Calibration formula: Y = 1695.391 X
Fit type = Avg CF with equal weighting, forced to origin
Coefficient of determination = 0.9502, Average error = 10.30%
Average CF = 1695.3910 with RSD = 13.23%

# 1.0 INTRODUCTION/EXECUTIVE SUMMARY

Alliant Ammunition and Powder Company, L.L.C. (AAPC) retained Draper Aden Associates (DAA) to conduct subsurface evaluations to determine the nature and extent of residual material from cleanup activities contained in closed Hazardous Waste Management Units (HWMUs) 5 and 7 at the Radford Army Ammunition Plant (Radford AAP) in Radford, Virginia. AAPC and the United States Army intended to implement source removal activities in 2003 in support of clean closures for both Units; the results of the field investigation conducted by DAA would be used in the preparation of individual closure plans for both Units. However, the laboratory analytical data collected during the field investigation indicated that the residual material in the Units is not hazardous and does not pose a threat to human health and/or the environment according to VDEQ guidelines and regulations. Therefore, the purpose of the project shifted to compiling a quantitative risk assessment in accordance with the USEPA *Risk Assessment Guidance for Superfund* (RAGS). This document presents the results of the field investigation and the risk assessment.

## 1.1 DESCRIPTION OF HWMU-5

HWMU-5 is a former lined surface impoundment. A Site Plan for HWMU-5 is illustrated in **Figure 1**. HWMU-5 is located approximately 3,000 feet southwest of the New River. The Unit is located on a river terrace that slopes gently downward to the north toward the New River. The Unit was put into operation as an unlined surface impoundment in 1970. In 1981, the Unit was retrofitted with a 60-mil Hypalon Liner; the bottom of the liner was covered with approximately 12 inches of sand, and the sides were covered with approximately 6 inches of sand and six inches of rip-rap. During operation, the Unit received stormwater runoff, spilled liquids, and washdown waters from an acid tank farm. The Unit was taken out of operation in 1986, and was closed in 1989 in accordance with the VDEQ-approved Closure Plan dated May 1988. The basin was drained of all waters, the soil was treated in-place with flyash and cement kiln dust to achieve a target pH of 6.3 and 10.5, and the basin was filled with soil and stone and capped. No waste has been processed through HWMU-5 since it was closed.

## 1.2 DESCRIPTION OF HWMU-7

HWMU-7 is a former unlined holding and neutralization basin located on the floodplain of the New River. A Site Plan for HWMU-7 is illustrated in **Figure 2**. Intermittent drainages are located to the north and south of the Unit, and the New River is located approximately 225 feet to the west of the Unit. The Unit was put into operation in 1972. During operation, influent into HWMU-7 included: spills, runoff, and wash down waters from the Acid Tank Farms in the Oleum Plant Area; waste sulfuric acid and caustics from oleum production; and waste caustic mixed with acidic water for neutralization. The Unit was taken out of operation in 1986, and was closed in 1989 in accordance with the VDEQ-approved Closure Plan dated May 1988. The basin was drained of all waters, the soil was treated in-place with flyash and cement kiln dust to achieve a target pH of 6.3 and 10.5, and the basin was filled with soil and stone and capped. No waste has been processed through HWMU-7 since it was closed.

## 2.0 SUBSURFACE EVALUATIONS

### 2.1 FIELD INVESTIGATION PROCEDURES

On October 31 and November 1, 2002, DAA advanced 16 soil borings at each Unit using a track-mounted Geoprobe® rig. The boring locations for HWMU-5 and for HWMU-7 are illustrated in **Figure 1** and **Figure 2**, respectively. The borings were located in a pattern to best determine the horizontal and vertical extent of the residual material in each Unit. At each Unit, nine borings were advanced within the Unit boundaries, and six borings were advanced around the perimeter just outside of the Unit boundaries. One additional boring was advanced approximately 30 feet topographically upgradient from each Unit for the collection of background soil samples. Soil samples were collected continuously throughout each of the borings. The differentiation between residual material and native soil was based on visual observation. The borings were backfilled with bentonite upon completion.

The nine borings located within HWMU-5 were advanced through the cap system and residual material and were terminated in the base sand layer; the borings did not penetrate the bottom 60-mil Hypalon liner. The nine borings located within HWMU-7 were advanced through the cap system and residual material and into the clay bottom liner; four of the borings were advanced through the clay liner and into native soils. The boring logs for both Units are presented in **Appendix A**.

At each Unit, DAA randomly collected eight soil samples from the 16 borings for laboratory analysis for the USEPA Target Analyte List (TAL) inorganic compounds and for the USEPA Target Compound List (TCL) organic compounds. The laboratory analytical results were subjected to Level IV data validation. The data validation reports and laboratory analytical data are presented in **Appendix B**.

DAA collected composite soil samples Unit-5-TCLP and Unit-7-TCLP from the residual material from the borings advanced within HWMU-5 and HWMU-7, respectively. The composite soil samples were submitted to the laboratory for waste characterization analysis. The waste characterization laboratory analytical results are presented in **Appendix C**. The soil cuttings and waste Geoprobe® sample collection sleeves were containerized (one drum per Unit) and staged at a central location on-site pending proper disposal.

The geosynthetic layers within the caps of both Units were penetrated by the Geoprobe® borings. The caps were repaired in accordance with VDEQ guidance. The results of the cap restoration activities are presented in **Appendix D**.

### 2.2 SUBSURFACE GEOLOGY

According to the *Soil Survey of Montgomery County, Virginia* (USDA, 1985), the areas in which HWMU-5 and HWMU-7 are located are underlain by soils of the Unison-Urban Land Complex (**Figure 3**). The Unison-Urban Land Complex makes up about 40% of the surface area

of Radford AAP, and consists of about 50% deep and well drained Unison soils, 30% Urban Land, and 20% other soils. This complex of soils varies in slope from 2 to 25%. In an undisturbed area, the Unison soils have a 15-inches thick surface layer of dark brown loam and a 43-inches thick subsoil of yellowish-red, sticky plastic clay underlain by a red sandy clay loam to a depth of 58 inches. This clay-rich layer is typically underlain by a brown sand to about 10 feet below ground surface (bgs), which then grades into a brown clay. Permeability is moderate in Unison soils, natural fertility is low, and organic matter content is low to moderate. The soil is medium to strongly acidic. Urban land is covered by pavement or structures; the original soil has been physically altered or obscured so that classification is not practical.

Underlying the soils throughout most of Radford AAP is a series of dolomite, limestone and shale strata known as the Cambrian-aged Elbrook Formation. The Elbrook Formation is the major outcropping formation as well as the predominant karstic formation below the facility. Sinkholes, solution channels, pinnacled surfaces, and springs are common to the Elbrook Formation. The bedrock beneath Units 5 and 7 is generally encountered at depths ranging from approximately 28 feet to over 65 feet below ground level, although the soil/bedrock interface is gradational.

Groundwater at both Units generally is encountered within the weathered bedrock residuum. Groundwater movement beneath HWMU-5 is toward the northeast; the groundwater contours and topography in this area suggest that HWMU-5 is located on a river terrace that contains several karst features and drains north toward the New River. Groundwater movement beneath HWMU-7 is generally to the west toward the New River, and to the northeast and southwest toward intermittent drainages that flow into the New River north and south of the Unit.

### 2.2.1 Material Profile of HWMU-5

According to the 1989 closure documentation, the cover system installed over the neutralized residual material at HWMU-5 consisted of a two-foot clay layer overlain by a 30-mil PVC membrane, which was in turn overlain by a one-foot drainage sand layer. The drainage sand layer was overlain by a one-foot soil cover and a one-foot topsoil and grass cover. Additional elements of the cover system included rip-rap slope protection and a filter cloth underneath the rip-rap to prevent piping of the cover soil along the Unit perimeter.

At HWMU-5, the nine borings located within the Unit boundaries (5GP-1, 5GP-2, 5GP-3, 5GP-5, 5GP-6, 5GP-8, 5GP-9, 5GP-10, and 5GP-11; **Figure 1**) were advanced to depths ranging from 10 to 12 feet below ground surface (bgs). The nine borings encountered a layer of topsoil approximately 0.5 foot thick, which was underlain by red-brown sandy clay ranging in thickness from 1 foot to 2 feet. The red-brown sandy clay in turn was underlain by light gray sand (drainage layer) ranging in thickness from 0.75 foot to 1 foot. The 30-mil PVC liner was encountered beneath the drainage sand layer. The PVC liner was underlain by light gray and yellow-brown mottled clay ranging in thickness from 2.5 feet to 4 feet. The clay layer in turn was underlain by red-brown to yellow-brown silty sand with green, compacted residual material. Borings 5GP-1 and 5GP-6 were terminated in light gray sand beneath the residual material – this

sand corresponds to the sand placed above the Unit's 60-mil Hypalon liner. The thickness of the residual material ranged from 4.5 feet to 6 feet. The remaining seven borings were terminated in residual material. The 60-mil Hypalon liner was not penetrated by any of the borings. A geologic cross-section of HWMU-5 is included as **Figure 4**.

The six borings located around the perimeter of HWMU-5 (5GP-4, 5GP-7, 5GP-12, 5GP-13, 5GP-14, and 5GP-15) were advanced to a depth of 4 feet bgs each. Red-brown to brown clay with gravel was encountered in each of the perimeter borings; no residual material was encountered in these six borings.

Boring 5GP-16 was located approximately 30 feet topographically upgradient from HWMU-5 for the collection of a background soil sample. Boring 5-GP-16 was advanced to a depth of 4 feet. Brown clay and red-brown sandy clay were encountered in boring 5GP-16.

### 2.2.2 Material Profile of HWMU-7

According to the 1989 closure documentation, the cover system installed over the neutralized residual material at HWMU-7 consisted of a two-foot clay layer overlain by a 30-mil PVC membrane, which was in turn overlain by a one-foot drainage sand layer. The drainage sand layer was overlain by a one-foot soil cover and a one-foot topsoil and grass cover. Additional elements of the cover system included rip-rap slope protection and a filter cloth underneath the rip-rap to prevent piping of the cover soil along the Unit perimeter.

At HWMU-7, the nine borings located within the Unit boundaries (7GP-1, 7GP-2, 7GP-3, 7GP-5, 7GP-6, 7GP-8, 7GP-9, 7GP-10, and 7GP-11; **Figure 2**) were advanced to depths ranging from 12 to 20 feet below ground surface (bgs). The nine borings encountered a layer of topsoil approximately 1 foot to 1.5 feet thick, which was underlain by yellow-brown sandy clay ranging in thickness from 1.25 feet to 2 feet. The yellow-brown sandy clay in turn was underlain by light gray sand (drainage layer) ranging in thickness from 0.50 foot to 1.5 feet. The 30-mil PVC liner was encountered beneath the drainage sand layer. The PVC liner was underlain by yellow-brown silty sand with green, compacted residual material. The thickness of the residual material ranged from 5 feet to 8.5 feet. The residual material in turn was underlain by red-brown to yellow-brown sandy clay ranging in thickness from 1.75 feet to 3 feet. Borings 7GP-5, 7GP-6, 7GP-8, 7GP-10, and 7GP-11 were terminated in the sandy clay. Borings 7GP-1, 7GP-2, and 7GP-9 penetrated the sandy clay and encountered dark gray fine sand and silt with round gravel; the dark gray sand and silt exhibited an aquatic odor. The red-brown to yellow-brown sandy clay was not encountered in boring 7GP-3; the dark gray sand and silt was encountered beneath the residual material at a depth of 9.5 feet bgs in boring 7GP-3. A geologic cross-section of HWMU-7 is included as **Figure 5**.

Five of the six borings located around the perimeter of HWMU-7 (7GP-7, 7GP-12, 7GP-13, 7GP-14, and 7GP-15) were advanced to a depth of 4 feet bgs each; boring 7GP-4 was advanced to a depth of 8 feet bgs. Brown sand was encountered in each of the perimeter borings, and dark gray fine sand and silt with round gravel was encountered at a depth of 7.75 feet bgs in boring 7GP-4. No residual material was encountered in the six perimeter borings.

Boring 7GP-16 was located approximately 30 feet topographically upgradient from HWMU-7 for the collection of a background soil sample. Boring 7GP-16 was advanced to a depth of 4 feet. Brown sand was encountered in boring 7GP-16.

## 2.3 SOIL SAMPLE COLLECTION AND ANALYTICAL RESULTS

### 2.3.1 HWMU-5

On October 31, 2002, DAA randomly collected eight soil samples from the 16 borings advanced at HWMU-5. The eight samples and the material from which they were collected are listed below:

- 5GP-1 (1-2') cap material (clay and sand above the PVC membrane);
- 5GP-1 (9-10') residual material;
- 5GP-3 (9-10') residual material;
- 5GP-6 (10-11') base sand (beneath the residual material);
- 5GP-8 (7-8') residual material;
- 5GP-8 (11-12') residual material;
- 5GP-12 (3-4') soil adjacent to the Unit; and
- 5GP-16 (3-4') background soil.

Aliquots of the eight soil samples were submitted to Severn Trent Laboratories of North Canton, Ohio for analysis for the USEPA Target Analyte List (TAL) inorganic compounds. Separate aliquots of the eight soil samples were submitted to Lancaster Laboratories of Lancaster, Pennsylvania for analysis for the USEPA Target Compound List (TCL) organic compounds. The laboratory analytical results were subjected to Level IV data validation. The data validation reports and laboratory analytical data are presented in **Appendix B**. A summary of the TAL inorganic constituents and the TCL organic constituents detected in the eight soil samples from HWMU-5 at concentrations above the respective Limits of Quantitation (LOQs) is presented in **Table 1**.

As shown in **Table 1**, the concentrations of TAL inorganic constituents detected in the samples of residual material are comparable to the TAL inorganic constituent concentrations detected in the samples of the cap material, base sand, adjacent soil, and background soil; the highest concentrations of 10 of the 16 TAL inorganic constituents detected were observed in the samples of the cap material, base sand, or adjacent soil. Cap material sample 5GP-1 (1-2') exhibited the highest concentrations of barium (85.1 mg/kg), lead (12.9 mg/kg), potassium (1,580 mg/kg), vanadium (64.9 mg/kg), and zinc (35.3 mg/kg). Base sand sample 5GP-6 (10-11') exhibited the highest concentration of calcium (9,930 mg/kg). Adjacent soil sample 5GP-12 (3-4') exhibited the highest concentrations of aluminum (19,600 mg/kg), iron (33,400 mg/kg), magnesium (2,200 mg/kg), and manganese (457 mg/kg). Residual material sample 5GP-1 (9-10') exhibited the highest concentrations of chromium (31.7 mg/kg), cobalt (17.6 mg/kg), and copper (19.8 mg/kg). Residual material sample 5GP-8 (7-8') exhibited the highest concentrations of arsenic (4.1 mg/kg) and beryllium (1.3 mg/kg). It should be noted that

background soil sample 5GP-16 (3-4') exhibited an arsenic concentration of 4.0 mg/kg. Residual material sample 5GP-8 (11-12') exhibited an aluminum concentration of 19,600 mg/kg – the same concentration as adjacent soil sample 5GP-12 (3-4').

Only one TCL organic constituent was detected in three of the eight soil samples from HWMU-5. The pesticide 4,4-DDD was detected in residual material samples 5GP-1 (9-10') and 5GP-8 (7-8') at concentrations of 0.019 mg/kg and 0.051 mg/kg, respectively, and in base sand sample 5GP-6 (10-11') at a concentration of 0.0067 mg/kg. No other TCL organic constituents were detected in any of the soil samples from HWMU-5.

### 2.3.2 HWMU-7

On November 1, 2002, DAA randomly collected eight soil samples from the 16 borings advanced at HWMU-5. The eight samples and the material from which they were collected are listed below:

- 7GP-1 (1-3') cap material (clay and sand above the PVC membrane);
- 7GP-2 (8-12') residual material;
- 7GP-2 (13.5-14.5') base clay (beneath the residual material);
- 7GP-3 (10-11') native soil (beneath the Unit);
- 7GP-4 (3-4') soil adjacent to the Unit;
- 7GP-5 (6-11') residual material;
- 7GP-8 (5-8') residual material; and
- 7GP-16 (3-4') background soil.

Aliquots of the eight soil samples were submitted to Severn Trent Laboratories of North Canton, Ohio for analysis for the USEPA Target Analyte List (TAL) inorganic compounds. Separate aliquots of the eight soil samples were submitted to Lancaster Laboratories of Lancaster, Pennsylvania for analysis for the USEPA Target Compound List (TCL) organic compounds. The laboratory analytical results were subjected to Level IV data validation. The data validation reports and laboratory analytical data are presented in **Appendix B**. A summary of the TAL inorganic constituents and the TCL organic constituents detected in the eight soil samples from HWMU-7 is presented in **Table 2**.

As shown in **Table 2**, the concentrations of TAL inorganic constituents detected in the samples of residual material are comparable to the TAL inorganic constituent concentrations detected in the samples of the cap material, base clay, native soil, adjacent soil, and background soil; the highest concentrations of 15 of the 18 TAL inorganic constituents detected were observed in the samples of the cap material, base clay, native soil, and background soil. Cap material sample 7GP-1 (1-3') exhibited the highest concentrations of magnesium (4,290 mg/kg) and manganese (662 mg/kg). Base clay sample 7GP-2 (13.5-14.5') exhibited the highest concentrations of cobalt (16.2 mg/kg) and iron (29,300 mg/kg). Native soil sample 7GP-3 (10-11') exhibited the highest concentrations of arsenic (26.1 mg/kg), barium (229 mg/kg), beryllium (1.5 mg/kg), calcium (28,100 mg/kg), chromium (32.8 mg/kg), copper (23.2 mg/kg), lead (35.1 mg/kg), and potassium (2,970 mg/kg), as well as the only detections of selenium (3.5 mg/kg),

and cyanide (0.69 mg/kg). Background soil sample 7GP-16 (3-4') exhibited the highest concentration of zinc (39.7 mg/kg). Residual material sample 7GP-2 (8-12') exhibited the highest concentration of nickel (21.6 mg/kg). Residual material sample 7GP-8 (5-8') exhibited the highest concentrations of aluminum (22,400 mg/kg) and vanadium (61.8 mg/kg).

Only three TCL organic constituents were detected in two of the eight soil samples from HWMU-7. The pesticide 4,4-DDD was detected in base clay sample 7GP-2 (13.5-14.5') at a concentration of 0.0035 mg/kg. In native soil sample 7GP-3 (10-11'), the pesticide 4,4-DDE and the semi-volatile compound n-nitrosodiphenylamine were detected at concentrations of 0.0035 mg/kg and 0.75 mg/kg, respectively. No other TCL organic constituents were detected in any of the soil samples (including the residual material samples) from HWMU-7.

### 2.3.3 Waste Characterization Analytical Results

DAA collected composite soil samples Unit-5-TCLP and Unit-7-TCLP from the residual material from the borings advanced within HWMU-5 and HWMU-7, respectively. The composite soil samples were submitted to the laboratory for waste characterization analysis. The soil cuttings and waste Geoprobe® sample collection sleeves were containerized (one drum per Unit) and staged at a central location on-site pending proper disposal.

The waste characterization laboratory analytical results are presented in **Appendix C**, and summarized **Table 3**. Based on the results of the waste characterization analyses, the residual material at HWMU-5 and at HWMU-7 cannot be classified as hazardous.

## 3.0 RISK ASSESSMENT

The procedures used to evaluate the data gathered during the field investigations at HWMU-5 and HWMU-7 were derived from the USEPA *Soil Screening Guidance* (July 1996) and the USEPA *Risk Assessment Guidance for Superfund* (RAGS). For the purposes of the risk assessments for each Unit, the detected constituent concentrations were compared to those from background samples collected from nearby areas (boring 5GP-16 at HWMU-5 and boring 7GP-16 at HWMU-7) as well as to facility-wide background concentrations derived from the IT Corporation *Radford Army Ammunition Plant Facility-Wide Background Report* (December 2001). Due to the fact that the planned future use for the capped Units is to leave them in place, the only potential exposure pathway was determined to be through constituent migration from soil to groundwater. Therefore, following the comparison to background concentrations, any constituent concentrations that exceeded their respective background concentrations were then compared to USEPA Region III Soil-to-Groundwater soil screening levels (SSLs). In addition, although expsosure to the residual material through direct ingestion was determined to be improbable, any constituent concentrations that exceeded their respective background concentrations also were compared to USEPA Region III risk-based concentrations (RBCs) for residential soil ingestion.

As specified in the USEPA Region III Soil-to-Groundwater SSLs memo (October 27, 1999), the soil-to-groundwater SSLs used in this risk assessment were the Region III tap water (residential) RBCs multiplied by a dilution attenuation factor (DAF) of 20. The DAF of 20 was chosen because Radford AAP is an industrial facility with no users of groundwater; therefore, this was deemed protective of human health and the environment. The DAF 20's for the constituents presented in this report were derived from the latest USEPA Region III RBC Table (October 9, 2002).

The *Soil Screening Guidance* is a tool developed by the USEPA to help standardize and accelerate the evaluation and cleanup of contaminated soils at sites on the National Priorities List (NPL) where future residential land use is anticipated. The *Soil Screening Guidance* provides a methodology to calculate risk-based, site-specific SSLs for contaminants in soil that may be used to identify areas needing further investigation at NPL sites. SSLs are designed for screening purposes. Exceedances of SSLs typically indicate that more detailed assessment is necessary. Accordingly, no exceedances of SSLs would indicate that no further assessment is necessary. SSLs are not intended as cleanup levels, and are not intended as trigger levels that require remediation.

SSLs developed in accordance with the *Soil Screening Guidance* are based on future residential land use assumptions and related exposure scenarios. The Radford AAP is an industrial site and will never be used for residential purposes; however, SSLs developed in accordance with the *Soil Screening Guidance* can be used for sites with non-residential land use as a tool to conduct a conservative initial screening. As stated in the *Soil Screening Guidance: Fact Sheet* (July, 1996), "Generally, at sites where contaminant concentrations fall below SSLs, no further action or study is warranted..."

## 3.1 FACILITY-WIDE BACKGROUND STUDY (IT CORPORATION)

In August and September 2001, the IT Corporation conducted a Facility-Wide Background Study at the Main Manufacturing Area and the New River Unit of Radford AAP in accordance with a USEPA Region III-approved Work Plan. As stated in the *Radford Army Ammunition Plant Facility-Wide Background Report* (December 2001), the primary objective of the study was to collect soil samples representative of background conditions to establish a baseline for inorganic constituents of concern at Radford AAP. Sampling locations were positioned in tree stands to ensure associated soil samples were representative of areas that had not been affected by previous site activities or releases. Wherever possible, background sample locations were placed in tree stands estimated to predate potential construction activity at each location. The background soil samples were analyzed for the USEPA TAL inorganic compounds and for the USEPA TCL organic compounds. No TCL organic compounds were detected in the background soil samples.

Following the collection and analysis of the background soil samples, IT Corporation initially calculated facility-wide point estimates for the background soil data as confidence limits. As a result of discussions with the USEPA and VDEQ, the final facility-wide point estimates for the background soil data were calculated as tolerance limits. The use of tolerance limits rather than confidence limits evolved from comments questioning the use of the 95% upper confidence limit (UCL) as the point estimate for the background value. The 95% UCL was originally included in the Facility-Wide Background Study as a general point of reference. A confidence interval is used for comparisons within a single population. A compliance data set is then typically compared to a known standard. Using the 95% UCL as a single point comparison or background value, however, is likely to result in classifying many chemicals as greater than background when they are not. These misclassifications would be due to the 95% UCL representing an estimate of the mean. Such misclassifications could occur as often as 50% of the time. A tolerance limit is used for comparisons of similar but distinct populations. A concentration range is defined from a background data set, within which a large proportion of compliance data should fall with high probability. Therefore, it was recommended that a 95% upper tolerance limit (UTL) be developed in the Background Study for use as point-by-point comparisons.

The 95% UTLs calculated by the IT Corporation for the inorganic constituents detected in the background soil samples from the Main Manufacturing Area are summarized in **Table 4**. These facility-wide background values, in conjunction with the Unit-specific background concentrations detected in the samples from borings 5GP-16 and 7GP-16, were used in the initial comparisons to background for the inorganic constituents detected in the soil samples from HWMU-5 and HWMU-7, respectively.

## 3.2 HWMU-5

### 3.2.1 Comparison of Inorganic Constituent Concentrations to Background

The initial comparison of the detected inorganic constituent concentrations to background concentrations for the soils samples collected from HWMU-5 is summarized in **Table 5**. The maximum detected constituent concentrations were compared to those from background sample 5GP-16 (3-4') as well as to the facility-wide background concentrations. All of the maximum detected constituent concentrations exceeded the concentrations detected in background sample 5GP-16 (3-4'). However, with the exception of calcium, magnesium, and potassium, the maximum detected inorganic constituent concentrations did not exceed the facility-wide background concentrations; therefore, the detected inorganic constituents are not considered to be constituents of potential concern. Furthermore, due to the fact that calcium, magnesium, and potassium are not hazardous constituents as listed in Appendix VIII of 40 CFR Part 261, they are not considered to be constituents of potential concern even though their maximum detected concentrations exceeded their respective background concentrations.

### 3.2.2 Comparison to EPA Region III Residential Soil and Soil-to-Groundwater SSLs

Based on the initial comparison to background concentrations, none of the inorganic constituents detected in the soil samples from HWMU-5 were considered to be constituents of potential concern. Therefore, only the detected TCL organic constituent 4,4-DDD was compared to the USEPA Region III residential soil RBC and Soil-to-Groundwater SSL. As shown in **Table 6**, the maximum 4,4-DDD detected concentration of 0.051 mg/kg is below the residential soil RBC of 2.7 mg/kg, and below the soil-to-groundwater DAF 20 SSL of 11 mg/kg. Therefore, 4,4-DDD is not considered to be a constituent of potential concern at HWMU-5.

## 3.3 HWMU-7

### 3.3.1 Comparison of Inorganic Constituent Concentrations to Background

The initial comparison of the detected inorganic constituent concentrations to background concentrations for the soils samples collected from HWMU-7 is summarized in **Table 7**. The maximum detected constituent concentrations were compared to those from background sample 7GP-16 (3-4') as well as to the facility-wide background concentrations. With the exception of zinc, all of the maximum detected constituent concentrations exceeded the concentrations detected in background sample 7GP-16 (3-4'). The maximum detected concentrations of beryllium, calcium, magnesium, potassium, and selenium exceeded their respective facility-wide background concentrations. Due to the fact that calcium, magnesium, and potassium are not hazardous constituents as listed in Appendix VIII of 40 CFR Part 261, these three constituents are not considered to be constituents of potential concern, even though their maximum detected concentrations exceeded their respective background concentrations. However, although the only detected concentrations of beryllium and selenium were observed in native soil sample 7GP-3 (10-11'), these two constituents were retained for further comparison to the USEPA Region III Soil-to-Groundwater SSLs. The maximum detected concentrations for the remaining

inorganic constituents did not exceed their respective facility-wide background concentrations; therefore, these detected inorganic constituents are not considered to be constituents of potential concern.

### 3.3.2 Comparison to EPA Region III Residential Soil and Soil-to-Groundwater SSLs

Based on the initial comparison to background concentrations, the concentrations of inorganic constituents beryllium and selenium detected in native soil sample 7GP-3 (10-11') were retained for comparison to the USEPA Region III residential soil RBCs and Soil-to-Groundwater SSLs. In addition, the cyanide, 4,4-DDE, and n-nitrosodiphenylamine concentrations detected in native soil sample 7GP-3 (10-11') and the 4,4-DDD concentration detected in base clay sample 7GP-2 (13.5-14.5') were compared to the respective USEPA Region III residential soil RBCs and Soil-to-Groundwater SSLs. As shown in **Table 8**, the detected concentrations of beryllium, selenium, cyanide, 4,4-DDD, 4,4-DDE, and n-nitrosodiphenylamine are all below their respective residential soil RBCs and below their respective soil-to-groundwater DAF 20 SSLs. Furthermore, organic constituents 4,4-DDD, 4,4-DDE, and n-nitrosodiphenylamine have never been detected in the groundwater at HWMU-7 during annual monitoring for the all of the constituents listed in Appendix IX (Groundwater Monitoring List) of 40 CFR Part 264 as required by the Hazardous Waste Post-Closure Care Permit for the Unit. Therefore, beryllium, selenium, cyanide, 4,4-DDD, 4,4-DDE, and n-nitrosodiphenylamine are not considered to be constituents of potential concern at HWMU-7.

## 3.4 EXPOSURE ASSESSMENT

HWMU-5 and HWMU-7 are capped using impermeable PVC membranes and 2-3 feet of soil; therefore, there is no risk of exposure to human health and/or the environment through direct ingestion of the residual material or by inhalation of vapors or fugitive dusts. In addition, the constituent concentrations that exceeded their respective background concentrations were below their respective USEPA Region III risk-based concentrations (RBCs) for residential soil ingestion.

The only potential exposure pathway is through constituent migration from soil to groundwater. However, Radford AAP is an industrial facility with no users of groundwater. Furthermore, based on the comparison to the USEPA Region III Soil-to-Groundwater SSLs (derived from the Region III tap water RBCs multiplied by a DAF of 20), none of the constituents detected at HWMU-5 and at HWMU-7 at concentrations exceeding the facility-wide background concentrations are considered to be of concern. Therefore, exposure via constituent migrations from soil to groundwater is not considered to be a potential risk.

## 4.0 CONCLUSIONS AND RECOMMENDATIONS

Based on the results of the field investigation, the residual material in HWMU-5 and in HWMU-7 is not hazardous and should be left in place. The Units are capped using impermeable PVC membranes and 2-3 feet of soil; therefore, there is no risk of exposure to human health and/or the environment through direct ingestion of the residual material or by inhalation of vapors or fugitive dusts. In addition, the concentrations of the inorganic and organic constituents detected in soil samples collected from both Units do not pose a risk to groundwater via migration from the soil. Therefore, leaving the residual material in place does not pose a threat to human health and/or the environment according to VDEQ guidelines and regulations. Accordingly, Radford AAP requests that certifications for clean closure for soil be issued for both Units.

### 4.1 GENERAL GROUNDWATER MONITORING PROGRAM ISSUES

The groundwater at HWMU-5 and at HWMU-7 currently is monitored in accordance with the requirements of the Final Hazardous Waste Post-Closure Care Permit for Hazardous Waste Management Units 5, 7 10, and 16 (October 4, 2002). Due to the fact that the results of this investigation indicate that the residual material at both Units is not hazardous, Radford AAP desires to develop a protocol with which to cease groundwater monitoring at HWMU-5 and HWMU-7 under the Final Hazardous Waste Post-Closure Care Permit. This protocol is similar to the procedures specified in Permit Conditions V.F.1.c and V.F.2.c, wherein corrective action can be terminated if the Permittees demonstrate that the Groundwater Protection Standard has not been exceeded for three (3) consecutive years. In the event that the Groundwater Protection Standard is not exceeded for three (3) consecutive years at HWMU-5 and/or HWMU-7, Radford AAP will submit to the VDEQ a Minor Modification to the Final Hazardous Waste Post-Closure Care Permit petitioning for clean closure for groundwater at HWMU-5 and/or HWMU-7.

#### 4.1.1 HWMU-5

Radford AAP proposes to monitor the groundwater at HWMU-5 for those inorganic constituents detected in the October 31, 2002 soil samples that are also listed in Appendix VIII (Hazardous Constituents) of 40 CFR Part 261, as well as for the one organic constituent (4,4-DDD) detected in the October 31, 2002 soil samples. Radford AAP will monitor for these constituents **in addition to** the constituents listed in the compliance groundwater monitoring list for HWMU-5 specified in the Final Hazardous Waste Post-Closure Care Permit, as appropriate. Due to the fact that no other organic constituents were detected in the soil samples from HWMU-5, any organic constituents other than 4,4-DDD detected in groundwater at HWMU-5 would have to be derived from an alternate source, and would fall under the jurisdiction of Radford AAP's USEPA Region III Corrective Action Program. Radford AAP proposes that groundwater monitoring at HWMU-5 would cease in the event that 4,4-DDD is not detected for three (3) consecutive years, and in the event that the inorganic constituents are not detected at concentrations exceeding their respective USEPA Maximum Contaminant Levels (MCLs) or VDEQ Alternate Concentration Limits (ACLs) for three (3) consecutive years. Radford AAP is

an industrial facility with no users of groundwater; therefore, the USEPA MCLs and VDEQ ACLs, which are residential drinking water standards, provide conservative standards with which to compare the inorganic constituent concentrations detected at the Unit.

Radford AAP will follow this groundwater monitoring protocol as well as the compliance groundwater monitoring protocol specified in the Final Hazardous Waste Post-Closure Care Permit until the VDEQ approves Radford AAP's petition for the cessation of groundwater monitoring and certifications for clean closure of soil and groundwater have been issued for HWMU-5. In accordance with Permit Condition I.J.1, Radford AAP will request a reduction in the post-closure period for HWMU-5 upon receipt of certification of clean closure from the VDEQ. Radford AAP assumes that certifications for clean closure of soil and groundwater will trigger the termination of the post-closure period and signify the completion of post-closure care at HWMU-5.

