describes the data deliverables validation performed by the laboratory.

Project files are created per client/project and contain chain-of-custody records, analysis requirements, and laboratory acknowledgments that document samples received, laboratory sample number assignment, and analyses requested. Raw data is filed per batch number assignment and laboratory sample number that correlates to the sample receipt documents. When the project is complete, all documentation is archived for 10 years in a locked storage area.

**Table B10-1**
Sample and Data Flow

| Action | Personnel Involved |
|---|---|
| Sample received at Lancaster Labs<br>• Unpacked and reconciled against the client paper work or Chain of Custody<br>• SA Documentation log completed | Sample Administration |
| Sample is entered into sample management system<br>• Lab ID number assigned<br>• Analyses entered<br>• Chain of custody started<br>• Storage location assigned<br>• Electronic record of sample number<br>• Labels generated<br>• Acknowledgement printed (record of samples received and analysis entered) | Sample Administration |
| Sample stored in assigned location (refrigerator, freezer, etc)<br>• Electronic record of sample #, bottle code, and location | Sample Support |
| Acknowledgment sent to client | Sample Administration |
| Sample removed from storage for analysis<br>• Electronic requisition of sample number by bottle code<br>• Necessary aliquot taken<br>• Sample returned to storage | Technical Personnel |
| Analysis is performed according to selected analytical method<br>• Raw data recorded<br>• Reviewed<br>• Transferred to computer by chemist or technician* (This is tracked by the unique sample number and batch number.) | Technical Personnel |
| Computer performs calculations as programmed according to methods | Data Processing |
| Second chemist or supervisor verifies raw data | Technical Personnel |
| Data package deliverables are assembled | Data Package Group |
| Data packages are reviewed prior to sending to client | QA, Data Package Personnel, and Laboratory Management |
| Data packages are microfilmed or scanned onto CDROM<br>Hard copy of batch raw data is archived<br>Electronic files are backed up and archived | Data Package Personnel, Office Services |

* Analyses requiring the chemist's interpretation may involve manual data reduction before entry into the computer.

Each analytical run is reviewed by a chemist for completeness and accuracy before interpretation and data reduction. The following calculations are used to reduce raw data to reportable results.

***Semivolatiles and Volatiles by GC/MS Calculations:***

GC/MS calculation used by the data system to determine concentration in extract for semivolatiles or in the sample itself for volatiles:

$$Q = (Ax)(Is) / (Als)(RRF)(Vi)$$

Where:

| | | |
|---|---|---|
| Ax | = | Peak area |
| Ais | = | Internal standard peak area |
| Is | = | Amount of internal standard injected (ng) |
| RRF | = | Relative response factor |
| Vi | = | Volume of extract injected (L) or volume sample purged (mL) |

The extract concentration is further reduced by considering the initial sample weight or volume and the final extract volume:

$$Concentration = (Q)(D)(F)(1000) / IV \ (or \ IW)$$

Where:

| | | |
|---|---|---|
| Q | = | Concentration determined by the data system (mg/L) |
| D | = | Dilution factor if needed |
| F | = | Final extract volume (mL) |
| IW | = | Initial sample weight (g) |
| IV | = | Initial sample volument (mL) |

Results are reported in µg/L for water samples and µg/kg for solid samples. Soil samples are reported on a dry-weight basis. The results are reported on Lancaster Labs Analysis Report Forms shown in Appendix A.

***Volatiles by GC and Petroleum Analysis Calculations:***

For volatiles by GC and petroleum analysis, a calibration is performed with a minimum of five levels using either an internal standard calibration or external calibration.

A. Internal standard calibration

$$CF = \frac{(Ax)(Cis)}{(Ais)(Cx)} \quad or \quad CF = \frac{(Hx)(Cis)}{(His)(Cx)}$$

Where:

Ax = Peak area of the compound to be measured in that level of the initial calibration

Hx = Height area of the compound to be measured in that level of the initial calibration

Ais = Peak area of the internal standard

His = Height are of the internal standard

Cis = Concentration of the internal standard.

Cx = Concentration of the compound spiked into that level

$$\overline{CF} = \frac{\sum all\ CF\ in\ the\ initial\ calibration}{n}$$

Where:

n = Number of levels in the initial calibration

$$Concentration = \frac{(Ax)(Cis)}{(Ais)(\overline{CF})} \times DF \quad or \quad \frac{(Hx)(Cis)}{(His)(\overline{CF})} \times DF$$

Where:

Ax = Peak area of the compound to be measured
Hx = Height area of the compound to be measured
Ais = Peak area of the internal standard
His = Height area of the internal standard
Cis = Concentration of the internal standard.
$\overline{CF}$ = Average calibration factor
DF = Dilution factor or preparation factor

B. External calibration

$$CF = \frac{Ax}{CF} \times DF \quad or \quad \frac{Hx}{\overline{CF}} \times DF$$

$$Concentration = \frac{Ax}{\overline{CF}} \times DF \quad or \quad \frac{Hx}{\overline{CF}} \times DF$$

Where all parameters are defined in A above.

Results are reported in µg/L for water samples and mg/kg for solid samples. Soil samples are reported on a dry-weight basis. Results are reported on Lancaster Labs Analysis Report Forms shown in Appendix A.

***Herbicides and Organophosphate Pesticides***

For herbicides and organophosphate pesticides, an internal standard calibration is used. The results are calculated from the curve when the individual analyte %RSD is >20% and the average of all analyte %RSDs is also >20%. Otherwise, the results are calculated using the average response factor.

A. Curve

$$Sample\ Concentration, \mu g\ /\ kg\ or\ \mu g\ /\ L = Extract\ Concentration \times \frac{DF \times FV}{IW\ (or\ IV)}$$

Where:

Extract Concentration =(peak ht. - y-intercept)/slope

FV = Final volume
IW = Initial weight (g)
IV = Initial volume (mL)
DF = Dilution Factor
AF = Additional preparation factors

B. Average response factor

$$Extract\ Conc., mg/L = \frac{Pk\ Ht\ in\ sample}{ARF} \times \frac{Int\ std\ ht\ in\ L3\ std}{Int\ std\ ht\ in\ sample}$$

Where:

ARF = Average Response Factor [(RF Calib1 + ... + RF Calib 5)/5]
RF = Peak height/conc. in standard

Results are reported as µg/L for water samples and µg/kg for solid samples. Soil samples are reported on a dry weight basis. Results are reported on Lancaster Labs Analysis Report Forms shown in Appendix A.

***PAHs by HPLC and Pesticide/PCB Calculations:***

The results for the PAHs by HPLC and pesticide/PCBs analyses are calculated using external standard. The pesticides/PCBs results are calculated from the curve when the individual analyte %RSD is >20% and the average of all analyte %RSDs is also >20%. Otherwise, the results are calculated using the average response factor.

$$\frac{Pk\ Ht \times FV \times DF \times AF}{ARF \times IV\ (or\ IW)} = Concentration\ (mg/L\ or\ \mu g/kg)$$

Where:

| | | |
|---|---|---|
| Pk Ht | = | Peak height found in sample |
| ARF | = | Average response factor [(RFCalib1 + …+ RFCalib5)/5] |
| FV | = | Final volume of sample extract (mL) |
| DF | = | Dilution factor (where applicable) |
| IV | = | Initial volume of sample extracted (mL) |
| IW | = | Initial weight of the sample extracted (g) |
| AF | = | Additional factor |

If a curve is used, then $\frac{\text{Pk Ht}}{\text{ARF}}$ is replaced by the following in the preceding equation:

$$\frac{Pk\ Ht \quad - \quad y - intercept}{slope}$$

Results are reported as μg/L for water samples and μg/kg for solid samples. Soil samples are reported on dry weight basis. Results are reported on Lancaster Labs Analysis Report Forms shown in Appendix A.

***TPH-GRO and TPH-DRO Calculations:***

For TPH-GRO and TPH-DRO, an external calibration procedure of at least five levels of standards is used. The resulting point-to-point calibration curve is used by the data system to calculate analyte concentrations. The equations that the data system uses for calculating analyte concentrations are shown below:

$$Concentration = (Ax/ARF) \times (DF)$$

Where:

Ax = Total peak area in region defined as analyte
DF = Dilution factor
ARF = Average response factor from the calibration curve, calculated as shown below:

$$ARF = \frac{[(As1/Qs1) + (As2/Qs2) + (As3/Qs3) + (As4/Qs4) + (As5/Qs5) + ... (Asn/Qsn)]}{n}$$

Where:

As# = Analyte peak sum area for all components of calibration level #
Qs# = Analyte concentration sum for all components of calibration level #
n = Number of calibration levels

For DRO, the concentration determined is then multiplied by F/IV (or IW) to account for the sample preparation.

Where:

F = Final extract volume (mL)
IV = Initial sample volume (mL)
IW = Initial sample weight (g)

Results are reported in mg/L for water samples and in mg/kg for solid samples. Soil samples are reported on a dry-weight basis. Results are reported on Lancaster Labs Analysis Report Forms shown in Appendix A.

***Inorganic Calculations:***

The results for inorganic analyses are calculated using the following equation:

$$Concentration = (A)\ (D)\ (E)\ /\ IV\ (or\ IW)$$

Where:

| | | |
|---|---|---|
| A | = | The concentration determined by AA, ICP, or FTIR using calibration data programmed into the instrument (mg/L) |
| D | = | Dilution factor if needed |
| E | = | Final extract volume (mL) |
| IW | = | Initial sample weight (g) |
| IV | = | Initial sample volume (mL) |

Results are usually reported in mg/L for water samples and in mg/kg for solid samples. Alternate units are available upon request. Soil samples are reported on a dry weight basis. The results are reported on Lancaster Labs Analysis Report Forms shown in Appendix A.

# GROUP C

# ASSESSMENT AND OVERSIGHT

## C1. Assessments and Response Actions

Whenever any of the data generated falls outside of the established acceptance criteria outlined for instrument tune and calibration (Element B7) and internal QC (Element B5), the cause of this irregularity must be investigated, corrected, and documented. The documentation will be used to prevent a recurrence of the problem and to inform management of the situation.

If the results are not within acceptance criteria, the appropriate corrective action will be initiated. This may include, but is not limited to, checking calculations and instrument performance, reanalysis of the associated samples, examining other QC analyzed with the same batch of samples, and qualifying results with a comment stating the observed deviation.

A standard operating procedure is in place, which outlines the procedures to be followed when quality control data for an analysis falls outside of previously established acceptance limits. All batch QC data is entered into the computerized QC system promptly after its generation and evaluated for compliance. When the QC (blanks, check standards, continuing calibration verification, LCS/LCSD, etc) is noncompliant then corrective action is needed.

The Quality Assurance Department reviews monthly summaries of the quality control data entered onto the computerized sample management system by analysts. Control charts and statistics are reviewed for trends that may indicate problems with the analytical data. In this way, small problems are identified before they have any significant impact on laboratory results.

System audits are conducted on each department at Lancaster Laboratories by members of the Quality Assurance Department to ensure compliance with laboratory procedures and assist in identifying and correcting deficiencies. The audits include checks on methodology, reagent preparation, equipment calibration and maintenance, quality control results, and training of personnel. These audits may entail observation of procedures in process or a review of records to demonstrate traceability and compliance with all documented record keeping procedures. The QA Department will then issue a written report to management and the department that summarizes the audit. The department must respond in

writing to the audit report within 30 days of report receipt. The response must address the corrective action that needs to be taken along with an expected completion date. Audit results and the corresponding response are communicated to laboratory personnel and management. Follow-up audits verify that proper corrective action has been implemented.

Audits by outside organizations including clients, regulatory personnel, and the USEPA are permitted by arrangement with the Quality Assurance Department.

Performance audits consist of both intralaboratory and interlaboratory check samples. QC samples from commercial suppliers are analyzed quarterly to assess laboratory accuracy including a double blind program. The Laboratory also participates in a number of interlaboratory performance evaluation studies, which involve analysis of samples with concentrations of analytes that are known to the sponsoring organization, but unknown to the laboratory. Inorganics, pesticide/herbicides, trihalomethanes, volatile organic compounds, semivolatile organic compounds, and traditional wet chemistry analyses are analyzed by Lancaster Labs for studies conducted by the New York Department of Health and private vendors (WS, WP, solid and hazardous waste). Lancaster Labs has participated in the USEPA Contract Laboratory Program, which provides laboratory analysis in support of the Superfund program. Part of maintaining this contract includes analysis of quarterly blind samples. Representative results from some of these studies are in Figure C1-2.

When performance evaluation studies are identified as out of specification or when a nonconformance is due to a repetitive laboratory error, system failures, or observable trend, an Investigation and Corrective Action Report (ICAR) is issued. An example of an ICAR form is in Figure C1-1. The QA Department will circulate all completed Investigation and Corrective Action forms to the appropriate management.

Annually the QA Department itself is audited for compliance with corporate and departmental procedures, and meeting regulatory requirements. In a separate event, the laboratory Executive Group reviews the previous year’s activities and documentation to evaluate the effectiveness of the quality system and its implementation/adequacy for the operation.

# Figure C1-1

No. _____

**Investigation and Corrective Action Report (ICAR)**

**Part I** – Description of the Problem (Attach additional pages, if needed, in addition to supporting documentation.)

1. Date of issue:
2. LL sample number(s) involved:
3. Nature of the problem (describe in detail):

Initiated by: _____

**Part II** - The Investigation (Attach additional pages, if needed, in addition to supporting documentation.)

1. Steps taken to investigate the problem:

2. Explanation of probable cause(s):

3. Steps taken to prevent future occurrence (describe in detail and use corrective action check boxes below):

Corrective action(s): Check the appropriate box and attach supporting documentation

- ☐ Employee(s) retrained. (Attach proof of training)
- ☐ Employee(s) reread SOP, OMC, EQV, etc. (Attach copy of updated training record form)
- ☐ Other measures taken (Attach memo or equivalent proof)
- ☐ Further investigation needed from additional areas. (Include proof of the transfer of information)
- ☐ Additional information added to method reference – Pharm. option only (Attach proof)

4. Must investigation be complete before reporting further data to clients? Yes No

5. In addition to the samples listed above, would any additional data already reported to clients be affected by this problem? Yes No If yes, please explain:

Investigator(s): ..... Date: _____

Departmental Review*: ..... Date: _____
(*Group Leader or above, must be someone other than the investigator)

Quality Assurance: ..... Date: _____

Return to QA by: ..... Date: _____

## C2. Reports To Management

Reports of quality status from the Quality Assurance Department to management are made frequently and in various forms. All results from internal or external performance evaluation samples are circulated to management along with corrective action responses. A report of each audit performed is prepared and copied to management. Monthly summaries of data obtained from analysis of quality control check samples are generated via the computerized sample management system. These summaries include mean and standard deviation to aid in assessment of data accuracy and precision. Documentation summarizing problems that require investigation and corrective action are completed by group leaders and circulated to management. Through these channels, laboratory management is kept apprised of QA/QC activities.

Any problems or unusual observations that occur during the analysis of samples for a specific project will be listed on the laboratory report and/or in the case narrative delivered with the data package. The items often discussed in this manner include samples with surrogate recovery outside of the acceptance criteria and samples with matrix problems requiring dilution and causing increased detection limits. Where applicable, any corrective action attempted or performed to address the problem will also be presented.

Monthly and quarterly reports are sent to management which provide them with the quality status on each technical and support department. The reports detail areas of improvement, observable trends, ICAR summaries, MDL/statistical window status, and a summary of client/agency issues.

The laboratory will contact the client for direction regarding major problems. Such as, but not limited to: samples listed on the chain of custody but missing from the shipping container, samples which arrive broken or are accidentally broken in the laboratory, and samples with severe matrix problems. The client will be contacted if it is necessary to change any item in the original approved project plan.

# GROUP D

# DATA VALIDATION AND USABILITY

## D1. Data Review, Verification, and Validation

As stated in Element B10, following review, interpretation, and data reduction by the analyst, the data is transferred into the Laboratory Sample Management System by direct upload from the analytical data system or manually. This system stores the client information, sample results, and QC results. A security system is in place to control access of laboratory personnel and to provide an audit trail for information changes.

The data is again reviewed by the group leader or another analyst whose function is to provide an independent review before data is verified on the sample management system. The person performing the verification step reviews all data including quality control information before verifying the data. Any errors identified and corrected during the review process are documented and addressed with appropriate personnel to ensure generation of quality data.

If data package deliverables have been requested, the laboratory will complete the appropriate forms (see Appendix A) summarizing the quality control information, and transfer copies of all raw data (instrument printouts, spectra, chromatograms, laboratory notebooks, etc.) to the Data Packages Group. This group will combine the information from the various analytical groups and the analytical reports from the Laboratory Sample Management System into one package in the client requested format. This package is reviewed for quality, compliance, and conformance to SOPs and QC requirements. Any analytical problems are discussed in the case narrative, which is also included with the data package deliverables.

The validation of the data for quality assurance includes spot checking raw data versus the final report, checking that all pertinent raw data is included and does refer to the samples analyzed, review of all QC results for conformance with the method, and review of the case narrative for description of any unusual occurrences during analysis. This validation is performed using techniques similar to those used by the Sample Management Office for the USEPA's Contract Laboratory Program.

The validation performed by the laboratory does not address usability of the data, which usually requires some knowledge of the site. The laboratory will make every attempt to meet requirements of the project, thus reducing the need to assess usability of the data.

## D2. Verification and Validation Methods

Lancaster Laboratories has procedures in place to verify that instrumental computers and the computerized sample management system perform at the required accuracy, traceability and security for reporting verified data. Element D1 describes this process in more detail. Knowledge of the site and sampling methods are necessary to assess usability. Therefore, overall data validation and assessment of data usability is the responsibility of the client. Lancaster Laboratories will evaluate the analytical data to verify that method and/or project requirements have been met.

## D3. Reconciliation with User Requirements

Data quality requirements are based on the measurement process and the intended use of the data. Lancaster Laboratories evaluates the QC data generated by the following data quality objectives.

Precision – Precision refers to the reproducibility of a method when it is repeated on a second aliquot of the same sample. The degree of agreement is expressed as the relative percent difference (RPD). The RPD will be calculated according to the following equation:

$$RPD = \frac{\left| D_2 - D_1 \right|}{(D_1 + D_2) / 2} \times 100$$

Where:

$D_1$ = First sample value
$D_2$ = Second sample value (Duplicate)

Duplicates will be run on at least 5% of the samples and matrix spike duplicates are used for organics analyses. Acceptance criteria are detailed in Element B5. All quality control sample results are entered into the computer and compared with acceptance limits. In addition, there is a monthly review of values on the computer QC system. Data obtained from quality control samples is entered onto our computer system that charts the data and calculates a mean and standard deviation on a monthly basis. The Quality Assurance Department then reviews this data for trends, which may indicate analytical problems. The control charts are graphical methods for monitoring precision and bias over time.

Accuracy – Accuracy refers to the agreement between the amount of a compound measured by the test method and the amount present. Accuracy is usually expressed as a percent recovery (R). Recoveries will be calculated according to the following equations:

$$Surrogate\ \%\ Recovery\ = Qd/Qa\ \times 100$$

Where:

Qd = Quantity determined by analysis
Qa = Quantity added to sample

$$Matrix\ Spike\ \%\ Recovery = \left(SSR\ -\ SR\right) / SA \times 100$$

Where:

SSR = Spiked sample results
SR = Sample results
SA = Spike added

$$Laboratory\ Control\ Sample\ \%\ Recovery = LCS\ found\ /\ LCS\ true \times 100$$

Surrogate standards are added to each sample analyzed for organics. Spikes and laboratory control samples will be run on at least 5% of the samples (each batch or SDG, ≤20 samples). Refer to Element B5 for acceptance criteria for accuracy. The computer is programmed to compare the individual values with the acceptance limits and inform the analyst if the results meet specifications. If the results are not within the acceptance criteria, corrective action suitable to the situation will be taken. This may include, but is not limited to, checking calculations and instrument performance, reanalysis of the associated samples, examining other QC analyzed with the same batch of samples, and qualifying results with documentation of any QC problems in the case narrative.

Commercial quality control materials are run at least quarterly to ensure accuracy of the analytical procedure. Repetitive analysis of a reference material will also yield precision data. Accuracy information determined from reference materials is valuable because variables specific to sample matrix are eliminated.
The QC program is capable of charting data for surrogates, spikes, control materials, and reference materials. The Quality Assurance Department reviews these charts in association with the monthly trend report for any indication of possible problems (i.e., shift in the mean and standard deviation).

Completeness – Completeness is the percentage of valid data acquired from a measurement system compared to the amount of valid measurements that were planned to be collected. The objective is analysis of all samples submitted intact, and to ensure that sufficient sample weight/volume is available should the initial analysis not meet acceptance criteria. The laboratory's sample management system will assign a unique identification number to the sample which tracks and controls movement of samples from the time of receipt until disposal. All data generated will be recorded referencing the corresponding sample identification number. The completeness of an analysis can be documented by including in the data deliverables sufficient information to allow the data user to assess the quality of the results. This information will include, but is not limited to, summaries of QC data and sample results, chromatograms, spectra, and instrument tune and calibration data. Additional information will be stored in the laboratory's archives, both hard copy and electronic.

$$Completeness = \frac{Number\ of\ valid\ measurements}{Total\ measurements\ needed} \times 100$$

Method Detection Limit – It is important to ascertain the limit of quantitation that can be achieved by a given method, particularly when the method is commonly used to determine trace levels of analyte. The Environmental Protection Agency has set forth one method for determining method detection limits (MDLs) from which limits of quantitation (LOQs) can be extrapolated. MDLs are evaluated on an annual basis. MDL is defined as follows for all measurements:

$$MDL = t_{(n-1,\ 1-a\ =\ 0.99)} x s$$

Where:

MDL = Method detection limit

s = Standard deviation of the replicate analyses

$t_{(n-1,1-a = 0.99)}$ = Students' t-value for a one-sided 99% confidence level and a standard deviation estimate with n-1 degrees of freedom

**Definitions:**

Calculated Method Detection Limit – The calculated method detection limit is defined as the minimum concentration of a substance that can be measured and reported with 99% confidence that the analyte concentration is greater than zero. It is determined from analysis, on a given instrument, of a sample in a given matrix containing the analyte.

Reported Method detection limit (MDL) – The reported MDL is defined as the highest of all calculated MDLs obtained from all instruments used for a particular method/matrix. This can be the actual value or a default value set above the calculated values.

Limit of quantitation (LOQ) – The limit of quantitation is defined as the level above which quantitative results may be obtained with a specified degree of confidence. The Lancaster Laboratories' policy is to set quantitation limits at a value at least 3x the MDL.

COVER PAGE - INORGANIC ANALYSES DATA PACKAGE

Lab Name: LANCASTER_LABORATORIES___

SDG No.: _____

| Client Sample ID. | Lab Sample ID. |
|---|---|
| | |

Were ICP interelement corrections applied ? Yes/No YES

Were ICP background corrections applied ? Yes/No YES
If yes - were raw data generated before application of background corrections ? Yes/No NO_

LEGEND:

U = Below MDL B = Below LOQ

FLAGS: (indicate matrix interference)
- N = Matrix Spike OOS
- * = Duplicate OOS
- W = Method F Analytical Spike Recovery <85% or > 115% when the sample conc. is <50% of the spike conc.
- S = Analysis Determined by MSA
- + = MSA Correlation Coefficient < 0.995
- E = Matrix Effects exist as proven by Serial Dilution or Spiked Dilution
- M = Duplicate Injection Precision not met

Presence of FLAGS does not invalidate data

METHODS:
- A = Flame Atomic Absorption
- P = Inductively Coupled Plasma
- F = Graphite Furnace
- AS = Hydride Generation
- CV = Cold Vapor
- NR = Not Required

TERMS:
- MDL = Method Detection Limit
- LOQ = Limit Of Quantitation
- OOS = Out of Specification
- MSA = Method of Standard Addition

I certify that this data package is technically accurate and complete. Release of the data contained in this data package has been authorized by the Laboratory Manager or the Manager's designee, as verified by the following signature.

# Purpose and Scope

The purpose of this Laboratory Quality Manual (LQM) is to describe the implementation the Severn Trent Laboratories (STL) Quality System at the STL North Canton laboratory. The LQM is written within the guidelines of the STL Quality Management Plan (QMP), which applies to all STL laboratories. The organization of this LQM is based on the "EPA Requirements for Quality Management Plans" (EPA QA/R-2, August 1994). This LQM outlines specific policies, organization, responsibilities, and activities required to assure high quality laboratory services. The LQM also fulfills the requirements of our clients, government agencies, and NELAC to document the laboratory Quality System.

This LQM contains references to other essential STL quality documents. The company-wide QMP, STL North Canton LQM, and referenced policies and SOPs are interrelated. Together they provide an integrated quality foundation that meets the objectives of the STL Quality Assurance Policy, as stated in Section 1.2.

The requirements set forth in this document are applicable to all employees at the STL North Canton laboratory. The policies and practices described here are presented as minimum guidelines only. Based on good scientific judgment, more rigorous requirements may be applied by laboratory employees. Specific requirements delineated in project plans may supersede general quality requirements described in this manual. One such project requirement, OhioVAP, is listed below:

- Quality Manual Sections 3.3, 3.4, 3.5, and Table 3.4-1: Per OhioVAP OAC rule 374-300-4(B) – STL North Canton will retain project records for all samples performed under the OhioVAP program for a period of ten years. After 10 years, STL North Canton must notify the director of intent to destroy records.

- Quality Manual Section 8.2.1: Per OhioVAP OAC rule 3745-300-04(1)(6) – STL North Canton will not update SOPs and Quality Manuals associated with OhioVAP projects unless they have been reviewed and approved by the agency.

# 1.0 Management Commitment and Organization

## 1.1 STL Mission Statement

We enable our customers to create safe and environmentally favorable polices and practices by leading the market in scientific and consultancy services. We provide this support within a customer service framework that sets the standard to which others aspire. This is achieved by people whose professionalism and development is valued as the key to success and through continued investments in science and technology.