### 4.1.2 HWMU-7

Radford AAP proposes to monitor the groundwater at HWMU-7 for those inorganic constituents detected in the November 1, 2002 soil samples that are also listed in Appendix VIII (Hazardous Constituents) of 40 CFR Part 261, as well as for the three organic constituents (4,4-DDD, 4,4-DDE, and n-nitrosodiphenylamine) detected in the November 1, 2002 soil samples. Radford AAP will monitor for these constituents **in addition to** the constituents listed in the compliance groundwater monitoring list for HWMU-7 specified in the Final Hazardous Waste Post-Closure Care Permit, as appropriate. Due to the fact that no other organic constituents were detected in the soil samples from HWMU-7, any organic constituents other than 4,4-DDD, 4,4-DDE, and n-nitrosodiphenylamine detected in groundwater at HWMU-7 would have to be derived from an alternate source, and would fall under the jurisdiction of Radford AAP's USEPA Region III Corrective Action Program. Radford AAP proposes that groundwater monitoring at HWMU-7 would cease in the event that 4,4-DDD, 4,4-DDE, and n-nitrosodiphenylamine are not detected for three (3) consecutive years, and in the event that the inorganic constituents are not detected at concentrations exceeding their respective USEPA MCLs or VDEQ ACLs for three (3) consecutive years. Radford AAP is an industrial facility with no users of groundwater; therefore, the USEPA MCLs and VDEQ ACLs, which are residential drinking water standards, provide conservative standards with which to compare the inorganic constituent concentrations detected at the Unit.

Radford AAP will follow this groundwater monitoring protocol as well as the compliance groundwater monitoring protocol specified in the Final Hazardous Waste Post-Closure Care Permit until the VDEQ approves Radford AAP's petition for the cessation of groundwater monitoring and certifications for clean closure of soil and groundwater have been issued for HWMU-7. In accordance with Permit Condition I.J.1, Radford AAP will request a reduction in the post-closure period for HWMU-7 upon receipt of certification of clean closure from the VDEQ. Radford AAP assumes that certifications for clean closure of soil and groundwater will trigger the termination of the post-closure period and signify the completion of post-closure care at HWMU-7.

## 4.2 TRICHLOROETHENE IN GROUNDWATER AT HWMU-5

Trichloroethene (TCE) has been detected repeatedly at concentrations exceeding the USEPA Maximum Contaminant Level (MCL) of 5 µg/l in four groundwater monitoring wells within the monitoring network for HWMU-5. In correspondence to Radford AAP dated September 27, 2000, the VDEQ requested that Radford AAP implement a Corrective Action Program at HWMU-5 to address the TCE concentrations in groundwater which exceeded the USEPA MCL. During a teleconference between the VDEQ and Radford AAP on October 31, 2000, AAPC stated that, based on historical information for HWMU-5, it was believed that the wastes handled at the Unit prior to closure did not contain TCE or other organic compounds. Furthermore, TCE concentrations below the USEPA MCL had been detected in the upgradient monitoring well for the Unit during previous monitoring events. Therefore, it was believed that HWMU-5 was not the source of the TCE detected in the groundwater. In accordance with VDEQ guidance and pursuant to 40 CFR 264.99(i), AAPC chose to demonstrate that TCE was derived from a source other than HWMU-5. A copy of the Alternate Source Demonstration for Trichloroethene for HWMU-5 is included in **Appendix E**.

Historic information regarding operations at HWMU-5 prior to closure indicated that the wastes processed through the Unit did not contain TCE. A review of Radford AAP cleaning and maintenance practices in the vicinity of HWMU-5 identified areas in which chlorinated solvents had been used. An evaluation of historic waste disposal practices in these areas indicated the potential for groundwater impact from these operations. Hydrogeologic features such as fracture traces and sinkholes in this area would facilitate the transport of impacted groundwater from these potential source areas to certain monitoring wells (5W5B [shallow residuum] and nested wells 5WC21 [shallow residuum], 5WC22 [mid-depth residuum], and 5WC23 [deep residuum]) within the groundwater monitoring network for HWMU-5. Only these certain monitoring wells consistently exhibit TCE concentrations in exceedance of the USEPA MCL of 5 µg/l. In addition, TCE was detected in upgradient monitoring well 5W8B at a concentration exceeding the USEPA MCL during First Quarter 2002.

TCE was not detected in any of the soil samples collected within and around HWMU-5 during the October 31, 2002 field investigation. Based on the findings of the 2001 ASD as well as the October 31, 2002 field investigation and Year 2002 quarterly groundwater monitoring, it is Radford AAP's conclusion that the detected TCE concentrations in groundwater are derived from a source other than HWMU-5. Radford AAP assumes that remediation of TCE in groundwater in this area will fall under the jurisdiction of Radford AAP's USEPA Region III Corrective Action Program, and that TCE concentrations derived from an alternate source will not prevent HWMU-5 from receiving certification for clean closure of groundwater based on the protocol described in Section 4.1.1 of this report.

USEPA REGION III SOIL-TO-GROUNDWATER SOIL SCREENING LEVELS
RADFORD ARMY AMMUNITION PLANT, RADFORD, VIRGINIA

| CONSTITUENTS | CAS No. | Risk-Based Concentration (RBC) Residential[1] (mg/kg) | USEPA Region III Groundwater DAF 20 (mg/kg) | Maximum Unit-Specific Soil Concentration (mg/kg) | Constituent Of Potential Concern? |
|---|---|---|---|---|---|
| Inorganics | | | | | |
| Beryllium | 7440-41-7 | 160 | 1200 | 1.5 | no |
| Cyanide | 57-12-5 | 1600 | 150 | 0.69 | no |
| Selenium | 7782-49-2 | 390 | 19 | 3.5 | no |
| Semivolatile Organic Compounds (SVOCs) | | | | | |
| N-Nitrosodiphenylamine | 86-30-6 | 130 | 0.76 | 0.75 | no |
| Pesticides | | | | | |
| 4,4-DDD | 72-54-8 | 2.7 | 11 | 0.0035 | no |
| 4,4-DDE | 72-55-9 | 1.9 | 35 | 0.0025 | no |

NOTES:
[1] USEPA Region III Risk-Based Concentration Table, October 9, 2002.
DAF 20: Dilution Attenuation Factor of 20 for constituent migration from soil to groundwater.
Obtained from USEPA Region III Risk-Based Concentration Table, October 9, 2002.

# APPENDIX A

## BORING LOGS

# APPENDIX B

## DATA VALIDATION REPORTS AND LABORATORY ANALYTICAL RESULTS

## SW-846 INORGANIC DATA REVIEW SUMMARY

Draper Aden Associates (DAA) performed a limited review of the analytical results for the October 31-November 1, 2002 soil sampling event at hazardous waste management units 5 and 7, Radford Army Ammunition Plant (RAAP)/Alliant Ammunition and Powder Company, Montgomery County, Virginia. Soil samples were collected from locations 5GP-1 (1-2'), 5GP-1 (9-10'), 5GP-3 (9-10'), 5GP-6 (10-11'), 5GP-8 (7-8'), 5GP-8 (11-12'), 5 GP-12 (3-4'), 5GP-16 (3-4'), 7GP-1 (1-3'), 7GP-2 (8-12'), 7GP-2 (13.5-14.5'), 7GP-3 (10-11'), 7GP-4 (3-4'), 7GP-5 (6-11'), 7GP-8 (5-8') and 7 GP-16 (3-4').

DAA performed a limited review of the analytical results for twenty-two metal target analytes analyzed per SW-846 Method 6010B, one metal target analyte analyzed per SW-846 7471A and one metal target analyte analyzed per SW-846 9012A. Inductively coupled plasma (ICP), cold vapor atomic absorption (CVAA) and colorimetric were the techniques on which the individual analytical methods for each of the inorganics were based.

Soil samples were collected and submitted to the laboratory for analysis of the following metals: ICP Method 6010B (aluminum, antimony, arsenic, barium, beryllium, cadmium, calcium, chromium, cobalt, copper, iron, lead, magnesium, manganese, nickel, potassium, selenium, silver, sodium, thallium, vanadium and zinc), Method 7471A (mercury) and Method 9012A (total cyanide).

Severn Trent Laboratories (STL) of North Canton, Ohio performed the inorganic analyses. On behalf of RAAP, STL submitted results to Draper Aden Associates in a final certificate of analysis which included sample analytical results as well as relevant documentation to verify and validate the results.

The evaluation of STL's compliance with inorganic analytical methods and validation of results presented here are based upon a limited review of QA/QC information including chain of custody, case narrative, holding time, preservation procedures, standards, spike analysis on sample matrix (S), blank samples analyses (method, calibration and other blanks), and duplicate analyses (SD) results. Review was limited to summary sheets provided by the laboratory, unless a notable discrepancy in the data package required review of the raw data. Additionally, sample results were recalculated and verified for arsenic and cyanide, sample 7GP-3(10-11'). A summary of data review results and any observed deviations is provided below.

STL received the samples on ice and in good condition. All technical holding time criteria were met.

***Method 6010B***

The original certificate of analysis appeared complete in its presentation and the data were of acceptable quality. The data set exhibited the laboratory's ability to achieve the reported limit of quantitation (LOQ) for each target parameter, as outlined by the method detection limit study.

All instrument calibration and calibration verification criteria were met. Blank samples, calibration standards, pre-digestion spikes and duplicates were analyzed as required. All laboratory control samples, pre-digestion spikes and duplicates were recovered within control limits, except where noted below. Duplicate sample results exhibited acceptable precision, where applicable. All LOQ standards exhibited acceptable recovery. Deviations from specific quality control criteria that were identified and noted during the data review process are summarized below.

The associated blanks were not interference free, however, data qualification was necessary for only antimony. Antimony was reported in all samples less than the LOQ, however, all antimony results were attributed to laboratory contamination.

Antimony, chromium, vanadium, recovered low in the matrix spike sample and all results for these target parameters were qualified as estimated and should be considered biased low.

The laboratory presented all results in mg/kg and on a dry weight basis. Except where noted above, all sample results remain as reported by the laboratory. All results unaffected by the data validation process and/or detected less than their corresponding LOQs were validated and reported as "U." Refer to the attached table titled "Data Validation Report" for a summary of results which required data validation.

***Methods 7471A (CVAA/ 9012A(Colorimetric)***

The original certificate of analysis appeared complete in its presentation and the data were of acceptable quality. The data set exhibited the laboratory's ability to achieve the reported limit of quantitation for mercury and cyanide, as outlined by the method detection limit study.

All instrument calibration and calibration verification criteria were met. Blank samples, LCS samples, pre-digestion spikes and spike duplicates were analyzed as required. All blank criteria were met, except where noted below. Laboratory duplicate sample results exhibited acceptable precision, where applicable. All laboratory control samples, pre-digestion spikes and duplicates were recovered within control limits. Deviations from specific quality control criteria that were identified and noted during the data review process are summarized below.

The associated blanks were not interference free, however, data qualification was necessary for only cyanide. Cyanide was reported less than the LOQ in 5 GP-1(9-10') and 5-GP-6(10-11') and results were attributed to laboratory contamination. Cyanide reported above the LOQ in 7GP-3(10-11') was not influence by the observed laboratory blank contamination and no data qualification was required.

The laboratory presented all results in mg/kg and on a dry weight basis. Except where noted above, all sample results remain as reported by the laboratory. All results unaffected by the data validation process and/or detected less than their corresponding LOQs were validated and reported as "U." Refer to the attached table titled "Data Validation Report" for a summary of results which required data validation.

## INORGANIC DATA EVALUATION FOR ICP SW-846 METHOD 6010B-SOILS

**Sample ID:** 5GP-1 (1-2'), 5GP-1 (9-10'), 5GP-3 (9-10'), 5GP-6 (10-11'), 5GP-8 (7-8'), 5GP-8 (11-12'), 5 GP-12 (3-4'), 5GP-16 (3-4'), 7GP-1 (1-3'), 7GP-2 (8-12'), 7GP-2 (13.5-14.5'), 7GP-3 (10-11'), 7GP-4 (3-4'), 7GP-5 (6-11'), 7GP-8 (5-8'), 7 GP-16 (3-4')

**QC Samples:** Lab blanks, Pre-digestion spikes, Duplicates, ICS, LCS, etc.
- Matrix spike/duplicate-7GP5(6-11')

**Laboratory:** STL, North Canton, OH; SDG A2K040189

Does Laboratory analyte list correspond to analyte list requested by DAA? _X_ yes ___ no

"☑" denotes items reviewed. See Data Validation Summary for additional comments.

### A. QC DOCUMENTATION CRITERIA

☑ Specific LODs for all target analytes
☑ Specific LOQs for all target analytes

### B. TECHNICAL HOLDING TIMES AND PRESERVATION REQUIREMENTS:

☑ 6 month holding time

### C. INSTRUMENT CALIBRATION CRITERIA:

☑ 1 calibration blank and at least 1 standard

### D. INITIAL AND CONTINUING CALIBRATION VERIFICATION CRITERIA:

☑ 10 sample frequency
☑ Use of calibration blank and check standard
☑ %R within 90-110% range

**E. BLANK SAMPLES ANALYSES CRITERIA:**

- ☑ Method/Other Lab Blanks (check only if analyzed)
- ☑ Interference free
- ☑ CCB 10 sample frequency

**F. INTERFERENCE CHECK SAMPLES (ICS) CRITERIA:**

- ☑ ICS (80-120%)

**G. DUPLICATE ANALYSES CRITERIA:**

- ☑ One spike/sample duplicate per batch of samples
- ☑ %RPD ± 20% for spike/ sample values greater than 5 X LOQ
- ☑ {spike/sample ± LOQ} when spike/sample values are less than 5 X LOQ

**H. SPIKED SAMPLES ANALYSES /LCS CRITERIA:**

- ☑ %R within 75-125% range/ 80-120%

**I. SAMPLE RESULTS CRITERIA:**

- ☑ Samples fall within ICP linear concentration ranges

**Revisions:** No revisions were required. Prep method 3050B

DAA conducted a limited data validation of the above noted data set using the data package provided by the analyzing laboratory. Data evaluation was conducted using SW-846 (Test Methods for Evaluating Solid Waste-Physical/Chemical Methods, USEPA, SW-846, 3rd Edition-Final Update I, II/IIA and III) method requirements and CLP data validation guidelines (USEPA Contract Laboratory Program National Functional Guidelines for Inorganic Data Review, February 1994). Validation of this data set is limited to review of items detailed in this data review report.

## INORGANIC DATA EVALUATION FOR MERCURY- BY COLD VAPOR AA METHOD 7471A

**Sample ID:** 5GP-1 (1-2'), 5GP-1 (9-10'), 5GP-3 (9-10'), 5GP-6 (10-11'), 5GP-8 (7-8'), 5GP-8 (11-12'), 5 GP-12 (3-4'), 5GP-16 (3-4'), 7GP-1 (1-3'), 7GP-2 (8-12'), 7GP-2 (13.5-14.5'), 7GP-3 (10-11'), 7GP-4 (3-4'), 7GP-5 (6-11'), 7GP-8 (5-8'), 7 GP-16 (3-4')

**QC Samples:** Lab blanks, Pre-digestion spikes, Duplicates, LCS, Matrix spike/duplicate-7GP5(6-11')

**Laboratory:** STL, North Canton, OH; SDG A2K040189

Does Laboratory analyte list correspond to analyte list requested by DAA? √yes ___no

"☑" denotes items reviewed. See Data Validation Summary for additional comments.

### A. QC DOCUMENTATION CRITERIA

☑ Specific LODs for all target analytes
☑ Specific LOQs for all target analytes

### B. METHOD INFORMATION DOCUMENTATION

☑ All target parameters analyzed by requested methods?

### C. TECHNICAL HOLDING TIMES AND PRESERVATION REQUIREMENTS:

☑ 28 Day holding time
☑ Cool 4°C

### D. INSTRUMENT CALIBRATION CRITERIA:

☑ 1 calibration blank and 5 standards
☑ Instrument calibrated for every analytical sequence for every method

**E. INITIAL AND CONTINUING CALIBRATION VERIFICATION CRITERIA:**

- ☑ 10 sample frequency for CCV
- ☑ %R within 90-110% range

**F. BLANK SAMPLES ANALYSES CRITERIA:**

- NA Trip Blank (check only if analyzed)
- NA Equipment Blank (check only if analyzed)
- ☑ Method/other laboratory blanks (check only if analyzed)
- ☑ Interference free
- ☑ CCB 10 sample frequency

**G. DUPLICATE ANALYSES CRITERIA:**

- ☑ One spike/sample duplicate per batch of samples
- ☑ %RPD ± 20% for spike/sample values greater than 5 X LOQ
- ☑ {spike/sample ± LOQ} when spike/sample values are less than 5 X LOQ

**H. SPIKED SAMPLES ANALYSES/LCS CRITERIA:**

- ☑ Pre-digestion matrix spikes for all analytes
- ☑ %R within 75-125% range/80-120%

**I. SAMPLE RESULTS CRITERIA:**

- ☑ Samples fall within calibration concentration range

**J. Revisions:** No revisions were required.

DAA conducted a limited data validation of the above noted data set using the data package provided by the analyzing laboratory. Data evaluation was conducted using SW-846 (Test Methods for Evaluating Solid Waste-Physical/Chemical Methods, USEPA, SW-846, 3rd Edition-Final Update I, II/IIA and III) method requirements and CLP data validation guidelines (USEPA Contract Laboratory Program National Functional Guidelines for Inorganic Data Review, February 1994). Validation of this data set is limited to review of items detailed in this data review report.

## INORGANIC DATA EVALUATION FOR CYANIDE BY METHOD 9012A

**Sample ID:** 5GP-1 (1-2'), 5GP-1 (9-10'), 5GP-3 (9-10'), 5GP-6 (10-11'), 5GP-8 (7-8'), 5GP-8 (11-12'), 5 GP-12 (3-4'), 5GP-16 (3-4'), 7GP-1 (1-3'), 7GP-2 (8-12'), 7GP-2 (13.5-14.5'), 7GP-3 (10-11'), 7GP-4 (3-4'), 7GP-5 (6-11'), 7GP-8 (5-8'), 7 GP-16 (3-4')

**QC Samples:** Lab blanks, Pre-digestion spikes, Duplicates, ICS, LCS, etc.
- Matrix spike/duplicate-7GP5(6-11')

**Laboratory:** STL, North Canton, OH; SDG A2K040189

Does Laboratory analyte list correspond to analyte list requested by DAA? X yes ___no

"☑" denotes items reviewed. See Data Validation Summary for additional comments.

### A. QC DOCUMENTATION CRITERIA

☑ Specific LODs for all target analytes
☑ Specific LOQs for all target analytes

### B. TECHNICAL HOLDING TIMES AND PRESERVATION REQUIREMENTS CRITERIA:

☑ 14 days holding time
☑ Cool 4° C

### C. INSTRUMENT CALIBRATION CRITERIA:

☑ 6 levels plus blank

### D. INITIAL AND CONTINUING CALIBRATION VALIDATION CRITERIA:

☑ 20 sample frequency
☑ Use of check standard with every batch of samples
☑ %R within 85-115% range (± 15%)

### E. BLANK SAMPLES ANALYSES CRITERIA:

☑ Interference free

☑ Verification Blank analysis every 20 samples

**F. DUPLICATE SAMPLE ANALYSES CRITERIA:**

☑ One duplicate for every 20 samples
☑ %RPD ± 20% for sample values greater than 5 times LOQ
☑ (Sample ± LOQ) when values are less than 5 times LOQ

**G. SPIKED SAMPLE ANALYSES CRITERIA:**

☑ One spike for every 20 samples
☑ Spikes fall within 85-115% range

**H. LCS CRITERIA:**

☑ 80-120%

**I. SAMPLE RESULTS CRITERIA:**

☑ Samples fall within calibration concentration range

DAA conducted a limited data validation of the above noted data set using the data package provided by the analyzing laboratory. Data evaluation was conducted using SW-846 (Test Methods for Evaluating Solid Waste-Physical/Chemical Methods, USEPA, SW-846, 3rd Edition-Final Update I, II/IIA, and III) method requirements and CLP data validation guidelines (USEPA Contract Laboratory Program National Functional Guidelines for Inorganic Data Review, February 1994). **SW-846 METHODS 8081A**
**VOLATILE DATA REVIEW SUMMARY**

Draper Aden Associates (DAA) performed a limited review of the analytical results for the October 31-November 1, 2002 soil sampling event at hazardous waste management units 5 and 7, Radford Army Ammunition Plant (RAAP)/Alliant Techsystems. Soils samples were collected from sixteen sample locations (see page 3 for specific sample identifications). All soil samples were analyzed for twenty-eight (28) pesticides and polychlorinated biphenyls (PCBs) per USEPA Methods 8081A.

Lancaster Laboratories (Lancaster) of Lancaster, Pennsylvania performed the analyses. On behalf of RAAP, Lancaster submitted results to DAA in a final certificate of analysis, which included sample analytical results as well as relevant documentation to validate and verify the results.

The evaluation of laboratories' compliance with Method 8081A and validation of the results was based on a limited review of the following items: quality control (QC) deliverables package, QC history documentation, case narrative, technical holding time and preservation requirements, extraction procedures, instrument calibrations, blank analysis, surrogate spike recoveries, retention time, matrix spike (MS/MSD) analyses, laboratory control samples (LCS), and internal standards requirements, where applicable. A review of all transcriptions from instrument data to sample summary sheets was performed. Specific representative calculations were performed. The following information is intended to summarize data review results and any observed significant deviations from method and/or contractual requirements.

The laboratory received the samples on ice and in good condition with custody seals intact. All technical holding time criteria were met. All sample extraction and analysis holding time criteria were met. All preservation criteria were met.

***Method 8081A***

The original certificate of analysis for Method 8081A was complete in its presentation and the data were of acceptable quality. The data set exhibited the laboratory's ability to achieve the reported limit of quantitation (LOQ) for each target parameter, as outlined by the method detection limit study.

All QC history documentation and QC check sample criteria were met. All initial calibration, calibration verification, breakdown check, blank, surrogate, retention time, MS/MSD and LCS criteria were met.

Sample results were reviewed for transcription errors from the instrument data to the laboratory report and no errors were noted. Deviations from specific quality assurance and quality control criteria that were identified during the review process are summarized below.

Sample analysis by Method 8081A included PCBs. However, since the LCS and MS/MSD samples were not spiked with PCBs, all PCB results were qualified as estimated due to limited availability of quality control data.

All sample results were reported on a dry-weight basis. All samples were florisil cleaned. To obtain a final result within the instrument calibration range, sample dilutions were required, where appropriate.

Target parameters reported above the LOQ remain as reported by the laboratory. All sample results unaffected by the data validation process and/or detected less than their corresponding LOQs were validated and reported as "U" (i.e., not detected above the LOQ). Refer to the attached table titled "Data Validation Report" for a summary of results which required data validation.

**SW-846 METHOD 8081A (ORGANOCHLORINE PESTICIDES/PCBs)**
**GC DATA VALIDATION FOR SOILS**

**Sample ID:** 5GP-1(1-2'), 5GP-1(9-10'), 5GP-6(10-11'), 5GP-3(9-10'), 5GP-8(7-8'), 5GP-8(11-12'), 5GP-16(3-4'), 5GP-12(3-4'), 7GP-1(1-3'), 7GP-2(8-12'), 7GP-2(13.5-14.5'), 7GP-3(10-11'), 7GP-8(5-8'), 7GP-5(6-11'), 7GP-16(3-4'), 7GP-4(3-4')

**QC Samples:** 7GP-5(6-11') Matrix spike/Matrix spike duplicate, Extraction Blank, LCS

**Laboratory:** Lancaster Laboratories, Lancaster, PA, SDG RAR01-01

***Comments: Method 8081A involves the extraction of samples usingSW-846 Method 3550B-ultrasonic extraction. Target parameters are separated and quantified by GC using electron capture detection (ECD). All samples were florisil cleaned.***

## A. QC DELIVERABLES PACKAGE:

| | | |
|---|---|---|
| 1. | Was case narrative present and signed by a laboratory representative? | ☑ YES ☐ NO |
| 2. | Was the Chain of Custody present and signed by a laboratory representative? | ☑ YES ☐ NO |
| 3. | Were sample results included for all sample locations? | ☑ YES ☐ NO |
| 4. | Did the laboratory parameter list correspond to project specific parameter list? | ☑ YES ☐ NO |
| 5. | Were the LOQs reported on sample summary sheets supported by the MDL study? | ☑ YES ☐ NO |
| 6. | Did the electronic deliverable list the correct LOQs? | ☑ YES ☐ NO |

**Comments:** All QC deliverables requirements were met.

## B. INSTRUMENT QC HISTORY DOCUMENTATION CRITERIA:

| | | |
|---|---|---|
| 1. | Was the specific extraction method specified? | ☑ YES ☐ NO |
| 2. | Was documentation of DDT/Endrin breakdown study provided? | ☑ YES ☐ NO |
| 3. | Were instrument specific LODs for the target parameters provided? | ☑ YES ☐ NO |
| 4. | Were instrument specific LOQs for the target parameters provided? | ☑ YES ☐ NO |
| 5. | Were instrument specific working ranges for target parameters specified? | ☑ YES ☐ NO |
| 6. | Were sample analysis log sheets provided? | ☑ YES ☐ NO |

7. Were chromatograms and integration reports provided? ☑ YES ☐ NO

**Comments:** All instrument QC history criteria were met.

## C. CHECK SAMPLE CRITERIA:
***(Initial Demonstration of Capability)***

1. Was the check sample data obtained from the instrument that was used for analysis? ☑YES ☐ NO
2. Did the check sample contain all required target parameters? ☑ YES ☐ NO
3. Were the check samples analyzed in quadruplicate? ☑ YES ☐ NO
4. Were the average recoveries of the target parameters in the check samples reported? ☑ YES ☐ NO
5. Were the standard deviations for the recoveries of target parameters quadruplicated and reported? ☑ YES ☐ NO

**Comments:** All check sample criteria were met.

## D. TECHNICAL HOLDING TIME AND PRESERVATION CRITERIA:

1. Was the 7-day sample collection to extraction holding time met? ☑ YES ☐ NO
2. Was the 40-day extraction to analysis holding time met? ☑ YES ☐ NO
3. Were the samples received at 4°C (± 2°C)? ☑ YES ☐ NO

**Comments:** All preservation criteria were met. All sample extraction and analysis holding time criteria were met.

## E. INITIAL GC CALIBRATION CRITERIA:

1. Were all target parameters included in the ICAL? ☑ YES ☐ NO
2. Was a minimum five-point calibration analyzed prior to analysis? ☑YES ☐ NO
3. Calibration type used by laboratory: *External.*
4. Was the % Relative Standard Deviation (%RSD) for all target parameter CFs <20% over the established working range? ☑ YES ☐ NO
5. State the Quantitation Method used by the laboratory: *Calibration Factor.*
6. List target parameters with a % RSD >20% over the established working range: *None.*
   Note: Up to 2 target parameters may exceed the 20% criteria, but must be <30%.

7. Was the lowest concentration calibration standard at or below the LOQ, MCL, regulatory compliance or action limit? ☑ YES ☐ NO
8. Were calibration standards dropped to meet calibration criteria? ☑NA ☐YES ☐ NO

**Comments:** All initial calibration criteria were met. The lowest calibration standard for 4,4-DDD was manually calculated to verify the calibration standard concentration was less than the LOQ.

## F. DDT / ENDRIN BREAKDOWN CHECK CRITERIA:

1. Was a 4,4'-DDT and Endrin standard analyzed every 12-hours? ☑ YES ☐ NO
2. For every 12-hours, was 4,4'-DDE, 4,4'-DDD, Endrin Ketone or Endrin Aldehyde present which indicated breakdown? ☑ YES ☐ NO
3. Was the calculated % breakdown less than 15%? ☐ NA ☑ YES ☐ NO
   If no, corrective action must be taken before proceeding with analysis.

**Comments:** All DDT/Endrin breakdown criteria were met.

## G. CALIBRATION VERIFICATION CRITERIA:

1. Was a calibration verification (CV) standard performed once every 12-hours? ☑ YES ☐ NO
2. Did target parameter responses have a % Difference (%D) within ± 15%? (For chlordane and toxaphene, qualify only 3 peaks). ☑ YES ☐ NO
   If no, was a new calibration curve prepared? *No.*
3. Was a mid-concentration standard analyzed after each group of 20 samples (10 recommended) and at the end of the analytical sequence? ☑YES ☐ NO
4. Were all target parameters and surrogates included in the CV? ☑ YES ☐ NO

**Comments:** All calibration verification criteria were met.

## H. BLANK CRITERIA:

1. Was a blank analyzed prior to the batch samples? ☑ YES ☐ NO
2. Was a blank analyzed after 20 batch samples? ☐ NA ☑ YES ☐ NO
3. Was an extraction blank analyzed with the batch samples? ☑ YES ☐ NO

4 Was a trip blank analyzed per analytical batch? ☑ YES ☐ NO

5. List target parameters identified in the blanks: *None.*

**Comments:** All blank criteria were met.

## I. SURROGATE CRITERIA:

1. Were all samples, standards, blanks, and checks spiked with at least 2 surrogate parameters for dual column analysis? ☑ YES ☐ NO
2. List surrogate used and laboratory's surrogate % recovery range criteria:
   tetrachloro-xylene (TCMX): 40%-130%
   decachlorobiphenyl (DCBP): 40%-130%
   4-chloro-3-nitrobenzotrifluoride (CNBT): 40%-130%
3. List samples whose surrogate % recoveries were not within the laboratory range: *None*

**Comments:** All surrogate recovery criteria were met.

## J. RETENTION TIME CRITERIA:

1. Were the daily Retention Time (RT) windows reported? ☑ YES ☐ NO

**Comments:** All retention time criteria were met.

## K. MATRIX SPIKE/ MATRIX SPIKE DUPLICATE CRITERIA:

1. Was a MS/MSD analyzed per sample batch or every 20 samples, whichever may occur first? ☑ YES ☐ NO
2. Did the MS/MSD contain required target parameters? See comment section
3. Was the MS/MSD analyzed on the specific project matrix? ☑ YES ☐ NO
4. List laboratory's matrix spike % recovery range criteria: *40%-130%, select analytes*
5. List matrix spike target parameters not within the recovery range criteria: None
6. Was a LCS analyzed to address failed matrix spike criteria? ☑ NA ☐ YES ☐ NO
7. Did the LCS for the failed matrix spike

parameter(s) fall within the recovery range criteria and was the problem identified as matrix interference? ☑ NA ☐ YES ☐ NO

8. Were any parameters flagged as estimated concentrations? ☐ YES ☑ NO
9. List parameters flagged as estimated concentrations:

**Comments:** The QC samples were not spiked with PCBs. All PCB results were qualified as estimated due to insufficient quality control data. All other matrix spike criteria were met.

## L. LABORATORY CONTROL SAMPLE (LCS) CRITERIA:

1. Was a LCS included in the sample analysis? ☑ YES ☐ NO
2. Did the LCS contain all required target parameters?*select analytes* ☑ YES ☐ NO
3. List the LCS parameters and the laboratory's recovery range criteria. *See certificate of analysis.*
4. List the LCS parameters not within the recovery range criteria. *None.*

**Comments:** The LCS was not spiked with PCBs. All PCB results were qualified as estimated due to insufficient quality control data. All other LCS data were met.

## M. TARGET PARAMETER IDENTIFICATION:

1. Were the reported parameters within the retention time windows? ☑ NA ☐ YES ☐ NO
2. Were retention time shifts observed when compared with the last calibration verification? ☐ YES ☑ NO
3. Were all reported parameters confirmed? ☑ YES ☐ NO
4. Did the initial analysis of any sample have a concentration of a target parameter which exceeded the instrument calibration range? ☑ NA ☐ YES ☐ NO
5. Were sample dilutions required? ☑ YES ☐ NO
6. Were all parameter concentrations that were recorded on the sample quantitation reports accurately transferred to the sample summary sheets? ☑ YES ☐ NO

**Comments:** All target parameter identification criteria were met. The 4,4"-DDD sample result for 7GP-2(8-12") was manually verified and no calculation discrepancy was observed. All results above the LOQ were verified against the instrument data, primary

and confirmation data. For results above the LOQ, the disparity between the results from both columns was acceptable (<40RPD).

## N. DAA CORRECTIVE ACTION TAKEN AND GENERAL COMMENTS:

**Comments:** No corrective action was taken.

## LIMITATIONS AND REFERENCES:

Draper Aden Associates conducted a limited data validation for the above noted data set using summary tables and raw data provided by the analyzing laboratory. Data evaluation was conducted in general accordance with SW-846 Method requirements (Test Methods for Evaluating Solid Wastes - Physical and Chemical Methods, USEPA SW-846, 3rd edition - Final Update I, II/IIA and III) and CLP data validation guidelines (USEPA Contract Laboratory Program National Functional Guidelines for Organic Data Review, October 1999). Validation of this data set is limited to the items detailed in this report.

## METHODS 8260B AND 8270C ORGANIC DATA REVIEW SUMMARY

Draper Aden Associates (DAA) performed a limited review of the analytical results for the October 31-November 1, 2002 soil sampling event at hazardous waste management units 5 and 7, Radford Army Ammunition Plant (RAAP)/Alliant Techsystems, Montgomery County, Virginia. Soil samples were collected from locations 5GP-1 (1-2'), 5GP-1 (9-10'), 5GP-3 (9-10'), 5GP-6 (10-11'), 5GP-8 (7-8'), 5GP-8 (11-12'), 5 GP-12 (3-4'), 5GP-16 (3-4'), 7GP-1 (1-3'), 7GP-2 (8-12'), 7GP-2 (13.5-14.5'), 7GP-3 (10-11'), 7GP-4 (3-4'), 7GP-5 (6-11'), 7GP-8 (5-8'), and 7 GP-16 (3-4'). Soil samples were analyzed for the 33 (thirty-three) volatile parameters by Method 8260B and 64 (sixty-four) semivolatile parameters according to Method 8270C.

Lancaster Laboratories (Lancaster) of Lancaster, Pennsylvania performed the GC/MS analysis. Lancaster Laboratories submitted results to DAA in a final certificate of analysis, which included sample analytical results as well as relevant documentation to validate and verify the results.

The evaluation of Lancaster's compliance with Methods 8260B and 8270C and validation of the results was based on a limited review of the following items: QC deliverables package, QC history documentation, case narrative, technical holding time and preservation requirements, instrument performance (tune) check, instrument calibrations, blank analysis, surrogate spike recoveries, matrix spike and matrix spike duplicate (MS/MSD) analyses, laboratory control sample (LCS) data, and internal standard requirements. A review of all transcriptions from instrument data to sample summary sheets was performed. Specific representative calculations were not performed. The following information is intended to summarize data review results and any observed significant deviations from method and/or contractual requirements.

### *Method 8260B*

The revised certificate of analysis for Method 8260B appeared complete in its presentation and the data were of acceptable quality. The data set demonstrated the laboratory's ability to achieve the reported LOQ, as outlined by the initial calibration data and the method detection limit study data. The first calibration level was less than the reported LOQ in all cases.

All sample holding time criteria, QC history documentation, instrument performance check (tuning) criteria, initial calibration, blank, and internal standard requirements were met. All sample results were reviewed for transcription errors from the instrument data to the laboratory report and no errors were noted. Deviations from specific quality assurance/quality control (QA/QC) criteria that were identified during the data review process are discussed below.

Samples collected from HWMU 5 on October 31, 2002 were shipped on ice and under chain of custody for overnight delivery to the laboratory. Although samples were packed in ice

for shipment, the Lancaster Laboratories Sample Administration Receipt Documentation Log noted that only bagged ice was present the morning of November 1, 2002. As well, the cooler temperature bottle/blank was recorded as 7°C, which is 1 degree higher than method guidelines of 4°C (± 2°C). Sample results for HWMU-5 may be biased slightly low due to elevated sample storage temperature.

All calibration verification criteria were met except acetone, 2-butanone, 2-hexanone and 1,1,2,2-tetrachloroethane (associated with HWMU-5) and 1,1-dichloroethane (associated with HWMU-7) exceeded validation guidelines for percent drift / difference. Results for these parameter, where appropriate, were qualified as estimated

All surrogate criteria were met except for one slightly low surrogate recovery in sample 5GP-1 (1-2'). Insufficient sample was available for reanalysis. However, the matrix spike analysis for this sample had compliant surrogate recoveries. As per validation guidelines all results were qualified as estimated for this sample.

A MS, LCS and LCS duplicate were performed. Due to limited sample volume a MSD was not performed. All quality control samples were spiked with all parameters of interest. All recoveries and %RPD results, where applicable, were acceptable for all target parameters.

All target parameter identification and quantitation requirements were met. No target parameters were reported above the LOQ in any sample.

All results were reported on a dry weight basis. All sample results unaffected by the data validation process and less than their corresponding LOQs were validated and reported as "U." Refer to the attached table titled "Data Validation Report" for a summary of results which required data validation.

***Method 8270C***

The original certificate of analysis for Method 8270C was complete and the data were of acceptable quality. The data set demonstrated the laboratory's ability to achieve the reported LOQ, as outlined by the initial calibration data as well as the method detection limit study data.

QC history documentation were provided. Sample preservation, instrument performance check (tuning), initial calibration, calibration verification, blank, surrogate, MS/MSD, LCS and internal standard requirements were met. All sample results were reviewed for transcription errors from the instrument data to the laboratory report and no errors were noted. No deviations from specific QA/QC criteria were identified during the data review process.

## METHODS 8260B AND 8270C ORGANIC DATA REVIEW SUMMARY

Draper Aden Associates (DAA) performed a limited review of the analytical results for the October 31-November 1, 2002 soil sampling event at hazardous waste management units 5 and 7, Radford Army Ammunition Plant (RAAP)/Alliant Techsystems, Montgomery County, Virginia. Soil samples were collected from locations 5GP-1 (1-2'), 5GP-1 (9-10'), 5GP-3 (9-10'), 5GP-6 (10-11'), 5GP-8 (7-8'), 5GP-8 (11-12'), 5 GP-12 (3-4'), 5GP-16 (3-4'), 7GP-1 (1-3'), 7GP-2 (8-12'), 7GP-2 (13.5-14.5'), 7GP-3 (10-11'), 7GP-4 (3-4'), 7GP-5 (6-11'), 7GP-8 (5-8'), and 7 GP-16 (3-4'). Soil samples were analyzed for the 33 (thirty-three) volatile parameters by Method 8260B and 64 (sixty-four) semivolatile parameters according to Method 8270C.

Lancaster Laboratories (Lancaster) of Lancaster, Pennsylvania performed the GC/MS analysis. Lancaster Laboratories submitted results to DAA in a final certificate of analysis, which included sample analytical results as well as relevant documentation to validate and verify the results.

The evaluation of Lancaster's compliance with Methods 8260B and 8270C and validation of the results was based on a limited review of the following items: QC deliverables package, QC history documentation, case narrative, technical holding time and preservation requirements, instrument performance (tune) check, instrument calibrations, blank analysis, surrogate spike recoveries, matrix spike and matrix spike duplicate (MS/MSD) analyses, laboratory control sample (LCS) data, and internal standard requirements. A review of all transcriptions from instrument data to sample summary sheets was performed. Specific representative calculations were not performed. The following information is intended to summarize data review results and any observed significant deviations from method and/or contractual requirements.

### *Method 8260B*

The revised certificate of analysis for Method 8260B appeared complete in its presentation and the data were of acceptable quality. The data set demonstrated the laboratory's ability to achieve the reported LOQ, as outlined by the initial calibration data and the method detection limit study data. The first calibration level was less than the reported LOQ in all cases.

All sample holding time criteria, QC history documentation, instrument performance check (tuning) criteria, initial calibration, blank, and internal standard requirements were met. All sample results were reviewed for transcription errors from the instrument data to the laboratory report and no errors were noted. Deviations from specific quality assurance/quality control (QA/QC) criteria that were identified during the data review process are discussed below.

Samples collected from HWMU 5 on October 31, 2002 were shipped on ice and under chain of custody for overnight delivery to the laboratory. Although samples were packed in ice

for shipment, the Lancaster Laboratories Sample Administration Receipt Documentation Log noted that only bagged ice was present the morning of November 1, 2002. As well, the cooler temperature bottle/blank was recorded as 7°C, which is 1 degree higher than method guidelines of 4°C (± 2°C). Sample results for HWMU-5 may be biased slightly low due to elevated sample storage temperature. All other sample preservation criteria were met.

All calibration verification criteria were met except acetone, 2-butanone, 2-hexanone and 1,1,2,2-tetrachloroethane (associated with HWMU-5) and 1,1-dichloroethane (associated with HWMU-7) exceeded validation guidelines for percent drift / difference. Results for these parameters, where appropriate, were qualified as estimated

All surrogate criteria were met except for one slightly low surrogate recovery in sample 5GP-1(1-2'). Insufficient sample was available for reanalysis. However, the matrix spike analysis for this sample had compliant surrogate recoveries. As per validation guidelines, all results were qualified as estimated for this sample.

A MS, LCS and LCS duplicate were performed. Due to limited sample volume a MSD was not performed. All quality control samples were spiked with all parameters of interest. All recoveries and %RPD results, where applicable, were acceptable for all target parameters.

All target parameter identification and quantitation requirements were met. No target parameters were reported above the LOQ in any sample.

All results were reported on a dry weight basis. All sample results unaffected by the data validation process and less than their corresponding LOQs were validated and reported as "U." Refer to the attached table titled "Data Validation Report" for a summary of results which required data validation.

***Method 8270C***

The original certificate of analysis for Method 8270C was complete and the data were of acceptable quality. The data set demonstrated the laboratory's ability to achieve the reported LOQ, as outlined by the initial calibration data as well as the method detection limit study data.

QC history documentation were provided. Sample preservation, instrument performance check (tuning), initial calibration, calibration verification, blank, surrogate, MS/MSD, LCS and internal standard requirements were met. All sample results were reviewed for transcription errors from the instrument data to the laboratory report and no errors were noted. No deviations from specific QA/QC criteria were identified during the data review process.

All target parameter identification and quantitation requirements were met. All results were reported on a dry weight basis. All sample results unaffected by the data validation process and greater than their corresponding LOQs remain as reported by Lancaster Laboratories. All sample results less than their corresponding LOQs were validated and reported as "U." Refer to the attached table titled "Data Validation Report" for a summary of results which required data validation.

## SW-846 METHOD 8260B (GC/MS) VOLATILE ORGANIC DATA VALIDATION

*HWMU-5*

**Sample ID:** 5GP-1 (1-2'), 5GP-1 (9-10'), 5GP-3 (9-10'), 5GP-6 (10-11'), 5GP-8 (7-8'), 5GP-8 (11-12'), 5 GP-12 (3-4'), 5GP-16 (3-4')

*HWMU-7*

**Sample ID:** 7GP-1 (1-3'), 7GP-2 (8-12'), 7GP-2 (13.5-14.5'), 7GP-3 (10-11'), 7GP-4 (3-4'), 7GP-5 (6-11'), 7GP-8 (5-8'), 7 GP-16 (3-4')

**QC Samples:** 5GP-1 (1-2')MS, LCS, LCS DUP, Method Blank
7GP-5 (6-11')MS, 7GP-5 (6-11')MSD, LCS, Method Blank

**Laboratory:** Lancaster Laboratories, Lancaster PA; SDG RAR01-01

***Comment:*** *Method 8260B uses a purge and trap system to remove volatile organic target analytes from a 5 gram soil sample (SW-846 5035). Parameters are separated and quantified using a capillary column GC/MS.*

### A. QC DELIVERABLES PACKAGE:

1. Was the case narrative present and signed by a laboratory representative? ☑ YES ☐ NO
2. Was the Chain of Custody present and signed by a laboratory representative? ☑ YES ☐ NO
3. Were the sample results included for all sample locations? ☑ YES ☐ NO
4. Did the laboratory parameter list correspond to the project specific parameter list? ☑ YES ☐ NO
5. Did the laboratory parameter list include methylene chloride and vinyl chloride for confirmational analysis? ☑ NA ☐ YES ☐ NO
6. Were all parameter LOQs reported on sample summary sheets in agreement with the instrument specific MDL study? ☑ NA ☐ YES ☐ NO

**Comments:** All QC deliverables package requirements were met. The MDL study does not list the LOQ. However, all LOQs are supported by an acceptable MDL study. A 1 ppb standard was also analyzed and reported to support limit of detection (LOD) values.

## B. QC HISTORY DOCUMENTATION CRITERIA:

1. Was an instrument specific MDL study provided, which included LOD and LOQ values for all target parameters? ☑ YES ☐ NO
2. Was the instrument specific working range for each target parameter specified? ☑ YES ☐ NO
3. Was initial demonstration of capability data provided for each target parameter? ☑ YES ☐ NO

**Comments:** QC history documentation criteria were met. MDL study is laboratory specific.

## C. TECHNICAL HOLDING TIME AND PRESERVATION CRITERIA:

1. Was the 14-day sample collection to analysis holding time met? ☑ YES ☐ NO
2. Were the samples received at 4°C (± 2°C)? ☐ YES ☑ NO
3. Was the pH of each sample adjusted to < 2 with HCl? ☑ NA ☐ YES ☐ NO

**Comments:** All sample holding time criteria were met.

Samples collected from HWMU 5 on October 31, 2002 were shipped on ice and under chain of custody for overnight delivery to the laboratory. Although samples were packed in ice for shipment, the Lancaster Laboratories Sample Administration Receipt Documentation Log noted that only bagged ice was present the morning of November 1, 2002. As well, the cooler temperature bottle/blank was recorded as 7°C, which is 1 degree higher than method guidelines of 4°C (± 2°C). Sample results for HWMU-5 may be biased slightly low due to elevated sample storage temperature. All other sample preservation criteria were met.

## D. GC/MS INSTRUMENT PERFORMANCE (TUNING) CHECK CRITERIA:

1. Was analysis of the instrument performance check solution performed at the beginning of each 12-hour period during which standards or samples were analyzed? ☑ YES ☐ NO
2. Was there documentation of the injection of 5-50 ng bromofluorobenzene (BFB)? ☑ YES ☐ NO
3. Were all ion abundance criteria met? ☑ YES ☐ NO
4. Were calibration, blank, and sample analyses performed within 12 hours of tuning? ☑ YES ☐ NO

**Comments:** All instrument performance check criteria were met.

## E. INITIAL GC/MS CALIBRATION CRITERIA:

***SW-846 Criteria:***

1. Was the internal standard (IS) which was selected for target parameter RF calculation the IS which had the closest retention time? ☑ YES ☐ NO
2. Were all target parameters included in the ICAL? ☑ YES ☐ NO
3. Did all ICALs consist of a minimum of 5 calibration levels? ☑ YES ☐ NO
4. Was the lowest concentration calibration standard at or below the associated MCL, regulatory compliance, or action limit? ☑ NA ☐ YES ☐ NO
4. Was the calibration curve developed using the same purge volume used for sample analysis? ☑ YES ☐ NO
6. Were 8260B SPCC criteria met? ☑ YES ☐ NO
   - chloromethane (0.100)
   - 1,1-dichloroethane (0.100)
   - bromoform (0.100)
   - 1,1,2,2-tetrachloroethane (0.300)
   - chlorobenzene (0.300)

7. Were 8260B CCC criteria met? (%RSD ≤ 30%) ☑ YES ☐ NO
   - 1,1-dichloroethene
   - chloroform
   - 1,2-dichloropropane
   - toluene
   - ethylbenzene
   - vinyl chloride

8. Was each target parameter %RSD ≤ 15%? ☐ YES ☑ NO

9. Was the correlation coefficient >0.99 for target parameters with ≥15 % RSD? ☐ NA ☑ YES ☐ NO

***Method Validation Performance Criteria:***

1. Did target parameters and surrogates have % RSDs ≤ 15% and >0.99 correlation coefficient? ☐NA ☑ YES ☐ NO

   (Evaluate RRFs < 0.05 for potential problems.)

**Comments:** All initial calibration criteria were met.

## F. CALIBRATION VERIFICATION CRITERIA:

***SW-846 Criteria:***

1. Was a calibration verification analyzed at the beginning of each 12-hour period following the analysis of the instrument performance check and prior to analysis of the method blank and samples? The calibration verification may be part of the ICAL or analyzed independently during another 12-hour analysis period. ☑ YES ☐ NO

2. Were 8260B SPCC criteria met? ☑ YES ☐ NO
   - chloromethane (0.100)
   - 1,1-dichloroethane (0.100)
   - bromoform (0.100)
   - 1,1,2,2-tetrachloroethane (0.300)
   - chlorobenzene (0.300)

3. Were 8260B CCC criteria met?
   (%Drift or % Difference (%D) within ± 20%) ☑ YES ☐ NO
   - 1,1-dichloroethene
   - chloroform
   - 1,2-dichloropropane
   - toluene
   - ethylbenzene
   - vinyl chloride

***Method Validation Performance Criteria:***

1. Did all target parameters and system monitoring parameters (surrogates) have the % D within ± 25.0%? ☐ YES ☑ NO
   (Evaluate RRFs < 0.05 for potential problems.)

   If "NO", list parameters that exceed these criteria:

*HWMU-5*

*acetone %D = 26%*
*2- butanone %D = 41%*
*2-hexanone %D = 35%*
*1,1,2,2-tetrachloroethane %D = 28%*

*HWMU-7*

*1,1-dichloroethane %D = 26%*

***DAA Contractual Requirements:***

1. Did all target parameters and system monitoring parameters (surrogates) have % Ds within ± 25.0%? *not applicable for this project*

2. Three parameters may fail to meet maximum % D as long as the % D is within ± 40.0%
   Did the calibration verification meet this criteria? *not applicable for this project*

**Comments:** All calibration verification criteria were met except acetone, 2-butanone, 2-hexanone and 1,1,2,2-tetrachloroethane (associated with HWMU-5) and 1,1-dichloroethane (associated with HWMU-7) exceeded validation guidelines for percent drift / difference. Results for these parameter, where appropriate, were qualified as estimated.

## G. BLANK CRITERIA:

1. Was a method blank analyzed after the calibration standards, prior to sample analysis, and once for every 12-hour period beginning with the injection of BFB? ☑ YES ☐ NO
2. Was a trip blank analyzed with this sample batch? ☐ YES ☑ NO
3. Were the trip blanks and method blanks interference free? ☑ YES ☐ NO
4. List target parameters detected in the blanks: *none*
5. Was the level of blank contamination less than 5% of the MCL associated with the analyte? ☑ NA ☐ YES ☐ NO
6. Did any samples contain high concentrations of VOCs in excess of the linear range of the calibration curve? ☐ YES ☑ NO
7. Were one or more blanks analyzed following the high concentration sample to prevent cross contamination? ☑ NA ☐ YES ☐ NO

**Comments:** All blank criteria were met.

## H. SURROGATE CRITERIA:

***SW-846 Criteria:***

1. Were the following surrogates used? ☑ YES ☐ NO
   - dibromofluoromethane ( 80%-120%)
   - 4-bromofluorobenzene (74%-121%)
   - toluene-$d_8$ (81%-117%)

- 1,2-dichloroethane-$d_4$ (80%-120%)

2. Were recoveries within the specified ranges? ☐ YES ☑ NO
   If "NO", corrective action is required. Flagging of the data as estimated is not acceptable until corrective action has been attempted.

3. Were samples with surrogates outside the QC window reanalyzed as required? *See comment*

**Comments:** All surrogate criteria were met except for one slightly low surrogate recovery in sample 5GP-1 (1-2'). Insufficient sample was available for reanalysis. However, the matrix spike for this sample had compliant surrogate recoveries. As per validation guidelines, all results were qualified as estimated for this sample. All other surrogate criteria were met.

## I. MATRIX SPIKE, MATRIX SPIKE DUPLICATE CRITERIA:

(MS/MSD Requirements - CLP Guidelines)

| *Parameter* | *% R Water* | *RPD Water* |
|---|---|---|
| 1,1-dichloroethene | 61-145 | 14 |
| trichloroethene | 71-120 | 14 |
| benzene | 76-127 | 11 |
| toluene | 76-125 | 13 |
| chlorobenzene | 75-130 | 13 |

1. Was a matrix spike and matrix spike duplicate (MS/MSD) analyzed per sample batch or every 20 samples, whichever may occur first? *See comment*
2. Did the MS/MSD contain additional target parameters? *See comment*
3. Was the MS/MSD analyzed on the specific project matrix? *See comment*
4. List matrix spike target parameters not within laboratory recovery ranges: *none*
5. Was a LCS analyzed to address failed matrix spike criteria? *See comment*
6. Did the LCS for the failed matrix spike parameter(s) fall within the acceptable recovery ranges and was the problem identified as matrix interference? *NA.*
7. Were any parameters flagged as estimated concentrations? ☐ NA ☐ YES ☑ NO
8. List parameters flagged as estimated concentrations: *none*

**Comments:**
HWMU-5: Due to limited sample volume, a MSD was not performed. A MS, LCS and LCS Duplicate were performed. These QC samples were spiked with all parameters of interest. All recoveries and %RPD results, where applicable, were acceptable for all target parameters.
HWMU-7: All MS/MSD criteria were met. QC was performed on 7 GP-5(6-11').

## J. LABORATORY CONTROL SAMPLE (LCS) CRITERIA:

1. Was a LCS included in the sample analysis? ☑ YES ☐ NO
2. Did the LCS contain all required target parameters? ☑ YES ☐ NO
3. List the LCS parameters and the laboratory's acceptable recovery range. *See page 37-38 and 137-138 of the volatile certificate of analysis.*
4. List the LCS parameters that exceeded the acceptable recovery range. *None.*

**Comments:** All LCS criteria were met.

## K. INTERNAL STANDARDS CRITERIA:

1. Were the following internal standards used? ☑ YES ☐ NO
   - fluorobenzene
   - chlorobenzene-$d_5$
   - 1,4-dichlorobenzene-$d_4$
2. Were internal standard areas within - 50% to + 100% of the last calibration verification? ☑ YES ☐ NO
3. Were internal standard retention times within ± 30 seconds of the last calibration verification? ☑ YES ☐ NO
4. Were samples failing items 2. and/or 3. above reanalyzed as required by the method? ☑ NA ☐ YES ☐ NO

**Comments:** All internal standard criteria were met.

## L. TARGET PARAMETER IDENTIFICATION:

1. Were the RRTs of the reported parameters within ± 0.06 RRT units of the standard RRT? ☐ NA ☑ YES ☐ NO
2. Check the sample spectra against the laboratory standard spectra to see that the following criteria were met:

- Did characteristic ions maximize in the same scan or within one scan of each other? ☐ NA ☑ YES ☐ NO
- Were all characteristic ions present in the standard spectra present in the sample spectra for parameters detected above the LOQ? ☑ NA ☐ YES ☐ NO
- Were the relative intensities of the ions between the standard and sample spectra within ± 30 %? ☐ NA ☑ YES ☐ NO

3. Were all reported parameters confirmed? ☐ NA ☑ YES ☐ NO

**Comments:**
HWMU-5: All target parameter identification criteria were met. Acetone was reported below the LOQ in several samples. No target parameters were reported above the LOQ in any sample.
HWMU-7: All target parameter identification criteria were met. 1,1-Dichloroethene was reported below the LOQ in 7GP-16(3-4'). No target parameters were reported above the LOQ in any sample.

## M. TARGET PARAMETER QUANTITATION:

- If the %RSD of a parameter was 15% or less, then the average relative response factor should have been used for quantitation.

- If the %RSD of a parameter was greater than 15%, then the quantitation should be based on a calibration curve using the first or higher order regression fit of the five calibration points (6 calibration points for 2nd order).

1. List the detected parameters whose %RSD was >15%: *none*
   a. Was the subsequent quantitation based on a linear regression fit? ☑ NA ☐ YES ☐ NO
   b. Was the curve forced through the origin? ☑ NA ☐ YES ☐ NO
2. Did the initial analysis of any sample have a target parameter concentration that exceeded the initial calibration range? ☐ NA ☐ YES ☑ NO
   -If so, was the sample reanalyzed at a higher dilution? ☑ NA ☐ YES ☐ NO

3. Were the parameter concentrations that were recorded on the raw sample quantitation reports accurately transferred to the sample summary sheets? ☑ YES ☐ NO

**Comments:** All target parameter quantitation criteria were met.

## N. LIBRARY SEARCHES:

**Comments:** Library searches were not requested with this data set.

## O. DAA CORRECTIVE ACTION TAKEN AND GENERAL COMMENTS:

**Comments:** DAA requested, and Lancaster Laboratories provided, method detection limit study and initial demonstration of proficiency documentation.

Sample results for HWMU-5 were originally reported on an "as received" basis without dry weight factors. Lancaster Laboratories provided revised sample results including the dry weight factors.

## SW-846 METHOD 8270C (GC/MS) SEMIVOLATILE ORGANIC DATA VALIDATION

| | | | | |
|---|---|---|---|---|
| **Sample ID:** | 5GP-1 (1-2'), | 5GP-1 (9-10'), | 5GP-3 (9-10'), | 5GP-6 (10-11'), |
| | 5GP-8 (7-8'), | 5GP-8 (11-12'), | 5 GP-12 (3-4'), | 5GP-16 (3-4') |
| | 7GP-1 (1-3'), | 7GP-2 (8-12'), | 7GP-2 (13.5-14.5'), | 7GP-3 (10-11'), |
| | 7GP-4 (3-4'), | 7GP-5 (6-11'), | 7GP-8 (5-8'), | 7 GP-16 (3-4') |

**QC Samples:** 7GP-5 (6-11') MS/MSD, LCS, Extraction Blank

**Laboratory:** Lancaster Laboratories, Lancaster PA, SDG RAR01-01

***Comment: Semivolatile (a.k.a, base/neutral and acid extractables) analysis involves sample preparation using SW-846 Method 3550B-ultrasonic extraction. The semivolatile extracts are concentrated through evaporation. Target analytes are separated and quantified using capillary column GC/MS.***

### A. QC DELIVERABLES PACKAGE:

1. Was the case narrative present and signed by a laboratory representative? ☑ YES ☐ NO
2. Was the Chain of Custody present and signed by a laboratory representative? ☑ YES ☐ NO
3. Were the sample results included for all sample locations? ☑ YES ☐ NO
4. Did the laboratory parameter list correspond to the project specific parameter list? ☑ YES ☐ NO
5. Were all parameter LOQs reported on sample summary sheets in agreement with the instrument specific MDL study? ☑NA☐ YES ☐NO

**Comments:** All QC deliverables package criteria were met. All LOQs were supported by an acceptable MDL study. Additionally, Lancaster Laboratories provided a calibration standard at 1 ppm to verify instrument sensitivity at the LOD level.

### B. QC HISTORY DOCUMENTATION CRITERIA:

1. Were the instrument specific LODs for target parameters provided? ☑ YES ☐ NO
2. Were the instrument specific LOQs for target parameters provided? ☑ YES ☐ NO
3. Was the instrument specific calibration range for each target parameter specified? ☑ YES ☐ NO
4. Was initial demonstration of capability data provided for all

target parameters? ☑ YES ☐ NO

**Comments:** All QC history documentation criteria were met.

## C. TECHNICAL HOLDING TIME AND PRESERVATION CRITERIA:

1. Was the 7-day sample collection to extraction holding time met? ☑ YES ☐ NO
2. Was the 40-day extraction to analysis holding time met? ☑ YES ☐ NO
3. Were the samples received at 4°C (± 2°C)? ☑ YES ☐ NO

**Comments:** The sample collection to extraction and extraction to analysis holding times were met. All preservation criteria were met.

## D. GC/MS INSTRUMENT PERFORMANCE CHECK CRITERIA:
***(Tuning, Injection Port And Column Performance)***

1. Was analysis of the instrument performance check solution performed at the beginning of each 12-hour period of standard and/or sample analysis? ☑ YES ☐ NO
2. Was there documentation of the injection of 50 ng of DFTPP? ☑ YES ☐ NO
3. Were all ion abundance criteria met? ☑ YES ☐ NO
4. Was the injection port inertness verified by analysis of 4,4'-DDT? ☑ YES ☐ NO
   - If no, does associated data require qualification? ☑ NA ☐ YES ☐ NO
   - Was the injection port inertness check acceptable? ☐ NA ☑ YES ☐ NO

5. Was column performance checked through the analysis of peak tailing of pentachlorophenol and benzidine? ☑ YES ☐ NO
   - If no, does associated data require qualification? ☑ NA ☐ YES ☐ NO
   - Was column performance check acceptable? ☐ NA ☑ YES ☐ NO

**Comments:** All GC/MS instrument performance check criteria were met.

## E. INITIAL GC/MS CALIBRATION CRITERIA:

***SW-846 Criteria:***

1. Were the initial calibrations (ICAL) and any directly associated

blanks and samples analyzed within 12-hours of the associated instrument performance (tune) check? ☑ YES ☐ NO

2. Were quantitation ions, used and listed on data, randomly checked against primary quantitation ions as required by Method 8270C and the RFP? ☑ YES ☐ NO
3. Were all target parameters included in the ICAL? ☑ YES ☐ NO
4. Did the ICAL consist of a minimum of 5 calibration levels? ☑ YES ☐ NO
5. Was the lowest concentration calibration standard at or below the associated MCL, regulatory compliance, or action limit? ☑ YES ☐ NO
6. Were calibration levels removed from the curve that would negatively impact the data integrity? ☐ YES ☑ NO
7. Were 8270C SPCC criteria met?
   (Relative Response Factor-average(RRF) ≥ 0.050) ☐ NA ☑ YES ☐ NO
   - N-nitroso-di-n-propylamine
   - Hexachlorocyclopentadiene
   - 2,4-Dinitrophenol
   - 4-nitrophenol
   -
8. Were 8270C B/N Fraction parameter criteria met?
   ( % Relative Standard Deviation (%RSD) ≤ 30%) ☐ NA ☑ YES ☐ NO
   - acenaphthene
   - 1,4-dichlorobenzene
   - hexachlorobutadiene
   - N-nitrosodiphenylamine
   - Di-n-octyl phthalate
   - fluoranthene
   - benzo(a)pyrene
9. Were 8270C Acid Fraction parameter criteria met?
   ( % Relative Standard Deviation (%RSD) ≤ 30%) ☐ NA ☑ YES ☐ NO
   - 4-chloro-3-methylphenol
   - 2,4-dichlorophenol
   - 2-nitrophenol
   - phenol
   - pentachlorophenol
   - 2,4,6-trichlorophenol
10. Was each target parameter %RSD ≤ 15%?
    (with the exception of SPCC/CCC compounds) ☐ NA ☑ YES ☐ NO
11. Was the correlation coefficient or coefficient of determination >0.99 for target parameters with ≥ 15 % RSD
    (with the exception of SPCC/CCC compounds)? ☑ NA ☐ YES ☐ NO

***Method Validation Performance Criteria:***

1. Did target parameters and surrogates (with the exception of SPCC/ CCC compounds)that have % RSDs ≥ 15% have >0.99 correlation coefficient or coefficient of determination? ☐ NA ☑ YES ☐ NO
(Evaluate RRFs < 0.05 for potential problems.)

**Comments:** All initial calibration criteria were met.
ICAL performed on October 15, 2002 - Instrument ID HP06754.

## F. CALIBRATION VERIFICATION CRITERIA:

***SW-846 Criteria:***

1. Was a calibration verification analyzed at the beginning of each 12-hour period following the analysis of the instrument performance check and prior to analysis of the method blank and samples? The calibration verification may be part of the ICAL or run independently on another 12-hour analysis period. ☑ YES ☐ NO
2. Were 8270C SPCC criteria met?
(Relative Response Factor (RRF) ≥ 0.050) ☑ YES ☐ NO
3. Were all 13 8270C CCC criteria met?
(%D within ± 20%) ☑ YES ☐ NO

***Method Validation Performance Criteria:***

1. Did all target parameters and system monitoring parameters (surrogates) have % Ds within ± 25.0%? ☑ YES ☐ NO
(Evaluate RRFs < 0.05 for potential problems.)
If "NO", list parameters that exceed this criterion:

***DAA Contractual Requirements:***

1. Did all target parameters and system monitoring parameters (surrogates) have % Ds within ± 25.0%? *not applicable for this project*

2. Five parameters, in each standard mix, may fail to meet maximum % D as long the % D is within ± 40.0%
Did calibration verification meet this criteria? *not applicable for this project*
If "NO", explain.

**Comments**: All calibration verification criteria were met.

## G. BLANK CRITERIA:

1. Was a method/extraction blank analyzed on each GC/MS system used for sample analysis? ☑ YES ☐ NO
2. Was a trip blank analyzed with this sample batch? ☐ YES ☑ NO
3. Were the blank samples interference free? ☑ YES ☐ NO
4. Was the level of blank contamination less than 5% of the MCL? ☑ NA ☐ YES ☐ NO
5. List target parameters detected in the blanks:
   *none*

**Comments:** All blank criteria were met.

## H. SURROGATE CRITERIA:

1. Were the following surrogates used? ☑ YES ☐ NO
   - phenol - $d_6$ (24%-113%)
   - 2-fluorophenol (25%-121%)
   - 2,4,6-tribromophenol (19%-122%)
   - nitrobenzene – $d_8$ (23%-120%)
   - 2-fluorobiphenyl (25%-121%)
   - p-terphenyl - $d_{14}$ (18%-137%)
2. Were recoveries within the specified ranges? ☑ YES ☐ NO
3. Were any two base/neutral or acid surrogates out of specification or did any one base/neutral or acid extractable surrogate have a recovery of less than 10%? ☐YES ☑ NO
   If yes, was a reextraction and reanalysis performed to confirm that the non-compliance was due to sample matrix effects rather than laboratory deficiencies? ☑ NA ☐ YES ☐ NO

**Comments:** All surrogate requirements were met. (Lancaster Laboratories used laboratory derived surrogate limits as suggested by SW-846.)