## 1.2 STL Quality Assurance Policy

It is STL's policy to:

- provide high quality, consistent, and objective environmental testing services that meet all relevant federal, state, and municipal regulatory requirements;
- generate data that are scientifically sound, legally defensible, meet project objectives, and are appropriate for their intended use;
- provide STL clients with the highest level of professionalism and the best service practices in the industry;
- build continuous improvement mechanisms into all laboratory administration, and managerial activities; and
- maintain a working environment that fosters open communication with both clients and staff.

## 1.3 STL Management Statement of Commitment to Quality Assurance

STL management is committed to providing the highest quality data and the best service in the environmental testing industry. To ensure that the data produced and reported by STL meet the requirements of its clients and comply with the letter and spirit of municipal, state and federal regulations, STL maintains a Quality System that is clear, effective, well communicated, and supported at all levels in the company.

## 1.4 Ethics, Waste, Fraud and Abuse

Establishing and maintaining a high ethical standard is an important element of a Quality System. In order to ensure that all personnel understand the importance the company places on maintaining high ethical standards at all times, STL has established an Ethics Agreement (see Figure I.4-1). Ethics is also a major component of the STL QA training program (see Section 4 for details). A central tenant is that management must

consistently convey the message to analysts that financial pressures can never be allowed to compromise the quality of work. See the following policies for further details on specific policies related to this section:

LQM Section 6 – Computer Hardware and Software
QA-008 – Data Recording Requirements
QA-010 – Maintaining Time Integrity
QA-011 – Acceptable Manual Integration Practices
P-T-001 – Selection of Calibration Points

## *1.5 Organizational Structure and Relationships*

STL North Canton is a local operating unit of Severn Trent Laboratories, Inc., a Delaware corporation. Date of incorporation was August 27, 1997.

The organizational structure for Severn Trent Laboratories, Inc. is presented in Figure-1.5-1. The responsibilities and authorities of the members of the STL corporate staff employees are described in the STL QMP

STL North Canton has day-to-day independent operational authority that is overseen by corporate officers (e.g., President, Commercial Director, Chief Operating Officer, Corporate Quality Assurance, etc.). The STL North Canton laboratory operational and support staff work under the direction of the Laboratory Manager. The organizational structure for STL North Canton is presented in Figure 1.5-2. A list of key STL North Canton personnel is provided in Figure 1.5-3. The lab maintains Job Descriptions which contain general job responsibilities for all laboratory employees. The following section outlines responsibilities and authorities for all employees of the STL North Canton laboratory, as they relate to quality management.

The STL North Canton QA Manager (QAM) is <u>independent</u> from day-to-day laboratory operations, has no direct analytical testing responsibilities, and is free from financial and other undue pressures which might adversely affect the quality of work. The QAM, a key member of the laboratory's management team, has direct access to the Corporate Quality Assurance Manager on all matters involving quality. The QAM is available to any lab employee to resolve quality or ethical issues. The QAM, if required, has the authority to cease operations adversely affecting the validity or integrity of the analytical data.

## Figure 1.4-1 STL Ethics Agreement

It is the policy of STL to incorporate the highest standard of quality with all analytical programs by adhering to the following practices:

STL will only offer environmental analyses for which it can consistently demonstrate compliance with high quality, traceable and legally defensible performance standards.
All STL staff is committed to the practice of complete honesty in the production and reporting of data.
Staff who are aware of misrepresentation of facts or data manipulation to bypass established QA/QC requirements, are required to immediately inform their supervisor or any member of the upper management.

All employees are asked to sign a copy of the statement below upon their first day of employment.

*I, _____(print name) understand that high standards of integrity are required of me with regard to the duties I perform and the data I report in connection with my employment at the Company. I agree that in the performance of my duties at the Company:*
*I will not intentionally report data values that are not the actual values obtained;*
*I will not intentionally report the dates, times, sample or QC identifications, or method citations of data analyses that are not the actual dates, times, sample or QC identifications, or method citations;*
*I will not intentionally misrepresent another individual's work; and*
*If a supervisor or a member of STL management requests me to engage in or perform an activity that I feel is compromising data validity or quality, I will not comply with the request and report this action immediately to a member of the upper management, up to and including the president of Severn Trent Laboratories Inc.*
*I will not intentionally report data values that do not meet established quality control criteria as set forth in the Method and/or Standard Operation Procedures, or as defined by Company Policy.*

I agree to inform my Supervisor of any accidental reporting of non-authentic data by me in a timely manner. I agree to inform my Supervisor of any accidental or intentional reporting of non-authentic data by other employees. I have read this Ethics Agreement and understand that failure to comply with the conditions stated above will result in disciplinary action, up to and including termination from the Company.

Compliance with this policy of business ethics and conduct is the responsibility of every STL employee. Disregard or failing to comply with this standard of business ethics and conduct could lead to disciplinary action, up to and including possible termination of employment.

## *1.6 Quality Organization*

All personnel are responsible for quality, which includes complying with all QA/QC requirements that pertain to their organizational/technical function.

### 1.6.1 Quality Assurance Manager

- Reports directly to the Laboratory Manager and, for all QA matters, to the Corporate QA Director to maintain independence of QA oversight
- Responsible for the implementing and communicating the QMP
- Maintains, approves, and implements the LQM

- Has joint signature authority, with the Laboratory Manager and Technical Manager for approval of quality documents, e.g., LQM, policies, and SOPs
- Directs controlled distribution of laboratory quality documents
- Provides Quality System training to all new personnel
- Reviews and approves documentation of analyst training records
- Serves as a focal point for QA and QC issues, reviews corrective actions and recommends resolution for recurring nonconformances within the laboratory
- Assists in maintaining regulatory analytical compliance, including maintaining certifications, and in this regard has signature authority for laboratory quality documents
- Monitors data quality measures via statistical methods to verify that the laboratory routinely meets stated quality goals
- Performs systems, data, contract compliance, and surveillance audits.
- Hosts external audits conducted by outside agencies
- Responsible for approving quality control reference data changes in the LIMS
- Oversees the selection, review, and approval of analytical subcontractors
- Prepares monthly QA Reports to management describing significant quality events
- Has the final authority to accept or reject data and to stop work in progress in the event that procedures or practices compromise the validity and integrity of analytical data

### *1.6.2 Laboratory Manager*

- Reports directly to the Regional General Manager
- Responsible for implementation and adherence by lab staff to the STL QMP, STL North Canton LQM and all policies and procedures within the laboratory.
- Has signature authority for LQM, policies, SOPs, and contracts (as detailed in STL policy)
- Annually assesses the effectiveness of the QMP and LQM within the operation
- Maintains adequate trained staffing documented on organization charts
- Responsible for implementing internal/external audit findings corrective actions.

### *1.6.3 Operations Manager/Laboratory Supervisor*

- Reports directly to the Laboratory Manager
- Supervises daily activities of the Operational Groups
- Schedules analytical operations
- Supervises QC activities performed as a part of routine analytical operations
- Implements data review procedures
- Supervises the preparation and maintenance of laboratory records
- Supervises maintenance of instruments and scheduling of repairs

- Works with the Project Managers and Group/Team Leaders to assure the requirements of projects are met in a timely manner
- Supervises daily activities of the Sample Control Group.

### 1.6.4 *Laboratory Technical Director*

- Reports directly to Laboratory Manager
- Responsible for the technical operation of the laboratory
- Responsible for coordinating the development and implementation of SOPs
- Has joint signature authority for LQM, policies, SOPs, and training records
- Performs technical training in area(s) of expertise
- Interfaces with management on technical needs and solving day-to-day technical issues
- Investigates technical issues related to projects as directed by QA
- Evaluates new methods, technical proposals, and statements of work
- Certifies technical laboratory personnel based on education and background to ensure that staff have demonstrated capability in the activities for which they are responsible by reviewing and signing analyst demonstrations.
- Performs other tasks as required by NELAC.

The Technical Director meets the requirements specified in the Section 4.1.1.1 of the NELAC standards.

### 1.6.5 *Project Manager Group Leader*

- Reports directly to the Laboratory Manager
- Supervises daily activities of the Project Management and Administrative Groups
- Works with the Operations Manager and/or Group/Team Leaders to ensure the requirements of projects are met in a timely manner

### 1.6.6 *Customer Service Managers (CSMs)*

- Reports directly to the Project Manager Group Leader
- Has signature authority for contracts for laboratory services, as detailed in STL policy, and for laboratory reports.
- Defines customer requirements through project definition
- Assesses and assures customer satisfaction
- Provides feedback to management on changing customer needs
- Brings together resources necessary to ensure customer satisfaction.

### 1.6.7 *Project Manager*

- Reports directly to the Project Manager Group Leader
- Monitors analytical and QA project requirements for a specified project
- Acts as a liaison between the client and the laboratory staff

- Prepares Quality Assurance Summary (QAS) or equivalent summary form and communicates project-specific requirements to all parties involved
- Assists the laboratory staff with interpretation of work plans, contracts, and QAPP requirements
- Oversees project data packages for completeness and compliance to client needs
- Has signature authority for final reports
- Keeps the laboratory and client informed of project status
- Together with the QA Manager, approves customer requested variances to methods and to standard laboratory protocols
- Monitors, reviews, and evaluates the progress and performance of projects
- Reports client inquiries involving data quality issues or data acceptability to the facility QA Manager and to the operations staff
- Conducts project reviews to assess the laboratory's performance in meeting customer requirements
- Prepares reissue requests for project data
- Responsible for meeting quality requirements.

### 1.6.8 *Group (Area) Leader, Team Leader or Supervisor*

- Reports directly to the Operations Manager
- Supervises daily activities of analyses within the group
- Supervises QC activities performed as a part of routine analytical operations
- Implements data review procedures
- Supervises the preparation and maintenance of laboratory records
- Evaluates instrument performance and supervises the calibration, preventive maintenance, and scheduling of repairs
- Oversees or performs review and approval of all analytical data
- Reports nonconformances to the appropriate managers
- Responsible for generation of SOPs for their section
- Responsible for meeting quality requirements.

### 1.6.9 *Analyst*

- Performs analytical methods and data recording in accordance with documented procedures
- Performs and documents calibration and preventive maintenance
- Performs data processing and data review procedures
- Reports nonconformances to the Supervisor/Manager and QA Manager
- Ensures sample and data integrity by adhering to internal chain-of-custody procedures
- Responsible for meeting quality requirements defined in this LQM and other supporting QA procedures.

### 1.6.10 Sample Custodian

- Ensures implementation of proper sample receipt procedures, including maintenance of chain-of-custody
- Reports nonconformances associated with condition-upon-receipt of samples
- Logs samples into the LIMS
- Ensures that all samples are stored in the proper environment
- Assists Environmental Health and Safety staff with sample disposal
- Responsible for meeting quality requirements.

### 1.6.11 Report Production Staff

- Accurately generates and compiles analytical reports and associated deliverables for delivery to the client
- Responsible for meeting quality requirements
- Produce as needed reports that meet the NELAC requirements.

# 2.0 Quality System and Description

## 2.1 Objectives of the STL Quality System

The Quality System is a set of management principles, objectives, policies, responsibilities, and implementation plans at the organizational and project-specific levels. The goal of the STL Quality system is to ensure that business operations are conducted with the highest level of professionalism in the industry. To achieve this goal, it is necessary to provide STL clients with not only scientifically sound, well documented, and regulatory compliant data, but also to ensure that STL provides the highest quality service available in the industry. A well-structured and well-communicated Quality System is essential in meeting this goal. STL's Quality System is designed to minimize systematic error, encourage constructive, documented problem solving, and provide a framework for continuous improvement within the organization.

## 2.2 Structure of the STL Quality System

At the highest level, the STL Quality Management Plan (QMP) is the basis for STL's Quality System. The QMP provides the guidance under which all STL facilities conduct their operations. This Laboratory Quality Manual (LQM) describes the implementation of the Quality System at the STL North Canton laboratory. This LQM and the series of associated quality documents described in Section 2.3 define the organization, project-specific principles, goals, controls, and tools of the Quality System as it is applied at this laboratory. The Quality System as described in this LQM demonstrates the commitment to accepted laboratory practices by STL North Canton.

## 2.3 Quality Assurance and Quality Controls

Quality Assurance (QA) is defined as the system of activities which ensures the quality of a process, product, or service. Quality controls (QC) are the tools used to monitor and regulate the the desired type and quality of product. The QA activities and QC controls employed in STL North Canton are defined in the following quality documents.

## 2.4 Quality Documents

The STL Quality System is developed from the reference documents shown in Table 2.4-1. The review and control of the STL North Canton documents described in the following subsections is described in Section 3 of this LQM. A cross-reference of the LQM to NELAC requirements quality manuals is presented in Table 2.4-2.

### 2.4.1 STL Quality Management Plan (QMP)

The requirements set forth in the QMP are applicable to all STL facilities. The policies and practices outlined in the QMP are minimum guidelines only. Requirements that are more rigorous may be applied for specific client or regulatory programs.

### 2.4.2 STL Company-Wide Policies

Severn Trent Laboratories has certain policies that apply company-wide. These policies are consistent with the QMP, and set forth requirements that all STL facilities are to follow.

### 2.4.3 Laboratory Quality Manual (LQM)

This STL North Canton LQM along with the associated policies and SOPs, provides the criteria and specifications for the generation of environmental analytical data. The LQM provides QC criteria for standard procedures, facility-specific instrumentation, and reporting.

### 2.4.4 STL North Canton Quality Policy Documents

Quality policies are referenced throughout the LQM that provide further detail to specific requirements of the QMP and LQM. These policies describe general quality objectives and guidelines in effect for this facility, rather than the details of specific practices. Refer to Table 2.4-3 for a list of the STL North Canton quality policies and required approvals. Table 2.4-4 lists the frequency of review for the documents.

### 2.4.5 Standard Operating Procedures

Standard Operating Procedures (SOPs) describe step-by-step instructions for performing a method or activity. In addition, there are SOPs which relate to other support services performed in the laboratory. Details of SOP format and document control are described in Policy QA-001, "Standard Operating Procedures" and Policy S-Q-001, "Official Document Control and Archive." SOPs that are actively used in this laboratory are listed in Table 8.2-2. SOPs are living documents and may supersede some requirements in this document until the LQM is updated annually.

### 2.4.6 Quality Assurance Project or Program Plans (QAPPs)

Regulations and contracts may contain QA requirements which are different from those described in this LQM. To address unique project requirements, Quality Assurance Project Plans (QAPjPs) may be prepared and implemented. The requirements documented in a

QAPjP, as agreed to by STL North Canton, take precedence over the LQM for that project. Typical specifications contained in a QAPjP or similar documentation include:

- New or modified testing methods
- Unique QC logic
- Special requirements for equipment use and maintenance
- Special handling due to safety considerations
- Project-specific detection and reporting limits
- Project-specific accuracy and precision limits or the statistical treatment of data
- Additional or unique documentation or records management requirements.

#### *2.4.6.1 Quality Assurance Summary*

Quality Assurance Summaries (QAS) or equivalent (e.g., Client Requirement Checklist in LIMS) are used to distill client-specific requirements typically documented in project QA plans onto a concise format, highlighting the requirements that are different than the laboratory standard practice. The summary describes for each project the required quality control samples, batching schemes, flagging conventions, deliverables, or other special client requests that may differ from routine laboratory operations. The QAS or equivalent is disseminated to laboratory operations by the Project Manager or Quality Assurance Manager to document client or program specific requirements. The QAS may be used alone or in conjunction with the project-specific QA plans.

### *2.4.7 Other Documents*

Other documents which can affect the quality program may include the Chemical Hygiene Plan (CHP), memos, guidance documents, work instructions, and periodic management assessment reports. These documents may further define or guide the implementation of quality standards at STL but shall not conflict with the LQM or diminish the effectiveness of the Quality System.

# 3.0 Document Control and Records Management

## 3.1 Objectives for Control of Quality Documents and Records

Quality Documents - The quality documents discussed in Section 2 of the LQM define the framework of the STL Quality System. Control and security of these documents are necessary to ensure that all staff have access to current policies and procedures at all times, to ensure that all changes to the policies and procedures are properly reviewed, to ensure that the history of use of documents can be reconstructed, and to ensure that confidential information is not improperly distributed. The system described in this section is designed to accomplish these objectives.

Vital Records – Vital records are the documents that provide objective evidence of the performance of a process or observations of an item. Records management ensures that results produced by the laboratory are scientifically and legally defensible, and ensures that project events can be reconstructed. Confidentially of the records and records retention requirements are discussed in this section.

## 3.2 Document Control Procedures

Unambiguous identification of a controlled document is maintained by identification of the following items in the document header:

- document title,
- unique document number,
- revision number,
- revision date,
- effective or implementation date, and number of pages

Controlled documents are marked as such, and the QA department keeps records of document distribution. Controlled distribution may be achieved by either electronic or hardcopy means. The effective date is the date when controlled copies are distributed. Controlled documents must be available in the immediate areas where the related work is performed. Details of the numbering system, required format, and restrictions for uncontrolled distribution of documents are in Policy # QA-001, "Standard Operating Procedures" and STL Corporate SOP # S-Q-001, "Official Document Control and Archive".

## 3.3 Document Review, Approval, and Revision

Controlled quality documents are authorized by the Laboratory Director, the Technical Manager, and the QA Manager. They indicate their authorization by signing the cover page of the document. STL North Canton quality documents, the individuals responsible for reviewing the documents, and the required frequency of review are listed in Table 3.3-1 and Table 3.3-2. In addition to periodic review and revision, quality documents must be

revised when a procedure or activity changes in a significant manner. Amendments to documents must be reviewed and approved by the same parties approving the original document, distributed in a controlled manner, and clearly indicated in the document. Obsolete versions of documents are removed from service when new revisions are issued. The QA Department maintains a record of history of use of all documents based on the effective date. For further details see Policy # QA-001, "Standard Operating Procedures".

### *3.4 Records Management*

Records may be either hardcopy or electronic copies. It is not required to maintain both if they are properly secured and are complete and true copies. The record keeping system allows for reconstruction of all laboratory activities that produced the analytical results. The history of the sample is readily understood through the documentation. This includes

- chain-of-custody records, including intra-laboratory and inter-laboratory transfers of samples;
- records identifying the personnel involved in sampling, preparation, calibration, and testing;
- observations, calculations, and derived data;
- information relating to laboratory facilities, equipment, analytical test methods, and related laboratory activities (e.g., sample preparation, standards preparation, and data verification);
- original records clearly identifying all subcontracted test data, and
- a copy of the final test report.

Requirements for data recording are described in Policy # QA-008, "Data Recording Requirements". Details concerning control of electronic records are given in Policy # QA-017, "Electronic Reporting". The types of vital records maintained are listed in Table 3.4-1.

STL North Canton utilizes a controlled access public drive to post controlled electronic QA records such as MDLs, SOPs, Laboratory or QA forms, Certifications, etc. Only QA personnel have write access to the QA public drives labeled, "QAQC" and "QA". The records are maintained and backed-up according to the record retention policy. The processes for producing these electronic (or hardcopy) records are described in their specific QA Policy, SOP, and/or the STL QMP.

### *3.5 Document and Record Storage, Retention, and Disposal*

It is the policy of STL North Canton that company records will be available to meet business needs and comply with all applicable legal records retention and disposition requirements. STL North Canton retains copies of records in a manner that allows prompt retrieval of documents and records for inspection purposes. In accordance with NELAC, all quality

documents and records are stored for at least five years. Other types of records have different retention requirement, refer to Table 3.4-1 for details.

STL North Canton retains copies of all vital records in a manner that allows prompt retrieval of documents and records for inspection purposes. In accordance with NELAC, all quality documents and records are stored for at least five years.

Specific projects and regulatory programs have longer record retention requirements than the standard STL record retention time. Refer to QMP Table 5 for a listing of examples of special program requirements. The inventory sheet accompanying the stored records must include disposal instructions, which take into account any special requirements, and who to contact for authorization prior to destroying the data.

When records, as contained in files, are transferred to a records storage area or off-site storage area, they shall be placed in suitable containers and include an inventory sheet (hard copy or electronic) prepared by the person submitting the records. The contents of each container shall be compared to the inventory sheet and labeled. If there are any discrepancies, the container and inventory sheet shall be returned to the person who prepared the box for correction. Archives are indexed such that records are accessible on a project or temporal basis. Archives are protected against fire, theft, loss, deterioration, and vermin. Backup copies of electronic media are stored in off-site archive facilities and are protected against deterioration caused by magnetic fields and/or electronic deterioration. Access to archives is controlled and documented. Further details of the laboratory's document and records archiving process are described in SOP # NC-QA-0019, "Records Information Management".

If the laboratory transfers ownership, vital records will be transferred to the new owner. If the laboratory goes out of business, vital records will be transferred to another operating STL laboratory or to our clients.

### *3.6 Data Confidentiality*

Data and sample materials provided by the client or at the client's request, and the results obtained by STL, shall be held in confidence (unless such information is generally available to the public or is in the public domain or client has failed to pay STL for all services rendered or is otherwise in breach of the terms and conditions set forth in the STL and client contract) subject to any disclosure required by law or legal process. STL's reports, and the data and information provided therein, are for the exclusive use and benefit of client, and are not released to a third party without written consent from the client.

In some cases the client may identify projects requiring confidentiality due to national security. Information concerning these projects will be limited only to those STL North Canton associates with a need to know.

The audit reports supplied by federal, state, and local regulatory agencies are public information and can be released without written consent of those agencies. However, specific client audits are confidential and must be approved by the client before releasing them to a third party.

# 4.0 Staff Qualification, Orientation and Training

All activities performed by STL North Canton shall be accomplished by qualified personnel. Each staff member must have the combination of experience and education needed to demonstrate the required knowledge for his or her position. Each must also have an appropriate general knowledge of laboratory operations, test methods, quality assurance and quality control procedures, and records management. Minimum training requirements are shown in Table 4.0-1. SOP # CORP-QA-0013 describes details of the training process and documentation. The Chemical Hygiene Plan (CHP) describes details for health and safety training.

## 4.1 Qualifications

STL North Canton maintains job descriptions for all positions. These job descriptions specify the minimum qualifications for education and experience, knowledge and skills, which are necessary to perform at a satisfactory level. Qualifications of professional staff are documented by resumes that include academic credentials, employment history, experience, and professional registrations. A copy of each person's resume is maintained in an electronic file, and is readily available for inspection.

## 4.2 Orientation and Technical Training

Each new staff member shall receive orientation in quality and in health and safety. Each new staff member shall be supervised in their assigned duties by their supervisor or a knowledgeable individual designated by the supervisor. The ability and authorization to perform independently shall be documented in the training files, as described below, with technical duties approved by the Technical Director or designee.

### 4.2.1 Quality Assurance (QA) Orientation

Each new staff member will receive a QA orientation. The QA Manager or designee will conduct this orientation within two weeks of the new employee's first day on the job. The orientation will, at a minimum, include the following topics:

- STL Quality System and hierarchy of quality documents (QMP, LQM, policies, and SOPs);
- key elements of the LQM and the Quality Control Policy (QA-003);
- introduction to the nonconformance memo (NCM) system and corrective action procedures;
- proper data recording practices;
- STL ethics agreement, including the potential consequences of unethical behavior; and
- the role of the QA department.

The QA orientation will be documented on a checklist, which is signed by the trainee. The documentation will be placed in the employee's training file.

### *4.2.2 Quality Training*

Continued training in the mission and goals of the QMP and LQM shall be provided at least annually. These may be done in a single session or divided into separate sessions conducted at different times throughout the year. Formal training sessions are conducted and documented by the QA Manager or designee. In addition, each lab staff member shall read and document their awareness of the quality documents related to his or her position.

### *4.2.3 Health and Safety, Orientation and Training*

Each new employee, contract worker, or working visitor is required to go through health and safety orientation and training as described in the CHP. The Health and Safety Coordinator must conduct the orientation as soon as possible after the individual reports to work and before chemicals are handled. More comprehensive health and training, both initial and on going, must be completed at the frequency given in the CHP.

## *4.3 Training Files*

Each active STL North Canton staff member has an individual training file maintained by the QA Manager or designee. This file can be documented on paper forms or in a database. The following sections shall be included in the training files at a minimum:

- Resume - containing hardcopy or a reference to the electronic file
- Quality Assurance - containing documentation of QA/QC orientation and training completed
- Health and Safety - orientation and training documents
- Technical Proficiency - initial and on-going demonstrations of proficiency, one-on-one training, training courses or workshops on specific equipment or analytical methods is documented in this file. Note that documentation of awareness of technical SOPs is document on the demonstration of capability forms (see next section).

Other types of records to be included in the training file include work place regulatory compliance training, and professional development courses. The exact contents will vary depending upon a person's job function and tenure with the company. Details of requirements for training records and the approval process are given in SOP CORP-QA-0013.

## *4.4 Technical Proficiency Training*

All new personnel are required to demonstrate competency in performing a particular method by successfully completing a Demonstration of Capability (DOC) before conducting analysis independently on client samples. On-going proficiency must be demonstrated annually.

DOCs are most commonly performed by analysis of four replicate QC check samples. Results of successive LCS analyses can be used to fulfill the DOC requirement. As required by the referenced method, the accuracy and precision, measured as average recovery and standard deviation (using n-1 population), of the four replicates are calculated and compared to the method limits or against current laboratory limits if multi-laboratory method acceptance limits are not specified. Single-blind proficiency samples and other NELAC acceptable proficiency samples are described in SOP # CORP-QA-0013. The DOC Certification documentation must be signed by the Technical Director and the Quality Assurance Manager and filed in the employee's training file (see example in CORP-QA-0013). The DOC Certification documentation must include a statement that the individual has read, understood, and agreed to perform the most recent version of the test procedure. In procedures such as %Solids, Color, Dissolved oxygen, Ignitability etc., where spiking is not an option and for which quality control samples are not readily available, the proficiency can be demonstrated by analyzing a duplicate sample provided the RPD≤10%.