## I. MATRIX SPIKE/ MATRIX SPIKE DUPLICATE CRITERIA:

(MS/MSD Requirements - CLP Guidelines)

| Parameter | % R Water | % RPD Water |
|---|---|---|
| Phenol | 12-110 | 42 |
| 2-Chlorophenol | 27-123 | 40 |
| N-Nitroso-di-n-propylamine | 41-116 | 38 |
| 4-Chloro-3-methylphenol | 23-97 | 42 |
| Acenaphthene | 46-118 | 31 |
| 4-Nitrophenol | 10-80 | 50 |
| 2,4-Dinitrotoluene | 24-96 | 38 |
| Pyrene | 26-127 | 31 |

1. Was a matrix spike and matrix spike duplicate (MS/MSD) analyzed per sample batch or every 20 samples, whichever may occur first? ☑ YES ☐ NO
2. Did the MS/MSD spike contain additional target parameters? ☐ YES ☑ NO
3. Was the MS/MSD analyzed on the specific project matrix? ☑ YES ☐ NO
4. List MS/MSD target parameters not within acceptable laboratory recovery ranges: *none*
5. Was a LCS analyzed to address failed matrix spike criteria? ☑ NA ☐ YES ☐ NO
6. Did the LCS for the failed matrix spike parameter(s) fall within the acceptable recovery ranges and was the problem identified as matrix interference? ☑ NA ☐ YES ☐ NO
7. Were any parameters flagged as estimated concentrations? ☐ YES ☑ NO
8. List parameters flagged as estimated concentrations: *none*

**Comments:** MS/MSD analyses were performed on sample 7GP-5(6-11') and all method requirements were met.

## J. LABORATORY CONTROL SAMPLE (LCS) CRITERIA:

1. Was a LCS included in the sample analysis? ☑ YES ☐ NO
2. Did the LCS contain all required target parameters? ☑ YES ☐ NO
3. List the LCS target parameters and laboratory recovery range. *See page 402-403 of the semivolatile certificate of analysis.*
4. List the LCS parameters which exceeded the acceptable recovery range: *none*

**Comments:** All LCS criteria were met.

## K. INTERNAL STANDARDS CRITERIA:

1. Were the following internal standards used? ☑ YES ☐ NO
   - 1,4-Dichlorobenzene-$d_4$
   - Naphthalene-$d_8$
   - Acenapththene-$d_{10}$
   - Phenanthrene-$d_{10}$
   - Chrysene-$d_{12}$
   - Perylene-$d_{12}$

2. Were internal standard areas within ± 50% of last calibration verification? ☑ YES ☐ NO
3. Were internal standard retention times within ± 30 seconds of last calibration verification? ☑ YES ☐ NO

**Comments:** All internal standard criteria were met.

## L. TARGET PARAMETER IDENTIFICATION:

1. Were the RRTs of the reported parameters within ± 0.06 RRT units of the standard RRT? ☐ NA ☑YES ☐ NO

2. Check the sample spectra against the laboratory standard spectra to see that the following criteria were met:
   - Did characteristic ions maximize in the same scan or within one scan of each other? ☐ NA ☑YES ☐ NO
   - Were all characteristic ions present in the standard spectra present in the sample spectra for parameters detected above the LOQ? ☐ NA ☑YES ☐ NO
   - Were the relative intensities of the ions between the standard and sample spectra within ± 30 %? ☐ NA ☑YES ☐ NO
3. Were all reported parameters confirmed? ☐NA ☑YES ☐ NO

**Comments:** All target parameter identification requirements were met.

## M. TARGET PARAMETER QUANTITATION:

- If the %RSD of a parameter was 15% or less, then the average relative response factor should have been used for quantitation.
- If the %RSD of a parameter was greater than 15%, then the quantitation

should be based on a calibration curve using the first or higher order regression fit of the five calibration points (6 calibration points for 2nd order).

1. List the parameters detected above the LOQ whose %RSD was >15%: *none*
   a. Was the subsequent quantitation based on a linear regression fit? ☑ NA ☐ YES ☐ NO
   b. Was the curve forced through the origin? ☑ NA ☐ YES ☐ NO

2. Did the initial analysis of any sample have a concentration of a target parameter that exceeded the initial calibration range? ☐ YES ☑ NO
   -If so, was the sample reanalyzed at a higher dilution? ☑ NA ☐ YES ☐ NO
3. Were the parameter concentrations that were recorded on the raw sample quantitation reports accurately transferred to the sample summary sheets? ☑ YES ☐ NO

**Comments:** Target parameter quantitation criteria were met.

## N. LIBRARY SEARCHES:

**Comments:** Library searches were not requested with this data set.

## O. DAA CORRECTIVE ACTION TAKEN AND GENERAL COMMENTS:

**Comments:** No corrective action was required.

**LIMITATIONS AND REFERENCES:**

Draper Aden Associates conducted data validation of the above noted data set using summary tables and raw data provided by the analyzing laboratory. Data validation was conducted in general accordance with SW-846 Method requirements (Test Methods for Evaluating Solid Wastes - Physical and Chemical Methods, USEPA SW-846, 3rd edition - Final Update I, II/IIA and III) and CLP data validation guidelines (USEPA Contract Laboratory Program National Functional Guidelines for Organic Data Review, October, 1999). Validation of this data set is limited to the items detailed in this report.

**Data Validation Qualifier Definitions:**

**U-** Denotes the analyte was analyzed for, but was not detected above the laboratory limit of quantitation (LOQ).

**J-** Denotes an estimated value. See sample specific note presented on data validation report table for further explanation.

**UJ-** The LOQ should be considered estimated. See sample specific note presented on data validation report table for further explanation.

**R-** Denotes sample result was rejected. See sample specific note presented on data validation report table for further explanation.

NOTE: The table summaries all detected results and results which required qualification based on data validation. All Results reported on a dryweight basis.
See laboratory report for definition of laboratory result qualifiers, if needed.

Blacksburg VA 24060

5GP11 SDG#: RAR02-01

| CAT No. | Analysis Name | CAS Number | Dry Result | Dry Method Detection Limit | Units | Dilution Factor |
|---|---|---|---|---|---|---|
| 06296 | 2-Butanone | 78-93-3 | N.D. | 5. | ug/kg | 0.88 |
| 06297 | trans-1,3-Dichloropropene | 10061-02-6 | N.D. | 1. | ug/kg | 0.88 |
| 06298 | cis-1,3-Dichloropropene | 10061-01-5 | N.D. | 1. | ug/kg | 0.88 |
| 06299 | 4-Methyl-2-pentanone | 108-10-1 | N.D. | 3. | ug/kg | 0.88 |
| 06300 | 2-Hexanone | 591-78-6 | N.D. | 3. | ug/kg | 0.88 |
| 06301 | Xylene (Total) | 1330-20-7 | N.D. | 1. | ug/kg | 0.88 |

A site-specific MSD sample was not submitted for the project. A LCS/LCSD was performed to demonstrate precision and accuracy at a batch level.

Poor surrogate recovery was observed for 1,2-dichloroethane-d4 in the GC/MS volatile fraction. The percent recovery was 79%. The sample was reanalyzed as a matrix spike, and 1,2-dichloroethane-d4 was 86% recovery which was within the QC limits. Another vial of the sample was not available for further analysis.

Paired with 5GP-1 (1-2') for % MOS result. See SW3933074

## METHODOLOGY

Lancaster Laboratories REPRINT

Where quality is a science.

The specific methodologies used in obtaining the enclosed analytical results are indicated on the laboratory chronicles.

MWMU5 SDG#: RAR01-20

| CAT No. | Analysis Name | CAS Number | Dry Result | Dry Method Detection Limit | Units | Dilution Factor |
|---|---|---|---|---|---|---|
| 00111 | Moisture | n.a. | 15.3 | 0.50 | % | 1 |
| | "Moisture" represents the loss in weight of the sample after oven drying at 103 - 105 degrees Celsius. The moisture result reported above is on an as-received basis. | | | | | |
| 00394 | pH | n.a. | 7.38 | 0.010 | | 1 |
| | The pH was performed on a 1:1 slurry (25 gms. of sample and 25 ml. of deionized water) after being tumbled for 30 min. | | | | | |
| 00496 | Corrosivity | n.a. | See Below | | See Below | 1 |
| | Corrosivity:<br>The pH of a 1:1 slurry (with deionized water) was 7.38 indicating that the waste is not corrosive.<br>A waste is corrosive if it exhibits a pH equal to or less than 2 or equal to or greater than 12.5. | | | | | |
| 00542 | Ignitability | n.a. | See Below | | See Below | 1 |
| | The sample did not spontaneously ignite when exposed to air or water.<br>The sample did not ignite by friction.<br>The sample vapors did not ignite when exposed to a flame using a closed cup apparatus. | | | | | |
| 01121 | Reactivity | n.a. | See Below | | See Below | 1 |
| | Reactivity:<br>The sample was extracted by the interim method described in SW 846, Chapter 7.3. This solution was analyzed for cyanide and sulfide. This waste is not considered reactive and hazardous because it does not generate a quantity of hydrogen cyanide exceeding 250 mg/kg or hydrogen sulfide exceeding 500 mg/kg. These interim threshold limits were established by the Solid Waste Branch of EPA, July, 1992. These results do not reflect total cyanide or total sulfide. | | | | | |
| 01122 | Sulfide (Reactivity) | n.a. | N.D. | 27. | mg/kg | 1 |
| 01123 | Cyanide (Reactivity) | n.a. | N.D. | 98. | mg/kg | 1 |

Alliant Ammunition and Powder Company, LLC
P.O. Box 1
RAAP
Radford, Virginia 24141

**RE: Radford Army Ammunitions Plant PVC Cap Repair – HWMU 7**
**DAA No. R02564-01**

Dear Mr. Redder:

From December 19, to December 20, 2002 Draper Aden Associates (DAA) conducted PVC liner repair inspection for the above noted project. Site visit reports, photographs, and repair location sketches are attached for work performed during this period. The work was performed by Landsaver Environmental (Landsaver). The work performed at each repair location was in accordance with the approved VDEQ closure plan dated May 27, 1988 and the attached VDEQ comments. Each repair was conducted as follows:

- Excavated the topsoil and cover soil (3' thick); no filter fabric was encountered
- Excavated the sand drainage layer (1' thick)
- The existing 30 mil PVC liner was wiped free of dirt and dust
- Applied a bonding adhesive to the existing 30 mil PVC Liner
- Installed a new 30 mil PVC patch with a minimum 6" overlap in all directions
- Applied a bonding adhesive to the overlap (minimum 2" perimeter bonding area) and applied pressure to the two bonding surfaces
- After allowing the adhesive to cure, the patch was Air Lance Tested in accordance with ASTM D4437-99
- The repair location was backfilled and compacted with a 1 foot layer of sand drainage layer and 3' of topsoil/cover soil material. Topsoil/cover soil material was compacted in 1 foot lifts with use of a hand tamper and the excavator bucket. The compaction of each lift was verified with the use of a probe rod.

Based on our field observations and documentation, laboratory test results and geotechnical engineering experience, we conclude that the liner installation and repairs

on the above referenced project site has been completed in accordance with industry standard and acceptable engineering practices.

If you should have any further questions, please feel free to contact Ken Piazza or myself at (804) 264-2228.

Sincerely,
**DRAPER ADEN ASSOCIATES**

# Site Visit Report

Project No.: R02564-01

Date: 19-Dec-02

Arrived on-site @ 8:00 am and proceeded to get a visitor's pass at the gate. Landsaver was late and arrived around 10:30. Ross, myself, and the two Landsaver guys proceeded to the Administration building where we waited for Mr. Redder for approximately 30 minutes. Another half-hour was spent getting a camera pass for the site. Next we went to Shipping and Receiving to pick up the hand tamper and the Bobcat. The Bobcat had to be driven from S & R to the project site. We started with HWMU 7 by the river. The holes were marked by flagging so we proceeded to dig with the Bobcat down to the liner. Approx. 3 feet of soil covered the liner on top of a 1 foot drainage layer of a fine stone. The holes were cleared enough to make room for the patches and air lance testing. Four holes were dug and patched today. No air testing was performed. Holes 2,3,10 & 11 were patched today. Patching consisted of cleaning the area - cutting a round patch to cover the hole - then a pvc cement was applied beneath the patch - pressure was applied to the patch to assure a good bond.

# Site Visit Report

Project No.: R02564-01

Date: 20-Dec-02

Arrived on-site @ 8:00 am. Ross, Landsaver, and myself proceeded through the security check points and over to HWMU 7. We finished uncovering and patching the remaining holes in the morning. After a lunch break the patches were air lance tested to assure a good bond. All testing passed and the holes were backfilled and compacted. The equipment was then loaded up and we headed over to HWMU 5. Upon leaving today four of the holes were patched and all of the holes were excavated. No air testing was attempted today on HWMU 5. Patching consisted on cleaning the repair area - cutting a rounded patch to cover the area - placing a pvc cement down under the patch - applying pressure to assure a good bond. Air testing consisted of shooting a concentrated stream of compressed air around the edge of the patch and visually observing for the patch to bubble up as a result of an unsuitable bond. Failing air tests were repaired accordingly before backfilling.

DEQ CRITERIA

The Department's Office of Waste Permitting (the Department) would like to provide the following comments concerning the development of the removal activities for Units 5 and 7:

1. Task 1, Subsurface Evaluation, paragraph 1 – In addition to the subsurface evaluations, the Department also recommends reviewing the plans and drawings provided in the approved post-closure reports to assist in determining the nature of wastes closed in place and the approximate limits and final grades of the closed units.

2. During the telephone conference, it was indicated that the sample locations would be backfilled with bentonite to the level of the existing geomembrane liner. This method of restoring the low permeability layer beneath the geomembrane liner is acceptable.

3. Task 1, Subsurface Evaluation, paragraph 2 – Any penetrations of or damage to the existing liner must be repaired as soon as practicable after the sample is collected. The repairs shall be made using new liner material that is, at least, of equivalent grade as and compatible with the existing liner. The method of repair (e.g., weld, glue, etc.) shall be such that the integrity of the existing liner or patch will not be compromised over the anticipated life of the cover (at minimum, the current remaining post-closure care period of that unit). All of the manufacturer's QA/QC procedures (e.g., test seams/patches, destructive testing, non-destructive testing, certified/trained installers, etc.) shall be followed in making the repairs. Also, RFAAP shall comply with the most up-to-date versions of the QA/QC procedures specified in the approved closure plan (e.g., ASTM D4437-99 as opposed to D4437) for field seaming of the geomembrane.

4. Task 1, Subsurface Evaluation, paragraph 2 – The soil cover overlying the geomembrane liner shall be restored with like materials (i.e., one foot drainage sand layer, filter fabric, one foot cover soil, and one foot of topsoil with grass cover), placed and compacted, and revegetated to the requirements of the approved closure plan. The filter fabric shall be repaired in accordance with manufacturer recommendations and the approved closure plan.

5. Since the final covers will be disturbed and then repaired, RFAAP must provide for each unit a certification that the unit has been repaired to meet the design standards specified in the approved closure plan. Pursuant to 40 CFR 264.115, the certification must be signed by an independent P.E. registered in the Commonwealth of Virginia and the owner or operator.

6. Task 1, Subsurface Evaluation, paragraph 3 – Although the Department is aware that RFAAP must analyze for CERCLA TAL/TCL constituents, we recommend that the following constituents be included in the initial study/investigation phase:
   a. all hazardous waste constituents that were handled at the unit (this list may be found in the approved closure plan); and
   b. all groundwater monitoring constituents that have been detected above background levels.

RAAP
Radford, Virginia 24141

**RE: Radford Army Ammunitions Plant PVC Cap Repair – HWMU 5**
**DAA No. R02564-01**

Dear Mr. Redder:

From December 20, to December 22, 2002 Draper Aden Associates (DAA) conducted PVC liner repair inspection for the above noted project. Site visit reports, photographs, and repair location sketches are attached for work performed during this period. The work was performed by Landsaver Environmental (Landsaver). The work performed at each repair location was in accordance with the approved VDEQ closure plan dated May 27, 1988 and the attached VDEQ comments. The each repair was conducted as follows:

- Excavated the topsoil and cover soil (3' thick); no filter fabric was encountered
- Excavated the sand drainage layer (1' thick)
- The existing 30 mil PVC liner was wiped free of dirt and dust
- Applied a bonding adhesive to the existing 30 mil PVC Liner
- Installed a new 30 mil PVC patch with a minimum 6" overlap in all directions
- Applied a bonding adhesive to the overlap (minimum 2" perimeter bonding area) and applied pressure to the two bonding surfaces
- After allowing the adhesive to cure, the patch was Air Lance Tested in accordance with ASTM D4437-99
- The repair location was backfilled and compacted with a 1 foot layer of sand drainage layer and 3' of topsoil/cover soil material. Topsoil/cover soil material was compacted in 1 foot lifts with use of a hand tamper and the excavator bucket. The compaction of each lift was verified with the use of a probe rod.

Based on our field observations and documentation, laboratory test results and geotechnical engineering experience, we conclude that the liner installation and repairs

on the above referenced project site has been completed in accordance with industry standard and acceptable engineering practices.

If you should have any further questions, please feel free to contact Ken Piazza or myself at (804) 264-2228.

Sincerely,

After a lunch break the patches were air lance tested to assure a good bond. All testing passed and the holes were backfilled and compacted. The equipment was then loaded up and we headed over to HWMU 5. Upon leaving today four of the holes were patched and all of the holes were excavated. No air testing was attempted today on HWMU 5. Patching consisted on cleaning the repair area - cutting a rounded patch to cover the area - placing a pvc cement down under the patch - applying pressure to assure a good bond. Air testing consisted of shooting a concentrated stream of compressed air around the edge of the patch and visually observing for the patch to bubble up as a result of an unsuitable bond. Failing air tests were repaired accordingly before backfilling.

# Site Visit Report

Project No.: R02564-01

Date: 12/22/02

The nine boring holes for the second closure had been excavated the previous workday. Excavations where the liner puncture had not been located were hand dug near the liner to avoid further damage.

The boring punctures were then cleaned with solvent roughly 8 inches in radius. Any errant tears due to shovel excavation were treated the same as bore punctures and dressed in the same fashion. Glue was then applied and a patch of 30 mil PVC was cut to a size and shape so as to cover damaged liner. At least one foot diameter patches were used. The patches were then set with a hand roller.

After 30 minutes of curing the patches were air lanced around their entire perimeters. No bubbling indicating failure was found.

The cuts were then backfilled in roughly one foot lifts and compacted with the bucket of the backhoe. I probed each lift with a rod to ensure compaction. The final lift was tracked with the backhoe to compact.

DEQ CRITERIA

The Department's Office of Waste Permitting (the Department) would like to provide the following comments concerning the development of the removal activities for Units 5 and 7:

1. Task 1, Subsurface Evaluation, paragraph 1 – In addition to the subsurface evaluations, the Department also recommends reviewing the plans and drawings provided in the approved post-closure reports to assist in determining the nature of wastes closed in place and the approximate limits and final grades of the closed units.

2. During the telephone conference, it was indicated that the sample locations would be backfilled with bentonite to the level of the existing geomembrane liner. This method of restoring the low permeability layer beneath the geomembrane liner is acceptable.

3. Task 1, Subsurface Evaluation, paragraph 2 – Any penetrations of or damage to the existing liner must be repaired as soon as practicable after the sample is collected. The repairs shall be made using new liner material that is, at least, of equivalent grade as and compatible with the existing liner. The method of repair (e.g., weld, glue, etc.) shall be such that the integrity of the existing liner or patch will not be compromised over the anticipated life of the cover (at minimum, the current remaining post-closure care period of that unit). All of the manufacturer's QA/QC procedures (e.g., test seams/patches, destructive testing, non-destructive testing, certified/trained installers, etc.) shall be followed in making the repairs. Also, RFAAP shall comply with the most up-to-date versions of the QA/QC procedures specified in the approved closure plan (e.g., ASTM D4437-99 as opposed to D4437) for field seaming of the geomembrane.

4. Task 1, Subsurface Evaluation, paragraph 2 – The soil cover overlying the geomembrane liner shall be restored with like materials (i.e., one foot drainage sand layer, filter fabric, one foot cover soil, and one foot of topsoil with grass cover), placed and compacted, and revegetated to the requirements of the approved closure plan. The filter fabric shall be repaired in accordance with manufacturer recommendations and the approved closure plan.

5. Since the final covers will be disturbed and then repaired, RFAAP must provide for each unit a certification that the unit has been repaired to meet the design standards specified in the approved closure plan. Pursuant to 40 CFR 264.115, the certification must be signed by an independent P.E. registered in the Commonwealth of Virginia and the owner or operator.

6. Task 1, Subsurface Evaluation, paragraph 3 – Although the Department is aware that RFAAP must analyze for CERCLA TAL/TCL constituents, we recommend that the following constituents be included in the initial study/investigation phase:
   a. all hazardous waste constituents that were handled at the unit (this list may be found in the approved closure plan); and
   b. all groundwater monitoring constituents that have been detected above background levels.

Re: Radford Army Ammunition Plant
*Facility-Wide Background Study Report*
Document submittal and review

Dear Mr. McKenna and Ms. Jake:

The U.S. Environmental Protection Agency (EPA) has reviewed the Army's December, 2001 *Facility-Wide Background Study Report* for use at the Radford Army Ammunition Plant (RFAAP) and the New River Ammunition Storage Depot (NRASD). Based upon our review, the *Facility-Wide Background Study Report* is approved. In accordance with Part II. (E)(5) of RFAAP's Corrective Action Permit, the *Facility-Wide Background Study Report* is now final. EPA expects that future site-specific *Work Plans* and *Reports* for the investigation of areas at the RFAAP and NRASD will reference the final *Facility-Wide Background Study Report*.

If you have any questions, please call me at 215-814-3357.

Sincerely,

Robert Thomson, PE
Federal Facilities Branch

**Subject:** ...no subject...

Hey Jim,

Sorry I couldn't make the RAB. Someday soon I hope. I would like to kill
two birds with this email.

First, in regards to the January 17th 2002 conference call regarding WPA 009,
we discussed all the areas in which I had concerns and through the call this
office concurs with WPA 009 and no revisions are needed.

Secondly, the Final Facility Wide Background Study Report (Study), dated

December 2001, has been reviewed and this office concurs with the Study and
no revisions are needed.

Hard copy letters will follow shortly documenting the concurrence for both
documents.

anks,

Mark S. Leeper

**Subject:** Radford documents

Based upon the Army's draft revised Site Screening Process document submittal on 10/26/01, the draft revised document is acceptable to EPA. Therefore, at this time the Region requests that a formal final version be submitted to EPA and VaDEQ for approval. The final version should include a cover page. EPA requires 3 copies of the final document.

With respect to the Background Report, EPA has received the final December, 2001 version of the Background Report. The final Report is being circulated for tox review to insure that all comments were addressed. EPA expects to have an approval letter out the second week in February, barring any unforeseen problems with the Report (I do not anticipate any).

Dear Mr. Thomson:

Enclosed are three certified copies of the subject report. We are submitting this as a final report.

This report has been revised to address draft EPA March 2001comments and Virginia Department of Quality (VDEQ) September 10, 2001 comments. Responses to these comments are attached. Please note the VDEQ September 10, 2001 comments overcame the VDEQ April 2, 2001 comments as well as the minutes of the meeting held July 17, 2001. Responses to the VDEQ April 2, 2001 comments and the minutes of the July 17, 2001 meeting are also attached for completeness of the record.

Please coordinate with and provide any questions or comments to myself at (540) 639-8266, Jerry Redder of my staff (540) 639-7536 or Jim McKenna, ACO Staff (540) 639-8641.

Sincerely,

C. A. Jake

**Response to Draft Comments from USEPA Region III**
**Dated March, 2001**
**Draft Facility-Wide Background Study Report**
**Radford Army Ammunition Plant**

1. **Comment: Section 2.4, Field Sampling, Page 2-2:** This section does not contain a subsection discussing field observations and air monitoring (PID) readings. Please revise this section to include a discussion of significant field observations and air monitoring readings obtained during the sampling events.
**Response:** Section 2.4 was revised to include a discussion of field observations and air monitoring data. Please see the third paragraph of Section 2.4.1 on page 2-12.

2. **Section 4.1.1, Analytical Methodology, page 4-1:** The third paragraph states that PID screening was used to monitor organic compounds and relocate borings as necessary. Section 2, Background Sampling, did not contain a discussion of field activities or air monitoring readings. Please revise the text to indicate what levels detected on the PID would have necessitated a relocation of the boring and which, if any, boring location(s) were relocated as a result of PID readings.
**Response:** Section 4.1.1 was revised to evaluate the revised Sec.2 (Comment #1) and clarify whether borings were relocated and why. Please see the third paragraph of Section 4.1.1 on page 4-1.

3. **Section 4.1.1, Analytical Methodology, page 4-1:** The second paragraph of 4.1.1 states that "Results demonstrated that selected locations did not exhibit explosive contamination or were not impacted by previous facility operations associated with releases." If this is true, then any location on either facility having non-detect for explosives would be non-impacted by DoD operations regardless of other TCL or TAL findings at these future sampling locations. Please amend this sentence to read "Results indicated that selected locations did not exhibit explosive contamination or were not impacted by previous facility operations associated with releases."
**Response:** Sentence was revised as proposed. Please see the second paragraph of Section 4.1.1 on page 4-1.

4. **Section 4.1.2, Data Validation and Qualifiers, pages 4-1 and 4-9:** The discussions of this section are focused upon target analyte list (TAL) metals, and omit TCL considerations. Since samples were analyzed for TCL VOC and SVOC, their data quality evaluation criteria should be included within this section. Please revise the text to include a discussion of the VOC and SVOC data validation and qualifiers.
**Response:** Section 4.1.2 was revised to include a discussion of VOC and SVOC data validation including qualifiers. The qualifiers are defined in Section 4.1.2 on page 4-1. The validation criteria are described for metals (Section 4.1.2.1 on page 4-1), VOCs (Section 4.1.2.2 on page 4-9), and SVOCs (Section 4.1.2.3 on page 4-10).

5. **Section 4.2, Statistical Approach, pages 4-10 through 4-20:** This section details the statistical methodology utilized for this background study. Table 4-8, Statistical Test, describes the equations utilized for the necessary calculations; and Tables 4-9, Surface Soil Statistical Summary and 4-10 Subsurface Soil Statistical Summary, describe the results of the individual statistical tests conducted. The actual calculations and variables utilized are not provided in the report for verification. Please include an additional table or appendix which details the individual calculations conducted in this section.
**Response:** The output for each of the statistical analyses is provided in Appendix G.

6. **Section 4.3, Confidence Limits, pages 4-20 through 4-24:** This section details the statistical methodology utilized to calculate the 95% upper confidence limit (UCL) for the combined data sets. Table 4-8, Statistical Tests, describes the equations utilized for the necessary calculations and Tables 4-11, Occurrence and Distribution of Chemicals Combined Surface Soil (MMA and NRU) and 4-12 Occurrence and Distribution of Chemicals Combined Subsurface Soil (MMA and NRU), describe the results of the individual statistical tests conducted. The actual calculations and variables utilized are not provided in the report for verification. Please include an additional table or appendix which details the individual calculations conducted in this section.
**Response:** The output for the 95% UCL calculations is provided in Appendix G.

7. **Section 4.1.3, Data Grouping, page 4-20:** The last paragraph of this section states that the coefficient of variation (CV) was used to evaluate the data variability for element distribution across soil type, with elements having CVs of less than one being grouped together, and elements with CVs greater than one further evaluated to address the causes of variability. This step is not depicted in Figures 4-1 and 4-2. Please include this step in the appropriate figures, and elaborate on the use of CVs and the resulting groups formed based on the outcome of these calculations.
**Response:** Text was added to explain that CVs were used to identify chemicals that exhibited high variability (i.e., the CV was greater than 1) for further evaluation. (Please see fourth paragraph of Section 4.1.3 on page 4-11). After further review, the flow chart (Figure 4-1) was not expanded to include the CV because this value was not used in the screening or decision-making process. Due to subsequent discussions with the USEPA and VaDEQ regarding the data groups for the background study, it was agreed that the background data sets (surface and subsurface soil, MMA and NRU soil) would be combined. Therefore, none of the data groups resulted from the evaluation of CV values.

8. **Table 4-11, Occurrence and Distribution of Chemicals Combined Surface Soil (MMA and NRU), page 4-22:** This table lists the 95% UCL in surface soils for the combined data sets (MMA and NRU). As it may be necessary in the future to view each area independently, the table should include the individual area calculations in addition to the combined 95% UCL calculation. Please revise

the table to include the individual area (MMA and NRU) 95% UCL calculations in addition to the combined 95% UCL calculation.
**Response:** Table was revised to include MMA and NRU 95% UCL numbers as well as the combined 95% UCL. The values for the individual areas are shown in Tables 4-13 and 4-14 on pages 30 and 31.

9. **Table 4-12, Occurrence and Distribution of Chemicals Combined Subsurface Soil (MMA and NRU), page 4-22:** This table lists the 95% UCL in subsurface soils for the combined data sets (MMA and NRU). As it may be necessary in the future to view each area independently, the table should include the individual area calculations in addition to the combined 95% UCL calculation. Please revise the table to include the individual area (MMA and NRU) 95% UCL calculations in addition to the combined 95% UCL calculation.
**Response:** Table was revised to include MMA and NRU 95% UCL numbers as well as the combined 95% UCL. The values for the individual areas are shown in Tables 4-15 and 4-16 on pages 32 and 33.

10. **Section 5.1, Background Sample Locations, page 5-1:** This section reads that "Additionally, semivolatile and volatile organic compounds were evaluated as secondary markers to substantiate the selection of true background locations. Analytical results demonstrated that organic contaminants had not impacted the selected locations, indicating that sample locations represented background conditions." The organic results were not provided in this report. Please revise the report to include the organic results obtained or delete those two sentences from the report.
**Response:** Organic results are provided in Appendix B.

11. **Section 5.1, Background Sample Locations, page 5-1:** This section reads that "Explosive results were negative, proving background sampling locations had not been impacted by RFAAP operations." If this is true, then any location on the Site having non-detect for explosives would be non-impacted by RFAAP operations regardless of other TCL or TAL findings at these future sampling locations. Please amend this sentence to read "Explosive results were negative, indicating background sampling locations had not been impacted by RFAAP operations."
**Response:** The sentence was revised as suggested. Please see Section 5.1 on page 5-1.

12. **Section 5:** The 95 % UCL was used as a point estimate of the background data. However, when we compare on-site contamination at RFI sites to background, we need to answer two questions: (1) Are there any hot spots on-site? (2) Is the average concentration on-site the same or higher than the average concentration of background? Given the data in the draft *Background Report*, we should be able to answer these questions for RFI type sites using hypothesis testing. Therefore, EPA is requesting that, for RFI sites, the Army propose a methodology (ies) in the draft revised *Background Report* for accomplishing this end.

**Response:** The 95% UCL was included in the report as a general point of reference, at the request of the Installation, for site prioritization purposes. At the time the Background Workplan was developed there was intent for point-to-point comparisons. As described in the Background Study Workplan, the intent was to use hypothesis testing for RFI sites. Such hypothesis testing would include tests for similarities in shape and location between the site and background data sets. Depending on these initial tests other tests (e.g., t-test or Mann-Whitney U, or Kolmogorov-Smirnov) would be used to assess whether there is a difference between the means. Likewise, statistical procedures also would be used for assessing outliers.

Although not contemplated during the development of the Site-Screening Process for Site Screening Areas (SSA), the 95% UCLs could be used for point-to-point comparisons. However, using the 95% UCL as a single point comparison or background is very likely to result in classifying many chemicals as greater than background when they are not. This is due to the fact that the 95% UCL is an estimate of the mean, which would likely result in misclassification as much as 50 percent of the time. Therefore, the Army suggests that a 95% upper tolerance limit (95% UTL) approach be included in the Background Study report and used for point-to-point comparisons in the SSP.

The following discussion further explains the Army's position regarding UTL versus UCL:

*Three types of statistical intervals are often constructed from environmental data: Confidence, Tolerance and Prediction. They are mathematically similar, but have very different purposes:*

| ***Appropriate Use*** | ***Interval Type*** | ***Purpose*** |
|---|---|---|
| *Comparison Within A Single Population.* | *Confidence Interval:* | *To compare a compliance data set to a known standard (i.e., USEPA, 1989; 1992).* |
| *Comparison of Similar But Distinct Populations.* | *Tolerance Interval:* | *To define a concentration range from background data, within which a large proportion of compliance data should fall with high probability (i.e., USEPA, 1989; 1992).* |
| | *Prediction Interval:* | *To define a concentration range from background data, within which the next K compliance values should fall with high probability (i.e., USEPA, 1989; 1992).* |

*A Confidence Interval contains a specified population parameter (generally the mean) with a specified level of confidence (USEPA, 1989). " It offers little information about the highest or most extreme sample concentrations one is likely to observe over time" (USEPA, 1989). For these reasons, Confidence Limits are generally constructed on*

*compliance data, not on background data. The limits for compliance data can then be compared to a known standard (e.g., RBCs, MCLs, GWPSs) to assess if the mean value of the compliance data might be statistically above the standard (cf., VDEQ, 1998; 2000).*

*If a statistically robust data set, and thus good information about the population mean, is available (implying a tightly constrained confidence interval and low UCL), then a large portion of the population of individual values used to construct the UCL will actually be above the UCL. Therefore, an exceedance of the UCL by an individual sample result in a separate compliance population is not indicative of the site being above background.*

*The appropriate Interval to be constructed on background data for comparison to individual compliance points is a Tolerance Interval (USEPA, 1989; 1992). The UTL approach compares individual compliance point sample values to individual values in the background population, e.g. the 95th percentile of the population. If the compliance population is within background, we expect no more than 5% individual values to be above the 95th percentile of the background population. Tolerance intervals are robust for normally distributed data. For lognormal data sets, lognormal tolerance intervals can be constructed; however, caution must be used to discern spurious results. In the event that a data set is lognormally distributed and the results of a lognormal tolerance interval calculation appear erroneous (based on a UTL that is an outlier as compared to the known spread of the background data set), one should use a prediction interval approach on the lognormal data.*

As a result of subsequent discussions with USEPA and Virginia Department of Quality (VaDEQ), it was agreed that the point estimates for background soil would be calculated as 95% UTL values and based on a single data set consisting of surface and subsurface soil data for the MMA and NRU areas (VaDEQ comments dated September 10, 2001). The rationale for using the 95% UTLs as point estimates for constituents from the combined data sets is described in Section 4.5 on page 4-29 and Section 5.2 on page 5-1. The calculated 95% UTLs are presented in Table 5-1 on page 5-2.

Hot spots need to be defined by two parameters: aerial extent and concentration. The size of a hot spot is best examined through adequate sampling design. The concentration that defines a hot spot can be addressed through a risk-based comparison or through a background-based comparison. Both of the extent and the concentration parameters require proper sampling plan development. The number of samples at the SSAs is unlikely to be adequate for statistical hot-spot evaluation. Hot-spots are best addressed with purposeful sampling at suspected release points for the SSP. The hot-spot issue at RFI sites will be addressed during the development of the RFI Work Plans. This approach was explained in Section 4.5 on page 4-28 and Section 5-2 on page 5-1.

13. **Section 5:** Please include language in Section 5 stating that the Facility-Wide inorganic point estimates for surface soil "background" and subsurface soil "background" can be used in the evaluation of Site-Screening Areas.

**Response:** The suggested language was added to Section 5.2 on page 5-1.

14. **Appendix A, Drilling Log MMAU1:** This drilling log does not show PID screening readings. Please clarify why readings were omitted on this boring or revise the log to indicate the PID readings obtained.
**Response:** Log in Appendix A was revised to indicate PID readings.

15. **Appendix B, Data Validation Reports:** This appendix does not contain the VOC and SVOC data validation and summary sheets. Please revise this appendix to include the VOC and SVOC data validation package and sample summary sheets.
**Response:** Appendix B was revised to include VOC and SVOC data validation data and sample summary sheets.

**Response to Comments from VDEQ (September 10, 2001)**
**Draft Facility-Wide Background Study Report**
**Radford Army Ammunition Plant**

**General:** Comments from VDEQ dated April 2, 2001 were superseded by comments from September 10, 2001. These comments from VDEQ are considered to be **Final** and have been reconciled with USEPA Region III.

**Comment:** Having reviewed the revised surface soil and subsurface soil data, the statistical analysis of that data, including the soil type groupings and the 95% Upper Tolerance Limits, and having compared it with much of the currently existing site data, additional consideration was given to the practical application of this background data to the site screening process. Each potentially contaminated site at the facility is located in an area where excavation of surface soils has occurred at some point in the facility operations; therefore, the technical rationale behind a statistical comparison of surface soil, natural area, background data to subsurface soil, excavated area, site data is questioned.

Given the conditions of mixed surface and subsurface soils at the potentially contaminated sites, it is recommended that the background data for both surface and subsurface soils be combined for each element to determine the 95% UTL to be used in conjunction with the USEPA Region III RBCs for human health risk screening, and with various ecological screening data for ecological screening purposes. This will not only simplify the screening process, but will add power to the statistical comparison and prevent the unnecessary, and costly, carrying forward of naturally occurring elements into the full-fledged risk assessment process.

This recommendation has been made following consultation with Mr. Robert Thomson, USEPA Region III.

**Response:** The rationale for combining background soil data sets and calculating 95% UTLs as point estimates for background soil is described in Section 4.5 on page 4-29 and Section 5.2 on page 5-1. The 95% UTL values are provided in Table 5-1 on page 5-2.

**Response to Comments from VDEQ (April 2, 2001)**
**Draft Facility-Wide Background Study Report**
**Radford Army Ammunition Plant**

**General:** Following discussions with VDEQ and USEPA regarding the soil data groupings and the point estimates, these comments were superseded by comments from VDEQ dated September 10, 2001.

**Comment:**
Based upon their statistical evaluation of the analytical data provided in the report, surface and subsurface soils should be evaluated separately. Within each stratum (surface and subsurface) data for each chemical constituent (aluminum, antimony, arsenic, etc.) can be grouped into either one or two groups by soil type (Braddock, Unison, Wheeling, etc.).

The Department used the Tukey method[1] to conduct simultaneous comparison of the constituent mean concentrations, by chemical constituent, for the seven different soil types at a 95% confidence limit. The resulting groups observed for each surface soil chemical constituent are marked with a code 1 or 2. Surface soil types with code "1" may be combined into one data set and those with code "2" may be combined into second data set for each chemical constituent. Data sets marked with an asterisk (*) contain outliers that should not be included in the data set for the background comparison. See Table 1 below.

For example, the cobalt data for the Braddock Loam and Groseclose and Poplimento Silt Loam in the surface soil types can be combined into one statistical data set; and the cobalt data for the Unison-Urban Land Complex, Wheeling Sandy Loam, Cabro Silty Clay Loam, Lowell Silt Loam, and Wurno-Newberg-Faywood Silt Loam surface soil types can be combined into a second statistical data set. Statistical comparisons from future potentially contaminated sites would compare aluminum data from a surface soil sample in Braddock Loam to aluminum data from the Braddock Loam and Groseclose and Poplimento Silt Loam data set.

---

1 Robert V. Hogg and Johannes Ledolter, Applied Statistics for Engineers and Physical Scientists, - 2nd ed. New York: Macmilllan Publishing Company, 1992

**Table 1 Surface Soil Groupings**

| Constituents | Braddock | Unison | Wheeling | Cabro | Groseclose | Lowell | Wurno |
|---|---|---|---|---|---|---|---|
| Aluminum | 1 | 1 | 1 | 1 | 1 | 1 | 1 |
| Antimony | 1 | 1 | 1 | 1 | 1 | 1 | 1 |
| Arsenic | 1 | 2 | 1 | 1 | 1 | 1 | 1 |
| Barium | 1 | 1 | 2 | 1 | 1 | 1 | 1 |
| Beryllium | 1 | 1 | 2 | 1 | 1 | 2 | 2 |
| Cadmium | 1 | 1 | 1 | 1 | 1 | 1 | 1 |
| Chromium | 1 | 1 | 1 | 1 | 1 | 1 | 1 |
| Cobalt | 1 | 2 | 2 | 2 | 1 | 2 | 2 |
| Copper | 1 | 1 | 1 | 1 | 1 | 1 | 1 |
| Iron | 1 | 1 | 1 | 1 | 1 | 1 | 1 |
| Lead | 1 | 1* | 1 | 1 | 1 | 1 | 1 |
| Maganese | 1 | 1 | 1 | 1 | 1 | 1 | 1 |
| Mercury | 1* | 1 | 1 | 1 | 1 | 1 | 1 |
| Nickel | 1 | 2 | 2 | 2 | 2 | 2 | 2 |
| Selenium | 1 | 1 | 1 | 1 | 1 | 1 | 1 |
| Silver | 1 | 1 | 1 | 1 | 1 | 1 | 1 |
| Thallium | 1 | 1 | 1 | 1 | 1 | 1 | 1 |
| Vanadium | 1 | 1 | 1 | 1 | 1 | 1 | 1 |
| Zinc | 1 | 1* | 2 | 1 | 1 | 1 | 1 |

Similarly, subsurface soil has been marked with code 1or 2. Soil types with code "1" may be combined as one background data set and those with code "2" may be combined as a second background data set for each constituent.

**Table 2 Subsurface Soil**

| Constituents | Braddock | Unison | Wheeling | Cabro | Groseclose | Lowell | Wurno |
|---|---|---|---|---|---|---|---|
| Aluminum | 1 | 2 | 2 | 1 | 2 | 2 | 2 |
| Antimony | 1 | 1 | 1 | 1 | 1 | 1 | 1 |
| Arsenic | 1 | 1 | 1 | 1 | 1 | 1 | 1 |
| Barium | 1 | 1 | 2 | 1 | 1 | 1 | 1 |
| Beryllium | 1 | 1 | 1 | 1 | 1 | 1 | 1 |
| Cadmium | 1 | 1 | 1 | 1 | 1 | 1 | 1 |
| Chromium | 1 | 1 | 1 | 1 | 1 | 1 | 1 |
| Cobalt | 1 | 2 | 2 | 2 | 2 | 2 | 2 |
| Copper | 1 | 2 | 2 | 1 | 2 | 2 | 2 |
| Iron | 1 | 1 | 1 | 1 | 1 | 1 | 1 |
| Lead | 1 | 2 | 1 | 1 | 1 | 1 | 1 |
| Maganese | 1 | 1 | 1 | 1 | 1 | 1 | 1 |
| Mercury | 1 | 1 | 1 | 1 | 1 | 1 | 1 |
| Nickel | 1 | 2 | 2 | 2 | 2 | 2 | 2 |
| Selenium | 1 | 1 | 1 | 1 | 1 | 1 | 1 |
| Silver | 1 | 1 | 1 | 1 | 1 | 1 | 1 |
| Thallium | 1 | 1 | 1 | 1 | 1 | 1 | 1 |
| Vanadium | 1 | 2 | 1 | 2 | 1 | 1 | 1 |
| Zinc | 1 | 1* | 2 | 1 | 1 | 1 | 1 |

Notes for tables 1 and 2 on prior page:

* Indicates that soil type has outlier(s)

The detection limits for some of the constituents varied between soil types.

Based on the above information, the facility may develop two background data sets for surface and

subsurface soils.

The facility must conduct an outlier test on grouped background data sets as part of the revisions to this document and prior to developing the statistical limits for comparing on-site against background levels. Outliers from the background data set are to be excluded prior to establishing the 95% upper confidence limit (UCL) on the mean of the background data.

When performing statistical comparisons of the potentially contaminated area sample results to the background results, the facility may use a Student's t-test, provided the data sets follow normal distributions and other test specific assumptions (eg. variance). The facility also has the option to calculate the 95% upper confidence limit on background data (excluding outliers) and compare the individual on-site sample concentrations to the established UCL.

**Response**:
It is emphasized that the approach and methods used in the Background Study report had been accepted by both EPA Region III and VDEQ in the Workplan prior to its implementation. The Tukey method presented by VDEQ is no more valid a statistical approach than the methods employed per the Workplan. Further, during presentation of the Workplan, the possibility of certain elements not "passing" the 95% confidence interval was discussed. This possibility was not considered to invalidate the data, rather that data would simply have to be evaluated within the appropriate context. It should be noted that the elements, identified by the Army, as failing the statistical tests were still relatively high in confidence interval albeit not 95%. Finally, these elements (aluminum, barium, iron, lead, vanadium, zinc) are rarely risk drivers in a risk assessment. A comparison of RBC values for these elements indicate that the calculated UCL is either below the residential RBC for that element or between the residential and industrial RBC values.

The approach recommended in VDEQ's comments represents a significant change. The implementation of the Commonwealth of Virginia's approach would be difficult since there would have to be at least four different background data sets for each element. This would inevitably lead to data sets that would not be statistically significant. The selection of the background data set would also have to change based on the soil type and element.

Another difficulty with the implementation of the Commonwealth's approach would occur when samples are collected that involve multiple soil types or where soil types are not clearly distinguishable. For example, which background data set would be used if the samples collected from the site are from multiple soil types and the background analysis indicated that there are differences between the data for some or all of the elements?

The Army proposes the following course of action. Evaluation of outlier will proceed using an appropriate statistical method (eg., Box and Whisker diagram). P-values will be evaluated using another statistical package to assess whether differences will result from the values already calculated. Finally, a meeting to discuss finalization of the Background Study report may prove to be more successful than multiple response and comment rounds.

SUMMARY OF MEETING MINUTES

Jim McKenna began the meeting at 9:15 with a brief history of the Background Study, providing an overview of the project to date, followed by introductions of the participants and their respective roles in the project.

Sharon Wilcox asked why the Parson's background data from 1996 data was not incorporated. John Tesner indicated that there were issues that related to sample locations (i.e., some of the sample locations did not have coordinates) and collection that compromised the quality of the data; therefore, the Army withdrew this report with EPA consent.

After completion of project overview, John Tesner explained the meeting objective, which was to discuss the technical concerns of Virginia Department of Environmental Quality (VDEQ) relative to the method used by the Army to calculate inorganic background concentrations.

John Tesner then asked Cindy Hassan to briefly outline of background study process and the statistical procedures used to develop the calculated background concentrations. Ms. Hassan then proceeded to describe the technical approach used by IT and acknowledge that there are other methods, such as the Tukey statistical method used by VDEQ, to arrive at similar results.

Sanjay Thirunagari asked Cindy Hassan if before she proceeded further into the explanation of the statistical approach to explain what the ultimate use of the background data would be. Sanjay Thirunagari discussed that VDEQ had grouped data by soil type, while IT had relied more heavily on the physical description and chemistry and had grouped the data sets as surface and subsurface). He commented that we can still make this data work so that a background data set can be achieved for use on the project.

Cindy Hassan explained that there were three points to consider when looking at soil types and ultimate use of the data. The first point being that there was significant consideration given in the field to selection of samples by soil type, and data from the different sets had been combined by individual elemental comparisons across different soil types. The second point is that the Chemicals of Potential Concern (COPCs) will be selected by comparison to U.S. Environmental Protection Agency (USEPA) Region III risk based concentrations (RBCs). Those chemicals with detected concentrations less than the respective RBC will be dropped from further consideration as a COPC. Once COPCs are selected then the data will be compared to background levels. At that point, it will be appropriate to consider soil type and look at elemental composition of site samples relative to background comparison samples. The third point is that the existing background samples were selected from representative soil types to provide a data set that could be developed into a quick reference set of background comparison values.

Cindy Hassan then went on to address VDEQ's first concern regarding combination of background data sets and explained that the soil characteristics were considered during the combination of different data sets among the similar soil types. This combination was based upon a physical and chemical properties of each soil type; similar soil types were grouped together. The study identified four soil groups in the New River Unit (NRU) and three major groups in the Main Manufacturing Unit (MMA).

John Tesner and Jim McKenna commented that the soil types encountered were based on the selection of background locations that would be representative of areas that contained Solid Waste Management Units (SWMUs).

Cindy Hassan explained that for each soil type a qualitative evaluation between soil types was performed in which the physical and chemical composition of each type was compared. The

conclusion of this evaluation was that the soil types were similar enough that data sets could be combined into one data set for the surface soil and one data set for the subsurface soil.

Cindy Hassan then began a brief discussion of the outlier issues explaining that the data sets were reviewed for possible extraneous data values, but their analyses did not result in the rejection of data. Since these locations were specifically selected to represent background, there was a reluctance to eliminate a data point unless there was a Quality Control concern. IT's review of the data did not reveal a justification to remove data points from the background population. Cindy Hassan then explained that the background data set was used to derive point estimate values using the 95 percent Upper Confidence Level (UCL) on the mean and 95 percent Upper Tolerance Level (UTL) approaches. Previous discussion and comments from EPA indicated that EPA had agreed to a preference to use the 95 percent UTL approach.

Sanjay Thirunagari then expressed that it will be key for VDEQ to know how the background data will be used. After which the group can then look at methodology derivation of background estimates.

Drew Rak then explained that the primary use would be as background comparison criteria for use in the following:

1. Site screening process (SSP) (95% UTL approach).
2. Background comparison in RFI (mean-to-mean comparison e.g., t-test).

The different soil types in the MMU and the NRU were being combined in order to achieve the power and confidence necessary for a meaningful means comparison. Drew Rak noted that the low number of samples per soil type in the VDEQ analysis would not allow for a meaningful mean-to-mean comparison.

Drew Rak reviewed the flowchart for statistical evaluation as depicted in the meeting handout. He then explained that the previous 1996 soil data was used to estimate the number of sampling locations for this background study. The minimum relative detectable difference and coefficient of variation were used to predict the number of samples to collect. This approach and number of sample locations was discussed and agreed to by Dr. Lynn Flowers of EPA, as well as EPA's subsequent approval of Work Plan Addendum 10. Drew Rak then proceeded to describe the screen out of macronutrients.

Drew Rak explained that elements with a low number of detections (greater than 80 percent below detection limit) were dropped from the statistical process. As a result, there were smaller, but focused data sets containing 14 elements for surface and 16 for subsurface. During the comparison between data sets, there was generally good agreement between NRU and MMA data and also between surface and subsurface data. The surface and subsurface data sets were kept separate due to separate pathways evaluations that are completed during risk assessment.

Hassan Kaceli explained that VDEQ is looking at the differences in the seven different soil types in the two areas; certain soil types could be combined then compared statistically.

Sanjay Thirunagari referenced his previous question that the ultimate use of the data should be determined. For onsite detections, they should be below the 95 percent UTL. The mean of onsite data could be compared to the mean of background data set with an appropriate statistical test. He expressed concern that combination of soil types could mask differences between soil types.

Sanjay Thirunagari indicated that he had no problem with 95 percent UTL, or mean-to-mean comparison if background data are normally distributed and random sampling was conducted. The 95 percent UTL approach should be used if a grid sampling approach is used.

Rob Thomson/Alvaro Alvarado commented that USEPA has experience with many Federal facilities that have many AOCs; for areas with low risk it is difficult to prove there is no risk. It is important that we focus on sites where we have an obvious risk.

John Tesner re-iterated that sites will be screened by a comparison with RBCs. Sharon Wilcox and Sanjay Thirunagari commented that values below the RBCs will not be a concern.

Hassan Kaceli commented that the data NRU & MMA can be combined; any sample with the same soil type can be grouped by each element. Sanjay Thirunagari elaborated that, for example, the Unison soil type with similar elemental compositions could be combined in one background data set. For risk assessment, surface data would be combined to evaluate risk. Then samples within same soil type would be combined and the risk from each background soil type would be compared to the constituents contained in the site surface soil.

Sharon Wilcox clarified the VDEQ proposed grouping of the different soil types by each element into two groupings for surface soil and two grouping for subsurface soil. She used the example of Subsurface Group 1 would contain soil types except Unison. Group 2 would contain the other soil types. Alvaro Alvarado indicated that VDEQ's approach made sense. John Tesner asked for additional clarification of the element by element basis, with each element having either one or two soil groups. There were several minutes of discussion relative to soil types and the low number of samples that may be available in a particular group, for example Arsenic, which could have a data set with only 4 data points.

John Tesner pointed out that the statistical evaluation performed by the Army resulted in seven elements that did not pass the statistical evaluation. These seven elements are different than the seven elements VDEQ indicated are statistically different. John Tesner indicated that soil type comparison was done on a qualitative basis. Drew Rak pointed out that the VDEQ approach requires that the 95%UTL approach be used for derivation of background values. Sanjay Thirunagari questioned whether the UTL could be used with four data points. Alvaro Alvarado indicated that for arsenic in Unison Soil, the arsenic concentration is less than 10 ppm, and at

that concentration, this level will not drive a risk that will result in cleanup. Sanjay pointed out that it is a mute point (there was a general comment regarding 20 ppm); do not have to worry over arsenic risk. John Tesner emphasized the point that for many of the elements the derived background concentration is less than the RBC.

Bob Goodman provided the following calculated background values (in milligrams per kilogram) using the Army combined data set and the VDEQ Groups 1 and 2.

| | rmy ombined ata Set | VDEQ Group 1 | VDEQ Group 2 |
|---|---|---|---|
| Al | 20 | 16 | 23 |
| Ba | 67 | 51 | 140 |
| Pb | 13 | 11 | 520 |

← *Small data set*

Drew Rak commented that with small data sets; the approach will capture variability by using the 95 percent UTL to calculate background values. Sanjay Thirunagari commented that to use the 95 percent UTL approach the data set must have a normal distribution; otherwise, the maximum value will be used for a non-normal distribution.

John Tesner commented that the SSP currently includes a surface and a sub-surface table of background point values that were derived using UTL calculations. Using the VDEQ approach including soil types for each element, what will those tables look like now? There is an expectation that comparison to these values will provide a decision point. Rob Thomson commented that background numbers that are too low will result in remediation of too many sites; if a higher number is selected, then too few are remediated. Sharon Wilcox indicated that the RBC would be the driving number.

There were several minutes of discussion as the group worked through two examples using aluminum and beryllium to illustrate the VDEQ methodology of looking at each element and whether it has a single soil group or two groups. If there is more than one group for the particular element, then the data set should be selected that matches the soil type of the environmental sample. Once the data set is selected (Group 1 or Group 2), then if the data set distribution is normal, then the 95 percent UTL calculated value will be used for background point comparison. If the Group 1 or 2 data set distribution is non-normal, then the maximum value of the background data set is used as point comparison value. Sanjay Thirunagari indicated that he was comfortable with the point to point comparison and use of the 95 percent UTL; however, all site sample points must pass the comparison. There was general discussion that the Army will apply the VDEQ approach to the data sets and generate a new set of background numbers for comparison. Sanjay Thirunagari indicates that if the numbers

calculated by the VDEQ approach is similar to the numbers calculated by the Army, then VDEQ may accept the Army approach.

Jim McKenna and John Tesner indicated that the Army would create a new background point-values table using the VDEQ approach and compare with existing Army background point values. If the values are close, then the group will proceed with finalization of the report using the current statistical approach utilized by the Army. Sharon Wilcox indicated that VDEQ will be satisfied with that approach if VDEQ values are close to the Army values. The Army will prepare the table and submit in a letter to VDEQ for review.

Jim McKenna requested a discussion of the outliers in the letter to make sure that VDEQ outstanding comments are addressed. Cindy Hassan indicated that based on the box and whisker plots that were completed as part of the outlier evaluation, the outlier do not have a significant impact on the data. Alvaro Alvarado expressed caution in deleting a data point. Sharon Wilcox wants notification of outliers that are used as maximum values. Cindy Hassan indicated that typically outliers are discussed in the uncertainties section of the Risk Assessment. Sanjay Thirunagari indicated that if the outliers made a significant difference in the calculated background values, then resampling may be required. Jerry Redder recommended that in the new table, outliers that have a significant impact for resampling to be identified. Sharon Wilcox expressed that the number of samples should be added to the table.

John Tesner then summarized saying that the Army would put a new table together, which would contain the background point values using the 95 percent UTL (for SSP and RFI application) and UCL (for informational) approaches for the soil types as defined in the VADEQ analyses. This table will also contain the sample size that was used for these UTL/UCL calculations and the residential and industrial RBC's for the compounds. This table ~~and letter~~ will be distributed to the group. A time frame of Mid-August was suggested for the table completion and a conference call. The meeting adjourned at 12:45 p.m.

Subject: re: Background Study table

The revised table is acceptable. I suggest, for ease of reading in the future, that the final column include the to-be-screened -against value so
one isn't hunting back and forth between the two central columns.

From: "McKenna, Jim" <Jim_McKenna@ATK.COM>, on 10/10/2001 9:40 AM:

Sharon,

As I recall you were going to handle finishing up the background study report. Attached table has been revised per your 10 Sept 2001 letter. Sent
this table out earlier with the 9/20-21/2001 conference call minutes but I
don't think I cc'd you. In any case all that is needed is to review this table and if it is ok then we can revise the background study report and submit it as final.

Let us know.

Jim

| MANGANESE | 79/79(100) | 16.7 - 2,040 | L | 2,543 | 160 | 4,100 | 95% UTL |
| MERCURY | 19/79(24) | 0.038 - 1.2 | NP | 0.130 | 0.78 | 20 | RBC |
| NICKEL | 63/79(80) | 4.6 - 94.2 | L | 62.8 | 160 | 4,100 | RBC |
| THALLIUM | 16/79(20) | 1.3 - 5.0 | NP | 2.11 | 0.55 | 14 | 95% UTL |
| VANADIUM | 79/79(100) | 12.2 - 114 | L | 108 | 55 | 1,400 | 95% UTL |
| ZINC | 79/79(100) | 4.7 - 598 | L | 202 | 2,300 | 61,000 | RBC |

[a] Statistical Distribution: N = Normal distribution; L = Lognormal distribution; U = Undetermined distribution; NP = Nonparametric distribution for data sets with greater than 50% nondetects.

[b] 95% Upper Tolerance Limit calculated for the indicated distribution.

[c] RBC = Region III risk-based concentration adjusted for a Hazard Quotient = 0.1 to account for potential cumulative effects (dated May 8, 2001).

Note: Highlighted values are below the residential screening RBC.

## McKenna, Jim

**From:** McKenna, Jim
**Sent:** Friday, September 28, 2001 7:42 AM
**To:** 'rob thomson'; 'mark leeper'
**Cc:** 'john e tesner'; 'Andrew Rak'; 'Barnes, Kenneth G'; 'peter rissell'; 'Parks, Jeffrey N'; Redder, Jerome; Davie, Robert
**Subject:** Sept 20-21 teleconference notes & background study numbers

All:

Please see the attached files for the subject as above (SAB). Note your action items.

Status of Radford AAP/ATK action items: Jerry has located the SWMU 76 UST paperwork and is sending under separate cover to Rob Thomson, Mark Leeper and John Tesner. I have contacted our command and we have relooked at the Radford AAP situation and pesticide screening samples are in. We will propose 1 to 2 samples per site for screening purposes. That does it for Radford AAP/ATK direct action items. Of course I will be working with John Tesner and Jeff Parks on their direct action items as well as scheduling, programming, budgeting, etc, etc.

Thanks,
Jim

PS Rob, Mark: Also please look over the background numbers and provide comments or concurrence so we can get moving on finalizing the Background Study report.

MEETING MINUTES FOR RADFORD AAP
WORK PLAN ADDENDUM 12
20-21 SEPTEMBER 2001

**Day 1:**
20 September 2001
Time: 1300-1600

Participants:

USEPA, Region III: Rob Thomson
VDEQ: Mark Leeper, Sharon Wilcox
RFAAP: Jim McKenna
ATK: Jerry Redder
USAEC: Pete Rissell
OSC: Ken Barnes
USACE, Baltimore District: John Tesner, Andrew Rak
IT Group: Jeff Parks, Mark Thomas, Tim Leahy

GENERAL ISSUES

**1. Pesticide sampling:**
Jim McKenna stated the Army's positions; that pesticides were not manufactured at RFAAP, that there has been no identified location were pesticides were regularly mixed or stored, and the Army's uncertainty regarding the end use of data especially as it relates to BTAG screening values.

Rob Thomson of EPA stated that EPA wants sampling, but in a rational way. There would be no need to collect pesticide samples from former sampling locations nor is 100 percent sampling required for all new sampling. Further, Mr. Thomson stated that EPA needs to be able to document that pesticide releases didn't occur in conjunction with other releases at a site. In addition, if a site were seeking a No Further Action (NFA) status then it would be incumbent upon EPA and VDEQ to be able to show that pesticides were not an issue at the site. Sharon Wilcox of VDEQ concurred with this assessment from EPA adding that she thought that the number of samples per site would vary based on site conditions (e.g., the presence of a single runoff area from a site may require only one sample) and/or site size.

The Army and EPA agreed that pesticides receive analysis in laboratories when PCB's are being analyzed. This could possibly reduce the financial impact of adding pesticide sampling given that some sites will already be performing PCB sampling.

The Army advanced the idea that Tentatively Identified Compound (TIC) analyses that has already been included in the Site Screening Process (SSP) document, would provide indication as to the presence or absence of pesticide compounds. EPA did not agree with this assertion stating that their opinion is that TIC analyses identifies classes of compounds not specific compounds.

The discussion concluded with the Army agreeing to take this issue back to Command, but this may yet be an issue that requires Tier II involvement to resolve. The Army will continue to apprise the team as to the results of these discussions.

**2. COPC Residential/Industrial**

VDEQ stated that there is room to make risk management decisions on COPC's that fall between residential and industrial RBC's. This represents a clarification to their comments on WPA 12.

In the ensuing conversation relative to the role of BTAG and BTAG screening values, Rob Thomson indicated that a pre-remedial site screening process was now available from BTAG.

**3. Groundwater**

In order to respond to VDEQ comments regarding the inclusion of groundwater data in WPA 12, Jim McKenna restated its intent for the study of groundwater at RFAAP. The goals of WPA 9 and the Current Conditions report were discussed. Also, the plans for an expanded investigation of groundwater to include the balance of the Main Manufacturing Area were reiterated. VDEQ concurred with this discussion stating that this was "... a good game plan."

It was established that removing the label DNE (Does Not Exceed) from tables in the Current Conditions report will satisfy VDEQ comments.

**4. Air Pathway**

Both VDEQ and EPA stated that air sampling would not be required at this time. Air sampling would become necessary should a completed air pathway be established. VDEQ clarified their comment regarding the air pathway stating that they took exception with the assertion made in WPA 12 that air was not considered a complete pathway prior to the investigation. It was agreed that presumptive language relative to the completeness of risk pathways would be removed from the WPA.

**5. BTAG Issues**

The group quickly agreed on the need for another meeting that would include the BTAG in order to clarify their issues. It was also agreed that this meeting needed to occur ASAP. Drew Rak from USACE was tasked with contacting Bruce Pluta from EPA Region III BTAG to set up this meeting.

**6. Surface soil sampling depth, end use of data**

After some discussion on this issue, the group agreed on the following regarding surface soil sampling at RFAAP:

- Future surface soil sampling, including that proposed in WPA's 9 and 12, would be defined as soil in the first six inches below the root mat.
- Sampling for VOC compounds (where proposed) would occur from the interval between 6 and 12 inches in realization that the volatile nature of VOC compounds makes their detection in the 0-6 inch interval unlikely.

- Previous surface soil sampling, that until now had been 0 to 2 feet at Radford AAP, is considered valid for evaluation of surface soil. Additional sampling from previous sampling locations is not required.

SITE SPECIFIC ISSUES

**SWMU 39**

Based on review of the additional figures and tables provided to meeting attendee's in preparation for this conference, and explanation provided by the Army, EPA and VDEQ approved the proposed sampling locations and analyte suites.

It was agreed that the vertical sampling profile would be adjusted to capture subsurface soil in the intervals from 1 to 3 feet and the interval from 3 to 5 feet in order to better capture intervals were COPC's may be present. This did not result in an addition of samples, rather it was an adjustment to proposed sampling depths.

**SWMU 48, 49, 50, 59**

Upon discussion of VDEQ comments regarding inclusion of dioxin/furan sampling, it was agreed that these analyte suites were not required for SWMU's 48 and 50. The attendee's agreed that dioxin/furan analyte suites would be included at sites where burning activities had taken place; or where ash, burned material, or burn residue was suspected of being deposited. SWMU's 48 and 50 did not appear to meet this criteria. VDEQ requested and the attendee's agreed that they be given time to double check why the comment was made initially to ensure that there was no other rationale for the inclusion of dioxins/furans.

With regards to SWMU 48, the Army agreed that some additional sampling for explosives was justified. Additional characterization samples for explosives will be proposed by the Army. The use of immunoassay test kits for this purpose was discussed and approved by EPA and VDEQ.

Additionally, at the request of VDEQ, proposed boring 49SB02 will be advanced to a depth of 17-19 feet in order to assess the interval where relatively high TPH detection's had previously occurred. This will be an additional sample at this location and will receive the same analytical analyses as other sample intervals proposed at this location.
A discussion ensued as to the final disposition of SWMU 50 in light of the recent delisting of calcium sulfate sludge as a listed hazardous waste for explosive manufacture. Depending on analytical results (i.e., no COPC's), and review of Commonwealth regulations, no further action may be an appropriate remedy.