**Figure 4-1 Employee Minimum Training Requirements**

| Required Training | Time Frame | Employee Type |
|---|---|---|
| Environmental Health & Safety | Initial training before start of production work. | All |
| | Additional training as specified in the CHP | As required |
| Quality Assurance | Orientation within 2 weeks of hire date | All |
| | Annual QA program training | All |
| Technical Proficiency | Initial demonstration prior to unsupervised method performance | Technical staff |
| | Annual on-going demonstration | Technical staff |

# 5.0 Procurement of Supplies and Services

Controlling the quality of supplies and services is necessary to ensure that STL North Canton provides high quality analytical services to our clients. The STL procurement program requires:

- assurance that purchased items and services meet requirements set by STL North Canton and perform as expected
- definitions and descriptions of the levels of documentation required for applicable technical and administrative procurement functions
- maintenance of records of all suppliers from whom we obtain services or supplies required for our analytical testing

Additional information is contained in QA Policies # QA-018, "Vendor Approval" and # QA-019, "Vendor Review and Oversight".

## 5.1 Selection of Vendors

Materials and supplies are purchased from approved vendors. Prospective vendors are selected based upon criteria appropriate to the materials or supplies provided. Policy # STL /PG-001 "Procurement and Contracts" details the process used. For national vendors and contracts, the vendor is selected by the STL Procurement Director through a competitive bidding process, strategic business alliance or negotiated vendor partnership. Potential vendors are required to complete a vendor acceptance application and are evaluated on the following criteria, as appropriate:

- the vendor's history of providing identical or similar products that perform satisfactorily in actual use
- the vendor's service record and ability to provide a complete product line and commensurate service
- the vendor's ability to administer inventory at the STL North Canton facility through an inventory management system that will ensure correct stocking levels as well as shelf-life tracking
- objective evaluation of the vendor's current quality records, supported by documentation
- results of audits by STL of the vendor's technical and quality capabilities

Vendors that provide measuring equipment, solvents, chemical standards, instrument service contracts, or subcontracted laboratory services shall be subject to more rigorous controls than vendors that provide off-the-shelf items.

## 5.2 Controlling Quality of Purchased Items

The quality of equipment, reagents, solvents, chemical standards, gases, and laboratory containers used in analyses must be of known quality so that their effect upon analytical results can be defined. These quality specifications are derived from analytical method

requirements, project-specific requirements, and defined national standards for analytical testing. Quality specifications of materials are described in analytical SOPs. These quality specifications shall be included or referenced in the purchasing documents for the items being purchased. This includes specifications for the purity of standards, reagents, or chemicals, and technical specifications for accuracy and precision (e.g., Class A volumetric glassware). Reference to a catalogue number, model, lot number, or chemical grade is sufficient.

The Laboratory Director or designee has the responsibility for approving purchase orders. The section supervisors or designees are responsible for ensuring that the requested quality of materials ordered matches those received, for verifying that material storage is properly maintained and for removing materials from use when shelf life has expired

### *5.2.1 Evaluation of Off-the-Shelf Items*

For items that are used regularly by STL North Canton where no unique requirements or specifications exist, the items may be purchased off-the-shelf. These items are ordered from the supplier on the basis of specifications set forth in the supplier's published product description. These include items such as glassware, filter paper, pipettes, and chromatography columns. The items are evaluated as a function of the standard analytical process.

### *5.2.2 Evaluation of Instruments*

Evaluation of instruments purchased shall be conducted according to an acceptance-testing plan . The acceptance testing plan may be defined by the vendor or the method demonstration requirements specified in the laboratory analytical SOPs. Acceptance criteria may include instrument reliability, sensitivity, stability, selectivity, accuracy, precision, and ability to interface with existing computer systems.

### *5.2.3 Evaluation of Critical Solvents and Acids*

STL North Canton is part of a group of STL laboratories that conducts additional evaluations for certain solvents and chemical reagents where our criteria for purity are more stringent than the vendor's. These QRIs are subject to chemical analysis on a lot-by-lot basis before they are put into use. They are tested at one of the STL laboratories, and the chemical test results are evaluated by a designated quality representative. If the solvents or reagents meet the specifications given in SOP # CORP-QA-0001, "Quality Testing of Solvents, Acids, and Reagents (QRI Program)" an approval memorandum is issued to all participating laboratories. All laboratories then use the same lot, and reject any lots received at the facility that have not been tested.

### *5.2.4 Evaluation of Chemical Standards or Standard Reference Materials*

Where available chemical standards will be traceable to the National Institute of Standards Technology (NIST) or an equivalent source. This is largely limited to physical and inorganic chemical standards. If NIST traceability is not commercially available, commercially certified materials shall be used, which are then tested for accuracy before reporting data. Details of the testing procedures and documentation are described in the laboratory SOP. Standards must be received with a certification report from the vendor with information such as purity/concentration, traceability, lot number, expiration date, preparation date, unique identification number, formula weight, density, radionucleide half-life, mass and/or volume of standards, and suggested storage requirements. Further details about labeling and handling of standards is described in Section 8 of this LQM.

### 5.2.5 Corrective Action for Failure to Meet Required Specifications

Corrective actions for failure of an item to meet required specifications are as follows:

- review of current supplies to eliminate the problem item
- notification to the STL Procurement Director to avoid additional problems at other STL labs
- return of the problem item to the vendor
- evaluate the impact on product or process

The QA Manager shall be notified of any significant or systematic quality problems. The STL Procurement Director and the STL Quality Assurance Director shall be notified of any quality problems with national vendors.

## 5.3 Procurement of Subcontract Laboratory Services

Whether external to STL or not, all subcontracting from the STL North Canton laboratory to another laboratory is arranged with the documented consent of the client, in a timely response that shall not be unreasonably refused. All QC guidelines specific to the client's analytical program are transmitted to the subcontractor and agreed upon before sending the samples to the subcontract facility. Documentation of required certifications from the subcontract facility are maintained in STL project records. Where applicable, specific QC guidelines, QAPjPs, and similar project documents are transmitted to the subcontract laboratory. Samples are subcontracted under formal Chain of Custody (COC).

Subcontract laboratories may receive an on-site audit by a representative of STL's QA staff if it is deemed appropriate by the QA Manager. The audit involves an assessment of compliance with the required test method, QC requirements, documentation, as well as any special client requirements.

Project reports received from external laboratories are not altered and are included in original form in the final report provided by STL. Intracompany subcontracting may also occur between STL facilities. The originating laboratory is responsible for communicating QA/QC, reporting, and other project requirements.

The final report from STL North Canton clearly identifies what testing was performed by other laboratories, and, per NELAC, the certification status of the lab performing the work.

# 6.0 Computer Hardware and Software

The primary purpose of quality assurance systems for computer hardware and software is to protect the integrity of computer-resident data. Procedures are in place at STL-North Canton to assure that computer-resident data are accurate, traceable to a known source, protected against loss, and secure.

STL's computer and hardware controls are based on the guidance in EPA's "Good Automated Laboratory Practices" (GALP), August, 1995. This includes both corporate level Information Technology (IT) functions and STL-North Canton IT functions. Some GALP requirements, such as management responsibilities and the training program, are addressed in other sections of the LQM. Some corporate level IT functions, such as the system change management procedures, is described in more detail in corporate IT documents. Table 6-1 provides a cross reference of practices outlined in Section 8 of the GALP manual to corresponding sections of STL's QA and IT documents. STL North Canton's listing of hardware and software are in Tables 6-2 and 6-3.

## 6.1 Computer Hardware

Computer hardware used in the generation, measurement, or assessment of client data shall be of appropriate design and adequate capacity to function according to specifications. Computer equipment must be installed in accordance with the manufacturer's recommendations, and undergo documented acceptance testing.

### 6.1.1 Wide-Area Systems

STL-North Canton's LIMs (QuantIMs) and the Office Network run on a wide-area network (WAN) serving multiple laboratories. The central node for the network is located at the Denver facility. The central processor is an IBM AS-400 with multiple servers and Cisco routers. Records for the system architecture, testing and maintenance, such as Initial Program Loads (IPLs), are documented in the AS-400 System Log, which is also in Denver. The central System Administrator maintains records for installation of the network hardware.

### 6.1.2 Local Systems

The local systems consist of computer equipment for analytical instruments, data evaluation, and upload to the LIMS. A local-area network (LAN) supports the local office software. Testing, maintenance, and repair of the local computer hardware are the responsibility of the STL-North Canton LAN Analyst. The LAN Analyst maintains documentation for the local systems.

## 6.2 Facilities and Security

### 6.2.1 Central Computer Facilities

The environmental conditions of the facility housing the LIMS are controlled to protect against data loss. Access to the central computer facility in Denver is restricted by keypad entry used by IT staff. The central computer room is temperature controlled, and has an Uninterrupted Power Supply (UPS) plus a power generator to ensure that the WAN functions are not disrupted by power failures. Backup media, such as tapes and disks, are maintained daily. In addition, full volume backup copies of the raw data are shipped offsite to a commercial facility specially designed to store electronic data.

### 6.2.2 Local Computer Facilities

Facilities for housing local computer hardware must meet manufacturer's recommendations. Electronic data must be protected against environmental hazards such as fire, water damage, and strong electromagnetic fields. Data files will have backup copies made at regular intervals to protect against accidental loss through hardware or software failure.

### 6.2.3 Controlled Software Access

The integrity of data is also assured by maintaining limited access to administrative functions through a hierarchy of operating system shells controlled by passwords. Access is granted by the LAN Administrator depending on a persons experience, training, and assigned duties (see SOP# CORP-IT-0005 for more details).

Protection against unauthorized Internet access is provided by firewalls.

### 6.2.4 Virus Protection

Commercial virus protection programs are installed on all computers to detect and remove computer viruses. LAN Analysts are to be notified whenever a virus is detected so that they can isolate any portions of the systems that may be at risk.

## 6.3 LIMS Raw Data

QuantIMs raw data and instrument raw data from instrument data systems such as Target, IDB, and Chemstation are stored on the Office Automation servers (e.g., QARVCO01). The Systems Administrator and the LAN Analyst are responsible for maintaining the servers.

The individuals responsible for entering and recording raw data must be uniquely identified in the data, together with the date and time the data were entered. The instrument transmitting raw data must be uniquely identified, together with the date and time of the transmission. Further data recording requirements exist to document manual integrations (see Policy # QA-011 for details).

Procedures for verifying raw data are discussed in LQM Sections 8.8-8.8.3.

## 6.4 Software

If computer software is used to acquire, process, or report client data, that software is tested to ensure that it correctly performs its intended function. Software is validated or verified, depending upon its complexity, size, and whether it was purchased or developed by STL. The following definitions are used by STL:

- Validation - the process of establishing documented evidence, which provides a high degree of assurance that a specific process will consistently produce a product meeting, predetermined specifications and quality attributes. This process demonstrates and documents that the software performs correctly and meets all specified requirements.

- Verification - the process of checking the accuracy of automatically (electronically) calculated information.

### 6.4.1 Industry Standard Software

Industry standard software programs are defined as those, which are purchased and widely used without modification to the program itself. The program is initially verified for use by using test problems with known solutions to demonstrate that the program is operational for the desired application.

All purchased software must be used in accordance with the terms of its software license. Any use of software contrary to its license terms is expressly prohibited by STL.

### 6.4.2 Testing of STL-Developed Software

For programs used to process client data and developed within STL, and externally prepared programs, which are modified by STL, validation or verification must be performed. The process used is dependent upon the function of the software as follows:

- Large complex systems consisting of several programs operating in unison to produce an intended result must be validated.

- For smaller software which only performs numerical manipulation, sample sets of numbers for which results are known should be processed and the results verified. In this case, known results are usually generated by performing hand calculations using the same equations and procedures as the software to verify that the software produces identical results.

- Software that performs as part of instrument operation should be verified as previously described and by processing reference materials through the instrument system. Processed instrument response should be evaluated against expected instrument response and performance.

IT SOPs governing software development and testing include CORP-IT-0001, "Software and Hardware Change Management", CORP-IT-0007, "Software Testing, Validation and Verification", and CORP-IT-0013, "Software Quality Assurance".

### *6.4.3 Control of Software Changes*

STL has a well established process for prioritizing and managing changes to LIMS and LIMS-related software (see CORP-IT-001 and CORP-IT-007). Proposals to modify software are written in a Software Enhancement Request, which includes a description of the task to be accomplished, the software to be modified, its functional requirements, and necessary algorithms. The Software Enhancement Request is submitted to the Change Management Committee for approval. The Committee includes representatives from each lab on the QuantIMs network. The Committee establishes a develop schedule and approves the resources needed. Documentation of changes, version control, and historical records of changes is the responsibility of the IT Manager of "Change Management and QA". Because these are modern networked systems, the documentation is kept on the network, rather than keeping redundant records at each facility as GALP suggests. All system software changes are developed in a test area and must pass the designed tests before it is installed in the working area.

The same principles of documenting software changes apply to spreadsheets, small databases, or other small programs that are used solely at the STL-North Canton lab. The verification/validation records must explain the functional requirements, the algorithms and formulas used, the testing performed, and are maintained by the lab QA Manager or designee.

### *6.4.4 Software Maintenance*

Software problems are presented to the local LIMS Administrator (LAS) in a Software Problem Report. The LAS presents the issue to a group of the network LASs. The problem is discussed to make sure it is understood, and then a solution is determined and prioritized. Changes to LIMS software for maintenance purposes are announced to each of the QuantIMs locations after revalidating the software.

### *6.4.5 Software Revalidation*

Whenever a program is changed, the change is evaluated to determine if it is significant enough to make revalidation necessary. If features have been added, previous test

problems are rerun to demonstrate that their function has not been affected. New test problems are processed, as previously discussed, to verify added performance. If software revision changes the basic operation of the program, complete revalidation of the program may be required.

Spreadsheets and unprotected software used to acquire, process, or report client data must be documented and reverified when changes are made. The test problems used to provide initial verification is reprocessed and the results compared to demonstrate that performance of the software is unchanged.

Laboratory operations are responsible for the generation of the validation and verification data for instrument level software. QA will maintain the necessary documentation. STL Information Technology is responsible for generation and maintenance of documentation relating to verification and validation of the STL QuantIMs system. This is described in Policy Attachment Number IT-013, Software Quality Assurance.

### *6.5 Comprehensive System Testing*

Comprehensive system testing is performed periodically. Independent auditors, such as Price Waterhouse, include computer systems in their audits, which are commissioned by the laboratory executive management. Extensive testing of all software was performed for the lab's Y2K readiness exercises.

As described in LQM Section 9.2.2.1, the STL-North Canton QA Manager is responsible for ensuring an annual internal audit of all lab areas is performed, including the local IT functions.

### *6.6 Records Retention*

As required by NELAC, electronic raw data and computer documentation are stored for a minimum of five years. See LQM Section 3.0 for further records retention details.

# 7.0 Contract Review and Project Planning

The generation of environmental analytical data is an intricate process. Success is dependent upon the timely execution of interrelated steps. For many environmental sampling and analysis programs, testing design is site or project specific and is not necessarily the same as the laboratory's standard service. It is STL's intent to provide both standard and customized laboratory services to our clients, provided that any special requirements are documented in writing, and provided performing the work in this manner does not cause the laboratory to violate relevant regulatory requirements. STL North Canton has an organizational system in place to ensure that projects are properly planned prior to project initiation. This means that laboratory personnel understand project requirements, that the client clearly understands the lab's capabilities, that the laboratory has the facilities and resources needed to perform the required tests, that samples will be properly handled, that contingency plans are in place, and that analytical data will be reported in accordance with project needs.

## 7.1 Contract Review

The process of client request for proposal (RFP) and the laboratory's tender of a written response is a process of communication between both parties to understand project requirements and the laboratory's capabilities. All contracts for new work entered into by STL North Canton are reviewed by the Customer Service Manager (CSM) or designee. Agreements for continuing work are the responsibility of laboratory Project Managers (PMs) or the CSM. Depending on the size and scope of the proposed project, the Laboratory Director and other STL management staff can also be involved. Technical staff (Operations Manager, QA Manager, and IT staff) can be called upon to perform a review of the technical and QA/QC requirements. The CSM or PM, with this internal support, will work with clients to align project requirements with laboratory capabilities. Any contract requirement or contract modification communicated to STL verbally is documented and communicated to the client in writing. Any discrepancy between client requirements and STL's capability to meet those requirements is resolved in writing before acceptance of the contract

All contracts, Quality Assurance Project Plans (QAPP), Sampling and Analysis Plans (SAPs), contract amendments and documented communications become part of the permanent project record as detailed in Section 3.5.

## 7.2 Certifications and Approvals

A necessary part of the review and work acceptance procedure is the evaluation of project needs for laboratory certification. The persons reviewing the prospective project must determine if project work plans or regulatory permits are tied to specific laboratory certifications or approvals. Where such requirements exist, the laboratory must have the certifications or approvals in place before the work begins. QA personnel coordinate with

the state certification agencies to maintain or add additional parameters. Copies of current laboratory certifications are maintained by the QA office, and are available upon request.

### 7.3 Data Collection Process

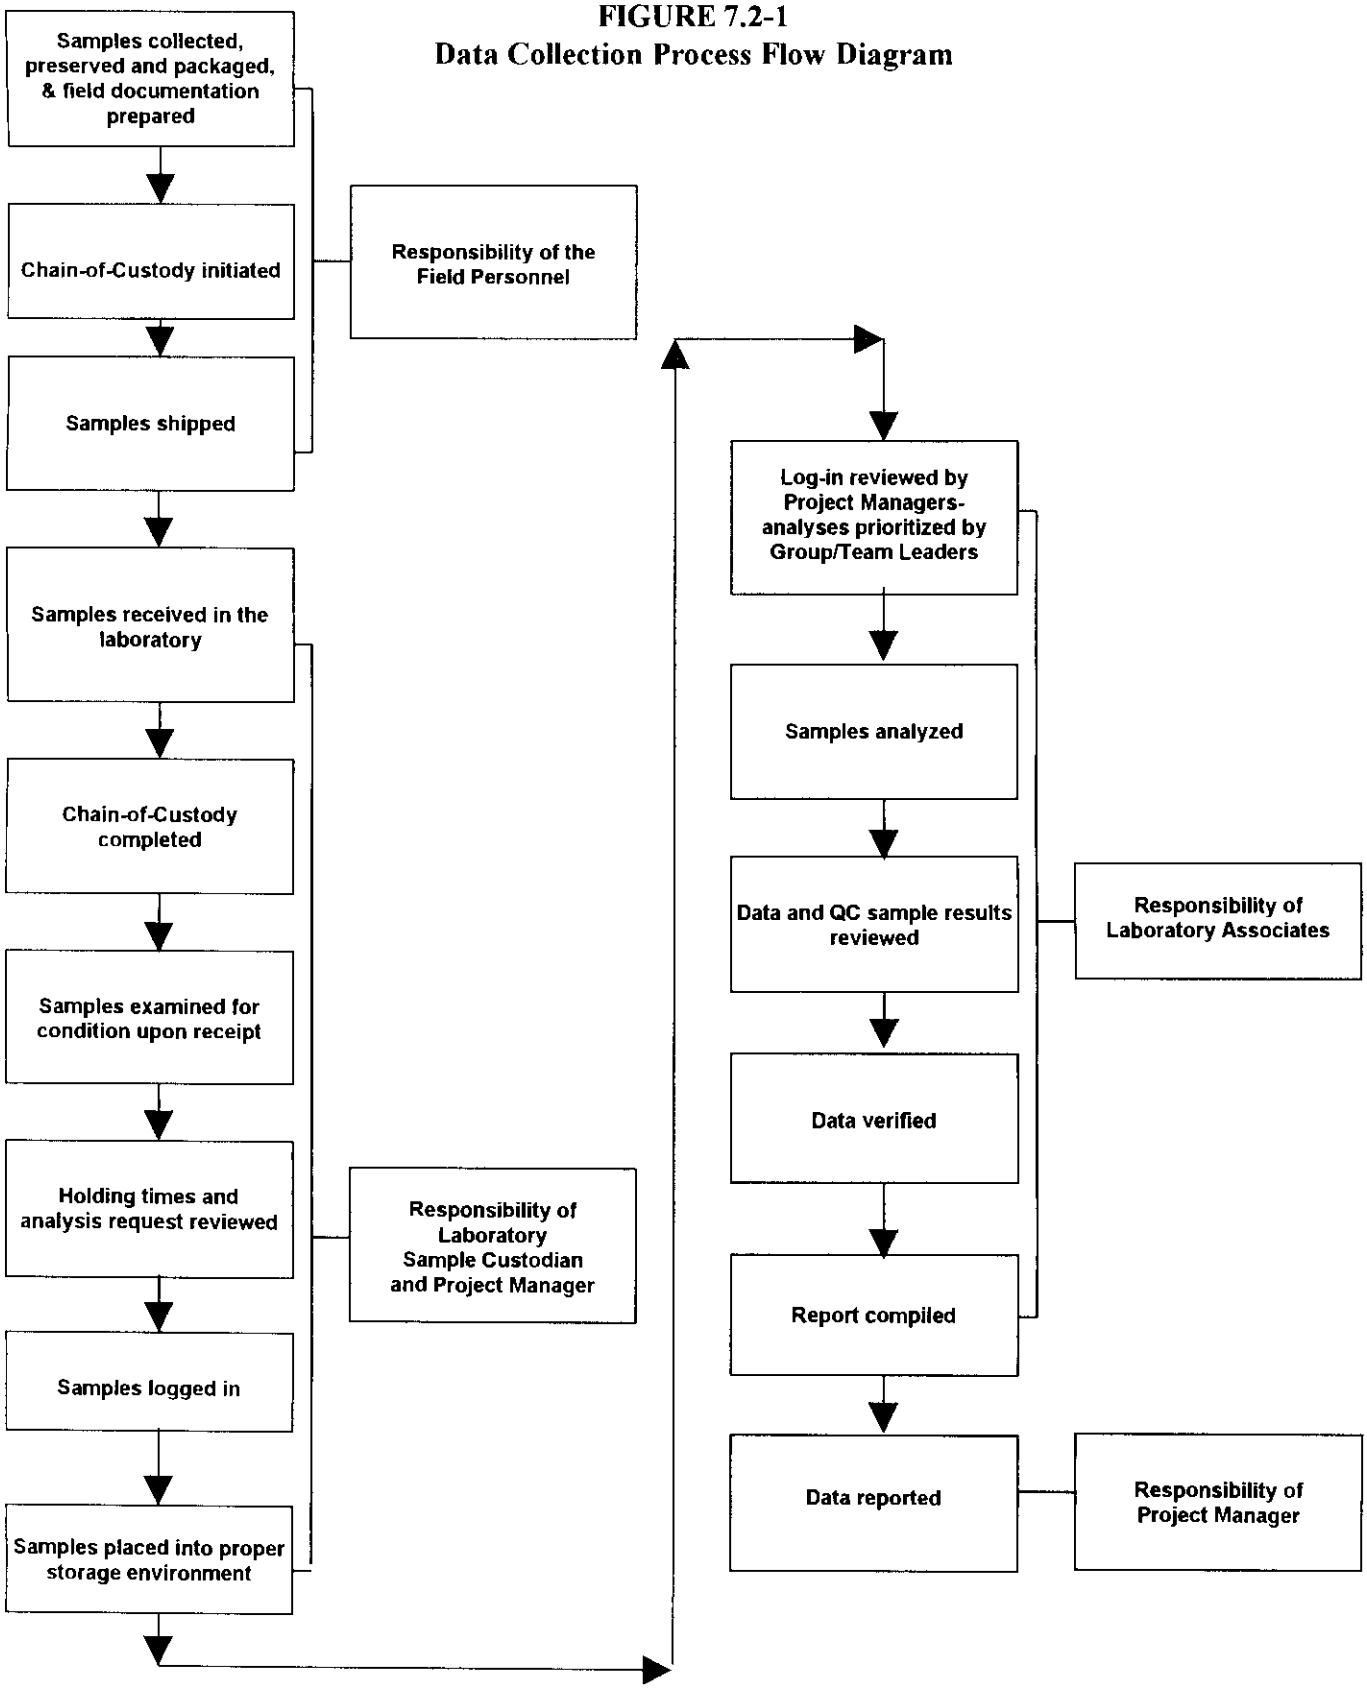
The sample collection and data generation processes are shown in Figure 7.2-1. These processes are designed to produce analytical data that accurately reflect the nature of the site or sampling point.

### 7.4 Project Organizational Responsibilities

Each laboratory client is assigned a single point of contact, usually a PM, to ensure that there is a strong line of communication between the client and STL North Canton. As a matter of policy, CSMs or designee, PMs, and Operations Managers work together to accomplish the following prior to receipt of samples at the laboratory:

- Samples are scheduled for arrival at the laboratory
- All unique project requirements have been identified and communicated to all appropriate personnel
- Standardized client, state, federal, or STL® programs are appropriately selected
- Fully-qualified and client approved subcontract laboratories have been selected if needed
- A review has been performed on all pre-project documents such as proposals, contracts, and/or QAPPs to identify the type of tests required and to ensure project requirements are within the scope of the laboratory being used
- All appropriate and required preparations have been made at the laboratory to accommodate or meet project requirements as described in proposals, contracts, and/or QAPPs
- It has been determined that the laboratory has the capability and the capacity to analyze the samples including equipment, staff, space and workload
- The laboratory is capable of meeting the required sample holding times and is able to report the resulting data within the time line specified by the client
- All known safety hazards associated with the samples have been communicated to all appropriate personnel.

**FIGURE 7.2-1**
**Data Collection Process Flow Diagram**



Approval and issuance of a quote, bid or contract document is documentation that this process has occurred. For particularly large or involved projects, STL North Canton encourages our clients to visit the laboratory and/or participate in kickoff meetings with the laboratory staff. STL has found it very effective to invite the client into the laboratory's project preparations.

## 7.5 Communicating Project Requirements Internally

STL North Canton PMs shall document all project-specific requirements prior to receipt of samples. The LIMS system, QuantIMS, requires the PM to enter a "quote" before any samples can be logged in. In addition to price information, the "quote" is a detailed technical specification of the work to be performed. The quote includes identification of project personnel, numbers and types of samples, tests to be performed, reporting limits, QC to be performed, control limits, data qualifier flags to be used, significant figures to be used, and the types of deliverables required. This is the primary means of communicating routine project requirements to laboratory personnel.