Based on review of the additional figures and tables related to SWMU 59, and explanation provided by the Army, EPA and VDEQ approved the proposed sampling locations and analyte suites.

**SWMU 58**

The Army agreed with VDEQ that given the sites reported history, the inclusion of dioxin/furan analyte suites was appropriate for SWMU 58. Otherwise, based on review of the additional figures and tables provided, and explanation provided by the Army, EPA and VDEQ approved the proposed sampling locations and analyte suites.

It was agreed that the vertical sampling profile would be adjusted to capture subsurface soil in the intervals from 0-2', 2-4', and 4-6' below ground surface where it begins beneath the rubble pile that is the primary feature of SWMU 58. This will not result in additional samples, rather it is an adjustment to the previously proposed sampling depths.

**Day 2:**
21 September 2001
Time: 0900-1200

Participants:

USEPA Region III: Rob Thomson
VDEQ: Mark Leeper
RFAAP: Jim McKenna
ATK: Jerry Redder
USAEC: Pete Rissell
USACE, Baltimore District: John Tesner, Andrew Rak
IT Group: Jeff Parks, Mark Thomas, Tim Leahy

GENERAL ISSUES

**1. ER, A Program Definitions (i.e., Active vs. Inactive sites)**
Jim McKenna provided definition of the program regarding the eligibility of SWMU's at Radford AAP. The Army's policy is that sites that were active beyond 17 October 1986 are considered active, therefore, ineligible for ER, A funding. This includes SWMU 17. The Army understands that it has an obligation to investigate SWMU's as named in the Installation's RCRA permit (October 2000), and will continue to pursue actions at active sites via separate funding mechanisms, programs, and documentation.

**2. VDEQ review status**
Jim McKenna recommended that VDEQ contact USACE's hydrogeologist, Mr. Drew Clemens (617-480-7732) for Radford AAP as they perform their review of WPA 9. VDEQ stated that WPA 9 comments will be made available the first week of October.

VDEQ agreed in the future to send out "draft" comments initially in order to allow the Army to address the issues more expeditiously and allow for the removal of comments when they become finalized.

USEPA agreed to accept these meeting minutes as the Army's response to draft USEPA comments.

The Army will submit formal responses to VDEQ's comments on WPA 12, since those comments were submitted as final.

**3. Project schedule**

The Army stated that adjusted project schedules will be provided for WPA 9 and 12 once WPA 9 comments are received/resolved and BTAG issue are resolved. At this time it is estimated that IT could be in the field in the November/December 2001 timeframe.

**4. Background Study**
Verified with EPA and VDEQ that the intent of the most recent comments from VDEQ was to have a single value for background that represented the 95% UTL calculated from a single combined data set. This was confirmed. IT will calculate these values and have them ready for distribution by COB 28 September.

**5. SSP Issues**
The group agreed that the remaining issues related to the SSP are to be resolved at the proposed BTAG meeting.

SITE SPECIFIC ISSUES

**Former Lead Furnace Area (FLFA)**
Jerry Redder from ATK provided a description and status of the non-ER, A funded project currently being executed at SWMU 17. He also discussed the solid waste permit being pursued at SWMU 17 as requested by VDEQ.

Based on review of the additional figures and tables provided for FLFA, and explanation provided by the Army, EPA and VDEQ tentatively approved the proposed sampling locations and analyte suites with the following issues pending resolution:

- The Army/ATK is to look for existing data/information regarding SWMU 76.
- Mark Leeper (VDEQ) will look into the Commonwealth's specific concerns at SWMU 17 that may relate to FLFA.
- The appropriate lead screening level may be an open issue relative to BTAG. This will need to be discussed a the upcoming BTAG meeting.
- The Army needs to screen the site data again versus recalculated background lead levels.

**Building 4343**
Based on review of the additional figures and tables provided for Building 4343, and explanation provided by the Army, EPA and VDEQ approved the proposed sampling locations and analyte suites. Also, cyanide will be added to the analyte list for this site based on its general use in metal finishing operations.

The Army agreed to look at ways of moving forward more quickly with this site. The Army noted that the IAP workshop, scheduled for Spring 2002, will provide the best opportunity to discuss moving project phases and funding.

**New River**

**Building Debris Disposal Trench (BDDT)**

The Army addressed or received clarification regarding several of VDEQ's comments. EPA believes that BTAG will want to discuss BDDT at the upcoming meeting.

Based on review of the additional figures and tables provided for BDDT, and explanation provided by the Army, EPA and VDEQ approved the proposed sampling locations and analyte suites. The Army agreed to modify the figure presented to show the extent of rip-rap at BDDT. This rip-rap extends to Avenue A though this is not evident on the figure.

**Igniter Assembly Area (IAA)**

Based on review of the additional figures and tables provided for IAA, the Army agreed to increase the number of samples collected as follows:

- Three additional subsurface soil samples will be collected and analyzed for TAL metals in the vicinity of IASB05 at a depth interval of 4-6 feet bgs (depth of elevated mercury detection).
- Three surface soil samples will be collected and analyzed in the vicinity of both SS11 and SS-12 (six additional samples).
- One subsurface soil sample from the 2-4 foot interval will be collected in the vicinity of both SS-11 and SS-12 (two additional samples).
- TAL metals analyses will be included at the other proposed sampling locations contained in WPA 12 for IAA.

**Northern Burning Ground (NBG)**

Based on review of the additional figures and tables provided for NBG, and explanation provided by the Army, EPA and VDEQ approved the proposed sampling locations and analyte suites.

**Western Burning Ground (WBG)**

Based on review of the additional figures and tables provided for WBG, and explanation provided by the Army, EPA and VDEQ tentatively approved the proposed sampling locations and analyte suites pending the outcome of the forthcoming BTAG meeting. Drew Rak recommended that surface water data be compared to Ambient Water Quality Criteria instead of MCL's in preparation for the BTAG meeting.

**Rail Yard**

Based on review of the additional figures and tables provided for the Rail Yard, and explanation provided by the Army, EPA and VDEQ tentatively approved the proposed sampling locations and analyte suites pending verification of site drainage and topography in the southeast portion of the site in the area near the unnamed creek.

**DRAFT Summary of Total Soil Data at Radford**
**Upper Tolerance Limits (UTLs)**

| Chemical | MMA/NRU and Surface/Subsurface Soil Data | | | | Residential Screening RBC [c], mg/kg | Industrial Screening RBC [c], mg/kg | Background Basis |
|---|---|---|---|---|---|---|---|
| | Frequency of Detection | Range of data, mg/kg | Statistical Distribution [a] | 95% UTL mg/kg [b] | | | |
| ALUMINUM | 79/79(100) | 3,620 - 47,900 | L | 40,041 | 7,800 | 200,000 | 95% UTL |
| ARSENIC | 76/79(96) | 1.2 - 35.9 | L | 15.8 | 0.43 | 3.8 | 95% UTL |
| BARIUM | 63/79(80) | 23.4 - 174 | L | 209 | 550 | 14,000 | RBC |
| BERYLLIUM | 40/79(51) | 0.61 - 5.4 | U | 1.02 | 16 | 410 | RBC |
| CADMIUM | 13/79(16) | 0.62 - 2.5 | NP | 0.69 | 3.9 | 100 | RBC |
| CHROMIUM | 79/79(100) | 6.3 - 75.8 | L | 65.3 | 23 | 610 | 95% UTL |
| COBALT | 57/79(72) | 5.9 - 130 | L | 72.3 | 160 | 4,100 | RBC |
| COPPER | 77/79(97) | 1.6 - 38.7 | L | 53.5 | 310 | 8,200 | RBC |
| IRON | 79/79(100) | 7,250 - 67,700 | N | 50,962 | 2,300 | 61,000 | 95% UTL |
| LEAD | 79/79(100) | 2.1 - 256 | U | 26.8 | 400 | 1,000 | RBC |
| MANGANESE | 79/79(100) | 16.7 - 2,040 | L | 2,543 | 160 | 4,100 | 95% UTL |
| MERCURY | 19/79(24) | 0.038 - 1.2 | NP | 0.130 | 0.78 | 20 | RBC |
| NICKEL | 63/79(80) | 4.6 - 94.2 | L | 62.8 | 160 | 4,100 | RBC |
| THALLIUM | 16/79(20) | 1.3 - 5.0 | NP | 2.11 | 0.55 | 14 | 95% UTL |
| VANADIUM | 79/79(100) | 12.2 - 114 | L | 108 | 55 | 1,400 | 95% UTL |
| ZINC | 79/79(100) | 4.7 - 598 | L | 202 | 2,300 | 61,000 | RBC |

[a] Statistical Distribution: N = Normal distribution; L = Lognormal distribution; U = Undetermined distribution; NP = Nonparametric distribution for data sets with greater than 50% nondetects.

[b] 95% Upper Tolerance Limit calculated for the indicated distribution.

[c] RBC = Region III risk-based concentration adjusted for a Hazard Quotient = 0.1 to account for potential cumulative effects (dated May 8, 2001).

Note: Highlighted values are below the residential screening RBC.

P.O. Box 2
Radford, VA 24141-0099

RE: Facility Wide Background Study Report
Main Manufacturing Area, Horseshoe Area, and New River Unit
Surface & Subsurface Soils
Radford Army Ammunition Plant

Dear Mr. McKenna:

Having reviewed the revised surface soil and subsurface soil data, the statistical analysis of that data, including the soil type groupings and the 95% Upper Tolerance Limits, and having compared it with much of the currently existing site data, additional consideration was given to the practical application of this background data to the site screening process. Each potentially contaminated site at the facility is located in an area where excavation of surface soils has occurred at some point in the facility operations; therefore, the technical rationale behind a statistical comparison of surface soil, natural area, background data to surface soil, excavated area, site data is questioned.

Given the conditions of mixed surface and subsurface soils at the potentially contaminated sites, it is recommended that the background data for both surface and subsurface soils be combined for each element to determine the 95% UTL to be used, in conjunction with the US EPA Region III RBCs for human health risk screening, and with various ecological screening data for ecological risk screening purposes. This will not only simplify the screening process, but will add power to the statistical comparison and prevent the unnecessary, and costly, carrying forward of naturally occurring elements into the full fledged risk assessment process.

This recommendation has been made following consultation with Mr. Robert Thomson, US EPA Region III. If you have any questions regarding this matter, please contact Mr. Mark Leeper at (804) 698-4308.

Very truly,

Sharon Skutle Wilcox
Office Of Remediation Programs

## McKenna, Jim

**From:** McKenna, Jim
**Sent:** Wednesday, August 22, 2001 7:00 AM
**To:** sharon wilcox (E-mail); rob thomson (E-mail); Mark Leeper (E-mail)
**Cc:** john e tesner (E-mail); Andrew Rak (E-mail); Redder, Jerome
**Subject:** Background Study, Tables

All:

Attached file contains the table of concentrations for surface and subsurface soil per the 17 July 2001 meeting. From the 17 July meeting we agreed to hold a conference call to wrap up VDEQ's comments on the background study. Also attached the meeting minutes I sent out on 8/1/2001. Don't know what everyone's schedule is but I'd like to get this done this Friday or early next week. John Tesner will send out a separate email to coordinate this call.

Thanks,

Jim

| IRON | 63000 (28) | 62,093 | 25,258 | 63000 (28) | 62,093 | 25,258 | | | | 2,300 | 61,000 | 62,043 [1] |
| LEAD | 225 (28) | 219 | 35.5 | 225 (28) | 219 | 35.5 | | | | 400 | 1,000 | RBC [2] |
| MANGANESE | 2040 (28) | 4,202 [d] | 1,193 | 2040 (28) | 4,202 [d] | 1,193 | | | | 160 | 4,100 | 4,202 [1] |
| NICKEL | 18.1 (28) | 10.8 | 8.3 | ND (4) | ND | ND | 18.1 (24) | 19.3 [d] | 9.5 | 160 | 4,100 | RBC [2] |
| VANADIUM | 101 (28) | 92.1 | 41 | 101 (28) | 92.1 | 41 | | | | 55 | 1,400 | 92.1 [1] |
| ZINC | 216 (28) | 169 | 56 | 216 (24) | 161 | 52 | 65.9 (4) | 84.1 [d] | 65.5 | 2,300 | 61,000 | RBC [2] |

[a] 95% Upper Tolerance Limit (UTL) calculated for the indicated distribution. For sample sizes with 4 data points, the normal UTL was calculated.

[b] Upper Confidence Limit calculated for the indicated distribution
ND = there were no detected samples for this chemical and the UCL was not calculated.

[c] RBC = Region III risk-based concentration adjusted for a Hazard Quotient = 0.1 to account for potential cumulative effects (dated May 8, 2001).

[d] Calculated UTL exceeds maximum value.

Note: Highlighted values are below the residential screening RBC.

**Recommended Concentrations**

(1) Per VaDEQ comment letter of 2 April and meeting of 17 July, this element is to be considered as a single data group. The calculated UTL is recommended for the background concentration.

(2) Calculated values are below the Residential Screening RBC. It was agreed during the meeting of 17 July that the residential RBC would be the appropriate background concentration.

(3) The UTL for the combined data set falls between the UTLs for the Group 1 and Group 2 data sets. Arsenic is the only metal in this group. Therefore, it is recommended that a single value (calculated UTL from the combined data set) be used for the background concentration.

## DRAFT Summary of Background Subsurface Soil Data at Radford

| Chemical | Combined MMA and NRU | | | VaDEQ Group 1 | | | VaDEQ Group2 | | | Residential Screening RBC [c], mg/kg | Industrial Screening RBC [c], mg/kg | Recommend. Conc. |
|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | Max. Conc., mg/kg (sample size) | 95% UTL mg/kg [a] | 95% UCL mg/kg [b] | Max. Conc., mg/kg (sample size) | 95% UTL mg/kg [a] | 95%UCL mg/kg [b] | Max. Conc., mg/kg (sample size) | 95% UTL mg/kg [a] | 95% UCL mg/kg [b] | | | |
| ALUMINUM | 47900 (51) | 44,557 | 20,413 | 21100 (11) | 25,205 [d] | 15,631 | 47900 (40) | 53,207 [d] | 22,720 | 7,800 | 200,000 | 44,557 [3] |

[a] 95% Upper Tolerance Limit calculated for the indicated distribution.

[b] 95% Upper Confidence Limit calculated for the indicated distribution

[c] RBC = Region III risk-based concentration adjusted for a Hazard Quotient = 0.1 to account for potential cumulative effects (dated May 8, 2001).

[d] Calculated UTL exceeds maximum value.

Note: Highlighted values are below the residential screening RBC.

**Recommended Concentrations**

(1) Per VaDEQ comment letter of 2 April and meeting of 17 July, this element is to be considered as a single data group. The calculated UTL is recommended for the background concentration.

(2) Calculated values are below the Residential Screening RBC. It was agreed during the meeting of 17 July that the residential RBC would be the appropriate background concentration.

(3) The UTL for the combined data set falls between the UTLs for the Group 1 and Group 2 data sets. Aluminum and vanadium are the only metals in this group. Therefore, it is recommended that a single value (calculated UTL from the combined data set) be used for the background concentration.

SUMMARY OF MEETING MINUTES

Jim McKenna began the meeting at 9:15 with a brief history of the Background Study, providing an overview of the project to date, followed by introductions of the participants and their respective roles in the project.

Sharon Wilcox asked why the Parson's background data from 1996 data was not incorporated. John Tesner indicated that there were issues that related to sample locations (i.e., some of the sample locations did not have coordinates) and collection that compromised the quality of the data; therefore, the Army withdrew this report with EPA consent.

After completion of project overview, John Tesner explained the meeting objective, which was to discuss the technical concerns of Virginia Department of Environmental Quality (VDEQ) relative to the method used by the Army to calculate inorganic background concentrations.

John Tesner then asked Cindy Hassan to briefly outline of background study process and the statistical procedures used to develop the calculated background concentrations. Ms. Hassan then proceeded to describe the technical approach used by IT and acknowledge that there are other methods, such as the Tukey statistical method used by VDEQ, to arrive at similar results.

Sanjay Thirunagari asked Cindy Hassan if before she proceeded further into the explanation of the statistical approach to explain what the ultimate use of the background data would be. Sanjay Thirunagari discussed that VDEQ had grouped data by soil type, while IT had relied more heavily on the physical description and chemistry and had grouped the data sets as surface and subsurface). He commented that we can still make this data work so that a background data set can be achieved for use on the project.

Cindy Hassan explained that there were three points to consider when looking at soil types and ultimate use of the data. The first point being that there was significant consideration given in the field to selection of samples by soil type, and data from the different sets had been combined by individual elemental comparisons across different soil types. The second point is that the Chemicals of Potential Concern (COPCs) will be selected by comparison to U.S. Environmental Protection Agency (USEPA) Region III risk based concentrations (RBCs). Those chemicals with detected concentrations less than the respective RBC will be dropped from further consideration as a COPC. Once COPCs are selected then the data will be compared to background levels. At that point, it will be appropriate to consider soil type and look at elemental composition of site samples relative to background comparison samples. The third point is that the existing background samples were selected from representative soil types to provide a data set that could be developed into a quick reference set of background comparison values.

Cindy Hassan then went on to address VDEQ's first concern regarding combination of background data sets and explained that the soil characteristics were considered during the combination of different data sets among the similar soil types. This combination was based upon a physical and chemical properties of each soil type; similar soil types were grouped together. The study identified four soil groups in the New River Unit (NRU) and three major groups in the Main Manufacturing Unit (MMA).

John Tesner and Jim McKenna commented that the soil types encountered were based on the selection of background locations that would be representative of areas that contained Solid Waste Management Units (SWMUs).

Cindy Hassan explained that for each soil type a qualitative evaluation between soil types was performed in which the physical and chemical composition of each type was compared. The

conclusion of this evaluation was that the soil types were similar enough that data sets could be combined into one data set for the surface soil and one data set for the subsurface soil.

Cindy Hassan then began a brief discussion of the outlier issues explaining that the data sets were reviewed for possible extraneous data values, but their analyses did not result in the rejection of data. Since these locations were specifically selected to represent background, there was a reluctance to eliminate a data point unless there was a Quality Control concern. IT's review of the data did not reveal a justification to remove data points from the background population. Cindy Hassan then explained that the background data set was used to derive point estimate values using the 95 percent Upper Confidence Level (UCL) on the mean and 95 percent Upper Tolerance Level (UTL) approaches. Previous discussion and comments from EPA indicated that EPA had agreed to a preference to use the 95 percent UTL approach.

Sanjay Thirunagari then expressed that it will be key for VDEQ to know how the background data will be used. After which the group can then look at methodology derivation of background estimates.

Drew Rak then explained that the primary use would be as background comparison criteria for use in the following:

1. Site screening process (SSP) (95% UTL approach).
2. Background comparison in RFI (mean-to-mean comparison e.g., t-test).

The different soil types in the MMU and the NRU were being combined in order to achieve the power and confidence necessary for a meaningful means comparison. Drew Rak noted that the low number of samples per soil type in the VDEQ analysis would not allow for a meaningful mean-to-mean comparison.

Drew Rak reviewed the flowchart for statistical evaluation as depicted in the meeting handout. He then explained that the previous 1996 soil data was used to estimate the number of sampling locations for this background study. The minimum relative detectable difference and coefficient of variation were used to predict the number of samples to collect. This approach and number of sample locations was discussed and agreed to by Dr. Lynn Flowers of EPA, as well as EPA's subsequent approval of Work Plan Addendum 10. Drew Rak then proceeded to describe the screen out of macronutrients.

Drew Rak explained that elements with a low number of detections (greater than 80 percent below detection limit) were dropped from the statistical process. As a result, there were smaller, but focused data sets containing 14 elements for surface and 16 for subsurface. During the comparison between data sets, there was generally good agreement between NRU and MMA data and also between surface and subsurface data. The surface and subsurface data sets were kept separate due to separate pathways evaluations that are completed during risk assessment.

Hassan Kaceli explained that VDEQ is looking at the differences in the seven different soil types in the two areas; certain soil types could be combined then compared statistically.

Sanjay Thirunagari referenced his previous question that the ultimate use of the data should be determined. For onsite detections, they should be below the 95 percent UTL. The mean of onsite data could be compared to the mean of background data set with an appropriate statistical test. He expressed concern that combination of soil types could mask differences between soil types.

Sanjay Thirunagari indicated that he had no problem with 95 percent UTL, or mean-to-mean comparison if background data are normally distributed and random sampling was conducted. The 95 percent UTL approach should be used if a grid sampling approach is used.

Rob Thomson/Alvaro Alvarado commented that USEPA has experience with many Federal facilities that have many AOCs; for areas with low risk it is difficult to prove there is no risk. It is important that we focus on sites where we have an obvious risk.

John Tesner re-iterated that sites will be screened by a comparison with RBCs. Sharon Wilcox and Sanjay Thirunagari commented that values below the RBCs will not be a concern.

Hassan Kaceli commented that the data NRU & MMA can be combined; any sample with the same soil type can be grouped by each element. Sanjay Thirunagari elaborated that, for example, the Unison soil type with similar elemental compositions could be combined in one background data set. For risk assessment, surface data would be combined to evaluate risk. Then samples within same soil type would be combined and the risk from each background soil type would be compared to the constituents contained in the site surface soil.

Sharon Wilcox clarified the VDEQ proposed grouping of the different soil types by each element into two groupings for surface soil and two grouping for subsurface soil. She used the example of Subsurface Group 1 would contain soil types except Unison. Group 2 would contain the other soil types. Alvaro Alvarado indicated that VDEQ's approach made sense. John Tesner asked for additional clarification of the element by element basis, with each element having either one or two soil groups. There were several minutes of discussion relative to soil types and the low number of samples that may be available in a particular group, for example Arsenic, which could have a data set with only 4 data points.

John Tesner pointed out that the statistical evaluation performed by the Army resulted in seven elements that did not pass the statistical evaluation. These seven elements are different than the seven elements VDEQ indicated are statistically different. John Tesner indicated that soil type comparison was done on a qualitative basis. Drew Rak pointed out that the VDEQ approach requires that the 95%UTL approach be used for derivation of background values. Sanjay Thirunagari questioned whether the UTL could be used with four data points. Alvaro Alvarado indicated that for arsenic in Unison Soil, the arsenic concentration is less than 10 ppm, and at

that concentration, this level will not drive a risk that will result in cleanup. Sanjay pointed out that it is a mute point (there was a general comment regarding 20 ppm); do not have to worry over arsenic risk. John Tesner emphasized the point that for many of the elements the derived background concentration is less than the RBC.

Bob Goodman provided the following calculated background values (in milligrams per kilogram) using the Army combined data set and the VDEQ Groups 1 and 2.

| | rmy ombined ata Set | VDEQ Group 1 | VDEQ Group 2 |
|---|---|---|---|
| Al | 20 | 16 | 23 |
| Ba | 67 | 51 | 140 |
| Pb | 13 | 11 | 520 |

*Small data set*

Drew Rak commented that with small data sets; the approach will capture variability by using the 95 percent UTL to calculate background values. Sanjay Thirunagari commented that to use the 95 percent UTL approach the data set must have a normal distribution; otherwise, the maximum value will be used for a non-normal distribution.

John Tesner commented that the SSP currently includes a surface and a sub-surface table of background point values that were derived using UTL calculations. Using the VDEQ approach including soil types for each element, what will those tables look like now? There is an expectation that comparison to these values will provide a decision point. Rob Thomson commented that background numbers that are too low will result in remediation of too many sites; if a higher number is selected, then too few are remediated. Sharon Wilcox indicated that the RBC would be the driving number.

There were several minutes of discussion as the group worked through two examples using aluminum and beryllium to illustrate the VDEQ methodology of looking at each element and whether it has a single soil group or two groups. If there is more than one group for the particular element, then the data set should be selected that matches the soil type of the environmental sample. Once the data set is selected (Group 1 or Group 2), then if the data set distribution is normal, then the 95 percent UTL calculated value will be used for background point comparison. If the Group 1 or 2 data set distribution is non-normal, then the maximum value of the background data set is used as point comparison value. Sanjay Thirunagari indicated that he was comfortable with the point to point comparison and use of the 95 percent UTL; however, all site sample points must pass the comparison. There was general discussion that the Army will apply the VDEQ approach to the data sets and generate a new set of background numbers for comparison. Sanjay Thirunagari indicates that if the numbers

calculated by the VDEQ approach is similar to the numbers calculated by the Army, then VDEQ may accept the Army approach.

Jim McKenna and John Tesner indicated that the Army would create a new background point-values table using the VDEQ approach and compare with existing Army background point values. If the values are close, then the group will proceed with finalization of the report using the current statistical approach utilized by the Army. Sharon Wilcox indicated that VDEQ will be satisfied with that approach if VDEQ values are close to the Army values. The Army will prepare the table and submit in a letter to VDEQ for review.

Jim McKenna requested a discussion of the outliers in the letter to make sure that VDEQ outstanding comments are addressed. Cindy Hassan indicated that based on the box and whisker plots that were completed as part of the outlier evaluation, the outlier do not have a significant impact on the data. Alvaro Alvarado expressed caution in deleting a data point. Sharon Wilcox wants notification of outliers that are used as maximum values. Cindy Hassan indicated that typically outliers are discussed in the uncertainties section of the Risk Assessment. Sanjay Thirunagari indicated that if the outliers made a significant difference in the calculated background values, then resampling may be required. Jerry Redder recommended that in the new table, outliers that have a significant impact for resampling to be identified. Sharon Wilcox expressed that the number of samples should be added to the table.

John Tesner then summarized saying that the Army would put a new table together, which would contain the background point values using the 95 percent UTL (for SSP and RFI application) and UCL (for informational) approaches for the soil types as defined in the VADEQ analyses. This table will also contain the sample size that was used for these UTL/UCL calculations and the residential and industrial RBC's for the compounds. This table will be distributed to the group. A time frame of Mid-August was suggested for the table completion and a conference call. The meeting adjourned at 12:45 p.m.

Subject: FW: Background Study Response to Comments

Rob,

Per my email about two weeks, I promised we would send our detailed response to the VADEQ's review comments on the Facility Wide Background Study Report. It is in the attached file below. Also we have provided a response to EPA's draft comments received via 4/16/2001 email and it is attached as separate file below.

I have reviewed what John Tesner has prepared in these files and concur. I would re-iterate I do not like the direction VADEQ is taking and perhaps a Richmond, VA meeting would be in order.

John, I'm officially off today and I don't have time to convert these files into WP so please follow up with Rob ASAP/today to ensure that he has readable/workable electronic files.

Thanks,
Jim

**Subject:** Background Study Response to Comments

Response to comments EPA.doc

Response to comments VADEQ.do

Jim-
As discussed. Let me just say a couple things. After riding the fence a bit regarding level of detail, I made the decision to go with the format you see. I didn't think the other info provided by the others, could be explained or presented easily. That leads into why you'll see a suggestion for a meeting at the end of the VADEQ comments. At this point I recommend it. We could even do it in Richmond if its more palatable, but I think face to face will help.

Also, if you find stupid spelling/grammatical errors, target me first. I was the author of the re-write, but had a lot of input from Drew, IT, and to some extent URS.

JT
<<Response to comments EPA.doc>> <<Response to Comments VADEQ.doc>>

Response to Draft Comments from USEPA Region III (transmitted via e-mail 16 April 2001)
Draft Facility-Wide Background Study Report
Radford Army Ammunition Plant

General: Comments from USEPA are considered to be in **Draft** until VADEQ comments are reconciled and incorporated.

1. **Comment: Section 2.4, Field Sampling, Page 2-2:** This section does not contain a subsection discussing field observations and air monitoring (PID) readings. Please revise this section to include a discussion of significant field observations and air monitoring readings obtained during the sampling events.
**Response:** Section 2.4 will be revised to include a discussion of field observations and air monitoring data.

2. **Section 4.1.1, Analytical Methodology, page 4-1:** The third paragraph states that PID screening was used to monitor organic compounds and relocate borings as necessary. Section 2, Background Sampling, did not contain a discussion of field activities or air monitoring readings. Please revise the text to indicate what levels detected on the PID would have necessitated a relocation of the boring and which, if any, boring location(s) were relocated as a result of PID readings.
**Response:** Section 4.1.1 will be revised to evaluate the revised Sec.2 (Comment #1) and clarify whether borings were relocated and why.

3. **Section 4.1.1, Analytical Methodology, page 4-1:** The second paragraph of 4.1.1 states that "Results demonstrated that selected locations did not exhibit explosive contamination or were not impacted by previous facility operations associated with releases." If this is true, then any location on either facility having non-detect for explosives would be non-impacted by DoD operations regardless of other TCL or TAL findings at these future sampling locations. Please amend this sentence to read "Results indicated that selected locations did not exhibit explosive contamination or were not impacted by previous facility operations associated with releases."
**Response:** Sentence will be revised as proposed.

4. **Section 4.1.2, Data Validation and Qualifiers, pages 4-1 and 4-9:** The discussions of this section are focused upon target analyte list (TAL) metals, and omit TCL considerations. Since samples were analyzed for TCL VOC and SVOC, their data quality evaluation criteria should be included within this section. Please revise the text to include a discussion of the VOC and SVOC data validation and qualifiers.
**Response:** Section 4.1.2 will be revised to include a discussion of VOC and SVOC data validation including qualifiers.

5. **Section 4.2, Statistical Approach, pages 4-10 through 4-20:** This section details the statistical methodology utilized for this background study. Table 4-8,

Statistical Test, describes the equations utilized for the necessary calculations; and Tables 4-9, Surface Soil Statistical Summary and 4-10 Subsurface Soil Statistical Summary, describe the results of the individual statistical tests conducted. The actual calculations and variables utilized are not provided in the report for verification. Please include an additional table or appendix which details the individual calculations conducted in this section.
**Response:** The output for each of the statistical analyses will be provided in an appendix.

6. **Section 4.3, Confidence Limits, pages 4-20 through 4-24:** This section details the statistical methodology utilized to calculate the 95% upper confidence limit (UCL) for the combined data sets. Table 4-8, Statistical Tests, describes the equations utilized for the necessary calculations and Tables 4-11, Occurrence and Distribution of Chemicals Combined Surface Soil (MMA and NRU) and 4-12 Occurrence and Distribution of Chemicals Combined Subsurface Soil (MMA and NRU), describe the results of the individual statistical tests conducted. The actual calculations and variables utilized are not provided in the report for verification. Please include an additional table or appendix which details the individual calculations conducted in this section.
**Response:** The output for the 95% UCL calculations will be provided in an appendix.

7. **Section 4.1.3, Data Grouping, page 4-20:** The last paragraph of this section states that the coefficient of variation (CV) was used to evaluate the data variability for element distribution across soil type, with elements having CVs of less than one being grouped together, and elements with CVs greater than one further evaluated to address the causes of variability. This step is not depicted in Figures 4-1 and 4-2. Please include this step in the appropriate figures, and elaborate on the use of CVs and the resulting groups formed based on the outcome of these calculations.
**Response:** The flow chart will be expanded and language will be added to the text to elaborate on the use of the CV in the decision-making process.

8. **Table 4-11, Occurrence and Distribution of Chemicals Combined Surface Soil (MMA and NRU), page 4-22:** This table lists the 95% UCL in surface soils for the combined data sets (MMA and NRU). As it may be necessary in the future to view each area independently, the table should include the individual area calculations in addition to the combined 95% UCL calculation. Please revise the table to include the individual area (MMA and NRU) 95% UCL calculations in addition to the combined 95% UCL calculation.
**Response:** Table will be revised to include MMA and NRU 95% UCL numbers as well as the combined 95% UCL.

9. **Table 4-12, Occurrence and Distribution of Chemicals Combined Subsurface Soil (MMA and NRU), page 4-22:** This table lists the 95% UCL in subsurface soils for the combined data sets (MMA and NRU). As it may be necessary in the future to view each area independently, the table should include the individual

area calculations in addition to the combined 95% UCL calculation. Please revise the table to include the individual area (MMA and NRU) 95% UCL calculations in addition to the combined 95% UCL calculation.
**Response:** Table will be revised to include MMA and NRU 95% UCL numbers as well as the combined 95% UCL.

10. **Section 5.1, Background Sample Locations, page 5-1:** This section reads that "Additionally, semivolatile and volatile organic compounds were evaluated as secondary markers to substantiate the selection of true background locations. Analytical results demonstrated that organic contaminants had not impacted the selected locations, indicating that sample locations represented background conditions." The organic results were not provided in this report. Please revise the report to include the organic results obtained or delete those two sentences from the report.
**Response:** Organic results will be provided as an appendix.

11. **Section 5.1, Background Sample Locations, page 5-1:** This section reads that "Explosive results were negative, proving background sampling locations had not been impacted by RFAAP operations." If this is true, then any location on the Site having non-detect for explosives would be non-impacted by RFAAP operations regardless of other TCL or TAL findings at these future sampling locations. Please amend this sentence to read "Explosive results were negative, indicating background sampling locations had not been impacted by RFAAP operations."
**Response:** The sentence will be revised as suggested.