Brief non-routine project requirements are entered into the comments section of the Client Requirements Checklist portion of the quote. The Checklist is reviewed by analysts as analyses are being scheduled and before testing has started. If the special requirements are too lengthy for the Client Requirements Checklist, the PM must prepare a Quality Assurance Summary (QAS) or equivalent, which is a written document describing all requirements that are different than routine work. The QAS is referenced in the Client Requirements Checklist, and is distributed by the PM to each of the operational groups involved. For complex projects, project kickoff meetings are conducted by the PM with each of the operational groups involved.

## 7.6 Contingency Planning

An effective QA program must emphasize contingency planning, actions to prevent problems from reoccurring, and to ensure timely and effective completion of a measurement effort. The following are considered relative to contingency planning.

### 7.6.1 Staffing

A primary objective is to ensure that qualified staff are available to perform the necessary analytical work, regardless of employee turnover, vacation, illness, or other absences. STL North Canton is a relatively large laboratory with multiple staff capabilities for the majority of tests performed. However, other sources of trained personnel are potentially available to assist in the event of unforeseen absences. Given sufficient time for necessary orientation, temporary agency staff can be used. More significantly, STL is a large laboratory network and a large pool of qualified staff can be made available from other STL laboratories.

### 7.6.2 Backup Instrumentation

Within STL North Canton, duplicate instrumentation is available for most methods to allow uninterrupted work flow if one piece of equipment fails. The laboratory may also choose to lease equipment. However, in circumstances where a catastrophic instrument failure occurs, alternative, but equivalent, methods may be recommended to the client for approval.

- Preventive Maintenance - STL's preventive maintenance program is designed to minimize analytical instrument malfunctions, permit simple adjustments, and to ensure fewer and shorter breakdowns of critical analytical equipment. (See Section 8.11, "Preventive Maintenance and Service".)

- STL Laboratories & Subcontractor Laboratories - To support the laboratory during peak periods or in the event of a critical instrument malfunction, STL has the capability to arrange for the use of other STL laboratories or other qualified analytical laboratories as subcontractors for short-term backup analytical support. **However, use of a subcontractor laboratory must be approved by the client in writing.** For projects requiring NELAC approval, the subcontractor must also be NELAC approved. See Section 5.3 for other procedures related to the control of subcontract laboratory services.

- Uninterruptable Power Supply - An Uninterruptable Power Supply (UPS) system which provides line conditioning and backup power to the LIMS computer system/server and laboratory instruments. This contingency allows sufficient time for the main computer system to be shut down and for data archival. All electronically generated data that are stored on the main or instrument computer systems and on individual personal computer (PC) hard drives are backed up at regular intervals. In the event that the main or instrument laboratory computer systems fail, the analytical data can be retrieved.

# 8.0 Work Processes and Operations

Many activities related to environmental projects activities are planned and designed externally to the laboratory or field operation, and are presented to the laboratory in the form of a contract, work plan, sampling and analysis plan (SAP) or QA Project Plan (QAPP). Laboratory and field activities are in turn planned, implemented, and assessed by STL to meet client requirements according to approved procedures and methodologies. The LQM provides the systems to document and implement these activities. The execution and assessment of the implemented operational systems are detailed in STL SOPs. The entire process is assessed on a regular basis for conformance to prescribed requirements.

Standard practices for STL North Canton operations are detailed in this section. Specific project or program requirements that differ from those described here can be met, but they must be explicitly stated in approved contracts, work plans, QAPPs or other project documents. Special project requirements can generally be accommodated provided that they are properly documented, communicated, and they do not cause the laboratory to violate relevant regulatory requirements.

Table 8.2-3 lists the test methods performed by STL North Canton. Table 8.2-2 lists the SOPs associated with those methods. Table 8.0-1 provides a list of the major equipment in place at the laboratory, and Figure 8.11 (at the end of this Section) shows the laboratory floor plan.

## 8.1 Traceability of Measurements

STL documents all laboratory activities in sufficient detail to allow their reconstruction. To this end, documentation is generated to trace a sample from its point of origin, through receipt in the laboratory, analysis, reporting and disposal.

The required documentation includes, but is not limited, to:

- Chain of custody documenting movement and possession of samples
- Sample preparation
- Sample analysis
- Calibration and QC data associated with the samples
- Instrument maintenance
- Control of ancillary equipment and materials (e.g., DI water and glassware)
- Sample disposal
- Final reports

These topics are described in this section. Traceability of chemical standards is also discussed in Section 5.2.4.

## 8.2 Analytical Methods

Whenever possible, STL operations use industry- and regulatory agency-recognized analytical methods from source documents published by agencies such as the Environmental Protection Agency (EPA), Department of Energy (DOE), and the American Society for Testing and Materials (ASTM) as described in STL's SOPs. Analytical methods performed

by STL Laboratories are given in Table 8.2-3 lists the methods routinely performed at the laboratory. The methods pending or approved by a NELAC Accrediting Authority are indicated in the table.

Method performance data, as described in Section 8.2.2 below, are developed by the laboratory operations staff to demonstrate method proficiency. The operations staff and the QA staff evaluate and approve the performance data before a methodology is performed routinely. The method must also be described and documented in an SOP.

### *8.2.1 Standard Operating Procedures*

SOPs are required for all repetitive analytical and administrative activities ranging from the receipt of samples in the laboratory through their analysis, reporting, and subsequent disposal. Training, health and safety procedures, QC, method procedures, and instrument and equipment calibrations are included in SOPs. SOP requirements are discussed in the Policy # QA-001, "Standard Operating Procedures". The specifications in the policy meet NELAC requirements. Table 8.2-2 lists laboratory standard operating procedures.

New SOPs and proposed SOP revisions are reviewed by technically qualified lab personnel. SOPs are controlled documents and are distributed and maintained as described in Policy QA-001. Requirements for SOP approval and frequency of review are listed in Tables 2.4-3 and 2.4-4. All significant modifications to the published method are described in a section of the SOP. All operations must be performed as described in these SOPs.

Planned changes in procedure which may occur due to expected sample matrix effects or project requirements are documented in the project files. These planned changes may be documented using nonconformance memos, NCMs (see discussion of NCMs in section 9.1), project-specific case narratives, or as modifications or additions to associated QAPPs. Every effort is made to obtain client written approval prior to implementing the change.

Unplanned deviations in the SOPs, which may occur due to sample matrix or other events, are documented in NCMs and in the project-specific case narratives.

### *8.2.2 Method Validation and Verification*

Before analyzing samples by a new method or method modification, the method must be verified or validated. After which, analyst capability must be demonstrated (see Section 4.4).

#### *8.2.2.1 Method Verification*

Method verification is required for methods developed by authoritative agencies, such as EPA or ASTM. The level of verification can vary

depending on the type of method or level of modification, but generally should include:

- Determination of method sensitivity,
- Determination of working range,
- An initial demonstration of capability (as specified by NELAC), and
- A written SOP or project-specific written protocol.

Each of these are described in the next section.

### *8.2.2.2 Method Validation*

A complete validation is required for methods developed by STL North Canton. While method validation can take a variety of courses, the following are the key concerns:

Determination of Method Selectivity

Method selectivity is the demonstrated ability to discriminate the analyte(s) of interest from other compounds in the specific matrix or matrices. In some cases, to achieve the required selectivity for an analyte, a confirmation analysis is required as part of the method

Determination of Method Sensitivity

Method sensitivity is normally demonstrated using the 40CFR 136B method detection limit protocol (see MDLs, section 8.2.3, below), but can also be based on variance of blank results, and signal-to-noise ratios.

Determination of Interferences

This is demonstrated by analyzing samples of the matrix of interest that is known to be free of the analyte(s) of interest.

Determination of Range

In most cases, analytical range is determined and demonstrated by comparison of the response of an analyte at different concentrations to targeted criteria. Often the targeted criteria are represented by the goodness of fit or linearity of the experimental data to a continuous mathematical function or curve. The curve is used to establish the range of quantitation, with the lower and upper values representing the upper and lower quantitation limits. Curves are not limited to linear relationships.

Determination of Accuracy and Precision

Accuracy and precision studies are generally performed using replicate analysis of samples of known concentration. The resulting percent recovery and relative standard deviation, or other precision measure, is calculated and compared to a set of target criteria.

Documentation of Method

The method is formally documented in an SOP (see policy QA-001 for details). If a method modification is being performed for a specific short-

term project, the modification should be described in a written protocol that is approved by the lab's client, in addition to the in-house approvals required by QA-001.

Continued Demonstration of Method Performance
Continued ability of the lab to perform the method is addressed in the SOP. Generally this is accomplished with the specified calibration and batch QC requirements.

### 8.2.3 Method Detection Limits

It is STL North Canton's policy to follow the specification in the U.S. EPA 40 CFR Part 136 Appendix B in determining MDLs for chemical tests. The STL requirement for this procedure is further detailed in Policy QA-005 entitled "Determination of Method Detection Limits for Chemical Tests." This policy requires that the MDLs be determined for each analyte of interest representing the aqueous and solid matrices within the capability of the primary analytical methods. STL North Canton has performed MDLs per instrument. Ongoing MDL verification is performed via MDL checks or MDL studies. The laboratory's MDLs are given in Table 8.2-4 .

### 8.2.4 Instrument Detection Limits

Instrument Detection Limits (IDLs) are required to be performed quarterly for metals constituents and cyanide when analyses are performed in support of Comprehensive Environmental Response, Compensation and Liability Act (CERCLA) activities or when the USEPA CLP SOW protocol is required. IDLs are not required by the SW-846 methods, with the exception of method 6020.

When required, IDLs will be performed in accordance with the procedures defined in the applicable USEPA SOW, ILMO3.0 or subsequent versions, and Policy QA-014, "Determination of Instrument Detection Limits".

Prior to acceptance and use for reporting purposes, all data from detection limit studies and reporting limits must undergo technical review and approval by the laboratory management and QA staff.

### 8.2.5 Reporting Limits

Reporting limits are established and modified within STL according to the STL Policy QA-009, "Reporting Limits." Two reporting limit conventions are discussed in the policy: the standard Reporting Limit (RL) and the Project-Specific Reporting Limit (PSRL). The standard STL Reporting Limit (RL) is the lowest level at which measurements become quantitatively meaningful. The RL is always greater than the statistically determined MDLs. PSRLs are used when project data quality objectives (DQO) require a reporting limit other than the RL. PSRLs tailor STL's product to meet customer requirements. Higher PSRLs may be established based on maximum contaminant level (MCLs), applicable or relevant and appropriate requirements (ARARs), or project-specific data quality objectives

(DQOs). PSRLs below the lab's standard RL may be used, but they must be supported MDL and the instrument calibration. The STL RLs and PSRLs are maintained by the LIMS.

## 8.3 Data Quality Objectives

Data quality objectives (DQOs) are qualitative and quantitative statements used to ensure the generation of the type, quantity, and quality of environmental data that will be appropriate for the intended application (EPA 1994)[1]. Typically, DQOs are identified during project scope and the development of sampling and analysis plans. In this LQM, however, we refer to only the analytical DQOs because laboratories generally do not have any authority over sample collection, shipment, or other field-related activities that may affect the data quality of the environmental sample before the sample is received in the laboratory. The EPA has established six primary analytical DQOs for environmental studies. These DQOs are precision, accuracy, representativeness, completeness, comparability, and detectability.

The components of analytical variability (uncertainty) can be estimated when QA and QC samples of the right types and quantities are incorporated into measurement procedures at the analytical laboratory. STL® incorporates numerous QA and QC samples to obtain data for comparison with the analytical DQOs and to ensure that the measurement system is functioning properly. The QA/QC samples and their applications, described in Section 8.4, are selected on the basis of method- or client-specific requirements. Field blanks, field duplicates, and performance evaluation (PE) samples are received from the client as unknown samples. Analytical laboratory QC samples for inorganic and organic analyses may include calibration or instrument blanks, method blanks, background, duplicates, replicates, laboratory control samples (LCSs), calibration standards, matrix spikes (MSs), matrix spike duplicates (MSDs), and surrogate spikes.

### 8.3.1 Precision And Accuracy

Precision is an estimate of variability, that is, it is an estimate of agreement among individual measurements of the same physical or chemical property, under prescribed similar conditions. The precision of a measurement system is affected by random errors. Precision is expressed either as relative standard deviation (RSD) for replicate measurements greater than two or as relative percent difference (RPD) for duplicate measurements. Table 8.6-1 illustrates the formulae used to calculate units of precision (i.e., RSD and RPD).

Accuracy is the degree of agreement between a measurement and the true or expected value, or between the average of a number of measurements and the true or expected value. Systematic errors affect accuracy. For chemical properties, accuracy is expressed either as a percent recovery (R) or as a percent bias (R - 100).

[1] "Guidance for the Data Quality Objectives Process", EPA 600/R-96/005, September 1994.

The precision and accuracy measures that are to be used in evaluating inorganic, organic, and radionuclide constituents at STL are provided in Tables 8.4-5 through 8.4-7, in method-specific SOPs, and in the documentation for the analytical method of interest.

Precision and accuracy are determined, in part, by analyzing data from matrix spike and matrix spike duplicates, unspiked duplicates, LCSs, and single blind audit samples. For radiochemical determinations, counting statistics can also provide an estimate of uncertainty. A description of these QC samples is provided in Section 8.4.

### *8.3.2 Completeness*

Completeness is a measure of the percentage of measurements that are judged to be valid measurements. At a minimum, the objective for completeness of data is 90% for each constituent analyzed.

### *8.3.3 Representativeness*

Representativeness is the degree to which data accurately and precisely represent a characteristic of a population, a variation in a physical or chemical property at a sampling point, or an environmental condition. Data representativeness is primarily a function of sampling strategy; therefore, the sampling scheme must be designed to maximize representativeness. Representativeness also relates to ensuring that, through sample homogeneity, the sample analysis result (concentration) is representative of the constituent concentration in the sample matrix. At STL every effort must be made to analyze an aliquot that is representative of the original sample, and to ensure the homogeneity of the sample before subsampling.

### *8.3.4 Comparability*

Comparability is a measure of the confidence with which one data set can be compared to another. To ensure comparability, all laboratory analysts are required to use uniform procedures (i.e., SOPs) and a uniform set of units and calculations for analyzing and reporting environmental data.

## *8.4 Quality Control Samples*

Two types of Quality Control (QC) samples are field QC samples and laboratory QC samples. Field QC samples are collected during the sampling event and are useful in determining sampling precision and accuracy and monitoring for contamination that may occur during collection, transport or storage of environmental samples. Laboratory QC samples are routinely added at the laboratory to the normal sample stream. Successful analysis of these samples demonstrates that the laboratory is operating within prescribed requirements for accuracy and precision. In addition, utilizing matrix-specific laboratory QC samples, information regarding the effect of the matrix or field conditions on the

analytical results can be obtained. The following sections describe common field and laboratory QC samples.

### 8.4.1 Field QC Samples

When field QC sample collection and analysis are required for a project, it is the responsibility of the project sampling supervisor to ensure that this sampling is performed correctly and at the project-required frequencies. Field QC samples may or may not be identified as such to the laboratory and are considered by the laboratory as field samples for the purpose of QC batching, sample preparation and analysis. Field QC sample results are reported in the same manner as actual field samples, unless a specific deliverable is requested by the client. No correction of the analytical data is done in the laboratory based on the analysis of field QC samples. Field QC sample types, applicability to organic and inorganic analyses, precision and accuracy applications and by whom they are introduced are summarized in Table 8.4-1.

### 8.4.2 Laboratory QC Samples

Laboratory performance QC is required to ensure the laboratory systems (instrumentation, sample preparation, analysis, data reduction, etc.) are operating within acceptable QC guidelines during data generation as required to meet the client's objectives. Laboratory QC samples consist of method blanks (MB), instrument blanks, laboratory control samples (LCS) and calibration verification samples. In addition to laboratory performance QC, matrix-specific QC is utilized to determine the effect of the sample matrix on the data being generated. Typically, this includes matrix spikes (MS), matrix spike duplicates (MSD), sample duplicates, and the use of surrogate compounds.

Laboratory and matrix-spike QC sample types are summarized in Tables 8.4-2 through 8.4-4. In addition, Tables 8.4-5 through 8.4-7 list laboratory QC samples, acceptance criteria and corrective actions by reference method for inorganic methods, organic methods, and the USEPA CLP Statements of Work respectively. The following sections provide descriptions of laboratory QC samples and their frequency of use. Policy QA-003, "Quality Control Program", describes in detail the QC data evaluation process.

#### 8.4.2.1 Quality Control (QC) Batch

The QC batch consists of a set of up to 20 field samples that behave similarly (i.e., same matrix) and are processed using the same procedures, reagents, and standards within the same time period. This definition of a QC batch is utilized by STL unless there is clear regulatory guidance, contract specifications, or differing client requirements that are explicitly documented. Environmental samples are associated to QC samples in the LIMs via the analytical batch, which is clearly indicated on each analytical

report as a cross-reference between the samples and associated QC. Further details and requirements for the application of the definition of QC batch are described in Policy QA-003.

#### *8.4.2.2 Method Blank*

The method blank (MB) is a QC sample that consists of all reagents specific to the method and is carried through every aspect of the procedure, including preparation, cleanup, and analysis. The method blank is used to identify any interferences or contamination of the analytical system that may lead to the reporting of elevated analyte concentrations or false positive data. Potential sources of contamination include solvent, reagents, glassware, other sample processing hardware, or the laboratory environment. In general, the method blank is a volume of deionized laboratory water for water samples, or a purified solid matrix for soil/sediment samples, that is processed as a sample. In the event that no appropriate solid matrix exists, deionized water may be used. The volume or weight of the method blank must be approximately equal to the sample volume or sample weight processed. A method blank shall be prepared with each group of samples processed.

#### *8.4.2.3 Instrument/ Calibration Blank*

The instrument blank is an unprocessed aliquot of reagent used to monitor the contamination of the analytical system at the instrument. System contamination may lead to the reporting of elevated analyte concentrations or false positive data. The instrument blank does not undergo the entire analytical process and generally consists of an aliquot of the same reagent(s) used for a sample dilution. Instrument blanks are also referred to as continuing calibration blanks (CCBs).

#### *8.4.2.4 Laboratory Control Sample*

A laboratory control sample (LCS) is a laboratory-prepared suitable clean matrix sample that is fortified with target analytes or a solid reference material purchased from an approved vendor. The LCS contains all target analytes specified in the method, and must contain the same analytes as the matrix spike and matrix spike duplicate. For certain regulatory or client programs, an LCS may contain a full list of analytes. However, in these cases, a subset of analytes, as defined by the program, is used to determine the acceptability of a batch of sample data. The LCS recovery data are used to monitor the analytical method performance in terms of analytical accuracy. On-going evaluation of the LCS recoveries demonstrates that the laboratory is performing the method within statistical control (i.e., accuracy and precision) in the absence of matrix interference. The LCS results, coupled with MS data, help determine

whether the laboratory performed the method correctly or the sample matrix affected the analytical results. When a laboratory control sample duplicate (LCSD) is required, a percent recovery for each target analyte is calculated, as well as a relative percent difference (RPD) between the LCS and the LCSD.

#### *8.4.2.5 Matrix Spike*

A matrix spike (MS) is an environmental sample to which known concentrations of target analytes have been added. MS samples are analyzed to evaluate the effect of the sample matrix on the analytical methodology. MS samples are generated by taking a separate aliquot of an actual field sample and spiking it with the selected target analyte(s) prior to sample extraction. The MS sample then undergoes the same extraction and analytical procedures as the unfortified client sample. Due to the potential variability of the matrix of each sample, these results may have immediate bearing only on the specific sample spiked and not on samples collected at other locations that are included in the QC batch.

#### *8.4.2.6 Matrix Spike Duplicate*

A matrix spike duplicate (MSD) is a second aliquot of a sample that is spiked with the selected target analyte(s) and analyzed with the associated sample and MS sample. The results of the MS and MSD are used together to determine the effect of a matrix on the accuracy and precision of the analytical process. Due to the potential variability of the matrix of each sample, the MS/MSD results may have immediate bearing only on the specific sample spiked and not all samples in the QC batch.

#### *8.4.2.7 Sample Duplicate*

A sample duplicate is a second aliquot of an environmental sample taken from the same sample container that is processed identically with the first aliquot of that sample. That is, sample duplicates are processed as independent samples within the same QC batch. The results are compared to determine the sample homogeneity and the precision of the analytical process.

#### *8.4.2.8 Surrogates*

Surrogates are organic compounds that are similar in chemical composition and behavior to the target analytes but that are not normally found in environmental samples. Surrogates are added to all appropriate samples and QC samples being tested for organic analytes to monitor the effect of the sample matrix and the procedure on the accuracy of the process.

#### 8.4.2.9 Analytical Spike

An analytical spike is created by spiking target analytes into a prepared portion (i.e., post digestion) of a sample just prior to analysis. It provides information on matrix effects encountered during analysis such as suppression or enhancement of instrument signal levels. It is most often used in elemental analysis involving various forms of atomic emission or atomic absorption spectroscopy. A single analytical spike serves as a single point application of the "method of standard additions" or MSA.

#### 8.4.2.10 Interference Check Sample

An interference check sample (ICS) is a solution containing known concentrations of both interfering and analyte elements. Analysis of this sample can be used to verify background and interelement correction factors.

#### 8.4.2.11 Internal Standards

An internal standard (IS) is a compound or element with similar chemical characteristics and behavior in the analysis process to the target analytes, but is not normally found in environmental samples. The internal standard is usually added after sample preparation. The primary function of the internal standard is quantitation, however, it also provides a short-term indication of instrument performance.

### 8.5 Data Collection Operations

Laboratory analyses are designed to produce data that are representative of existing conditions present at the time the sample was obtained. The data collection design includes field sampling events, sample handling and custody, analytical operations, data recording procedures, data assessments, data verification, and data reporting requirements and techniques to assess limitations of data use. These operations are discussed in this section through section 8.10.

#### 8.5.1 Field Collection and Shipment

In order to provide a sample that most accurately represents the test matrix, field sample collection personnel must abide by the sample collection guidelines and procedures established by involved regulatory agencies. A significant part of the efforts of regulatory agencies include the use of "approved" sample containers, chemical and physical preservation techniques, and observance of specified holding times. It is imperative that all samples be collected and preserved according to the appropriate analytical method specified in the QAPP (if one exists). Although the sampling may be performed by non-STL personnel, the importance of sampling and transportation of the sample to the laboratory is understood and must be considered

during data validation.

Sampling requirements must be communicated to the sampling team prior to field collection.

Field personnel are responsible for labeling each individual sample collected with the following information:

- Project name
- Unique client sample number
- Sample location (including as appropriate: borehole and depth or grid coordinates)
- Sampling date and time
- Sample preservation
- Analysis required.

An overriding consideration for the resulting analytical data is the ability to demonstrate that the samples have been obtained from the locations stated and that they have reached the laboratory without alteration. Evidence of collection, shipment, laboratory receipt, laboratory custody, and disposal must be documented to accomplish this. Figure 8.5-1 shows an example Chain-of-Custody (COC) form that is used by the STL laboratory to document this evidence. Field personnel are responsible for initiating the COC form.

The prompt shipment of samples to the laboratory is necessary to ensure that required holding times are met. Samples should be shipped by an overnight carrier, be hand-delivered, or transported in a manner that assures prompt delivery to the laboratory. Some sites require an extensive radioactive screening process before a sample may be shipped. In these cases, it is imperative for the Project Manager to maintain good communications with the client to assure proper staffing of the laboratory in response to a decreased holding time.

### 8.5.2 Sample Containers, Shipping Containers, Preservatives, and Holding Times

#### 8.5.2.1 Sample Containers

A sample container is defined as the sealed enclosure, usually made of plastic or borosilicate glass that the sample is collected in and stored in until analysis. All sample containers provided by STL operations for environmental sampling are new, with the exception of some air sampling canisters, which must be recertified before reuse, and demonstrated to be clean for their appropriate use. All documentation certifying sample container cleanliness must be maintained by the laboratory or the vendor and can be provided to the client upon request.

**Comments:**

The sample containers to be supplied are listed in Tables 8.5-1 through 8.5-5. Container volumes listed in these tables may be decreased with the approval of the laboratory QA Manager or Technical Director to accommodate reduced sample volumes required by the facility SOP or increased as applicable to accommodate duplicates and matrix spikes.

### *8.5.2.2 Shipping Containers*

Shipping containers are defined as the sealed enclosure in which the sample containers are stored during shipment from the sample collection site to the analytical laboratory. Shipping containers must be of sufficient number and size to accommodate the samples in an upright condition. Shipping containers must also meet all requirements for the shipment of environmental samples.

Packaged samples must be shipped to the analytical laboratory in a safe manner that preserves the integrity of the samples. The most common method of sample shipment employs coolers or ice chests that are sealed with custody tape and shipping tape. These coolers must be durable and resistant to crushing during shipment. All coolers must be well maintained and cleaned to prevent cross-contamination of the samples. All coolers contain a plastic liner to limit contamination. It is the ultimate responsibility of the person collecting and packaging the sample for shipment to ensure that the shipping containers are clean and functional.

To help prevent sample breakage during shipment, additional consideration must be given to providing shock absorbency to all samples packaged inside the shipping container. Use of bubble-wrap around each sample container is the best way to provide this protection. Foam packing materials and vermiculite are also successfully used.

### *8.5.2.3 Sample Preservatives*

Most analytes have a finite holding time in a given sample matrix. Sample preservation is the chemical or physical means by which samples are treated during and/or following sample collection to aid in the stability of the analytes of interest in that matrix. Sample holding times are also adversely affected when samples are improperly preserved, or shipped unpreserved. The preservation of samples at the time of sample collection will follow the requirements of the analytical methods used. This preservation includes the addition of reagents to deter chemical and biochemical degradation and the maintenance of refrigeration during transit and ultimate storage in the laboratory. The required preservatives for the analysis to be performed on each matrix are included in Tables 8.5-1 through 8.5-5.

#### 8.5.2.4 Sample Holding Times

Holding time is defined as the maximum allowable time a sample can be stored after sample collection and preservation (or laboratory receipt for CLP) until appropriate processing occurs (preparation or analysis). The holding time may vary according to method or client requirements and is tracked and controlled via the LIMs. Tests designated with holding times as "analyze immediately or ASAP" are considered parameters that should be tested by field personnel or on-site. Each operation has a system in place to ensure that holding times are monitored by each group within the operating unit. It is the responsibility of each STL associate processing the sample to assure that holding times are met. STL is responsible for meeting all holding times for properly preserved samples received within 48 hours of collection or if less than half the holding time has passed. If these conditions are not met, STL will attempt to expedite sample analysis as soon as possible. When holding times are exceeded, the laboratory uses a Nonconformance Memo (NCM) to identify and document the root cause of the holding time violation.

Sample holding times are listed in Tables 8.5-1 through 8.5-5.

### 8.5.3 Sample Handling

STL North Canton's SOP, Sample Receiving - NC-SC-0005, describes the sample receipt and log-in process in detail. The following sections describe the general policies followed by STL.

#### 8.5.3.1 Sample Receipt

Samples shall be received and logged in at STL by a designated sample custodian or other properly trained associate. Upon sample receipt, the sample custodian shall, as appropriate:

- Wear appropriate personal protective equipment. At a minimum, this consists of gloves, a lab coat, and safety glasses
- Examine the shipping containers to verify that the custody tape is intact
- Examine all sample containers for damage
- Open shipping containers in adequately ventilated areas to assure worker safety
- Determine if the temperature required by the requested testing program has been maintained during shipment. Document the shipping container temperature on the COC
- Compare samples received against those listed on the COC
- Verify that sample holding times have not been exceeded

- Examine all shipping records for accuracy and completeness
- Determine sample pH (if required for the scheduled analysis) (except VOA and TOX samples) and record on the cooler receipt form
- Sign and date the COC immediately (only after shipment is accepted) and attach the waybill
- Note any problems associated with the coolers and samples on the cooler receipt form and notify the PM who in turn notifies the client
- Attach durable (water-resistant) laboratory sample container labels with unique laboratory identification number and test
- Place the samples in proper laboratory storage.

A CUR or an equivalent form/system is generated by sample control during the sample log-in process to document anomalies identified upon the receipt of samples in the laboratory. These anomalies are outside of laboratory control and do not require corrective actions to be taken within the laboratory. The affected client shall be notified by the PM or designee of all CURs generated for their samples. The PM is responsible for resolving with the client how to proceed with the samples and documenting the decision to proceed with the analysis of compromised samples. CURs must be resolved prior to sample preparation and analysis. The completed CUR form shall be stored in the project file. An example CUR is shown in Figure 8.5-2. The report narrative will include an explanation of sample receiving related anomalies.

### *8.5.3.2 Exceptions or Discrepancies*

STL reserves the right to reject samples for any of the following reasons:

- No custody seals as required by project
- No chain of custody documentation provided
- Preservation inappropriate for analysis requested
- Sample container inappropriate for analysis requested
- Sample received out of holding time for analysis requested
- Incomplete sample information provided
- Discrepancies between COC and sample labels
- Samples have high levels of polychlorinated dibenzo-p-dioxins/ dibenzo furans (PCDD/PCDFs)
- Samples have a high level gross alpha or beta radiation
- Samples are from a site known to contain chemical warfare agents (CWAs) and the samples have not been screened for them.

These or any other project exceptions or discrepancies are discussed with the client and agreed upon action taken.

### 8.5.3.3 Sample Log-in

Sample log-in activities at STL are fully documented in Sample Receiving SOP, NC-SC-0005. The following is a general description of the log-in process:

- Enter the samples in the laboratory sample log-in book, and/or the LIMS which contains the following information at a minimum:
- Project name or identification number
- Unique sample numbers (both client and internal laboratory)
- Type of samples
- Required tests
- Date and time of laboratory receipt of samples
- Field ID supplied by field personnel
- Notify the PM and appropriate Group/Team Leader(s) of sample arrival
- Place the completed COCs, waybills, and any additional documentation in the project file.

### 8.5.3.4 Sample Storage

The primary considerations for sample storage are:

- Maintenance at the method prescribed temperature, if required
- Maintenance of sample integrity through adequate protection from contamination from outside sources or from cross-contamination of samples. Low-level and high-level samples, when known, must be stored separately. Samples and standards must be stored in separate refrigerators or freezers. Storage areas for volatile organic test requests should be monitored weekly by the analysis of a holding (refrigerator) blank (an aliquot of contaminant-free water stored in a VOA vial)
- Security of samples within the laboratory.

The requirements listed in Tables 8.5-1 through 8.5-5 for temperatures and holding times shall be used. Placing of samples in the proper storage environment is the responsibility of sample control personnel. STL will assign individuals the responsibility of notifying the Group/Team Leaders or their designees if there are any samples which must be analyzed immediately because of holding time requirements.

### 8.5.3.5 Internal Sample Chain-of-Custody and Interlaboratory Transfers

Sample custody within STL laboratories is described in Sample Receiving SOP, NC-SC-0005. Internal COC may be required for programs defined

by state or federal agency. The sample custody documentation shall include the following minimum requirements:

- Name of associate taking custody of the sample from the sample storage area for preparation or analysis
- Dates sample removed from and returned to the sample storage area
- Identification of tests to be performed on the sample aliquot(s) selected by the associate
- Sample matrix
- Laboratory sample numbers
- Sample storage location.

Additional custody records can be provided by the laboratory at the specific request of the client. Access to STL is restricted to prevent any unauthorized contact with samples, extracts, or documentation.

Samples transferred to a different laboratory than the original receiving facility are transferred under chain-of-custody (COC). The COC is maintained whether the laboratory is another STL facility or a subcontracted laboratory. If the entire sample volume is transmitted, the original copy of the client's COC form will be used to document the relinquishing of the sample and will accompany the sample to its destination. A copy of the completed COC form shall be retained in the laboratory project file. In the case where an aliquot of a sample is shipped from the laboratory, a new COC will be generated by the laboratory and shipped with the sample aliquot. The original COC will be retained in the project file at the site holding the original sample container.

Samples are not transferred to other STL facilities or to subcontractor laboratories without prior approval of the client.

### *8.5.3.6 Subsampling*

Sample preparation procedures are referenced and defined in the method SOPs.

### *8.5.3.7 Sample Disposal and Return Chain-of-Custody*

After the requested analyses on the samples have been completed, any remaining portions of the samples will be maintained by the sample custodian until the samples are disposed of or returned to the client. The

disposal of each sample is recorded on the client's COC form, in LIMS, or referenced in the project file. Sample disposal procedures and documentation are described in operation-specific SOPs. STL's routine sample retention period is at least thirty days after the analytical report is issued to the client, unless otherwise specified by the client.

If samples are returned to the client rather than disposed of by the laboratory, the original COC or a new COC is used to document custody transfer back to the client from the laboratory. A copy of the completed COC is retained in the laboratory project file.

### 8.5.4 Calibration Procedures and Criteria

All equipment and instruments used at STL operations for quantitative measurements are controlled by a formal calibration program. Table 8.0-1 lists the lab's major analytical instrumentation , and Tables 8.5-6 through 8.5-9 outline calibration requirements. Calibrations may be periodic or operational. These are described in the lab's method SOPs. The Policy P-T-001, "Selection of Data Points Required for an Initial Calibration Curve," is applicable when the number of data points is not described in the method. At a minimum, these calibration procedures shall include:

- Instrument to be calibrated
- Reference standards used for calibration
- Calibration technique (e.g., linear, quadratic)
- Acceptable performance tolerances and corrective actions required if specifications are not met
- Frequency of calibration
- Calibration documentation requirements.

Whenever possible, recognized procedures such as those published by ASTM or the USEPA or procedures provided by manufacturers shall be adopted. If established procedures are not available, a procedure shall be developed considering the type of equipment, stability characteristics of the equipment, required accuracy, and the effect of operation error on the quantities measured.

#### 8.5.4.1 Physical Reference Standards

Physical reference standards associated with periodic calibrations include weights for calibrating balances and certified thermometers for calibrating working thermometers. Whenever possible, physical reference standards shall be calibrated by a body that can provide traceability to nationally or internationally recognized standards. If these standards are not available, the basis for the reference standard shall be documented.

Physical reference standards shall be used only for calibration procedures and shall be stored separately from equipment used for analysis.

### *8.5.4.2 Chemical Reference Standards and Reagents*

Chemical reference standards are generally associated with operational calibration. These standards include reference materials traceable to recognized standards suppliers. This may include vendor-certified materials traceable to national or international standard reference materials (e.g., NIST). This topic is also discussed in the Section on "Procurement of Supplies and Services" (see 5.2.4).

All chemical reference standards maintained in the laboratory for use in calibrations (or as QC spiking solutions) and reagents prepared in the laboratory shall be labeled or referenced to appropriate documentation (hard copy or electronic) with the following information at a minimum:

- A unique identification including concentration (solutions containing several analytes can be identified such that the solution constituents and concentrations can be referenced to a logbook)
- Medium prepared in
- Preparation date
- Expiration date
- Initials of preparer.

Vials containing standard solutions that are not large enough to accommodate labels listing the above information may be referenced to a laboratory logbook/ notebook entry or standards software. The expiration date of the working standard and reagent must not exceed the expiration date of the original material. These records should provide sufficient detail to allow one to reproduce the standard or reagent.

Records for all purchased standards and reagents shall include the date of receipt, the date opened, and, where applicable, the expiration date.

### *8.5.4.3 Standard Verification*

When possible, reference standards are purchased from a STL preapproved vendor. Standards are verified by quantitation against a second known standard before reporting data. The standard for verification must meet the laboratory's criteria for the independent/second source ICV verification. Therefore, the verification of a new standard initial calibration with a second source ICV meets this verification requirement, some "bad acting" analytes may not meet these criteria and must be approved by the QAM before use. Standard spiking solutions and

surrogates shall be verified by analyzing an LCS with the new standards and verifying against historical criteria limits. Special standards that are obtained from another source must also be independently verified at the lab. Verification by the laboratory of a reference standard from neat materials is also necessary.

To extend the use of an expired standard, which may not be allowed by all programs, reverification is necessary provided that new analysis produces acceptable data. The verification of an expired standard is performed against a current, independent standard reference material by analyzing within a valid calibration and QC.

Stock and working standards and reagents are checked regularly for signs of deterioration, such as discoloration, formation of precipitates, or change in concentration. Care is exercised in the proper storage and handling of standard and reagent solutions. Standards and reagents are always stored separately from samples.

An independent or second source standard is used to verify initial calibrations. An independent/second source standard is defined as a standard composed of the same target constituents as, but from a different source than those used in the standards for the initial calibration. An independent standard may be a laboratory-prepared or a certified independent standard solution(s). Independence of reference material can be achieved by: (1) purchasing reference materials from two separate vendors, (2) using a different lot from the same vendor that is certified by the vendor as an independent standard or (3) having two separate individuals prepare the calibration and verification standard solutions if independent sources are not available.

#### *8.5.4.4 Periodic Calibration*

Periodic calibration is performed at prescribed intervals. In general, equipment that can be calibrated periodically is a distinct, singular purpose unit and is relatively stable in performance. These include balances, micropipettors, counters, thermometers, refrigerators, freezers, and ovens. Equipment employed at STL requiring periodic calibration are listed along with their respective calibration requirements in Tables 8.5-6. NELAC requires mechanical volumetric dispensing devices (except Class A glassware) to be checked for accuracy or at least a quarterly basis if in use. The laboratory unit has an SOP in place for the calibration of this equipment if in use at their location.

### *8.5.4.5 Operational and Continuing Calibration*

Operational calibration is routinely performed as part of instrument usage, such as the development of a standard calibration curve (see Tables 8.5-7 to 8.5-9). The accuracy of initial calibrations are to be verified prior to sample analysis through the use of an independent standard in situations where the source method requires calibration verification.

Detailed requirements for operational and continuing calibration are contained in method-specific SOPs.

When an initial calibration is not performed on the day of analysis, the validity of the initial calibration verification must be verified prior to sample analyses by a continuing instrument calibration verification with each analytical batch.

- A continuing instrument calibration verification must be performed as outlined in Tables 8.5-7 (inorganics) and 8.5-8 (organics).

- Sufficient raw data records must be retained to permit reconstruction of the continuing instrument calibration verification, e.g., test method, instrument, analysis date, each analyte name, concentration and response, and calibration curve or response factor.

- When the acceptance criteria for the continuing calibration verification is exceeded high, i.e., high bias, and there are associated samples that are non-detects, then those non-detects may be reported. Otherwise the samples affected by the unacceptable calibration verification shall be reanalyzed after a new calibration curve has been established, evaluated and accepted.

- When the acceptance criteria for the continuing calibration verification is exceeded low, i.e., low bias, those sample results may be reported if they exceed a maximum regulatory limit. Otherwise the samples affected by the unacceptable verification shall be reanalyzed after a new calibration curve has been established, evaluated and accepted.

### *8.5.4.6 Calibration Failure*

Equipment or instruments that fail calibration or become inoperable during use shall be tagged out (NCM created) to indicate they are out of calibration. Such instruments or equipment shall be repaired and successfully recalibrated before reuse. Following recalibration or verification, back to control will be documented in the injection/run

log and/or maintenance logbook through the routine identification of the required calibration runs specified by the standard operating procedure.

#### 8.5.4.7 Calibration Records

Calibration shall be documented for each piece of equipment subject to calibration. All calibration records (periodic and operational) directly affect data and may not be limited to one project. These records shall be stored in either the quality records or the associated project files. Project files that include sample data shall either include the calibration records or include reference to them

### 8.6 Quality Assessment

The effectiveness of the QA practices is measured by the quality of data generated by the laboratory. Procedures are in place to detect, prevent, and correct quality problems and to ensure quality improvement. Items and processes that do not meet established requirements must be investigated to determine their cause. Improvements must be implemented in the operations that will prevent a recurrence of these quality problems and provide overall quality performance. All phases of laboratory work should be designed with the objective of preventing problems and improving quality on a continuous basis.

#### 8.6.1 Data Quality Assessment

Data quality is judged in terms of precision, accuracy, representativeness, completeness and comparability. The areas of representativeness, comparability, and completeness for an overall project, inclusive of sampling issues, may be beyond the control of the laboratory. The elements over which the laboratory has direct control are precision, accuracy, and completeness relative to analytical testing results.

Precision and accuracy assessments are made as part of the evaluation of laboratory QC data generated during sample preparation and analysis. The QC samples employed at STL North Canton as part of routine sample analysis are summarized in Section 8.4 of this document. Table 8.6-1 shows the precision and accuracy measurements employed. Analytical method SOPs and STL Policy Number QA-003 include information on requirements for the type of QC samples, frequencies, and acceptance criteria. Additionally, the SOPs and Policy describe the appropriate actions to be taken when a QC sample result does not meet acceptance criteria.

#### 8.6.2 Statistical Evaluation of Data

In-house limits for all QC data must be evaluated at least annually and compared to the limits published in the methods for applicable matrices. Method limits will

be employed until sufficient QC data are acquired. A minimum of 20 to 30 data points are recommended to establish the in-house QC limits. Calculated results of the QC (LCS) samples are evaluated by comparing against control limits (3-sigma).

Control charts are used to develop control limits, trouble-shoot analytical problems, and, in conjunction with the non-conformance system, to monitor for trends. Program-specific data analysis requirements for control charts are followed as required for data generated under those programs. These additional requirements shall be documented in a QAPP or QAS.

Precision and accuracy measurements employed by STL North Canton are shown in Table 8.4-3 through 8.4-7. Calculated results of these QC samples are evaluated using statistical tables or control charts.

## 8.7 Data Recording Procedures

To ensure data integrity, all documentation of data and records generated or used during the process of data generation must be performed in compliance with Policy Number QA-008, "Data Recording Requirements".

## 8.8 Data Reduction and Verification Procedures

Data review procedures comprise a set of computerized and manual checks applied at appropriate levels of the measurement process. Data review begins with the reduction or processing of data and continues through verification of the data and the reporting of analytical results. Calculations are checked from the raw data to the final value prior to reporting results for each group of samples. Data reduction can be performed by the analyst who obtained the data or by another analyst. Data verification starts with the analyst who performs a 100 percent review of the data to ensure the work was done correctly the first time. Data verification continues with review by a second reviewer who verifies that data reduction has been correctly performed and that the analytical results correspond to the data acquired and processed. This procedure is outlined in Figure 8.8-1.

### 8.8.1 Data Reduction and Initial Verification

Data reduction and initial verification may be performed by more than one analyst depending upon the analytical method employed. The preparation and analytical data may be reviewed independently by different analysts. In these instances, each item may not be applicable to the subset of the data verified or an item may be applicable in both instances. It is the responsibility of the analyst to ensure that the verification of data in his or her area is complete. The data reduction and initial verification process must ensure that:

- Sample preparation information is correct and complete including documentation of standard identification, solvent lot numbers, sample

amounts, etc.

- Analysis information is correct and complete including proper identification of analysis output (charts, chromatograms, mass spectra, etc.)
- Analytical results are correct and complete including calculation or verification of instrument calibration, QC results, and qualitative and quantitative sample results with appropriate qualifiers
- The appropriate SOPs have been followed and are identified in the project and/or laboratory records
- Proper documentation procedures have been followed
- All nonconformances have been documented
- Special sample preparation and analytical requirements have been met.
- The data generated have been reported with the appropriate number of significant figures as defined by the analytical method in the LIMS or otherwise specified by the client.

In general, data will be processed by an analyst in one of the following ways:

- Manual computation of results directly on the data sheet or on calculation pages attached to the data sheets
- Input of raw data for computer processing
- Direct acquisition and processing of raw data by a computer.

If data are manually processed by an analyst, all steps in the computation shall be provided including equations used and the source of input parameters such as response factors (RFs), dilution factors, and calibration constants. If calculations are not performed directly on the data sheet, they may be attached to the data sheets.

Manual integrations are sometimes necessary to correct misintegrations by an automatic data system software program, but must only be performed when necessary. Further discussion of manual integrations and the required documentation is given in Policy Number QA-011, "Acceptable Manual Integration Practices".

For data that are input by an analyst and processed using a computer, a copy of the input shall be kept and uniquely identified with the project number and other information as needed. The samples analyzed must be clearly identified.

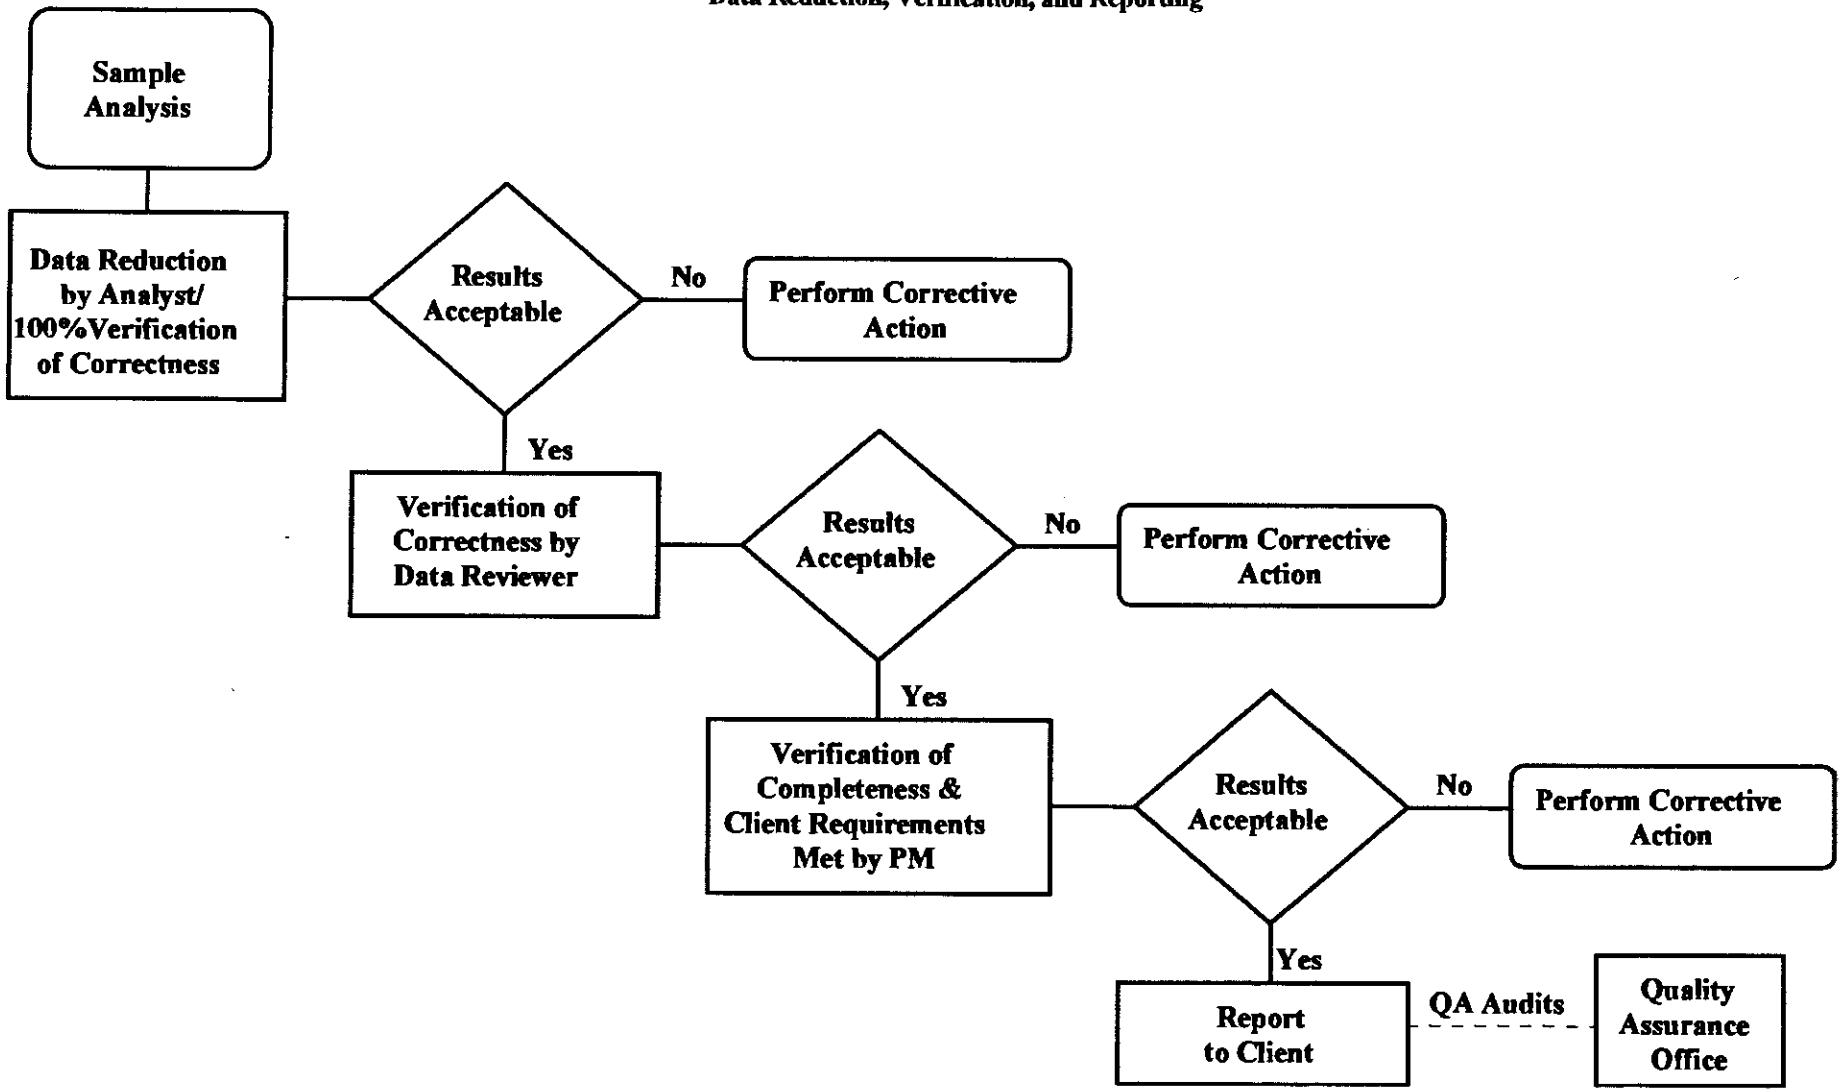
If data are directly acquired from instrumentation and processed, the analyst must verify that the following are correct:

- Project and sample numbers
- Calibration constants and RFs
- Units
- Numerical values used for reporting limits.

Analysis-specific calculations for methods are provided in SOPs. In cases where computers perform the calculations, software must be validated or verified, as described in Section 6.0 of this document, before it is used to process data.

The data reduction is documented, signed and dated by the analyst completing the process. Initial verification of the data reduction by the same analyst is documented on a data review checklist, signed and dated by the analyst. Data review requirements are described in Section 5.3.6 of the QMP.

**FIGURE 8.8-1**
**Data Reduction, Verification, and Reporting**



### *8.8.2 Data Verification*

Following the completion of the initial verification by the analyst performing the data reduction, a systematic check of the data that has been fully reduced and checked through Level 1 review is performed by an experienced peer, supervisor, or designee. This check is performed to ensure that level 1 review has been completed correctly and thoroughly. The second level reviewer examines the data signed by the analyst. This review includes an evaluation of all items required in the raw data package. Any exceptions noted by the analyst must be reviewed. Included in this review is an assessment of the acceptability of the data with respect to:

- Adherence of the procedure used to the requested analytical method SOP
- Correct interpretation of chromatograms, mass spectra, etc.
- Correctness of numerical input when computer programs are used (checked randomly)
- Correct identification and quantitation of constituents with appropriate qualifiers
- Numerical correctness of calculations and formulas (checked randomly)
- Acceptability of QC data
- Documentation that instruments were operating according to method specifications (calibrations, performance checks, etc.)
- Documentation of dilution factors, standard concentrations, etc.
- Sample holding time assessment.