12. **Section 5:** The 95 % UCL was used as a point estimate of the background data. However, when we compare on-site contamination at RFI sites to background, we need to answer two questions: (1) Are there any hot spots on-site? (2) Is the average concentration on-site the same or higher than the average concentration of background? Given the data in the draft *Background Report*, we should be able to answer these questions for RFI type sites using hypothesis testing. Therefore, EPA is requesting that, for RFI sites, the Army propose a methodology (ies) in the draft revised *Background Report* for accomplishing this end.
**Response:** The 95% UCL was included in the report as a general point of reference, at the request of the Installation, for site prioritization purposes. At the time the Background Workplan was developed there was intent for point-to-point comparisons. As described in the Background Study Workplan, the intent was to use hypothesis testing for RFI sites. Such hypothesis testing would include tests for similarities in shape and location between the site and background data sets. Depending on these initial tests other tests (e.g., t-test or Mann-Whitney U, or Kolmogorov-Smirnov) would be used to assess whether there is a difference between the means. Likewise, statistical procedures also would be used for assessing outliers.

Although not contemplated during the development of the Site-Screening Process for Site Screening Areas (SSA), the 95% UCLs could be used for point-to-point

comparisons. However, using the 95% UCL as a single point comparison or background is very likely to result in classifying many chemicals as greater than background when they are not. This is due to the fact that the 95% UCL is an estimate of the mean, which would likely result in misclassification as much as 50 percent of the time. Therefore, the Army suggests that a 95% upper tolerance limit (95% UTL) approach be included in the Background Study report and used for point-to-point comparisons in the SSP.

The following discussion further explains the Army's position regarding UTL versus UCL:

*Three types of statistical intervals are often constructed from environmental data: Confidence, Tolerance and Prediction. They are mathematically similar, but have very different purposes:*

| ***Appropriate Use*** | ***Interval Type*** | ***Purpose*** |
|---|---|---|
| *Comparison Within A Single Population.* | *Confidence Interval:* | *To compare a compliance data set to a known standard (i.e., USEPA, 1989; 1992).* |
| *Comparison of Similar But Distinct Populations.* | *Tolerance Interval:* | *To define a concentration range from background data, within which a large proportion of compliance data should fall with high probability (i.e., USEPA, 1989; 1992).* |
| | *Prediction Interval:* | *To define a concentration range from background data, within which the next K compliance values should fall with high probability (i.e., USEPA, 1989; 1992).* |

*A Confidence Interval contains a specified population parameter (generally the mean) with a specified level of confidence (USEPA, 1989). " It offers little information about the highest or most extreme sample concentrations one is likely to observe over time" (USEPA, 1989). For these reasons, Confidence Limits are generally constructed on compliance data, not on background data. The limits for compliance data can then be compared to a known standard (e.g., an RBCs, MCLs, GWPSs) to assess if the mean value of the compliance data might be statistically above the standard (cf., VDEQ, 1998; 2000).*

*If a statistically robust data set, and thus good information about the population mean, is available (implying a tightly constrained confidence interval and low UCL), then a large portion of the population of individual values used to construct the UCL will actually be above the UCL. Therefore, an exceedance of the UCL by an individual sample result in a separate compliance population is not indicative of the site being above background.*

*The appropriate Interval to be constructed on background data for comparison to individual compliance points is a Tolerance Interval (USEPA, 1989; 1992). The UTL*

*approach compares individual compliance point sample values to individual values in the background population, e.g the 95th percentile of the population. If the compliance population is within background, we expect no more than 5% individual values to be above the 95th percentile of the background population. Tolerance intervals are robust for normally distributed data. For lognormal data sets, lognormal tolerance intervals can be constructed; however, caution must be used to discern spurious results. In the event that a data set is lognormally distributed and the results of a lognormal tolerance interval calculation appear erroneous (based on a UTL that is an outlier as compared to the known spread of the background data set), one should use a prediction interval approach on the lognormal data.*

Hot spots need to be defined by two parameters: aerial extent and concentration. The size of a hot spot is best examined through adequate sampling design. The concentration that defines a hot spot can be addressed through a risk-based comparison or through a background-based comparison. Both of the extent and the concentration parameters require proper sampling plan development. The number of samples at the SSAs is unlikely to be adequate for statistical hot-spot evaluation. Hot-spots are best addressed with purposeful sampling at suspected release points for the SSP. The hot-spot issue at RFI sites will be addressed during the development of the RFI Work Plans.

13. **Section 5:** Please include language in Section 5 stating that the Facility-Wide inorganic point estimates for surface soil "background" and subsurface soil "background" can be used in the evaluation of Site-Screening Areas.
**Response:** The suggested language will be added to Section 5.

14. **Appendix A, Drilling Log MMAU1:** This drilling log does not show PID screening readings. Please clarify why readings were omitted on this boring or revise the log to indicate the PID readings obtained.
**Response:** Log will be revised to indicate PID readings.

15. **Appendix B, Data Validation Reports:** This appendix does not contain the VOC and SVOC data validation and summary sheets. Please revise this appendix to include the VOC and SVOC data validation package and sample summary sheets.
**Response:** Appendix B will be revised to include VOC and SVOC data validation data and sample summary sheets.

---

Response to Comments from VADEQ (April 2, 2001)
Draft Facility-Wide Background Study Report
Radford Army Ammunition Plant

General: Comments from VADEQ are considered to be **Final** and will need to be reconciled and incorporated with USEPA, Region III comments.

**Comment:**
Based upon their statistical evaluation of the analytical data provided in the report, surface and subsurface soils should be evaluated separately. Within each stratum (surface and subsurface) data for each chemical constituent (aluminum, antimony, arsenic, etc.) can be grouped into either one or two groups by soil type (Braddock, Unison, Wheeling, etc.).

The Department used the Tukey method[1] to conduct simultaneous comparison of the constituent mean concentrations, by chemical constituent, for the seven different soil types at a 95% confidence limit. The resulting groups observed for each surface soil chemical constituent are marked with a code 1 or 2. Surface soil types with code "1" may be combined into one data set and those with code "2" may be combined into second data set for each chemical constituent. Data sets marked with an asterisk (*) contain outliers that should not be included in the data set for the background comparison. See Table 1 below.

For example, the cobalt data for the Braddock Loam and Groseclose and Poplimento Silt Loam in the surface soil types can be combined into one statistical data set; and the cobalt data for the Unison-Urban Land Complex, Wheeling Sandy Loam, Cabro Silty Clay Loam, Lowell Silt Loam, and Wurno-Newberg-Faywood Silt Loam surface soil types can be combined into a second statistical data set. Statistical comparisons from future potentially contaminated sites would compare aluminum data from a surface soil sample in Braddock Loam to aluminum data from the Braddock Loam and Groseclose and Poplimento Silt Loam data set.

**Table 1 Surface Soil Groupings**

| Constituents | Braddock | Unison | Wheeling | Cabro | Groseclose | Lowell | Wurno |
|---|---|---|---|---|---|---|---|
| Aluminum | 1 | 1 | 1 | 1 | 1 | 1 | 1 |
| Antimony | 1 | 1 | 1 | 1 | 1 | 1 | 1 |
| Arsenic | 1 | 2 | 1 | 1 | 1 | 1 | 1 |
| Barium | 1 | 1 | 2 | 1 | 1 | 1 | 1 |
| Beryllium | 1 | 1 | 2 | 1 | 1 | 2 | 2 |
| Cadmium | 1 | 1 | 1 | 1 | 1 | 1 | 1 |
| Chromium | 1 | 1 | 1 | 1 | 1 | 1 | 1 |
| Cobalt | 1 | 2 | 2 | 2 | 1 | 2 | 2 |
| Copper | 1 | 1 | 1 | 1 | 1 | 1 | 1 |
| Iron | 1 | 1 | 1 | 1 | 1 | 1 | 1 |
| Lead | 1 | 1* | 1 | 1 | 1 | 1 | 1 |
| Maganese | 1 | 1 | 1 | 1 | 1 | 1 | 1 |
| Mercury | 1* | 1 | 1 | 1 | 1 | 1 | 1 |
| Nickel | 1 | 2 | 2 | 2 | 2 | 2 | 2 |
| Selenium | 1 | 1 | 1 | 1 | 1 | 1 | 1 |
| Silver | 1 | 1 | 1 | 1 | 1 | 1 | 1 |
| Thallium | 1 | 1 | 1 | 1 | 1 | 1 | 1 |
| Vanadium | 1 | 1 | 1 | 1 | 1 | 1 | 1 |
| Zinc | 1 | 1* | 2 | 1 | 1 | 1 | 1 |

Similarly, subsurface soil has been marked with code 1or 2. Soil types with code "1" may be combined as one background data set and those with code "2" may be combined as a second background data set for each constituent.

**Table 2 Subsurface Soil**

| Constituents | Braddock | Unison | Wheeling | Cabro | Groseclose | Lowell | Wurno |
|---|---|---|---|---|---|---|---|
| Aluminum | 1 | 2 | 2 | 1 | 2 | 2 | 2 |
| Antimony | 1 | 1 | 1 | 1 | 1 | 1 | 1 |
| Arsenic | 1 | 1 | 1 | 1 | 1 | 1 | 1 |
| Barium | 1 | 1 | 2 | 1 | 1 | 1 | 1 |
| Beryllium | 1 | 1 | 1 | 1 | 1 | 1 | 1 |
| Cadmium | 1 | 1 | 1 | 1 | 1 | 1 | 1 |
| Chromium | 1 | 1 | 1 | 1 | 1 | 1 | 1 |
| Cobalt | 1 | 2 | 2 | 2 | 2 | 2 | 2 |
| Copper | 1 | 2 | 2 | 1 | 2 | 2 | 2 |
| Iron | 1 | 1 | 1 | 1 | 1 | 1 | 1 |
| Lead | 1 | 2 | 1 | 1 | 1 | 1 | 1 |
| Maganese | 1 | 1 | 1 | 1 | 1 | 1 | 1 |
| Mercury | 1 | 1 | 1 | 1 | 1 | 1 | 1 |
| Nickel | 1 | 2 | 2 | 2 | 2 | 2 | 2 |
| Selenium | 1 | 1 | 1 | 1 | 1 | 1 | 1 |
| Silver | 1 | 1 | 1 | 1 | 1 | 1 | 1 |
| Thallium | 1 | 1 | 1 | 1 | 1 | 1 | 1 |
| Vanadium | 1 | 2 | 1 | 2 | 1 | 1 | 1 |
| Zinc | 1 | 1* | 2 | 1 | 1 | 1 | 1 |

Notes for tables 1 and 2 on prior page:

* Indicates that soil type has outlier(s)

The detection limits for some of the constituents varied between soil types.

Based on the above information, the facility may develop two background data sets for surface and

subsurface soils.

The facility must conduct an outlier test on grouped background data sets as part of the revisions to this document and prior to developing the statistical limits for comparing on-site against background levels. Outliers from the background data set are to be excluded prior to establishing the 95% upper confidence limit (UCL) on the mean of the background data.

When performing statistical comparisons of the potentially contaminated area sample results to the background results, the facility may use a Student's t-test, provided the data sets follow normal distributions and other test specific assumptions (eg. variance). The facility also has the option to calculate the 95% upper confidence limit on background data (excluding outliers) and compare the individual on-site sample concentrations to the established UCL.

**Response**:
It is emphasized that the approach and methods used in the Background Study report had been accepted by both EPA Region III and VADEQ in the Workplan prior to its implementation. The Tukey method presented by VADEQ is no more valid a statistical approach than the Mann-Whitney, Student-t, and Levene's methods employed per the Workplan. Further, during presentation of the Workplan, the possibility of certain elements not "passing" the 95% confidence interval was discussed. This possibility was not considered to invalidate the data, rather that data would simply have to be evaluated within the appropriate context. It should be noted that the elements, identified by the Army, as failing the statistical tests were still relatively high in confidence interval albeit not 95%. Finally, these elements (aluminum, barium, iron, lead, vanadium, zinc) are rarely risk drivers in a risk assessment. A comparison of RBC values for these elements indicate that the calculated UCL is either below the residential RBC for that element or between the residential and industrial RBC values.

The approach recommended in VADEQ's comments represents a significant change. The implementation of the Commonwealth of Virginia's approach would be difficult since there would have to be at least four different background data sets for each element. This would inevitably lead to data sets that would not be statistically significant. The selection of the background data set would also have to change based on the soil type and element.

Another difficulty with the implementation of the Commonwealth's approach would occur when samples are collected that involve multiple soil types or where soil types are not clearly distinguishable. For example, which background data set would be used if the samples collected from the site are from multiple soil types and the background analysis indicated that there are differences between the data for some or all of the elements?

The Army proposes the following course of action. Evaluation of outlier will proceed using an appropriate statistical method (eg., Box and Whisker diagram). P-values will be evaluated using another statistical package to assess whether differences will result from the values already calculated. Finally, a meeting to discuss finalization of the Background Study report may prove to be more successful than multiple response and comment rounds.

Re: Radford Army Ammunition Plant
Draft Report submittals and reviews

Dear Mr. McKenna and Ms. Jake:

The U.S. Environmental Protection Agency (EPA) has reviewed the Army's draft *Facility-Wide Background Study Report*, dated January, 2001 for the New River Storage Depot (NRU), and the Radford Army Ammunition Plant (RAAP). Based upon our review, EPA has the following comments:

1. **Section 2.4, Field Sampling, Page 2-2:** This section does not contain a subsection discussing field observations and air monitoring (PID) readings. Please revise this section to

include a discussion of significant field observations and air monitoring readings obtained during the sampling events.

2. **Section 4.1.1, Analytical Methodology, page 4-1:** The third paragraph states that PID screening was used to monitor organic compounds and relocate borings as necessary. Section 2, Background Sampling, did not contain a discussion of field activities or air monitoring readings. Please revise the text to indicate what levels detected on the PID would have necessitated a relocation of the boring and which, if any, boring location(s) were relocated as a result of PID readings.

3. **Section 4.1.1, Analytical Methodology, page 4-1:** The second paragraph of 4.1.1 states that "Results demonstrated that selected locations did not exhibit explosive contamination or were not impacted by previous facility operations associated with releases." If this is true, then any location on either facility having non-detect for explosives would be non-impacted by DoD operations regardless of other TCL or TAL findings at these future sampling locations. Please amend this sentence to read "Results indicated that selected locations did not exhibit explosive contamination or were not impacted by previous facility operations associated with releases."

4. **Section 4.1.2, Data Validation and Qualifiers, pages 4-1 and 4-9:** The discussions of this section are focused upon target analyte list (TAL) metals, and omit TCL considerations. Since samples were analyzed for TCL VOC and SVOC, their data quality evaluation criteria should be included within this section. Please revise the text to include a discussion of the VOC and SVOC data validation and qualifiers.

5. **Section 4.2, Statistical Approach, pages 4-10 through 4-20:** This section details the statistical methodology utilized for this background study. Table 4-8, Statistical Test, describes the equations utilized for the necessary calculations; and Tables 4-9, Surface Soil Statistical Summary and 4-10 Subsurface Soil Statistical Summary, describe the results of the individual statistical tests conducted. The actual calculations and variables utilized are not provided in the report for verification. Please include an additional table or appendix which details the individual calculations conducted in this section.

6. **Section 4.3, Confidence Limits, pages 4-20 through 4-24:** This section details the statistical methodology utilized to calculate the 95% upper confidence limit (UCL) for the combined data sets. Table 4-8, Statistical Tests, describes the equations utilized for the necessary calculations and Tables 4-11, Occurrence and Distribution of Chemicals Combined Surface Soil (MMA and NRU) and 4-12 Occurrence and

Distribution of Chemicals Combined Subsurface Soil (MMA and NRU), describe the results of the individual statistical tests conducted. The actual calculations and variables utilized are not provided in the report for verification. Please include an additional table or appendix which details the individual calculations conducted in this section.

7. **Section 4.1.3, Data Grouping, page 4-20:** The last paragraph of this section states that the coefficient of variation (CV) was used to evaluate the data variability for element distribution across soil type, with elements having CVs of less than one being grouped together, and elements with CVs greater than one further evaluated to address the causes of variability. This step is not depicted in Figures 4-1 and 4-2. Please include this step in the appropriate figures, and elaborate on the use of CVs and the resulting groups formed based on the outcome of these calculations.

8. **Table 4-11, Occurrence and Distribution of Chemicals Combined Surface Soil (MMA and NRU), page 4-22:** This table lists the 95% UCL in surface soils for the combined data sets (MMA and NRU). As it may be necessary in the future to view each area independently, the table should include the individual area calculations in addition to the combined 95% UCL calculation. Please revise the table to include the individual area (MMA and NRU) 95% UCL calculations in addition to the combined 95% UCL calculation.

9. **Table 4-12, Occurrence and Distribution of Chemicals Combined Subsurface Soil (MMA and NRU), page 4-22:** This table lists the 95% UCL in subsurface soils for the combined data sets (MMA and NRU). As it may be necessary in the future to view each area independently, the table should include the individual area calculations in addition to the combined 95% UCL calculation. Please revise the table to include the individual area (MMA and NRU) 95% UCL calculations in addition to the combined 95% UCL calculation.

10. **Section 5.1, Background Sample Locations, page 5-1:** This section reads that "Additionally, semivolatile and volatile organic compounds were evaluated as secondary markers to substantiate the selection of true background locations. Analytical results demonstrated that organic contaminants had not impacted the selected locations, indicating that sample locations represented background conditions.". The organic results were not provided in this report. Please revise the report to include the organic results obtained or delete those two sentences from the report.

11. **Section 5.1, Background Sample Locations, page 5-1:** This section reads that "Explosive results were negative, proving

background sampling locations had not been impacted by RFAAP operations." If this is true, then any location on the Site having non-detect for explosives would be non-impacted by RFAAP operations regardless of other TCL or TAL findings at these future sampling locations. Please amend this sentence to read "Explosive results were negative, indicating background sampling locations had not been impacted by RFAAP operations.".

12. **Section 5:** The 95 % UCL was used as a point estimate of the background data. However, when we compare on-site contamination at RFI sites to background, we need to answer two questions: (1) Are there any hot spots on-site? (2) Is the average concentration on-site the same or higher than the average concentration of background? Given the data in the draft *Background Report*, we should be able to answer these questions for RFI type sites using hypothesis testing. Therefore, EPA is requesting that, for RFI sites, the Army propose a methodology(ies) in the draft revised *Background Report* for accomplishing this end.

13. **Section 5:** Please include language in Section 5 stating that the Facility-Wide inorganic point estimates for surface soil "background" and subsurface soil "background" can be used in the evaluation of Site-Screening Areas.

14. **Appendix A, Drilling Log MMAU1:** This drilling log does not show PID screening readings. Please clarify why readings were omitted on this boring or revise the log to indicate the PID readings obtained.

15. **Appendix B, Data Validation Reports:** This appendix does not contain the VOC and SVOC data validation and summary sheets. Please revise this appendix to include the VOC and SVOC data validation package and sample summary sheets.

This concludes EPA's review of the Army's draft *Facility-Wide Background Study Report*, dated January, 2001 for the NRU and the RAAP. The referenced draft *Report* is disapproved by EPA in its current form, and must be revised to reflect the comments above. **As it exists, the data presented in the current background *Report* cannot be used to eliminate contaminants of concern until the Report is finalized.** Per Part II, Section E.4.e. of the EPA RCRA Corrective Action Permit, the Army is required to revise the draft document and submit a revised draft copy to EPA for review within 60 days of the receipt of EPA comments on the draft document. Part II, Section E.4.f. of the Permit allows for an additional 20 days

for issuing the revised draft document to EPA, provided that timely notice is given, i.e. within 10 days. Additional time extensions can be requested under Part II, Section F. of the permit.

If you have any questions, please call me at 215-814-3357.

Sincerely,

Robert Thomson, PE

RE: Draft Facility-Wide Background Study Report
Radford Army Ammunition Plant, January 2001

Dear Mr. McKenna:

Thank you for the opportunity to review the above referenced document. I have had Mr. Sanjay Thirunagari and Mr. Hasan Keceli, of our Office of Technical Support review the Draft Facility-Wide Background Study Report, dated January 2001, for the appropriate application and interpretation of the statistical methods utilized.

Based upon their statistical evaluation of the analytical data provided in the report, surface and subsurface soils should be evaluated separately. Within each stratum (surface and subsurface) data for each chemical constituent (aluminum, antimony, arsenic, etc.) can be grouped into either one or two groups by soil type (Braddock, Unison, Wheeling, etc.).

The Department used the Tukey method[1] to conduct simultaneous comparison of the constituent mean concentrations, by chemical constituent, for the seven different soil types at a 95% confidence limit. The resulting groups observed for each surface soil chemical constituent are marked with a code 1 or 2. Surface soil types with code "1" may be combined into one data set and those with code "2" may be combined into second data set for each chemical constituent. Data sets marked with an asterisk (*) contain outliers which should not be included in the data set for the background comparison. See Table 1 below.

For example, the cobalt data for the Braddock Loam and Groseclose and Poplimento Silt Loam in the surface soil types can be combined into one statistical data set; and the cobalt data for the Unison-Urban Land Complex, Wheeling Sandy Loam, Cabro Silty Clay Loam, Lowell Silt Loam, and Wurno-Newberg-Faywood Silt Loam surface soil types can be combined into a second statistical data set. Statistical comparisons from future potentially contaminated sites would compare

1 Robert V. Hogg and Johannes Ledolter, Applied Statistics for Engineers and Physical Scientists, - 2nd ed. New York: Macmilllan Publishing Company, 1992

aluminum data from a surface soil sample in Braddock Loam to aluminum data from the Braddock Loam and Groseclose and Poplimento Silt Loam data set.

**Table 1 Surface Soil Groupings**

| Constituents | Braddock | Unison | Wheeling | Cabro | Groseclose | Lowell | Wurno |
|---|---|---|---|---|---|---|---|
| Aluminum | 1 | 1 | 1 | 1 | 1 | 1 | 1 |
| Antimony | 1 | 1 | 1 | 1 | 1 | 1 | 1 |
| Arsenic | 1 | 2 | 1 | 1 | 1 | 1 | 1 |
| Barium | 1 | 1 | 2 | 1 | 1 | 1 | 1 |
| Beryllium | 1 | 1 | 2 | 1 | 1 | 2 | 2 |
| Cadmium | 1 | 1 | 1 | 1 | 1 | 1 | 1 |
| Chromium | 1 | 1 | 1 | 1 | 1 | 1 | 1 |
| Cobalt | 1 | 2 | 2 | 2 | 1 | 2 | 2 |
| Copper | 1 | 1 | 1 | 1 | 1 | 1 | 1 |
| Iron | 1 | 1 | 1 | 1 | 1 | 1 | 1 |
| Lead | 1 | 1* | 1 | 1 | 1 | 1 | 1 |
| Maganese | 1 | 1 | 1 | 1 | 1 | 1 | 1 |
| Mercury | 1* | 1 | 1 | 1 | 1 | 1 | 1 |
| Nickel | 1 | 2 | 2 | 2 | 2 | 2 | 2 |
| Selenium | 1 | 1 | 1 | 1 | 1 | 1 | 1 |
| Silver | 1 | 1 | 1 | 1 | 1 | 1 | 1 |
| Thallium | 1 | 1 | 1 | 1 | 1 | 1 | 1 |
| Vanadium | 1 | 1 | 1 | 1 | 1 | 1 | 1 |
| Zinc | 1 | 1* | 2 | 1 | 1 | 1 | 1 |

Similarly, subsurface soil has been marked with code 1or 2. Soil types with code "1" may be combined as one background data set and those with code "2" may be combined as a second background data set for each constituent.

**Table 2 Subsurface Soil**

| Constituents | Braddock | Unison | Wheeling | Cabro | Groseclose | Lowell | Wurno |
|---|---|---|---|---|---|---|---|
| Aluminum | 1 | 2 | 2 | 1 | 2 | 2 | 2 |
| Antimony | 1 | 1 | 1 | 1 | 1 | 1 | 1 |
| Arsenic | 1 | 1 | 1 | 1 | 1 | 1 | 1 |
| Barium | 1 | 1 | 2 | 1 | 1 | 1 | 1 |
| Beryllium | 1 | 1 | 1 | 1 | 1 | 1 | 1 |
| Cadmium | 1 | 1 | 1 | 1 | 1 | 1 | 1 |
| Chromium | 1 | 1 | 1 | 1 | 1 | 1 | 1 |
| Cobalt | 1 | 2 | 2 | 2 | 2 | 2 | 2 |
| Copper | 1 | 2 | 2 | 1 | 2 | 2 | 2 |
| Iron | 1 | 1 | 1 | 1 | 1 | 1 | 1 |
| Lead | 1 | 2 | 1 | 1 | 1 | 1 | 1 |
| Maganese | 1 | 1 | 1 | 1 | 1 | 1 | 1 |
| Mercury | 1 | 1 | 1 | 1 | 1 | 1 | 1 |
| Nickel | 1 | 2 | 2 | 2 | 2 | 2 | 2 |
| Selenium | 1 | 1 | 1 | 1 | 1 | 1 | 1 |
| Silver | 1 | 1 | 1 | 1 | 1 | 1 | 1 |
| Thallium | 1 | 1 | 1 | 1 | 1 | 1 | 1 |
| Vanadium | 1 | 2 | 1 | 2 | 1 | 1 | 1 |
| Zinc | 1 | 1* | 2 | 1 | 1 | 1 | 1 |

Notes for tables 1 and 2 on prior page:

* Indicates that soil type has outlier(s)

The detection limits for some of the constituents varied between soil types.

Based on the above information, the facility may develop two background data sets for surface and subsurface soils.

The facility must conduct an outlier test on grouped background data sets as part of the revisions to this document and prior to developing the statistical limits for comparing on-site against background levels. Outliers from the background data set are to be excluded prior to establishing the 95% upper confidence limit (UCL) on the mean of the background data.

When performing statistical comparisons of the potentially contaminated area sample results to the background results, the facility may use a Student's t-test, provided the data sets follow normal distributions and other test specific assumptions (eg., variance). The facility also has the option to calculate the 95% upper confidence limit on background data (excluding outliers) and compare the individual on-site sample concentrations to the established UCL.

If you have any questions regarding this information, I can be reached at (804) 698-4143.

Very truly,

Sharon Skutle Wilcox

The IT Corporation was tasked to conduct a Facility-Wide Background Study at the Main Manufacturing Area and New River Unit of Radford Army Ammunition Plant (RFAAP). Task objectives were to characterize naturally occurring background soil inorganic concentrations to establish a baseline for inorganic compounds of concern at RFAAP. Data was statistically evaluated across soil types, soil horizons, and study areas to assess the potential for expanding the effective data into one set. Statistical tests demonstrated that the data was statistically similar across soil types and study areas, resulting in one set of background values for both surface and subsurface soils.

VOCs—Volatile Organic Compounds

# EXECUTIVE SUMMARY

A Facility-Wide Background Study was conducted at the Main Manufacturing Area and the New River Unit of RFAAP in accordance with Work Plan Addendum No. 10. Task objectives were to characterize naturally occurring background soil inorganic concentrations within the MMA and the NRU. Scope of work activities included the collection of background soil samples to establish a baseline for inorganic compounds of concern at RFAAP. Background sample locations were selected based on soil types and collected in areas not impacted by installation activities. Associated soils were evaluated based on formation properties and chemical and physical characteristics.

Explosives were selected as primary background markers, and semivolatile and volatile organic compounds were selected as secondary markers to discern potential contamination associated with selected background sample locations. Explosives and organic compound results confirmed the selected background locations had not been impacted by facility operations and were indicative of natural background conditions.

Statistical performance objectives designated for the background study were designed to ensure study data were scientifically based and statistically valid. Data were evaluated across soil types, soil horizons, and study areas to assess the potential for developing a universal background data set. Statistical tests demonstrated that surface soil data for both the MMA and NRU could be combined into one facility-wide data set. Similarly, subsurface soil data were also combined from both areas to obtain a facility-wide subsurface data set.

Point estimate values were subsequently developed to represent background concentrations for future site comparisons. The 95% upper confidence limit was selected as the statistic to assess background point estimates for surface and subsurface soil samples. Results from the previously attempted background study (Parsons 1996) were evaluated, and it was demonstrated that inclusion of the prior data set would compromise the statistical validity of the current background study.

Further work was performed in response to review comments from the USEPA and VDEQ. As a result of subsequent discussions with the agencies, this Final Facility-Wide Background Study reflects two major revisions: 1) facility-wide point estimates for background soil data are calculated as tolerance limits rather than confidence limits, and 2) background data for soil (surface and subsurface, MMA and NRU) are combined into a single data set. The final set of point estimates for the background data set, therefore, are based on calculated 95% UTLs for a single facility-wide data set that represents surface and subsurface soil from the MMA and NRU areas. These values are included in the Facility-Wide Background Study as a point of reference for point-by-point comparisons for site screening.

# 1.0 Installation Description

Radford Army Ammunition Plant (RFAAP) is a government-owned, contractor-operated industrial complex located in Radford, Virginia. It is owned by the U.S. Department of the Army and was operated under contract with Hercules, Inc., from 1941 until 1995 when Alliant Techsystems, Inc. (ATK), became the operating contractor. The installation consists of two noncontiguous areas: the Main Manufacturing Area (MMA) and the New River Unit (NRU).

The MMA contains numerous buildings and facilities. The NRU was constructed in 1940 and operated as a bag-manufacturing and loading plant for artillery, cannon, and mortar projectiles.

## 1.1 LOCATION

The MMA is located approximately 10 mi west of Blacksburg and 37 mi southwest of Roanoke (Figure 1-1). It lies in one of a series of narrow valleys typical of the Appalachian Mountain region. The valley is oriented in a northeast-southwest direction and is approximately 25 mi long and 8 mi wide at the southwest end, narrowing to 2 mi at its northeast end. The facility is situated along the New River in the relatively narrow northeast region of the valley and is divided into northern and southern areas. The northern half, or "Horseshoe Area," is located within the meander of the New River; the southern area contains the MMA.

The NRU is located approximately 6 mi southwest of the MMA of RFAAP and 43 mi southwest of Roanoke. It is located east of the town of Dublin in Pulaski County, VA, in the southern portion of the Appalachian Mountain region. The facility is approximately 1.5 mi north of Claytor Lake and approximately 2 mi northwest of Claytor Lake Dam.

## 1.2 ENVIRONMENTAL SETTING

### 1.2.1 Climate

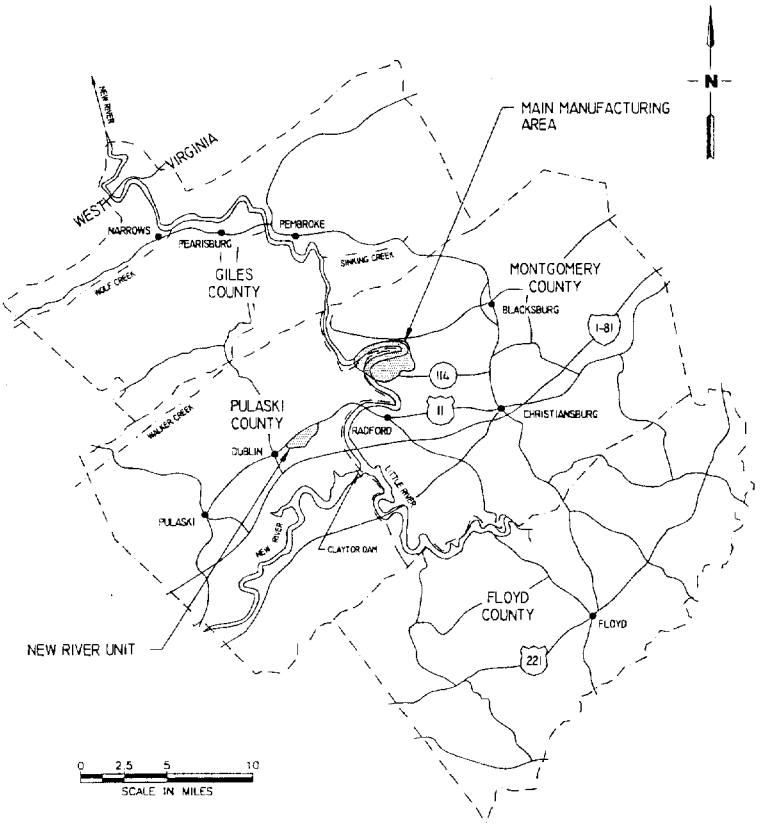
The climate of the area encompassing RFAAP is classified as "moderate continental," and is characterized by moderately mild winters and warm summers. Prevailing winds are from the southwest, with an average yearly wind speed between 8 and 10 mi/hr (SCS 1985). Average monthly temperature ranges from 29.6°F in January to 72°F in July, with an annual average temperature of about 52°F. Average monthly precipitation ranges from about 2.5 in. to 4.1 in. with an annual total precipitation between 36.9 in. and 41.5 in. (NCDC 1999). Lake evaporation was measured at 32 in./yr in the same area. Potential evapotranspiration has been calculated at 30 in./yr using the Thornthwaite method (Parsons 1996). Based on these data, the net precipitation in the vicinity of RFAAP ranges between 6.9 in. and 11.5 in. annually. Snowfall in the vicinity of RFAAP averages 17 in. annually. Montgomery and Pulaski Counties lie in one of the areas of highest occurrence of dense fog in the United States. Dense fog can be expected to occur between 20 and 45 days/yr.