This review also serves as verification that the process the analyst has followed is correct in regard to the following:

- The analytical procedure follows the methods and specific instructions given on the project QAS or equivalent summary form
- Nonconforming events have been addressed by corrective action as defined on a nonconformance memo
- Valid interpretations have been made during the examination of the data and the review comments of the initial reviewer are correct
- The package contains all of the necessary documentation for data review and report production and results are reported in a manner consistent with the method used for preparation of data reports.

The specific items covered in the second stage of data verification may vary according to the analytical method, but this review of the data must be documented by signing the same checklist. Data review requirements are described in Section 5.3.6 of the QMP.

### 8.8.3 Completeness Verification

A third-level review is performed by the reporting and project management staff. This review is required before results are submitted to clients. This review serves to verify the completeness of the data report and to ensure that project requirements are met for the analyses performed. The items to be reviewed are:

- Analysis results are present for every sample in the analytical batch, reporting group, or sample delivery group (SDG)
- Every parameter or target compound requested is reported with either a value or reporting limit
- The correct units and correct number of significant figures are utilized
- All nonconformances, including holding time violations, and data evaluation statements that impact the data quality are accompanied by clearly expressed comments from the laboratory
- The final report is legible, contains all the supporting documentation required by the project, and is in either the standard STL format or in the client-required format.
- Implement checks to monitor the quality of laboratory results using correlation of results for different parameters of a sample (for example, does the TOC results justify the concentration of organic compounds found by GC/MS.)
- A narrative to accompany the final report will be finalized by the PM. This narrative will include relevant comments collected during the earlier reviews.

## 8.9 Data Reporting

### 8.9.1 Data Reports

STL North Canton is capable of developing a variety of data deliverable reports. Standard reports will contain:

- Cover Letter/Narrative - Information on sample types, tests performed, any problems encountered, and general comments are provided.
- Analytical Data - Data are reported by sample or by test with the appropriate significant figures and reporting limits, and have been adjusted for dilution, if appropriate. Pertinent information including dates sampled, received, prepared, extracted, and analyzed are provided.
- Laboratory Performance QC Information - The results of LCSs and method blanks analyzed with the project are listed. Any data or QC anomalies are discussed in the narrative.
- Matrix-Specific QC Information - Results of any sample duplicates and MS/MSDs analyzed with the samples as batch QC are reported. Other project-specific QC requested by the client are also reported. The results

include supporting information such as amount spiked, percent recovery, or percent difference/RPD.

- Methodology - Reference for analytical methodology used is cited.
- Other Deliverables - Other deliverables available include disk deliverables, CDROM, sample raw data packages, complete deliverable packages, and custom report formats. Requirements for electronic reporting are defined in Policy CORP-QA-017, "Electronic Reporting".

### *8.9.2 Final Report Details*

STL North Canton will provide paginated reports or a uniquely defined, identifiable certificate/report (i.e. electronic file, CD). The report will include:

a) Report title, name, address and phone number of the laboratory.
b) Name and address of client/project name/client identification number.
c) Description (lab ID of sample).
d) Dates and Time of sample collections (if known), receipt, preparation and analysis.
e) If the required holding time is 48 or less, time of sample preparation and analysis.
f) Method identifiers traceable to all procedures used.
g) Reporting limit.
h) Test result with appropriate units and how reported (wet weight/dry weight). Also identify any results outside of quantitation limits. When required, a statement of the estimated uncertainty of the test result should be added.
i) If appropriate, description of any QC failures or deviations from SOPs.
j) Signature and title of the individual responsible for the report. Electronic signature is acceptable.
k) Date of issue.
l) All subcontract work must be clearly identified, and name and address of outside subcontractor noted.
m) Where relevant, a statement to the effect that the results relate only to the items tested or to the sample as received by the laboratory
n ) Where relevant, a statement that the certificate or report shall not be reproduced except in full, without the written approval of the laboratory.

After final report any correction, addition, or deletion must clearly identify its purpose and meet the above reporting requirements as appropriate.

All applicable elements from above should be available for review if not issued in a formal report by an in-house or captive laboratory.

### 8.9.3 Verbal Results

STL North Canton, as a policy, discourages the release of data verbally or without full data review. If however, the client requests analytical results to be communicated verbally or by facsimile prior to final review, they must be clearly identified as "Preliminary" results. The client must understand that the data have not undergone the required levels of review and may potentially change.

### 8.9.4 Reporting Analytical Results

Sample results are reported according to analytical method SOPs or client specifications. Normally, the laboratory uses the STL North Canton Reporting Limit (RL) at which any analyte of interest detected at or above that level is reported as a positive value and any analyte of interest not detectable or detected below that level is reported as "not detected" at the RL. The laboratory will normally report results within the calibration, however, any reported results outside of the calibration range will be documented in the final report.

If a QC measurement is out of control and the data is to be reported, data qualifiers are reported with samples associated with failed QC measurements.

The laboratory must certify that the test results meet all NELAC requirements or provide reasons and/or justification if they do not.

In some cases a contract, QAPP, or documented client request may require the laboratory to report sample results in a specified manner. Some examples are given below:

- The laboratory may be requested to report all analytes of interest that are less than the laboratory's RL but are greater than the MDL. This data will be flagged with an appropriate qualifier or noted in the report case narrative. (See precautions in "Establishing Reporting Limits", Policy Number QA-009).
- The laboratory may be requested to report any tentatively identified compounds (TICs). These data will be flagged with an appropriate qualifier.
- The laboratory may be requested to report sample results using an RL that is higher than their normal level. In this case, only the analytes of interest found at or above that level would be reported as positive values. In this case, the laboratory will state the PSRL rather than the RL. All analytes of interest not detected or detectable below that level would be reported as "not detected" at the PSRL.

  In this situation, the laboratory must include documentation in the project file that supports the reporting procedure employed.

It is the responsibility of the laboratory to provide for a reporting system that assures that any problems associated with an analysis are properly documented on a nonconformance memo, communicated to the appropriate STL North Canton staff, and addressed appropriately in the data report.

#### *8.9.5 Reissued Deliverables*

If, after issuance of a report, STL North Canton observes any mistake that affects the results reported or the QC interpretation of those results, the client will be notified. After issuance of the report, the laboratory report remains unchanged. Any material amendments to a report after issue made only in the form of a further document, or data transfer must include the statement "Supplement to Test Report" or otherwise identified.

#### *8.9.6 Client Confidentiality*

Data and sample materials provided by the client or at the client's request, and the results obtained by STL, shall be held in confidence, unless such information is generally available to the public or is in the public domain. STL's reports, and the data and information provided therein, are for the exclusive use and benefit of our clients, and are not released to a third party without written consent from the client. Data confidentiality is also discussed Section 3.6.

### *8.10 Data Validation*

Data validation for STL refers to data reviews conducted in accordance with the USEPA CLP "Laboratory Data Validation Functional Guidelines for Evaluating Organic Analyses" and "Laboratory Data Validation Functional Guidelines for Evaluating Inorganic Analyses", or modifications thereof, for non-CLP type analyses.

This form of data validation provides an impartial evaluation of the laboratory's results. Data validation may be requested by the client for a percentage of data and is usually performed by a third party, one which was not involved with the sample analysis. Qualifiers are assigned to data, when required, according to the requirements of the data validation protocol being used.

### *8.11 Preventive Maintenance and Service*

Facilities, instruments, equipment, and parts are subject to wear, deterioration, or change in operational characteristics. Within STL, preventive maintenance, coupled with vendor service agreements, is an organized program of actions taken to maintain facilities and equipment in control.

#### *8.11.1 Analytical Instrumentation and Equipment*

The primary purpose of the maintenance program is to prevent instrument and equipment failure and to minimize down time. A properly implemented maintenance program increases the reliability of a measurement system.

Each instrument or piece of equipment shall be uniquely identified. The laboratory maintains the following:

- Instrument/equipment inventory list
- Instrument/equipment major spare parts list or inventory
- External service agreement documents (if applicable)
- Instrument-specific preventive maintenance logbook or file for each functional unit.

The records of routine maintenance and non-routine maintenance shall include at a minimum:

- Name and serial number and/or unique ID of the item or equipment
- Details of maintenance performed
- Dates and results of recalibrations/ reverifications indicating return to control
- Analyst initials and the date maintenance was performed whether by the analyst or a contracted service representative.

Any item or equipment that does not perform to specifications or defective shall be taken out of service, and tagged as out of service until it has been repaired and shown by calibration/ verification to perform satisfactorily.

### *8.11.2 Frequency of Equipment Maintenance*

The frequency of maintenance must consider manufacturer's recommendations and previous experience. Frequency of preventive maintenance along with the recommended preventive maintenance schedules are given in Tables 8.11-1 through 8.11-25 for analytical instrumentation and equipment or defined in operation specific routine maintenance SOPs. Frequency of maintenance for the facility systems is documented in the CHP.

### *8.11.3 Facilities*

Another important aspect of the laboratory operation is the existence and maintenance of adequate, safe, and clean facilities including appropriate engineering controls such as proper ventilation, lighting, dust control, hoods, air flow, protection from extreme temperatures, waste disposal, and a source of stable power. The facility floor plan is provided in Figure 8.11.

The maintenance and use of these facilities and proper operations are described in the Chemical Hygiene Plan (CHP). The Laboratory Manager has

responsibility for ensuring a properly maintained facility. The Laboratory Director also has the responsibility for ensuring that facilities are available to store samples properly without contamination, work areas are equipped with adequate bench, hood and operational space, and that procedures are in place to ensure the areas are free from chemical contamination that may affect analytical results. The volatile laboratories are in a separate laboratory building from the semivolatile laboratories. The volatile laboratories utilize a separate air handling system with positive pressure to reduce possible contamination (refer to Floor Plan 8.11-1).

### *8.11.4 Facility Security*

The laboratory building is a limited access, secure facility. To ensure that only authorized personnel are able to enter the building from an entrance that is not monitored, entry into each building is limited by use of electronic locks activated by magnetic keys which are issued only to authorized personnel.

During business hours, guest entry is possible only through the main entrance. This entrance is monitored at all times, by a receptionist. All guests are required to sign in by using a visitor logbook and wear a visitor's badge. Clients may drop off samples through a sample receiving door after calling for entry.

## *8.12 Requirements for Ancillary Equipment and Materials*

### *8.12.1 Water*

High purity water (e.g., ASTM reagent grade or equivalent water) will be used in all metals, wet chemistry, and organic analyses. Demonstration of contaminant-free water is shown through the analysis of method blanks consisting of the reagent water on a each working day for the analyte of interest. This water is obtained by the use of either a commercial ion-exchange deionizing, distillation, or reverse osmosis unit plus an appropriate polishing unit. The resulting water has a maximum conductivity of 1.0 umho-cm at 25°C or a minimum resistivity of 1.0 Mohm at 25°C. Conductivity or resistivity will be monitored and documented daily or on each day that water is dispensed for analytical use.

For volatile analyses the laboratory purchases bottled water that is further purified by purging with an inert gas before use to remove potential traces of organic solvents. This is described further in the Reagent Water SOP, NC-QA-0023.

### 8.12.2 Compressed Air and Gases

Ultra high-purity compressed gases from preapproved vendors or in-house gas generators will be used when required for instrumentation. These air and gases must meet the requirements and specifications of the analytical methods performed. In-line filters will be used when appropriate to minimize contamination and moisture from the gases.

### 8.12.3 Glassware Preparation

Glassware preparation procedures implemented at operating units are designed to ensure that contaminants are not introduced during sample analysis. Procedures describing glassware preparation are detailed in operation-specific Glassware Washing SOP, NC-QA-0014.

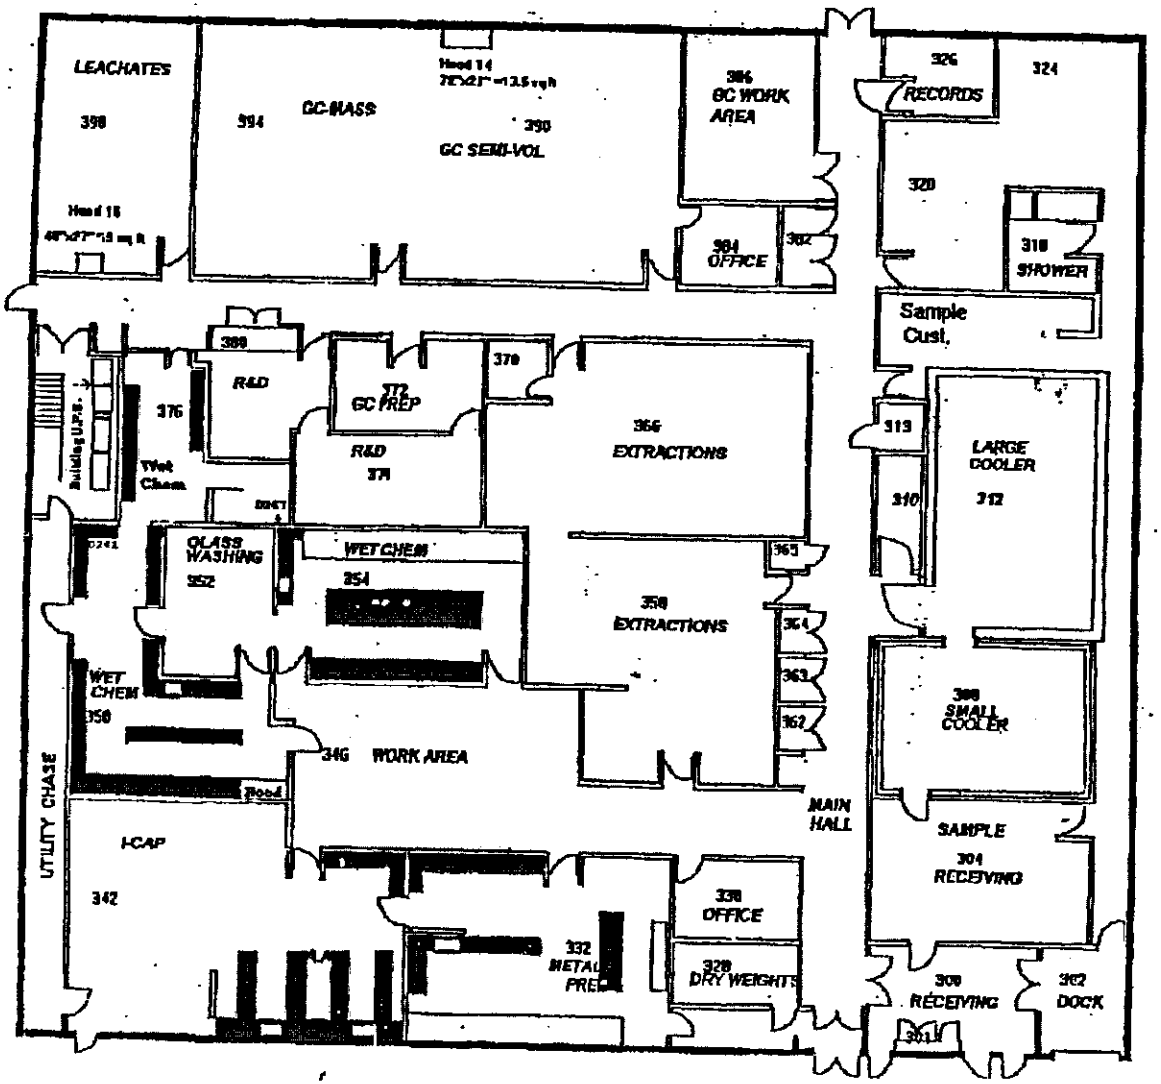
### 8.12.4 Chemical Storage

Storage of chemicals shall be conducted in a manner to minimize the potential for fire or release of hazardous material resulting from an unplanned chemical reaction. Refrigerators used for storing flammable liquids must have spark-free interior construction. Flammable solvents shall be stored in appropriate cabinets meeting all necessary codes. All chemicals are stored according to chemical compatibility. Further details regarding chemical storage are provided in the CHP.

### 8.12.5 Waste Management

The goal of STL's policy for waste management is to ensure that laboratory wastes are disposed of safely and in a manner consistent with applicable federal, state and local regulations. The waste disposal program is designed to assure that minimal harm to people and the environment shall result from the disposal of laboratory chemicals and samples. This goal is accomplished by requiring that the laboratory comply with the procedures presented in the CHP.

**Figure 8.11 -1 Floor Plan**



# 9.0 Quality Assessment and Response

## 9.1 Nonconformances

A nonconformance is an unplanned deviation from an established protocol or plan and in some cases may be exceptionally permitted departures from the documented policies and procedures or from standard specifications. The deviation may be the result of STL's actions as a systematic error, then termed a deficiency. A single isolated event or event beyond the control of STL is termed an anomaly.

Nonconformances can be identified on the basis of internal or external systems or performance audits, sample processing, routine calibration and monitoring of analytical and support equipment, or QC sample analyses. The Technical Director, Operations Manager, Project Manager, QA Manager, Group Leader, and Analyst may be involved in identifying the most appropriate corrective action. If previously reported data are affected, the issue is immediately brought to the attention of QA and Laboratory Management.

### 9.1.1 Nonconformance Memo (NCM)

All nonconformances, deficiencies and anomalies, are documented via an electronic process or on a paper form that meets NCM requirements as approved by QA. An allowed exception is log-in conformance problems, which are documented on a Condition Upon Receipt Form or equivalent (see Section 8.5). A detailed description of the procedure and responsibilities associated with nonconformance documentation, communication, and resolution is described in SOP # CORP-QA-0010, "Nonconformance and Corrective Action".

The Clouseau NCM program, available on the local-area network throughout the laboratory, is the main vehicle for documenting and communicating NCMs. The program allows anyone in the laboratory to document a nonconformance, explain the cause of the problem, and link to the LIMS system to identify the samples and clients involved. The program uses the local e-mail to automatically notify the person's supervisor, the Project Managers associated with the samples, and the QA department. The program is used to document approval and completion of the immediate corrective actions for the samples involved, and can be used to document long-term corrective actions. It provides a place to document resolution of problems with the clients and to query the associated database to examine trends and prepare management reports. A copy (paper or electronic) of the nonconformance memo will be kept in the project files along with the data it refers to. A copy, paper or electronic, shall also be kept in the quality files.

## 9.2 Client Complaints

Client inquiries and complaints are generally received through the PM or Customer Services Manager (CSM). Typically, the PM or CSM communicates with the client to determine the details of the inquiries, including technical data problems, deliverable issues, turn-around-time problems, etc. Technical and deliverable issues are coordinated by the PM and usually involve input from operations, QA, and management staff. A formal written response to the client is coordinated by the PM, but may on occasion be delivered by the CSM or the Account Manager. Details of the types and levels of complaints and required documentation are provided in Corporate Policy No. QA-013, "Procedures to Address Customer Complaints". Client complaints are recorded as a type of NCM in the Clouseau database, which are summarized in the monthly QA Reports to Management (see Section 9.6 for more about the monthly QA reports).

## 9.3 Corrective Actions

Corrective actions are measures taken to rectify conditions adverse to quality and, where possible, to prevent their reoccurrence. Investigations of potential problems and corrective actions should be timely, determine the root cause, and evaluate any propagation of the error or problem. Whenever a systematic error is discovered that affects the accuracy or defensibility of results reported to STL's clients, Corporate QA involvement followed by client notification would be part of the corrective action.

Corrective actions should be implemented with an understanding of the technology and work activities associated with the quality element, with appropriate training of STL associates and vendors, and should be monitored for progress and success. Depending on the nature of the problem, the corrective action employed may be formal or informal. In either case, occurrence of the problem, the corrective action employed, and verification that the problem has been eliminated must be documented properly. On-the-spot actions are used to correct minor problems, such as recalibration, retuning, or a minor repair (e.g., replacement of a minor part) of a malfunctioning instrument or the correction of poor analytical technique being used by an analyst. These occurrences are documented in the appropriate injection, run, or analysis logbooks. Similarly, routine instrument maintenance, malfunctions, and power failures are also documented in the appropriate instrument maintenance logbooks. These events do not require a formal NCM process, provided reported analytical results are not affected. Corrective actions specific to quality controls for analytical methods are discussed in the operational-specific SOPs.

### 9.3.1 Monitoring Corrective Actions

The QA department, either in the Clouseau database or in paper files maintains all formal corrective action documentation. The QA department reviews all corrective actions and selects one or more of the significant corrective actions for inclusion in the annual systems audit. The QA department may also implement a spot assessment audit. The purpose of these audits is to monitor the

implementation of the corrective action and to determine whether the action taken has been effective in overcoming the issue identified.

### *9.4 Internal Audits*

Internal audits are performed to assess the degree of adherence to established policies, procedures and standards. STL personnel who are independent of the area being evaluated conduct these assessments. Audits can identify areas for improvement with regard to compliance with policies, procedures and standards. Audits also provide a means for correction prior to system failure.

Audits and assessments are generally conducted through the use of checklists and relevant reference documents. The findings of all audits and assessments are documented as is the laboratory response and any corrective actions. Follow-up checks are performed and the status of implementation of corrective actions is documented for all categories of audits and assessments. This cycle continues until all issues are closed.

#### *9.4.1 Audit Types and Frequency*

The following types of audits are performed at STL North Canton:

**Figure 9.4.1-1 Audit Types and Frequency**

| Audit Type | Performed By | Frequency |
|---|---|---|
| Systems Audits | QA Department or designee | Annual per lab section |
| Data Audits | QA Department | Target of 5% of all report packages |
| Spot Assessment | QA Department or designee | As needed to monitor specific issues |
| Proficiency Testing | QA Department or designee | Two samples per year per program as required by NELAC |

#### *9.4.2 Systems Audits*

Facility systems audits are comprehensive technical and systems evaluations covering each operational and support area at least once per year. Generally, a rotating schedule is established throughout the year to ensure adequate coverage of all areas. This schedule can change as situations in the lab warrant. The objectives and schedule of the audit are communicated to the lab groups being assessed in advance of the audit. At the completion of the audit, a debriefing is held to outline the findings, including identification of positive performance, to discuss areas of deficiencies, and to answer questions. The audit report issued by the QA Manager within 21 calendar days of the audit. The audit report is addressed to the area supervisor and/or manager, and copied to the General

Manager and Laboratory Director. Written audit responses are required within 21 calendar days of the date of the audit report. The audit response from the lab areas must follow the format of the original audit report, and is sent from the respondents to all individuals copied on the audit report. Where a corrective action requires longer than 21 days to complete, the target date for the corrective action is stated and evidence of corrective action is submitted to the QA department in the agreed upon time frame.

### *9.4.3 Data Audits*

Data audits are routinely performed and documented to ensure that project records meet project requirements as described in method SOPs, project plans, or other documented requirements. The data audit is used to identify any lab errors that may have occurred. Significant issues found in the course of the audit are brought to the attention of appropriate personnel for clarification, and overseeing correction of final reports if necessary. The target frequency of QA data audits is 5% of reports. Data audits include spot-checking manual integrations to determine if they are appropriate and documented according to policy QA-011. Errors found in client project reports are revised and the revision sent to the client (also see Section 8.9.5).

### *9.4.4 Spot Assessments*

Spot assessments, equivalent to special audits in the STL QMP, are conducted on as needed basis, generally as a follow up to specific issues such as client complaints, validator concerns, corrective actions, control chart or NCM trends, proficiency testing results, data audits, or external audit issues. Spot assessments are focused on a specific issue. The frequency, report format, distribution, and timeframes are tailored to address the nature of the issue.

### *9.4.5 Proficiency Testing*

Proficiency testing samples (PTs) are analyzed to verify the ability of the laboratory to correctly identify and quantitate compounds in PT samples. PT samples may be supplied internally or externally as single-blind or double-blind samples. They can be used to assess if a deficiency has been corrected, they can be used to document the proficiency of the analyst performing the analysis, or they can be used to assess the overall performance of an analytical method.

PT samples are handled and tested in the same manner as environmental samples - it is not acceptable to run multiple replicates that would not otherwise be performed, it is not acceptable to average multiple results, and PT results cannot be shared among labs in advance of the close of the study. PT test sample data is archived using the same requirements as for project and raw data record retention.

#### *9.4.5.1 External PT Samples*

STL North Canton participates in a number of PT studies, as shown in Table 9.4-1. The primary one being the NELAC PT program, which involves a minimum of two PT rounds each year for NELAC field of testing for which the lab is maintaining certification. In addition, under the 12/99 SDWA requirements, the laboratory also analyzes annually a PT sample for each drinking water method, where more than one method is used for a given analyte.

#### *9.4.5.2 Internal PT Samples*

Each STL facility performing chemical analyses also participates in a double-blind performance evaluation annually. An external vendor is contracted to submit double blind samples to the STL labs. Both the level of customer service and the accuracy of the test results are assessed objectively by the external contractor. The PT contractor provides a detailed report to the Corporate QA Manager and to each of the STL facilities.

### *9.5 External Audits*

Clients and external regulatory authorities regularly audit STL North Canton. STL is available for these audits, and makes every effort to provide the auditors with the personnel, documentation and assistance they require. STL recommends that all audits be scheduled with the QA department so that all necessary personnel are available on the day of the audit. All deficiencies reported to the laboratory must be responded to within the time frame specified by the auditors. It is the responsibility of the QA Manager to coordinate the response to the audit report. The development and implementation of the corrective actions is the responsibility of the operations management of the affected areas and must be approved by the laboratory operations and management prior to submitting the final response. It is the responsibility of the QA Manager or designee to verify implementation of the corrective actions and inform the responsible manager of the closure of all deficiencies from the audit.

### *9.6 Management Reviews*

#### *9.6.1 Quality Reports to Management*

A monthly QA report is prepared by the QA Manager and forwarded to the Laboratory Director, the General Manager, and the Corporate QA Manager. The reports include metrics (i.e., frequency and number of revised reports, frequency and number of client complaints) to assess the effectiveness of the Quality System. The contents of the monthly report include:

- Audits
  Results of internal systems audits performed

Results of external systems audits hosted
Data audits performed, percent of total packages per month plus any issues

- Revised Reports / Client Complaints
  Frequency of revised reports
  Total number of client complaints, issues, and resolution
- Certification / Parameter Changes
- Proficiency Testing
  Score for each PT as a percentage of maximum score
  Note repeat failures and/or significant problems
- Miscellaneous QA and Operational Issues
  Narrative outlying improvements, regulatory compliance issues, general concerns, and assistance required from management

This information is compiled by the Corporate QA Manager together with similar information from and about other STL laboratories, which is then presented in a report to the STL Chief Operating Officer.

### *9.6.2 Management Systems Review*

Annually at a minimum, the laboratory management will evaluate the status of the quality systems in the laboratory to ensure the procedures and policies are in place and they are adhered to. The Laboratory Director, Operations Manager, Customer Service Manager, and Quality Assurance Manager regularly meet to evaluate quality system(s). Management systems reviews are accomplished by the QA Manager based on monthly quality assurance reporting, goal setting and an annual LQM review. The evaluation(s) shall consider:

- The suitability of policies and procedures
- Reports from managerial and supervisory personnel
- The outcome of recent internal audits
- Corrective and preventative actions
- Assessments by external bodies
- The results of interlaboratory comparisons and proficiency tests
- Status of QA documents
- Reviews of QA related requirements in RFPs, SOWs, SAPs, and QAPjPs
- Changes in the volume and type of work and the effects on QA systems
- Client feedback
- Complaints
- Quality control activities
- Resources and staff training

| NELAC QUALITY MANUAL: REQUIRED ELEMENTS* | LQM, QA POLICY, AND/OR QA SOP REFERENCE |
|---|---|
| w) A table of contents and applicable list of references, glossaries, and appendices | LQM Table of Contents<br>List of Policies and SOPs<br>Table 2.3-2 |

*National Environmental Laboratory Accreditation Conference Standard, Quality Systems, July 1, 1999

## TABLE 2.4-3
## STL North Canton Quality Documents and Required Approval

| Quality Document | Required Approvals |
|---|---|
| Laboratory Quality Manual (LQM) | • Laboratory Director<br>• Technical Director<br>• Quality Assurance Manager |
| STL North Canton Policies | • Laboratory Director<br>• Quality Assurance Manager |
| STL North Canton Standard Operating Procedures (SOPs) | • Laboratory Director<br>• Technical Specialist<br>• Laboratory Health and Safety Coordinator(1)<br>• Quality Assurance Manager |

(1) Required only if procedure encompasses more than standard office safety requirements.

## TABLE 2.4-4
## STL Quality Document Review Frequency[1]

| Document Type | Frequency of Review | Responsible Party |
|---|---|---|
| Laboratory Quality Manual (LQM) | Every Two Years | Quality Assurance Manager |
| Standard Operating Procedures (SOP) | Every Two Years[2] | Quality Assurance Manger & Operations Manager |

[1] SOP reviewed sheets can be utilized in lieu of changing an entire document to indicate that an SOP has been reviewed and no changes were necessary (QA-001).

[2] DOD/DOE requires an annual review of all "major" SOPs (NC-QA-0016).

# TABLE 3.4-1

## STL North Canton Records & Retention Schedule

| Type of Record | Retention | Disposition |
|---|---|---|
| **General Laboratory Documents** | | |
| Instrument output | 5 yrs from project completion | Shred or burn |
| Quality control data | 5 yrs from project completion | Shred or burn |
| Field sample data | 5 yrs from project completion | Shred or burn |
| Final analytical reports | 5 yrs from project completion | Shred or burn |
| Instrument logbooks | 5 yrs from last entry | Shred or burn |
| Equipment monitoring & maintenance records | 5 yrs from last entry | Shred or burn |
| Instrument calibration records | 5 yrs from last entry | Shred or burn |
| Standard preparation logs | 5 yrs from last entry | Shred or burn |
| Standards certificates | 5 yrs from last entry | Shred or burn |
| Measurement & test equipment logs (e.g., refrig., balances, etc.) | 5 yrs from last entry | Shred or burn |
| Method & instrument validation records | 5 yrs from last entry | Shred or burn |
| Instrument manuals | Retain until superseded | Trash |
| Project management files | 5 yrs from date of archival | Shred or burn |
| Quotes & proposals | 2 yrs from date of expiration | Shred or burn |
| LQM, policies, & SOPs | 5 yrs from date of archiving | Shred or burn |
| Analyst demonstrations of proficiency | 5 yrs from date of archival | Shred or burn |
| Quality assurance audits | 5 yrs from last entry | Shred or burn |
| Certifications & approvals | 5 yrs from last entry | Shred or burn |
| Employee signature list | 5 yrs from date of archival | Shred or burn |
| MDL Studies | 5 yrs from last entry | Shred or burn |
| Performance testing studies | 5 yrs from last entry | Shred or burn |
| QA reports to management | 5 yrs from last entry | Shred or burn |
| Quality control charts | 5 yrs from last entry | Shred or burn |

# TABLE 3.4-1

## STL North Canton Records & Retention Schedule

| Type of Record | Retention | Disposition |
|---|---|---|
| **Environment, Health and Safety Records** | | |
| Medical records | Retain while active & 30 yrs from last entry | Shred or burn |
| Employee exposure & monitoring records | Retain while active & 30 yrs from last entry | Shred or burn |
| Workers compensation files & first report of injury | Retain while active & 30 yrs from last entry | Shred or burn |
| Accident logs (OSHA Form 200) | 5 yrs from last entry | Shred or burn |
| Accident reports | 5 yrs from last entry | Shred or burn |
| Environmental permits | 5 yrs from last entry | Shred or burn |
| Environmental management, e.g., discharge reports | 5 yrs from last entry | Shred or burn |
| Health & safety audits | 5 yrs from last entry | Shred or burn |
| Chemical Hygiene Plan | 5yrs from archival | |
| Safety Inspections | 5 yrs from last entry | Shred or burn |
| Radioactive materials records | 5 yrs from last entry | Shred or burn |
| NRC or state radioactive materials handling inspections | 5 yrs from last entry | Shred or burn |
| TLD exposure records | 5 yrs from last entry | Shred or burn |
| EH&S training | 5 yrs from last entry | Shred or burn |
| | | |
| **Accounting** | See Accounting and Controls Procedures Manual | |
| | | |
| **Administrative** | | |
| Personnel records (not including medical or disability records) | 7 years from last entry | Shred or burn |

# TABLE 5.2-1
## List of STL Quality-Related Items that Require Evaluation Prior to Use

| Quality-Related Item | Standard Operating Procedure for Quality Testing |
|---|---|
| Acetone | CORP-QA-0001 |
| Dichloromethane | CORP-QA-0001 |
| Hexane | CORP-QA-0001 |
| Hydrochloric acid | CORP-QA-0001 |
| Freon | CORP-QA-0001 |
| Methanol | CORP-QA-0001 |
| Nitric acid | CORP-QA-0001 |
| Hydrogen Peroxide | CORP-QA-0001 |
| Sulfuric acid | CORP-QA-0001 |
| Toluene | CORP-QA-0001 |

# TABLE 6-1
# GALP Cross Reference To LQM

| GALP Section | GALP Guidance | STL Document |
|---|---|---|
| **8.1 Laboratory Management** | 8.1.1 ensure that personnel clearly understand the functions they are to perform | LQM 1.6.2, 1.6.4, and 4.0 |
| | 8.1.2 ensure that QAU monitors computer activities | LQM 9.2.2.1 |
| | 8.1.3 ensure that personnel, resources, and facilities are adequate and available as scheduled | CORP-IT-0002; LQM 1.6.1-1.6.4 |
| | 8.1.4 receive reports of QAU inspection and audit reports, and ensure corrective actions are promptly taken in response to any deficiencie | LQM 9.2.2.1 |
| | 8.1.5 approve SOPs related to the computer activities, and ensure that devations to the SOPs are documented | LQM 3.3 and 9.1.4 |
| | 8.1.6 assure that GALP provisions are followed | CORP-IT-013; LQM 6.0 |
| **8.2 Personnel** | 8.2.1 must have adequate education, training, and experience to perform assigned IT functions | CORP-IT-013; LQM 4.0 |
| | 8.2.2 a summary of training, experience, and job description must be maintained | LQM 4.1 |
| | 8.2.3 personnel must be of sufficient number for timely and proper operation of the computer systems | CORP-IT-0002; LQM 1.6.2 |
| **8.3 Quality Assurance Personnel** | 8.3.1 shall be separate and independent of IT personnel, and shall report directly to laboratory management | LQM 1.6.1 |
| | 8.3.2 shall have immediate access to the computer data, SOPs, and other records | LQM 1.61 and will be added to 9.2 |
| | 8.3.3 inspect the LIMS at intervals to ensure the integrity of LIMS raw data, and shall present inspection reports to management | LQM 9.2 |
| | 8.3.4 determine that no deviations from approved SOPs were made without proper authorization and documentation | LQM 9.1.1 |
| | 8.3.5 periodically audit raw data to ensure their integrity | 9.2 |
| | 8.3.6 maintain adequate records of the QAU operations | 9.2 |
| **8.4 LIMS Raw Data** | 8.4.1 LIMS raw data and the storage media on which they reside must be identified and documented. The documentation shall be included in the lab's SOPs. | System map is with IS Director |
| | 8.4.2 the individual(s) responsible for entering and recording LIMS raw data must be uniquely identified, together with the date and time the data were entered | QA-008 |
| | 8.4.3 the instrument transmitting raw data must be uniquely identified in the record, together with the date and time of transmission | QA-008 |

## TABLE 6-1
## GALP Cross Reference To LQM (cont.)

| | | |
|---|---|---|
| | 8.4.4 procedures and practices used to verify LIMS raw data must be documented in controlled SOPs | CORP-IT-0007; LQM 8.8-8.8.3 |
| **8.5 Software** | 8.5.1 SOPs shall be established for:<br>a. software development<br>b. software testing<br>c. change control<br>d. version control<br>e. maintaining historical file | CORP-IT-013; CORP-IT-0001; CORP-IT-0007 |
| | 8.5.2 documentation shall be maintained for:<br>a. software description & functional requirements<br>b. algorithms and formulas<br>c. testing and quality assurance | CORP-IT-013 |
| | 8.5.3 all documentation is readily available in the facility where the software is used and SOPs are readily available where procedures are performed | CORP-IT-013 includes this statement, but we are on a WAN and documentation is not duplicated at each lab |
| | 8.5.4 a historical file of software and documentaiton shall be retained | CORP-IT-0001, Sect 4.14.1 |
| **8.6 Security** | Laboratory management shall ensure that security practices are adequate to assure the integrity of data | LQM 6.2 [more detail can be added to this section]; CORP-IT-0005; CORP-IT-013 |
| **8.7 Hardware** | 8.7.1 must be of adequate design and capacity, and a documented description maintained | LQM 6.1; CORP-IT-013 |
| | 8.7.2 must be installed in accordance with manufacturer's recommendations, and undergo documented acceptance testing as described in a laboratory SOP | CORP-IT-0001; CORP-IT-013; LQM 6.1 |
| | 8.7.3 testing, maintenance, and repair must be described in a laboratory SOP | CORP-IT-013 includes this statement |
| **8.8 Comprehensive Testing** | Management shall ensure that comprehensive testing shall be documented at least every 24 months or more frequently as a result of software changes. | CORP-IT-0001; LQM 6.3.4 |
| **8.9 Records Retention** | Procedures must be in place for the retention of LIMS raw data and documentation and records pertaining to LIMS | QMP; LQM 3.4-3.5 |
| **8.10 Facilities** | 8.10.1 the environmental conditions of the facility housing the LIMS must be controlled to protect against data loss | LQM 6.2 |
| | 8.10.2 environmental conditions for storing LIMS raw data and records must be adequate | LQM 6.2 |

TABLE 6-1
GALP Cross Reference To LQM (cont.)

| | | |
|---|---|---|
| **8.11 SOPs** | 8.11.1 SOPs, as described above, must be maintained and readily available where the procedure is performed | LQM 3.1-3.2; SOP Index |
| | 8.11.2 SOPs must be reviewed periodically to ensure that they are accurate | LQM 3.3 |
| | 8.11.3 SOPs must be authorized and controlled, with all changes subject to the same approvals and control | LQM 3.3 |
| | 8.11.4 an historical file of SOPs must be maintained | LQM 3.5 |

## Laboratory Quality Control Samples

| Type | Frequency | Applicability | | Accuracy and Precision Application | Introduced By |
|---|---|---|---|---|---|
| | | Inorganic | Organic | | |
| Analytical Spike | As specified in methods, or as needed | Yes | No | Accuracy | Analyst/ Prep |
| Duplicate | 1 out of 20 or at least 1/month/run | Yes | Yes | Precision | Analyst/ Prep |
| Instrument Blank | As specified methods, or as needed | Yes | Yes | Accuracy | Analyst |
| Interference Check Sample | As specified in methods | Yes | No | Accuracy | Analyst |
| Internal Standard | Each sample and standard | Yes | Yes | Both | Analyst/ Prep |
| Laboratory Control Sample | 1 per each group of samples processed up to 20 samples. | Yes | Yes | Accuracy | Analyst/ Prep |
| Matrix Spike | 1 per each group of samples processed up to 20 samples. | Yes | Yes | Accuracy | Analyst/ Prep |
| Matrix Spike Duplicate | 1 per each group of samples processed up to 20 samples. | Yes | Yes | Both | Analyst/ Prep |
| Method Blank | 1 per each group of samples processed up to 20 samples. | Yes | Yes | Accuracy | Analyst/ Prep |
| Surrogate | All standards, method blanks, LCS, and samples. | No | Yes<br>Method Dependent | Accuracy | Analyst/ Prep |
| Yield Monitor | Operation-specific | Yes | No | Accuracy | Prep |

## TABLE 8.4-3
## Laboratory Performance Quality Control Samples

| Sample/Measurement | Purpose |
|---|---|
| Method Blanks | Demonstrates that the laboratory systems (*e.g.*, glassware cleaning procedures) and laboratory reagents used for the preparation and analysis of samples have not contributed to a false positive or negative measurement. |
| Instrument Blank | Demonstrates that the analytical system has not contributed to a false positive or negative measurement. |
| Laboratory Control Sample | Demonstrates the laboratory's ability to perform an analysis within the performance requirements of the method. |

## TABLE 8.4-4
## Matrix Specific Quality Control Samples

| Quality Control Sample | Purpose |
|---|---|
| Duplicate Samples | Estimates the ability of the laboratory to obtain precise measurements on a sample. This measure is dependent on the homogeneity of the sample being duplicated. Solid samples often portray poor sample homogeneity and therefore often have poor duplication with regards to the sample result. |
| Matrix Spike Sample | Estimates the ability of the laboratory to obtain accurate measurements on a sample. The measure is dependent on the bias a sample matrix may cause regarding a given analyte. |
| Matrix Spike Duplicate Sample | In addition to verifying the accuracy of the matrix spike sample, the matrix spike duplicate can be used with the matrix spike sample as a measure of precision by calculating the relative percent difference (RPD). |

# TABLE 8.5-1
## Inorganic Sample Containers, Preservatives, and Holding Times
## (Continued)

***Footnotes***

(1) Minimum sample size indicates sample amount needed for a single analysis. Matrix spikes or duplicates will require an additional sample amount of at least this amount for each additional QC sample aliquot required.
(2) National Pollutant Discharge Elimination System - MCAWW, March 1983.
(3) Holding times are calculated from date of collection.
(4) Resource Conservation and Recovery Act, Test Methods for Evaluating Solid Waste, Physical/Chemical Methods, (SW-846), Third Edition, September 1986. Contains Final Update I (July 1992), Final Update IIA, (August 1993), Final Update II (September 1994), Final Update IIB (January 1995), and Final Update III (December 1996).
(5) Solid matrix type includes soil, sediment, sludge and other solid materials not classified as waste.
(6) Samples to be analyzed for cyanide should be field-tested for residual chlorine. If residual chlorine is detected, ascorbic acid should be added.
(7) Method not listed in 40 CFR Part 136.
(8) If not done in the field (ASAP) per the method and requested by client, analyze in lab within 48 hours.
(9) EPA issued memo recommending not to use reactive cyanide and sulfide methods.

# TABLE 8.5-2
## Organic Sample Containers, Preservatives, and Holding Times
## (Continued)

*Footnotes*

(1) Minimum sample size indicates sample amount needed for a single analysis. Matrix spikes or duplicates will require an additional sample amount of at least this amount for each additional QC sample aliquot required.
(2) National Pollutant Discharge Elimination System - 40 CFR Part 136, Appendix A.
(3) Holding times are calculated from the date of collection.
(4) Resource Conservation and Recovery Act, Test Methods for Evaluating Solid Waste, Physical/Chemical Methods, Third Edition, September 1986. Contains Final Update I (July 1992), Final Update IIA (August 1993), Final Update II (September 1994), Final Update IIB (January 1995), and Final Update III (December 1996).
(5) Solid matrix type includes soil, sediment, sludge or other solids not classified as waste.
(6) Only one determination method is listed when separate methods are required for preparation and analysis.
(7) **Method 1664 was promulgated by the EPA with an effective date of June 14, 1999.**
(8) **For acrolein and acrylonitrile the pH should be adjusted to 4-5. This pH adjustment is not required if acrolein is not measured. Samples requiring analysis of acrolein that received no pH adjustment must be analyzed within three days of sampling.**
(9) **For acrolein and acrylonitrile the pH should be adjusted to 4-5.**
(10) Method not listed in 40 CFR Part 136.
(11) Should only be used in the presence of residual chlorine.
(12) Depending on regulatory programs, EnCore™ samplers may be preserved for up to 14 days from sampling by freezing at -5 to -12°C until analysis. Alternatively the EnCore™ sample may be transferred to a 40-ml VOA vial and preserved by freezing at -5 to -12°C until analysis. Some regulatory agencies may require 4 or 8 oz glass with Teflon®-lined lid, Cool 4°C, 14 days. This technique is not recommended, but will be supported where required. (Preservation and holding times are subject to client specifications.)

# TABLE 8.5-4
## Sample Containers, Preservatives, and Holding Times for USEPA Contract Laboratory Program Statement of Work

| Analytical Parameters | Matrix | Minimum Sample Size | Requirements[1] |
|---|---|---|---|
| Cyanide, Total and Amenable to Chlorination | Water | 500 mL | 500 mL, glass or polyethylene container, 0.6 g ascorbic acid (only in presence of residual chlorine) NaOH to pH > 12, Cool, 4°C, 12 days |
| | Soil/Sediment | 25 g | 8 or 16 oz glass with Teflon-lined lids, Cool, 4°C, 12 days |
| ICAP and GFAA (excludes mercury) | Water | 100 mL | 1 liter glass or polyethylene container, $HNO_3$ to pH =2, 180 days |
| | Soil/Sediment | 25 g | 4 or 8 oz glass or polyethylene container, Cool, 4°C, 180 days |
| Mercury (CVAA) | Water | 100 mL | 1 liter glass or polyethylene container, $HNO_3$ to pH =2, 26 days |
| | Soil/Sediment | 25 g | 8 or 16 oz glass with Teflon®-lined lids, Cool, 4°C, 26 days |
| Pesticides/PCBs | Water | 1 L | 1 liter amber glass with Teflon®-lined lid, Cool, 4°C, Extraction within 5 days of sample receipt Analysis within 40 days after start of extraction |
| | Soil/Sediment | 50 g | 8 or 16 oz glass wide mouth with Teflon®-lined lid, protect from light, Cool, 4°C, Extraction within 10 days of sample receipt Analysis within 40 days after start of extraction |

# TABLE 8.5-4

# TABLE 8.5-6
## Periodic Equipment Calibrations

| Type of Equipment | Calibration Requirements |
|---|---|
| Balances | • Must be serviced and calibrated annually by an approved vendor.<br>• Calibration must be checked daily or before use by analyst with weight(s) classified as Class 1 (formerly termed Class S) by NIST or Class 1 traceable. Acceptance criteria vary according to weight used and accuracy of balance. Acceptance criteria must be documented in the log.<br>• All Class 1 weights must be certified by an outside vendor every three years.<br>• All non-Class 1 weights must be checked annually against NIST Class 1 weights annually. |
| Thermometers | • Working glass thermometers must be calibrated against a certified NIST thermometer at least annually as described in operation-specific SOPs.<br>• Working non-glass thermometers must be calibrated against a certified NIST thermometer annually as described in operation-specific SOPs.<br>• The NIST thermometer must be recertified every three years. |
| Refrigerators/Freezers | • Thermometers must be immersed in a liquid such as mineral oil or glycol<br>• Temperature of units used for sample or standard storage must be checked<br>daily as described in operation-specific SOPs.<br>Refrigerator acceptance limits: 4°C ± 2°C<br>Freezer acceptance limits: < - 10°C |
| Ovens | • Temperature of units must be checked daily or before use.<br>• Acceptance limits vary according to use as described in operation-specific SOPs and must be documented in the temperature log. |
| Micropipettors | • Calibrations are checked gravimetrically as required by the operation-specific SOP.<br>• Must be calibrated at the frequency (normally quarterly) required by the manufacturer at a minimum. |
| Syringes, Volumetric Glassware and Graduated Glassware | • All syringes and volumetric glassware are purchased as Class A items.<br>• Class A items are certified by the manufacturer to be within ± 1% of the measured volume, therefore, calibration of these items by STL laboratories is not required.<br>• All analysts are trained in the proper use and maintenance of measuring devices to ensure the measurement of standards, reagents and sample volumes are within method tolerances. |

# TABLE 8.6-1
## Precision and Accuracy Measurements

| Measurement | Definition |
|---|---|
| Accuracy | The degree of agreement of a measurement with an accepted reference or true value. The only true or known values in the laboratory are spiked samples.<br>Expressed as laboratory control sample (LCS) percent recovery ( % R):<br>$$LCS\ \%Recovery = \frac{X}{t} x\ 100$$<br>where: $X$ = observed concentration<br>$t$ = concentration of spike added<br>Expressed as matrix spike/matrix spike duplicate (MS/MSD) sample percent recovery (% R):<br>$$MS/MSD\ \%Recovery = \frac{X_s - X}{t} x\ 100$$<br>where: $X_s$ = observed concentration in spiked sample<br>$X$ = observed concentration in unspiked sample<br>$t$ = concentration of spike added |
| Precision | The measure of analytical reproducibility of two values. Expressed as the relative percent difference (RPD) of two values.<br>$$RPD = \left[\frac{|X_1 - X_2|}{\left(\frac{X_1 + X_2}{2}\right)}\right] x\ 100$$<br>where: $X_1$ = first observed concentration<br>$X_2$ = second observed concentration |

# TABLE 8.6-1
## Precision and Accuracy Measurements
## (Continued)

| Measurement | Definition |
|---|---|
| Arithmetic mean | The average of a set of values.<br>$\bar{x} = \frac{\sum_{i=1}^{n} x_i}{n}$<br>where: $\bar{x}$ = the mean<br>$x_i$ = the $i^{th}$ data value<br>$n$ = number of data values |
| Standard Deviation | A measure of the random (probable) error associated with a single measurement within a data set.<br>$s = \sqrt{\frac{\sum_{i=1}^{n}(x_i - \bar{x})^2}{n-1}}$<br>where: $s$ = sample standard deviation<br>$\bar{x}$ = the mean<br>$x_i$ = the $i^{th}$ data value<br>$n$ = number of data values |
| Quality Control Chart | A graphical representation of analytical accuracy. Displays the arithmetic mean of a data set, the upper and lower warning limits and the upper and lower control limits. |
| **ACCURACY** | |
| Upper Control Limit (UCL) | $UCL = \bar{x} + 3s$ |
| Upper Warning Limit (UWL) | $UWL = \bar{x} + 2s$ |
| Lower Warning Limit (LWL) | $LWL = \bar{x} - 2s$ |
| Lower Control Limit (LCL) | $LCL = \bar{x} - 3s$ |
| **PRECISION** | |
| RPD | Zero to (mean RPD + 3s) |

## TABLE 8.11-1
## Instrument Maintenance Schedule
## Ion Chromatograph[1]

| As Needed | Daily | Weekly | Monthly | Semi-annually |
|---|---|---|---|---|
| Clean micromembrane suppressor when decreases in sensitivity are observed. | Check plumbing/leaks. | Check pump heads for leaks. | Check all air and liquid lines for discoloration and crimping, if indicated. | Lubricate left hand piston. |
| Check fuses when power problems occur. | Check gases. | Check filter (inlet) | Check/change bed supports guard and analytical columns, if indicated. | Clean conductivity cell. |
| Reactivate or change column when peak shape and resolution deteriorate or when retention time shortening indicates that exchange sites have become deactivated. | Check pump pressure. | | | Check conductivity cell for calibration. |
| De-gas pump head when flow is erratic. | Check conductivity meter. | | | |

## TABLE 8.11-2
## Instrument Maintenance Schedule
## Total Organic Halide Analyzer[1]

| Daily | As Needed |
|---|---|
| Check electrodes for damage, polish the electrodes. | Examine and clean or replace pyrolysis tube. |
| Replace dehydrating fluid and electrolyte fluid. | Clean titration cell. |
| Clean quartz boat. | Observe gas flow. |
| Observe check valves during use for backfeed. | Replace reference electrode fluid. |
| At end of each day of use, wash out absorption module, empty electrolyte and fill cell with DI water. Empty dehydrator tube | Change quartz wool. |
| Perform cell performance check. | Replace o-rings and seals. |

## TABLE 8.11-3
## Instrument Maintenance Schedule
## High Pressure Liquid Chromatograph[1]

| Daily | As Needed |
|---|---|
| Check level of solution in reservoirs. If adding, verify that solvent is from the same source. If changing, rinse gas and delivery lines to prevent contamination of the new solvent. | Replace columns when peak shape and resolution indicate that chromatographic performance of column is below method requirements. |
| Check gas supply. | Oil autosampler slides when sample does not advance. |
| Flush with an appropriate solvent to remove all bubbles. | Rinse flow cell with 1N nitric acid if sensitivity low. |
| Pre-filter all samples. | Change pump seals when flow becomes inconsistent. |
| | Repack front end of column<br>Backflush column. |

## TABLE 8.11-4
## Instrument Maintenance Schedule
## Flame Atomic Absorption Spectroscopy[1]

| Daily | Monthly | As Needed |
|---|---|---|
| Verify proper safety precautions are working. | Clean all filters and fans. | Check drain receptacle. |
| Verify gas box operates properly and safely. | Change capillary tubing | Check background corrector for alignment. |
| Verify sensitivity using elements in UV/VIS spectrum. | Clean optical windows | Clean burner head. |
| | | Clean nebulizer. |
| | | Clean spray chamber. |
| | | Check sample introduction O-rings. |

# TABLE 8.11-5
## Instrument Maintenance Schedule
## ICP & ICP/MS[1]

| Daily | Monthly or As Needed | Semi-annually | Annually |
|---|---|---|---|
| Check gases<br>Check that argon tank pressure is 50-60 psi and that a spare tank is available.<br><br>Check aspiration tubing | Clean plasma torch assembly to remove accumulated deposits. | Change vacuum pump oil. | Notify manufacturer service engineer for scheduled preventive maintenance service. |
| Check vacuum pump gage. (<10 millitorr) | Clean nebulizer and drain chamber; keep free flowing to maintain optimum performance. | Replace coolant water filter. (may require more or less frequently depending on the quality of water) | |
| Check that cooling water supply system is full and drain bottle is not full. Also that drain tubing is clear, tight fitting and has few bends. | Clean filters on back of power unit to remove dust. | | |
| Check that nebulizer is not clogged. | Replace when needed:<br>peristaltic pump tubing<br>sample capillary tubing<br>autosampler sipper probe | | |
| Check that capillary tubing is clean and in good condition. | Check yttrium position.<br><br>Check O-rings<br><br>Clean/lubricate pump rollers. | | |
| Check that peristaltic pump windings are secure. | | | |
| Check that high voltage switch is on. | | | |
| Check that exhaust screens are clean. | | | |
| Check that torch, glassware, aerosol injector tube, bonnet are clean | | | |

## TABLE 8.11-6
## Instrument Maintenance Schedule
## Graphite Furnace Atomic Absorption[1]

| Daily | Weekly | Monthly | Semi-annually | Annually |
|---|---|---|---|---|
| Check gas lines and gas supply. | Clean optical windows. | Check coolant level in cooling unit. Add coolant if error message appears. | Change graphite contacts | Notify manufacturer service engineer to clean optics. |
| | | | | Check optics |
| Clean contact cylinders. | | | | |
| Check tubes and platform; replace if corroded, faking, or if low absorbance results.<br><br>Check autosampler tubing and alignment.<br><br>Flush autosampler tubing | | | | |
| PE4100ZL: clean fume extraction tip, replace fume extraction filter and $H_2O$ trap. | | | | |
| As needed, trim sampling capillary. | | | | |
| Check drain lines and waste containers; empty as needed. | | | | |
| Check acid rinse containers; fill as needed. | | | | |

## TABLE 8.11-7
## Instrument Maintenance Schedule
## CVAS & CVAFS

| Daily | As Needed | Annually |
|---|---|---|
| Change drying tube | Change pump tubing | Change Hg lamp. |
| Check pump tubing/drain tubing | Check/change Hg lamp | |
| Check gas pressure | Clean optical cell | |
| Check aperture reading<br>Check tubing | Lubricate pump | |

# TABLE 8.11-8
## Instrument Maintenance Schedule
## Gas Chromatograph[1]

| Daily | As Needed | Quarterly/Semi-annually/Annually |
|---|---|---|
| Check for sufficient supply of carrier and detector gases. Check for correct column flow and/or inlet pressures. | Replace front portion of column packing or break off front portion of capillary columns. Replace column if this fails to restore column performance or when column performance (e.g. peak tailing, poor resolution, high backgrounds, etc.) indicates it is required. | Quarterly ELCD: change-roughing resin, clean cell assembly.<br><br>Quarterly FID: clean detector |
| Check temperatures of injectors and detectors. Verify temperature programs. | Change glass wool plug in injection port and/or replace injection port liner when front portion of column packing is changed or front portion of capillary column is removed. | Semi-annually ECD: perform wipe test. |
| Check inlets, septa. Replace septum<br><br>Clean injector port | | Annually ELCD: change finishing resin, clean solvent filter.<br><br>Annually FID: Replace flame tip<br><br>ECD: detector cleaning and re-foiling, every five years or whenever loss of sensitivity, or erratic response or failing resolution is observed. |
| Check baseline level. | Perform gas purity check (if high baseline indicates that impure carrier gas may be in use). | |
| Check reactor temperature of electrolytic conductivity detector. | Replace or repair flow controller if constant gas flow cannot be maintained. | |
| | Replace fuse. | |
| Inspect chromatogram to verify symmetrical peak shape and adequate resolution between closely eluting peaks. | Reactivate external carrier gas dryers. | |
| Clip column leader | Detectors: clean when baseline indicates contamination or when response is low.<br>FID: clean/replace jet, replace ignitor.<br>NPD: clean/replace collector assembly.<br>PID: clean lamp window monthly or replace as needed, replace seals.<br>ELCD: check solvent flow weekly, change reaction tube, replace solvent, change reaction gas, clean/replace Teflon® transfer line.<br>ECD: follow manufacturers suggested maintenance schedule | |
| | Reactivate flow controller filter dryers when presence of moisture is suspected. | |

# TABLE 8.11-8
## Instrument Maintenance Schedule
## Gas Chromatograph[1]
## (Continued)

| Daily | As Needed | Quarterly/Semi-annually/Annually |
|---|---|---|
| GC (continued) | HP 7673 Autosampler: replace syringe, fill wash bottle, dispose of waste bottle contents. | |
| | Purge & trap devices: periodic leak checks quarterly, replace/condition traps (when poor response or disappearance of reactive or poorly trapped compounds), clean sample lines, valves (if they become contaminated), clean glassware. Clean sparger weekly. Check purge flow monthly. Bake trap as needed to correct for high background. Change trap annually, or as needed whenever loss of sensitivity, or erratic response or failing resolution is observed. | |
| | Purge & trap autosamplers: leak check system, clean sample lines, valves. PTA-30 autosampler also requires cleaning the syringes, frits, valves, and probe needles, adjustment of micro switches, replacement of Teflon® valve, and lubrication of components. | |

# TABLE 8.11-9
## Instrument Maintenance Schedule
## Mass Spectrometer[1]

| Daily | Weekly | As Needed[2] | Quarterly | Semi-Annually | Annually |
|---|---|---|---|---|---|
| Check for sufficient gas supply. Check for correct column flow and/or inlet pressure. | Check mass calibration (PFTBA or FC-43) | Check level of oil in mechanical pumps and diffusion pump if vacuum is insufficient. Add oil if needed between service contract maintenance. | Check ion source and analyzer (clean, replace parts as needed) | | Replace the exhaust filters on the mechanical rough pump every 1-2 years. |
| Check temperatures of injector, detector. Verify temperature programs. | | Replace electron multiplier when the tuning voltage approaches the maximum and/or when sensitivity falls below required levels. | Check vacuum, relays, gas pressures and flows | Clean rods | |
| Check inlets, septa. | | Clean Source, including all ceramics and lenses - the source cleaning is indicated by a variety of symptoms including inability of the analyst to tune the instrument to specifications, poor response, and high background contamination. | Change oil in the mechanical rough pump. Relubricate the turbomolecular pump-bearing wick. | | |
| Check baseline level. | | Repair/replace jet separator. | | | |
| Check values of lens voltages, electron multiplier, and relative abundance and mass assignments of the calibration compounds. | | Replace filaments when both filaments burn out or performance indicates need for replacement. | | | |

## TABLE 8.11-10
## Instrument Maintenance Schedule
## TRAACS Auto Analyzer [1]

| As Needed | Daily | Monthly | Semi-annually | Annually |
|---|---|---|---|---|
| Replaces air filter when progressive loss of air pressure is observed. | Check air pressure gauge (22 ± 2 psi) | Change all pump tubes (or after 200 hours of pumping time) | (or after 1000 hours of pumping time) | Lightly lubricate the Linear Sample Rails (use semi-fluid lubricant) |
| Replace air valve tubing when occlusion in tubing is observed | Use recommended washout procedure (at end of analysis operations) | Clean sample probe shaft | Replace pump platens | Replace colorimeter lamp (or after 2500 hours of use) |

## TABLE 8.11-11
## Instrument Maintenance Schedule
## Sonicator [1]

| Daily | As Needed |
|---|---|
| Daily when used:<br>Inspect probe tips for inconsistencies (etching/pitting). | Replace probe tip. |
| | Disassemble and clean sonicator probe tips. |
| | Tune sonicator assembly. |

## TABLE 8.11-12
## Instrument Maintenance Schedule
## Analytical/Top Loading Balances[1]

| Daily | Annually |
|---|---|
| Check using Class S-verified weights once daily or before use<br>Clean pan and weighing compartment | Manufacturer cleaning and calibration. |

## TABLE 8.11-13
## Instrument Maintenance Schedule
## Refrigerators/Walk-in Coolers[1]

| Daily | As Needed |

# Glossary

**acceptance limits**
Data quality limits specified for analytical method performance.

**accuracy**
Accuracy is the degree of agreement between a measurement and the true or expected value, or between the average of a number of measurements and the true or expected value. Systematic errors affect accuracy. For chemical properties, accuracy is expressed either as a percent recovery (R) or as a percent bias (R - 100).

**aliquot, aliquant**
A measured portion of a sample taken for analysis.

**analytical spike**
A sample created by spiking target analytes into a prepared portion of a sample just prior to analysis. (Also see matrix spike.)

**anomaly**
See nonconformance.

**areas needing improvement**
Represent isolated instances of noncompliance or issues that are judged to have a less immediate impact on data quality. Laboratory management must correct the situation or otherwise ensure that the condition does not recur. This term replaces the previous term used "Observations."

**arithmetic mean**
The arithmetic mean ($\bar{x}$) is the average of a set of values. It is equal to the sum of the observed values divided by the number of observations. Also called "average".

# Glossary (continued)

where: $\bar{x}$ = the mean
$x_i$ = the $i^{th}$ data value
$n$ = number of data values

$$\bar{x} = \frac{\sum_{i=1}^{n} x_i}{n}$$

**assessment**
The evaluation process used to measure the performance or effectiveness of a system and its elements. Assessment is used as an all-inclusive term to denote any of the following: performance, systems, data and compliance audits, management systems reviews, peer reviews, inspections, or spot assessments.

**associate**
Employee.

**audit**
A planned and documented investigative evaluation of an item or process to determine its adequacy and effectiveness as well as compliance with established procedures, instructions, drawings, quality management plans, and other applicable documents.

**benchmarking**
A step-by-step method of improving performance by identifying and studying best practices and comparing them to industry practices.

**bias**
A systematic (consistent) error in test results. Bias is expressed as the difference between the population mean and the true or reference value, or as estimated from sample statistics, the difference between the sample average and the reference value.

# Glossary (continued)

**blind performance evaluation sample**
A sample either submitted to the laboratory or prepared in the laboratory whereby the concentrations of parameters of concern are known by the preparer and not by the laboratory.

**calibration**
Establishment of a relationship between various calibration standards and the measurements of them obtained by a measurement system, or portions thereof. The levels of the calibration standard should bracket the range of levels at which actual measurements are to be made. Calibration is also the act of making a scheduled comparison of instrument performance against national standards for instruments which measure physical parameters such as mass, time, and temperature. This type of calibration is independent of use in specific analyses and projects.

**calibration curve**
The graphical relationship between the known values for a series of calibration standards and instrument responses.

**calibration factor (CF)**
The ratio of the instrument response of an analyte to the amount injected. CFs are used in external standard calibrations.

$$CF = \frac{Total\ Area\ of\ Peak}{Mass\ Injected}$$

**calibration standard**
A standard used to quantitate the relationship between the output of a sensor and a property to be measured. Calibration standards should be traceable to standard reference materials (provided by NIST, or other recognized standards agencies) or a primary standard.

# Glossary (continued)

**Certificate of Analysis**
A STL® report format containing analytical results without supporting/backup information.

**certified reference material**
A reference material accompanied by a certificate issued by an organization certifying the contents and concentration(s) of the material. (See also standard reference material.)

**chain-of-custody (COC)**
A system of documentation demonstrating the physical custody and traceability of samples.

**check standard analyses**
A standard (often a midpoint standard) analyzed at a frequency specified in the method or in a SOP to verify the continuing calibration of the standard curve.

**client**
Any individual or organization for whom items or services are furnished or work is performed in response to defined requirements and expectations.

**client sample**
The material or collection media submitted to the laboratory for analysis. Field QC samples are considered client samples but laboratory QC samples are not counted as client samples when counting samples for QC batches.

**coefficient of variation (relative standard deviation)**
A measure of precision (relative dispersion). It is equal to the standard deviation ($s$) divided by the mean ($\bar{x}$) and multiplied by 100 to give a percentage value.

# Glossary (continued)

$$CV\ (RSD) = \left(\frac{s}{\bar{x}}\right) x\ 100$$

**collocated samples**
Independent samples collected in such a manner that they are equally representative of the variable(s) of interest at a given point in space and time. The results will indicate sampling as well as analytical variability.

**comparability**
Comparability is a measure of the confidence with which one data set can be compared to another. To ensure comparability, all laboratory analysts are required to use uniform procedures (i.e., SOPs) and a uniform set of units and calculations for analyzing and reporting environmental data.

**completeness**
Completeness is a measure of the percentage of measurements that are judged to be valid measurements. At a minimum, the objective for completeness of data is 90% for each constituent analyzed. It is usually expressed as a percentage:

$$\%\ Completeness = \frac{V}{n} x\ 100$$

where: $V$ = number of measurements judged valid
$n$ = total number of measurements

**composite**
A sample composed of two or more increments.

**control chart**
A graphical representation of analytical accuracy. Displays the arithmetic mean of a data set, the upper and lower warning limits and the upper and lower control limits.

# Glossary (continued)

**control table**
A tabular presentation of test results with respect to time or sequence of measurement, together with limits within which the results are expected to lie when the analytical process is in a state of control.

**controlled document**
A document for which the distribution is known. Updates of the document are sent to the original recipients, unless the copy distributed is an uncontrolled copy.

**corrective action**
A measure taken to rectify conditions adverse to quality and, where necessary, to preclude their recurrence.

# Glossary (continued)

**correlation coefficient**
The correlation coefficient (r) is a determination of how closely data "fits" a straight line. It is a number between -1 and 1 that indicates the degree of linear relationship between two sets of numbers. A correlation coefficient of +1 (usually calculated to three decimal places or 1.000) means the data falls exactly on a straight line with positive slope. A correlation coefficient of -1 (or -1.000) means the data falls exactly on a straight line with negative slope.

**customer**
See client.

**data quality objective (DQO)**
Data quality objectives (DQOs) are qualitative and quantitative statements used to ensure the generation of the type, quantity, and quality of environmental data that will be appropriate for the intended application (EPA 1994). Typically, DQOs are identified during project scope and development of sampling and analysis plans. In this QA manual, however, we refer to only the analytical DQOs because laboratories generally do not have any authority over sample collection, shipment, or other field-related activities that may affect the data quality of the environmental sample before the sample is received in the laboratory. EPA has established six primary analytical DQOs for environmental studies: precision, accuracy, representativeness, completeness, comparability, and detectability.

The components of analytical variability (uncertainty) can be estimated when QA and QC samples of the right types and quantities are incorporated into measurement procedures at the analytical laboratory. STL® incorporates numerous QA and QC samples to obtain data for comparison with the analytical DQOs and to ensure that the measurement system is functioning properly. The QA and QC samples and their applications, described in Section 8.4 and are selected on the basis of method- or client-specific requirements. Field blanks, field duplicates, and performance evaluation (PE) samples are received from the client as unknown samples. Analytical laboratory QC samples for inorganic, organic, and radionuclide analyses may include calibration or instrument blanks, method blanks, background, duplicates, replicates, laboratory control samples (LCSs), calibration standards, matrix spikes (MSs), matrix spike duplicates (MSDs), surrogate spikes, and yield tracers.

**data validation**

# Glossary (continued)

See validation - data.

**data verification**
See verification - data.

**deficiency**
See nonconformance or finding.

**degrees of freedom**
The number of independent deviations used in calculating an estimate of the standard deviation.

**double blind performance evaluation sample**
A sample that contains select parameters at defined levels. The levels are unknown to the laboratory. The laboratory is also unaware that the sample is a performance evaluation sample.

**duplicate sample analyses**
Different aliquots of the same sample are analyzed to evaluate the precision of an analysis.

**error**
The difference between an observed or measured value and its true value.

**field blank**
A blank that is prepared and handled in the field and analyzed in the same manner as its corresponding client samples.

**field matrix spike**
A sample created by spiking target analytes into a sample in the field at the point of sample acquisition.

**finding**
Noncompliant practices or policies which have significant adverse impact on data quality, technical defensibility, or regulatory acceptance of data. Findings require immediate attention by

# Glossary (continued)

the laboratory management and must be resolved to comply with STL's® quality documents and laboratory-established procedures often called deficiencies by auditors.

**geometric mean**
The $n^{th}$ root of the product of all values in a set of n values or the antilogarithm of the arithmetic mean of the logarithms of all the values of a set of n values. The geometric mean is generally used when the logarithms of a set of values are nearly normally (Gaussian) distributed, such as is the case of much population data.

**initial calibration**
Analysis of a series of analytical standards at different specified concentrations; used to define the linearity and dynamic range of the response of an instrument to the target compounds prior to the analysis of samples.

**inspection**
Examination or measurement of an item or activity to verify conformance to specific requirements.

**instrument detection limit (IDL)**
IDL is a calculated estimate of instrument detectability defined by the USEPA Contract Laboratory Program (CLP).

**internal standard (IS)**
A compound added to every standard, QC sample, client sample, or sample extract at a known concentration prior to analysis for the purpose of quantitation. For example, internal standards are used as the basis for quantitation of the target compounds by GC/MS.

**linear regression**
A statistical method for finding a straight line that best fits a set of two or more data points, thus providing a relationship between two or more variables.

**matrix**

# Glossary (continued)

The component or substrate which contains the analyte(s) of interest. Examples of matrices are water, soil or sediment, and air. Matrix is not synonymous with phase (liquid or solid).

**matrix effect**
An interference in the measurement of analyte(s) in a sample that is caused by materials in the sample. Matrix effects may cause elevated reporting limits or may prevent the acquisition of acceptable results.

**matrix spike (MS)**
An aliquot of a matrix fortified (spiked) with known quantities of specific compounds and subjected to an entire analytical procedure in order to indicate the appropriateness of the method for a particular matrix. The percent recovery for the respective compound(s) is then calculated.

**matrix spike duplicate (MSD)**
A second aliquot of the same matrix as the matrix spike (above) that is spiked in order to determine the precision of the method.

**may**
Denotes permission but not a requirement.

**mean**
See arithmetic mean.

**measurement**
The process or operation of ascertaining the extent, degree, quantity, dimensions, or capability with respect to a standard.

**median**
The middle value of a set of data when the data set is ranked in increasing or decreasing order.

**method**
An assemblage of techniques.

**method blank (MB)**

# Glossary (continued)

An analytical control consisting of all reagents, which may include internal standards and surrogate standards, that is carried through the entire analytical procedure. The method blank is used to define the level of laboratory background contamination. Examples of method blanks are a volume of deionized or distilled laboratory water for water samples, a purified solid matrix for soil/sediment samples, or a generated zero air.

**method detection limit (MDL)**

The minimum concentration of an analyte that, in a given matrix and with a specific method, can be identified, measured, and reported with 99% confidence that the analyte concentration is greater than zero. The MDL is operationally defined as:

$$MDL = st_{(n-1,\ \alpha=0.99)}$$

where:

$s$ = the standard deviation of a number of measurements of a blind or sample matrix containing the analyte at a concentration near the lowest standard recommended in the method and

$t_{(n-1,\ \alpha=0.99)}$ = the student's value for a one-sided t-statistic appropriate for the number of samples used to determine (s), at the 99% confidence level and n-1 degrees of freedom.

**modified method**

A standard or reference method which has been changed to meet project or matrix requirements.

**must**

Denotes a requirement is mandatory and has to be met.

**notable practices**

Laboratory practices that increase effectiveness and quality and represent improvements with respect to conventional laboratory operations.

**nonconformance**

# Glossary (continued)

An unplanned deviation from an established protocol or plan. The deviation may be the result of STL's® actions, then termed a deficiency. If the deviation is the result of events beyond the control of STL®, it is termed an anomaly.

**operational calibration**
Routinely performed as part of instrument usage, such as the development of a standard calibration curve. Operational calibration is generally performed for instrument systems.

**outlier**
A result excluded from the statistical calculations due to being deemed "suspicious" when applying the "Grubbs Test" (or equivalent).

**parameter**
A constant or coefficient that describes some characteristic of a population (e.g., standard deviation, mean, regression coefficients). Also, a chemical being measured, i.e., an analyte.

**percent difference**
When two independent measurements of the same characteristics are available, it is possible to use the percent difference instead of the coefficient of variation to measure precision.

$$\%D = \left| \frac{X_1 - X_2}{X_1} \right| x\ 100\%$$

where: $\%D$ = percent difference
$X_1$ = first value
$X_2$ = second value

**percent recovery**
A measure of accuracy determined from the comparison of a reported spike value to its true spike concentration.

$$\%R = \frac{observed\ conc. - sample\ conc.}{true\ spike\ conc.} x\ 100\%$$

# Glossary (continued)

**performance audit**
See performance evaluation.

**performance evaluation (PE)**
A type of audit in which a known or characterized value is compared to the result obtained through the routine analysis of the sample in the laboratory to evaluate the proficiency of an analyst or laboratory.

**periodic calibration**
A calibration that is performed at prescribed intervals for equipment such as balances, thermometers, and balance weights. In general, they are performed on equipment that are distinct, singular purpose units, and are relatively stable in performance.

**population**
A generic term denoting any finite or infinite collection of individual things, objects, or events.

**practical quantitation limit (PQL)**
The lowest concentration a method can reliably achieve within limits of precision and accuracy and is derived from empirical, matrix-free method performance studies.

**precision**
Precision is an estimate of variability, that is, it is an estimate of agreement among individual measurements of the same physical or chemical property, under prescribed similar conditions. The precision of a measurement system is affected by random errors. Precision is expressed either as relative standard deviation (RSD) for replicate measurements greater than two or as relative percent difference (RPD) for duplicate measurements. Table 8.6-1 illustrates the formulae used to calculate units of precision (i.e., RSD and RPD).

**preventive maintenance**
An organized program within STL® laboratories of actions (such as equipment cleaning, lubricating, reconditioning, adjustment and/or testing) taken to maintain proper instrument and equipment performance and to prevent instruments and equipment from failing during use.

# Glossary (continued)

**primary standard**
A material having a known, stable property that can be accurately measured or derived from established physical or chemical constants. It is readily reproducible and can be accepted (within stated limits) and used to establish the same value of another substance or item.

**procedure**
Detailed instructions to permit replication of a method. (See standard operating procedure.)

**proficiency testing**
A series of planned tests which will determine the ability of field technicians or laboratory analysts to perform routine analyses. The results from this testing may be used for comparison against established criteria or for relative comparisons among the data from a group of technicians or analysts.

**project-specific reporting limit (PSRL)**
See reporting limit.

**protocol**
Methodology specified in regulatory, authoritative, or contractual situations.

**QC batch**
The QC batch consists of a set of up to 20 field samples that behave similarly (i.e., same matrix) and are processed using the same procedures, reagents, and standards within the same time period.

**QC check sample**
A reference matrix containing known concentrations of parameters of interest. If prepared in the laboratory, it is made using stock standard solutions independent of those used for calibration. If the results of these parameters do not meet acceptance criteria, corrective actions are taken.

**qualification (personnel)**
The characteristics of abilities gained through education, training, or experience, as measured against established requirements, such as standards or tests, that qualify an individual to perform a required function.

# Glossary (continued)

**quality**
The sum of features and properties/characteristics of a process, item, or service that bears on its ability to meet the stated needs of the user. STL® has defined quality as meeting the needs of our clients, both internal and external.

**quality assurance (QA)**
An integrated system of management activities involving planning, implementation, assessment, reporting, and quality improvement to ensure that a process, item, or service is of the type and quality needed and expected by the customer.

**Quality Assurance Directive**
QA directives are memos issued by the QA Director (or the QA Managers for their facility) to clarify policies, Procedures, and the QMP; or to give direction for an immediate action to ensure or maintain quality.

**Quality Management Plan (QMP)**
The Quality Management Plan for Environmental Analyses (QMP) is a formal document that describes quality systems in terms of organizational structure, functional responsibilities of management, and staff, and lines of authority. The QMP documents the QMS and describes both the organizational and project-specific principles, goals, controls, and tools of the QMS. The QMP provides the criteria and specifications for the generation of environmental analytical data.

**Quality Assurance Project or Program Plan (QAPP)**
A formal document describing in comprehensive detail the necessary QA, QC, and other technical activities that must be implemented to ensure the results of the work performed will satisfy the stated performance criteria.

**quality control (QC)**
The overall system of technical activities that measures the attributes and performance of a process, item, or service against defined standards to verify that it meets the stated requirements established by the client or by STL®.

**quality improvement**

# Glossary (continued)

The process of improving the quality of operations. This process encourages worker recommendations for improvement of work processes and requires timely management evaluation and feedback or implementation.

**quality management**
That aspect of the overall management system of the organization that determines and implements the quality policy. Quality management includes strategic planning, allocation of resources, and other systematic activities (e.g., planning, implementation, and assessment) pertaining to the quality management system.

**quality management system (QMS)**
A structured and documented management system describing the policies, objectives, principles, organizational authority, responsibilities, and implementation plan of an organization for ensuring quality in its work processes, products, and services. The quality system provides the framework for planning, implementing, and assessing work performed by the organization and for carrying out required QA and QC.

**random error**
Variations of repeated measurements that are random in nature and individually not predictable.

**range**
The difference between the largest and smallest numbers in a set of numbers.

**raw data**