### 1.2.2 Physiography

RFAAP lies within the Valley and Ridge Province of the Appalachian physiographic division. The Valley and Ridge Province is characterized by a series of long, narrow, flat-topped mountain ridges separated by valleys of varying widths. Either of these landforms may predominate; the mountains may be widely spaced and isolated or so closely spaced that the lowlands are disconnected or absent.

RFAAP exhibits prominent karstic features including sinkhole, caves, and caverns. Karst landforms occur in carbonate rock formations as the result of the dissolution of rock by naturally occurring carbonic acid in rainwater. As the rock is dissolved, cavities or caverns are formed beneath the earth's surface. Occasionally, large caverns collapse producing a depression or sinkhole on the surface. Numerous sinkholes are apparent along the western and southern boundaries of the facility.

**Figure 1–1**
**RFAAP and Vicinity Map**



Topography within the MMA of the installation varies from a relatively flat floodplain to elevated uplands in the extreme southeast section. The New River forms the RFAAP boundary on the north, with an elevation approximately 1,675 ft above mean sea level (msl). The eastern boundary represents a transition from a floodplain elevation of 1,680 ft msl to an upland elevation of 1,900 ft msl. The southern boundary traverses terrain consisting of creek bottoms and sharply rising summits. The western boundary follows the bluff line overlooking the New River to a point where the Norfolk and Western Railroad crosses the western portion of the Horseshoe Area.

The topography at the NRU contains some relatively flat areas but is dominated by undulating terrain and occasional sinkholes. The highest elevation is approximately 2,160 ft msl in the western portion of the site, and the lowest elevation is approximately 1,860 ft msl at Hazel Hollow located in the northeastern section of the site. One stream flows to the southeast corner of the NRU. Several intermittent streams merge into Hazel Hollow to carry surface runoff to the northeast corner of the NRU.

## 1.3 LAND USE/DEMOGRAPHICS

The area around MMA has not been highly developed because of the steep terrain surrounding the area. Land use in the vicinity of the facility has been mostly rural; less rugged areas have been primarily used for agriculture. The majority of counties situated in the New River Valley, which includes Montgomery, Pulaski, Giles, and Floyd are forested. The Jefferson National Forest is located approximately 2 mi north of the facility. 38% of the area of the New River Valley is classified as nonforest land, including agricultural land, developed land, and water acreage (NRVPDC 1994). The Blacksburg, Christiansburg VPI Water Authority owns four parcels of land adjacent to the facility. There are approximately 200 private residences located adjacent to the facility (Dames & Moore 1992). The largest substantial development, Fairlawn, is located about 2 mi southwest of the MMA boundary.

In 1990, the city of Radford, located about 4 mi southwest of the MMA, had a population of 15,940, which is equivalent to 1,626 people/mi$^2$ and the adjacent city of Dublin had 1,156 people/mi$^2$. Population densities for Montgomery and Pulaski Counties included 190 and 108 persons/mi$^2$, respectively (NRVPDC 1994). According to the U.S. Census Bureau, the town of Dublin in 1999 had an estimated population of 2,009 people, which is equivalent to approximately 1,155 people/mi$^2$. The estimated population in 1999, for Montgomery and Pulaski Counties was 76,997 and 34,407 people, respectively (U.S. Census Bureau 2000). The current estimated population densities are 198 and 108 persons/mi$^2$, respectively.

## 1.4 GEOLOGY

RFAAP is located in the New River Valley, at the northwest terminus of the southern Valley and Ridge Province. The New River crosses the Valley and Ridge Province approximately perpendicular to the regional strike of bedrock and it chiefly cuts Cambrian and Ordovician limestone and dolomite. The valley is covered by river flood plain and terrace deposits; karst topography is dominant. Deep clay-rich residuum is prevalent in areas underlain by carbonate rocks. Karst features include sinkholes, caverns, and springs caused by the dissolution of calcium carbonate by naturally occurring carbonic acid in rainwater. The greatest areas of karst features are controlled by bedrock stratigraphy and structure, and by the presence of major drainages. Late Cambrian and Mid-Ordovician limestones are more soluble than Cambrian and Lower Ordovician dolomite and shaley dolomite; therefore, they have the greatest number of sinkholes and caverns. However, both rock types show increased karst development in areas of low bedrock dip, where bedding is intensely folded, cleaved or jointed, and near major drainages.

The Elbrook and McCrady/Price Formations are the rock outcrops at the Installation. The Elbrook Formation is composed of thickly bedded, blue-gray dolomite interspersed with blue-gray to white limestone; brown, green, and red shale; argillaceous limestone; and brecciated limestone (colors range from mottled light- to dark-gray and yellow-brown). Sinkholes, solution channels, pinnacled surfaces, and springs are common to the Elbrook, which ranges from 1,400 to 2,000 ft thick. The strike of bedding in the Elbrook Formation is variable throughout the region. The general orientation of bedding is seen in the nearly east-west alignment of sinkholes at the installation and the surrounding area. Most sinkholes in the area are oval shaped and elongated with respect to the strike of the bedding; they most likely represent fractured or faulted zones within the underlying Elbrook Formation. The McCrady/Price Formations outcrop in a fenster (window) east of the main plant area along Stroubles Creek. This Formation may be up to 1,500 ft thick and consists of mottled red and green shale and mudstone interspersed with brownish-green siltstone and sandstone.

Max Meadows tectonic breccia, which is evidence of the close proximity of the Pulaski fault surface, is observed within and in the vicinity of the facility. This tectonic breccia consists of poorly sorted, angular to subrounded clasts of massive dolomite, laminated dolomites, and finely-laminated greenish gray calcareous mudstones in a fine- to very fine-grained matrix of crushed dolomite. Clasts range from less than 1 in. to more than 3 ft in length. The breccias are massive to crudely layered and are well to poorly indurated. The breccia, which is most fine-grained along the fault contact (Schultz 1986), is an integral part of the highly deformed rocks along the base of the Pulaski thrust sheet. Tectonic breccia has been described along the entire strike (310 mi) of the Pulaski thrust sheet.

The installation is also underlain by unconsolidated sedimentary deposits, including: alluvial plain sediments deposited by the New River prior to entrenchment, residual deposits from in-place weathering of parent bedrock, and colluvial deposits developed by residual slope wash. Alluvial plain deposits commonly line the New River and Stroubles Creek; as either recent floodplain material or as geologically older terraces. For example, three alluvial terraces are evident on the horseshoe loop that exhibit an upward textural fining. Gravels and silty, clayey sands form the basal unit, which are overlain by finer micaceous silts and clays. Sporadic cobbles and boulders (known as river jack) occur as lenses throughout the alluvial strata. Thickness of the alluvial deposits varies from a few to 50 ft, with an average of 20 ft.

Residual deposits (clays and silts) are a result of chemical and physical weathering of the parent bedrock, which is composed primarily of Elbrook dolomite. Residual deposits generally underlie the alluvium along the New River and in the Horseshoe Area. The exception is where the residuum has been eroded to bedrock and replaced by alluvium. Overburden depths vary from a few to 70 ft.

Colluvial deposits are generally formed from mass-wasting of slopes and escarpments. In general, these deposits are a heterogeneous mixture of alluvium, residuum, and rock debris that has moved from its original position. These deposits are generally interbedded between the strata of alluvium and residuum; thickness is variable.

Photo. 1 Northerly view of sample location MMAB1 within the Braddock Loam soil type at the MMA

The NRU is located within the middle section of the Ridge and Valley province (Thornbury 1965). The rocks, which underlie this site, are Middle Cambrian limestones, dolomites and shales of the Elbrook formation. The thickness of the Elbrook formation in this area is approximately 1,500 ft. The uppermost portion of the Elbrook is characterized by interbedded sandy, commonly cross-bedded, fine-grained dolomite containing thin lenses of fine to medium-grained sandstone. This is followed by cyclic sequences of medium-gray, finely laminated; fine-grained dolomite with crossbedding, bioturbated fine-grained dolomite with burrowed areas filled with slightly coarser-grained dolomite. The percentage of limestone diminishes with depth. The basal unit is 25–50 ft of fine-grained finely laminated, light greenish-gray, phyllitic, dolomitic mudstone and interbedded dolomite. This formation is thought to be part of the Pulaski overthrust sheet. Most of the rock units trend northeast-southwest. Southeastward dipping thrust faults and asymmetric folds overturned to the northwest are common (Dietrich 1990).

## 1.5 SOIL TYPES

Soil Conservation Service (1985) map units were employed to identify soil types within the current facility boundaries of the MMA and the NRU. Soil types associated within the MMA and NRU were assessed, and background sampling locations were selected to include the major soil types.

### 1.5.1 Main Manufacturing Area

The MMA is underlain by 27 soil types, as depicted graphically on Figure 1-2. The Braddock Loam, Unison-Urban Land Complex, and Wheeling Sandy Loam were identified as the most prevalent soil types that underlay the solid waste management units (SWMUs) and areas of concern identified in the MMA. These three soil types account for approximately 72% of the soils (excluding rock outcrop) at the MMA. The focus of this background investigation was these three soil types because they account for approximately 72% of the soils at the MMA.

FIGURE 1-2

SCS SOIL TYPES AT THE MAIN MANUFACTURING AREA

***Braddock Loam.*** The Braddock Loam comprises about 21% of the MMA. This soil type has a variable slope between 2% and 30% and does not have a seasonal high water table within 6 ft of the surface. Photo 1 shows an example of the landscape surrounding a Braddock Loam sample location at the MMA. Typically, the surface layer is dark yellowish-brown, 7 in. thick. The subsoil, which is a yellowish-red and red clay, extends to a depth of 60 in. or more. Photo 2 shows a Braddock Loam soil profile collected from the MMA (A horizon: 0-10 in.; B horizon: 10-48 in.; C horizon: 48-84 in.). Depth to bedrock is more than 60 in. deep. Permeability of the Braddock Loam soil is moderate, natural fertility is low, and organic matter content is moderately low. This soil type is acidic or very strongly acidic.

Photo. 3 Northwest view of sample location MMAU3 within the Unison-Urban Land Complex soil type at the MMA

***Unison-Urban Land Complex.*** This complex makes up about 40% of the surface area of RFAAP, and consists of about 50% deep and well drained Unison soils, 30% Urban Land, and 20% other soils. This complex of soils varies in slope from 2 to 25%. Photo 3 shows an example of the landscape surrounding a Unison-Urban Land Complex sample location at the MMA. In an undisturbed area, the Unison soils have a 15-in.-thick surface layer of dark

Photo. 4 Unison-Urban Land Complex soil profile for sample location MMAU3: surface (A horizon) and subsurface (B and C horizons) collected from the MMA

brown loam and a 43-in.-thick subsoil of yellowish-red, sticky plastic clay underlain by a red sandy clay loam to a depth of 58 in. This clay-rich layer is typically underlain by a brown sand to about 10 ft below ground surface (bgs), which then grades into a brown clay. Photo 4 shows a Unison-Urban Land Complex soil profile collected from the MMA (A horizon: 0-9 in.; B horizon: 9-42 in.; C horizon: 42-72 in.). Urban land is covered by pavement or structures; the original soil has been physically altered or obscured so that classification is not practical.

Permeability is moderate in Unison soils, natural fertility is low, and organic matter content is low to moderate. The soil is medium to strongly acidic.

***Wheeling Sandy Loam.*** The Wheeling Sandy Loam comprises approximately 11% of the MMA soils and is level to nearly level (slopes ranging from 0 to 2%). Photo 5 shows an example of the landscape surrounding a Wheeling Sandy Loam sample location at the MMA. The seasonal high water table is not within 6 ft of the surface.

Photo. 5 Southwest view of co-located sample location MMAW2/W3 within the Wheeling Sandy Loam soil type at the MMA

Typically, the surface layer is a 10-in.-thick, dark

brown sandy loam underlain by a 42-in.-thick subsoil. The upper part of the subsoil is dark brown gravely sandy loam to a depth of 60 in. or more. At greater than 60 in. in depth, the soil is predominantly a mixture of silt and sand, with minor amounts of clay. Photo 6 shows a Wheeling Sandy Loam soil profile collected from the MMA (A horizon: 0-7 in.; B horizon: 7-48 in.; C horizon: 48-60 in.). Depth to bedrock is at least 60 in.

Photo. 6 Wheeling Sandy Loam soil profile for sample location MMAW2: surface (A horizon) and subsurface (B and C horizons) collected from the MMA

Permeability and available water capacity of Wheeling soils is moderate; surface runoff is slow. Natural fertility is medium, organic matter content is moderately low, and soil is moderately to strongly acidic. Hazard of erosion in this soil type is slight.

### 1.5.2 New River Unit

The NRU is underlain by 11 soil types as depicted graphically on Figure 1-3. A soil grouping approach was adopted that included the evaluation of soil formation properties, physical and chemical soil characteristics associated with each soil series, and delineation of associated family groups. Four soil groupings were selected for background sampling at the NRU including, Carbo Silty Clay Loam (very rocky), Groseclose and Poplimento Silt Loam, Lowell Silt Loam, and the Wurno-Newbern-Faywood Silt Loam. These four soil groupings account for 78% of the soils at the NRU. Figure 1-4 depicts the grouping of these soil types.

Photo. 7 Northwest view of sample location NRUC1 within the Carbo Silty Clay Loam soil type of the MMA

The Carbo series are formed in material weathered from limestone bedrock. Members of this family include Carbo Silty Clay Loam, Carbo Silty Clay Loam (very rocky), and the Carbo-Rock Outcrop Complex. The grouping of these soils was based on the Carbo family designation.

The Urban Land Complex represents disturbed Groseclose soils. Background samples collected from the Groseclose and Poplimento series will take Urban Land Complex soil characteristics into account.

The Lowell series consists of deep and very deep well-drained soils formed in residuum of limestone interbedded with thin layers of shale on upland ridgetops and sideslopes. Soils of the Slabtown series are deep, moderately well drained and have moderately slow permeability. Slabtown soils were formed in weathered material of mixed colluvium and underlying limestone residuum and are geographically associated with the Carbo, Faywood, Federick, Lodi, Lowell, Poplimento, and Wurno series. This soil series was grouped with the Lowell series based on its chemical and physical properties.

SCS SOIL TYPES AT THE NEW RIVER UNIT

The Lodi and Federick series are from the same family and are formed in residuum weathered from limestone rocks with interbedded sandstone and shale. These soils are consistent with the Wurno-Newbern-Faywood series in that permeability ranges from moderately slow to moderate, and soil pH ranges from strongly acidic to mildly alkaline.

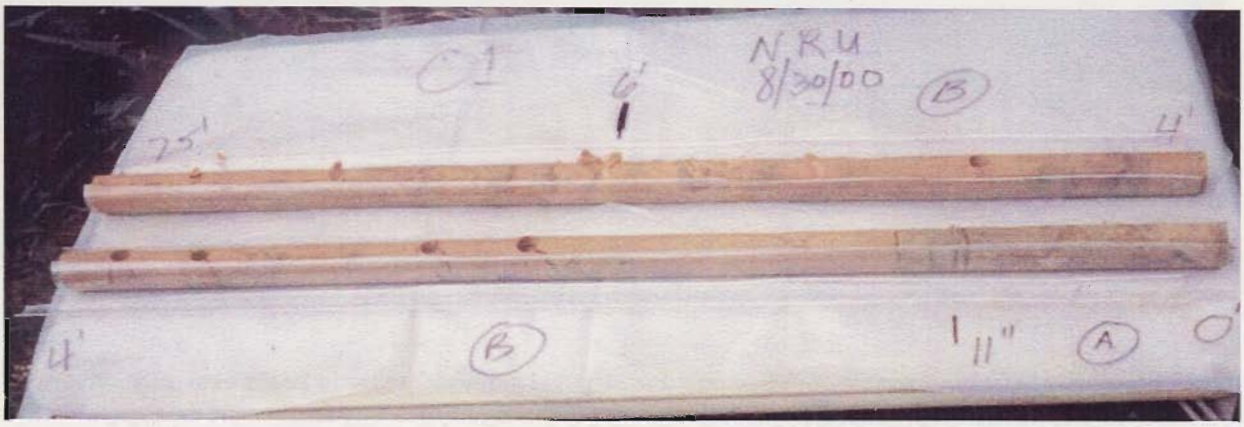

Photo. 8 Carbo Silty Clay Loam (very rocky) soil profile for sample location NRUC1: surface (A horizon) and subsurface (B and C horizons) collected from the NRU

***Carbo Silty Clay Loam (very rocky).*** The Carbo silty clay loam comprises 12% of the NRU and consists of strongly sloping to steep soils (7%–30% slopes) that are 20 to 40 in. deep to bedrock and do not have a seasonal high water table. This soil is located on ridgetops and convex side slopes along drainageways. Rock outcrops cover 1%–10% of the surface area. Photo 7 shows an example of the landscape surrounding a Carbo Silty Clay Loam sample location at the NRU. The surface layer of this soil is a 5-in.-thick layer of dark yellowish strong brown silty clay loam that is underlain by a 26-in.-thick subsoil of strong brown clay. Photo 8 shows a Carbo Silty Clay Loam soil profile collected from the NRU (A horizon: 0-11 in.; B horizon: 11-72 in.). Bedrock is at a depth of 31 in. Permeability of this soil is slow, and runoff is medium to rapid; available water capacity is low. Natural fertility is high, and the organic matter content is moderately low. Reaction is slightly acid to mildly alkaline in these soils.

***Groseclose and Poplimento Silt Loams.*** The Groseclose and Poplimento silt loams comprise 19% of the NRU and are grouped together because they have no major differences in use and management. These soils consist of moderately steep and steep soils (slopes ranging from 2% to 30%) that are at least 48 in. deep to bedrock and do not have a seasonal high water table. These soils exist on side slopes and ridgetops in irregularly shaped areas. Photo 9 shows an example of the landscape surrounding a Groseclose and Poplimento Silt Loam sample location at the NRU.

Photo. 9 Northerly view of co-located sample location NRUG2/G3 within the Groseclose and Poplimento soil type at the NRU

Groseclose soils typically have an 8-in.-thick surface layer of dark yellowish brown silt loam that is underlain by a 54-in.-thick subsoil. The upper portion of the subsoil consists of strong brown silty clay, the middle part is yellowish red and strong brown clay, while the lower portion consists of brownish yellow silty clay loam. At depths greater than 54 in., the substratum is a yellowish brown silty clay loam to a depth of at least 67 in.

Poplimento soils generally consist of a 7-in.-thick surface layer of dark yellowish brown silt loam that is underlain by a 37-in.-thick subsoil. The upper portion is strong brown silt loam, the middle portion is yellowish brown and strong brown clay, while the lower part consists of reddish yellow clay. The substratum extends to a depth of at least 60 in. and consists of reddish yellow and strong brown silty clay loam. Photo 10 shows a Groseclose and Poplimento Silt Loam soil profile collected from the NRU (A horizon: 0-7 in.; B horizon: 7-34 in.; C horizon: 34-57 in.).

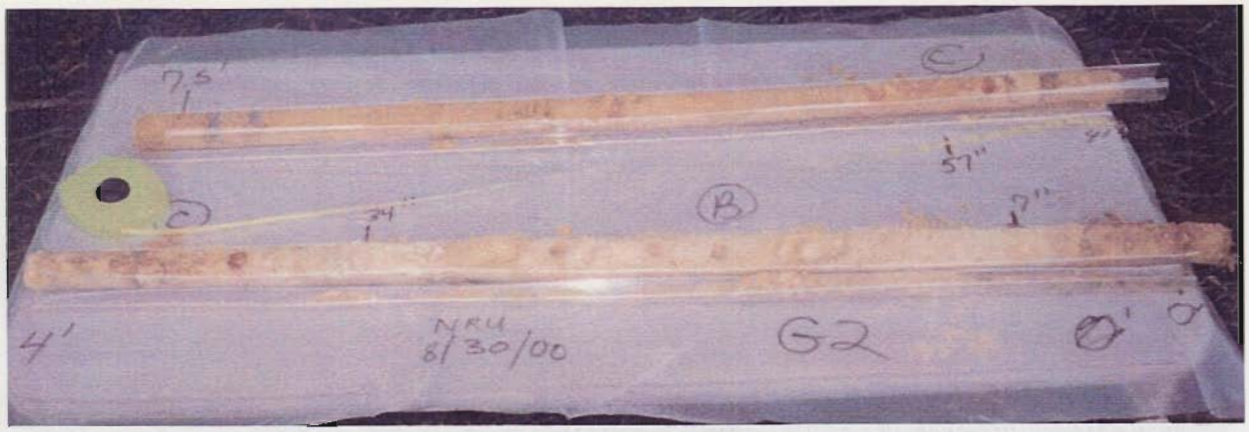

Photo. 10 Groseclose and Poplimento Silt Loam soil profile for sample location NRUG2: surface (A horizon) and subsurface (B and C horizons) collected from the NRU

Permeability in Groseclose soils is characterized as slow and moderately slow in Poplimento soils. Water capacity is moderate and surface runoff is rapid. Groseclose soils are low in natural fertility and medium in Poplimento soils. Both soil types contain a moderately low organic matter content. Groseclose soils are strongly acidic, while Poplimento soils have a medium acid content. Both soil types pose a severe erosion hazard.

***Lowell Silt Loam.*** The Lowell silt loam comprises about 18% of the NRU and consists of gently to steeply sloping (2 to 30%) soils located on ridgetops, side slopes, and on convex side slopes. Photo 11 shows an example of the landscape surrounding a Lowell Silt Loam sample location at the NRU. These soils do not have a seasonal high water table within 6 ft of the surface.

Photo. 11 Northerly view of co-located sample location NRUL1/L2 within the Lowell Silt Loam soil type at the NRU

The surface layer is typically dark yellowish brown silt loam 11 in. thick and is underlain by a 27-in.-thick subsoil consisting of dominantly strong brown and reddish yellow silty clay and clay. The substratum is yellowish brown shaly silt loam to a depth of 60 in. or more. Photo 12 shows a Lowell Silt Loam soil profile collected from the NRU (A horizon: 0-12 in.; B horizon: 12-42 in.; C horizon: 42-55 in.). Bedrock is at a depth of at least 40 in. Permeability of this soil is moderately slow and runoff is rapid; available water capacity is moderate. Reaction in these soils ranges from very strongly acidic to mildly alkaline.

Photo. 12 Lowell Silt Loam soil profile for sample location NRUL1: surface (A horizon) and subsurface (B and C horizons) collected at the NRU

Natural fertility is high and organic matter content is moderately low.

***Wurno-Newbern-Faywood Silt Loams.*** The Wurno-Newbern-Faywood silt loams comprise approximately 12% of the soils at the NRU and consist of moderately steep to steep soils (7%–30%) that do not have a seasonal high water table. Photo 13 shows an example of the landscape surrounding a Wurno-Newbern-Faywood Silt Loam sample location at the NRU. Bedrock is at a depth of 20 to 40 in. in the Wurno and Faywood soils and 10 to 20 in. in the Newbern soils. This unit is very intermingled and consists of approximately 35% Wurno, 30% Newbern, 25% Faywood, and 10% other soils.

Wurno soils typically have a surface layer of yellowish brown silt loam 8-in. thick underlain by a 6-in.-thick subsoil of brownish yellow very shaly silty clay loam. The substratum is partially weathered shale 13 in. thick. Bedrock is at a depth of 27 in. Permeability is moderate, and runoff is rapid; available water capacity is very low. Reaction ranges from slightly acid to mildly alkaline.

Newbern soils generally have a 5-in.-thick surface layer of yellowish brown silt loam underlain by an 8-in.-thick subsoil of brownish yellow shaly silt loam. The substratum is 5-in. thick and consists of brownish yellow shale and silt loam. Bedrock is at a depth of 18 in. Permeability of the Newbern soils is moderate, and runoff is medium to rapid; available water capacity is very low. Reaction ranges from slightly acid to mildly alkaline.

Photo. 13 Easterly view of sample location NRUW3 in the Wurno-Newbern-Faywood Silt Loam soil type at the NRU

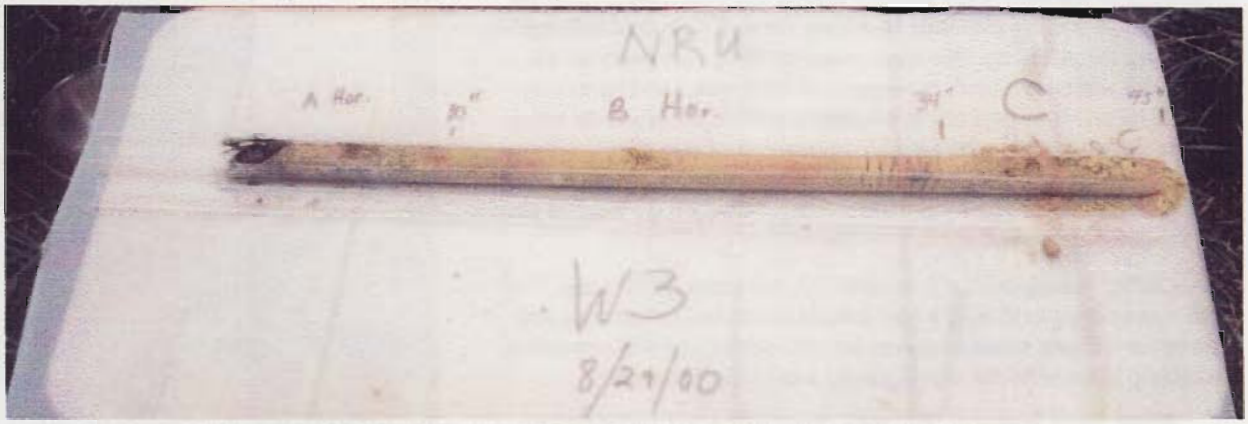

Photo. 14 Wurno-Newbern-Faywood soil profile for sample location NRUW3: surface (A horizon) and subsurface (B and C horizons) collected at the NRU

Typically, the Faywood soils have a 10-in.-thick surface layer of yellowish brown silt loam and an 18-in.-thick subsoil. The upper part of the subsoil consists of yellowish brown silty clay. Photo 14 shows a Wurno-Newbern-Faywood Silt Loam soil profile collected from the NRU (A horizon: 0-10 in.; B horizon: 10-34 in.; C horizon: 34-45 in.). Depth to bedrock is 18 in. Permeability of the Faywood soils is moderately slow, and runoff is medium to rapid; available water capacity is low. Natural fertility is high, and organic matter content is moderate. Reaction of the soil ranges from neutral to strongly acidic throughout.

### 1.5.3 Chemical and Physical Properties

Soil chemical and physical properties are often evaluated to adjust land uses to the limitations and potentials of natural resources and the environment. Soil scientists, conservationists, engineers, and others collect field data to predict soil behavior that can potentially affect various soil uses and management. A brief description of select chemical and physical soil properties follows below. Tables 1-1 (MMA) and 1-2 (NRU) present the SCS physical and chemical characteristics associated with soil types sampled during background sampling activities. Values for properties listed in these tables represent averages for the entire soil column.

**Table 1-1**
**Physical and Chemical Properties of Soil Types**
**Sampled at the Main Manufacturing Area**

| Soil Name | Depth (in.) | Clay (%) | Moist Bulk Density ($g/cm^3$) | Permeability (in./hr) | Soil pH | Organic Matter (%) |
|---|---|---|---|---|---|---|
| Braddock | A: 0–7<br>B: 7–60 | 10–55 | 1.20–1.50 | 0.6–6.0 | 4.5–5.5 | 1–2 |
| Unison | A: 0–10<br>B: 10–52<br>C: 52–60 | 10–70 | 1.30–1.65 | 0.6–2.0 | 4.5–6.0 | 1–3 |
| Wheeling | A: 0–10<br>B: 10–52<br>C: 52–60 | 8–30 | 1.20–1.50 | 0.6–20 | 5.1–6.0 | 1–3 |

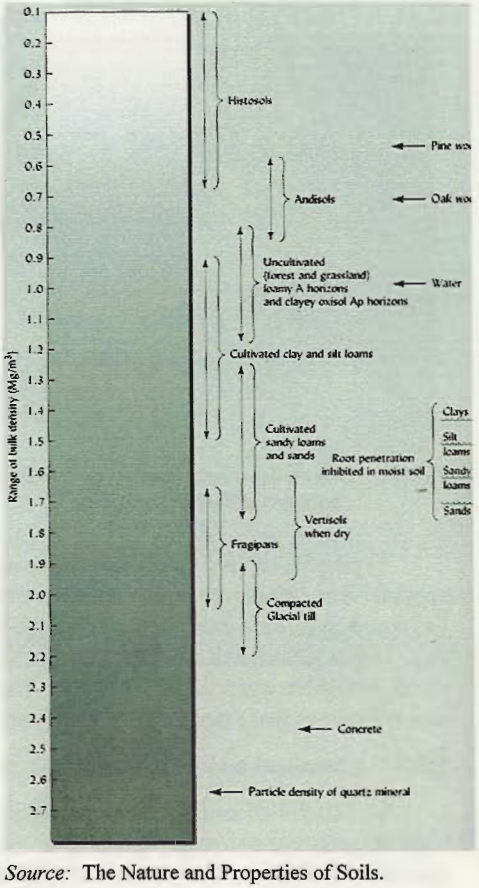
Source: SCS 1985.

**Clay.** Soil particles less than 0.002 mm are classified as clay and have a very large specific surface area, allowing them a significant capacity to adsorb water and other substances. Clay composition percentages greatly influences soil fertility and the physical conditions of the soil. Clay directly affects the permeability and the plasticity of a soil by generally lowering the soil's permeability and increasing the plasticity. Because pores between clay particles are very small and convoluted, movement of both water and air is very slow. Fate and transport of chemical compounds are hindered when passing through a soil with a high composition of clay due to clay's ability to adsorb cations and to retain soil moisture. Soil properties and behavior can be greatly influenced depending on the kind of clay and the amount present.

During hexahydro-1,3,5-trinitro-1,3,5-triazine (RDX) and TNT field screening activities, if a soil sample contained a high composition of clay, eluant separation was delayed during the soil extraction procedure because of the clay's strong adsorption properties.

**Moist Bulk Density.** The bulk density of a soil is defined as the wet weight per unit volume of dry soil. The volume includes both the solids and the pore space. It is assessed by obtaining a known volume of soil, drying it to remove the water, and weighing the dry mass. Bulk density is important because it reflects the porosity of a soil. Loose, porous soils have lower bulk densities than tight, compacted soil. The bulk density of a soil increases with compaction. Typical soil bulk densities for fine sands, silt loams, and silty clay loams are 1.5, 1.35, and 1.25 $g/cm^3$, respectively. Figure 1-5 presents a range of typical bulk densities for a variety of soils and soil materials.

**Figure 1–5**
**Typical Bulk Densities for a Variety of Soils and Soil Materials**



*Source:* The Nature and Properties of Soils.

**Permeability.** Permeability is a physical and chemical property that estimates the ability of a soil to transmit water or air. In saturated soil conditions permeability is taken into account because it estimates the rate of the downward movement of water. Soil conditions in the field that may affect permeability include particular structure, porosity, and texture. Sandy soil permits fast movement of percolating water, and lowers the opportunity for dissolved chemicals to be adsorbed.

Clay and organic soils tend to hold water and dissolved chemicals longer. Also, these soils have more surface area on which chemical compounds can be adsorbed, in comparison with sandy soils. The sandier the soil, the greater the chance of a compound of concern reaching groundwater.

**Table 1-2**
**Physical and Chemical Properties of Soil Groupings Sampled at the New River Unit**

| Soil Group | Soil Type | Depth (in.) | Clay (%) | Moist Bulk Density ($g/cm^3$) | Permeability (in./hr) | Soil pH | Organic Matter (%) |

Source: SCS 1985.

**Soil pH.** Soil pH is a measure of acidity or alkalinity and is an important physical and chemical property because it is an indication of soil reaction potential. Soil reaction influences the fate of many pollutants, affecting their breakdown and potential movement from the soil into groundwater and streams.

Most soils range in pH from slightly less than 2.0 to slightly more than 11.0, although sulfuric acid forms and pH may decrease to below 2.0 when some naturally wet soils that contain sulfides are drained. The descriptive terms to use for ranges in pH are as follows:

| | |
|---|---|
| Ultra acid | <3.5 |
| Extremely acid | 3.5-4.4 |
| Very strongly acid | 4.5-5.0 |
| Strongly acid | 5.1-5.5 |
| Moderately acid | 5.6-6.0 |
| Slightly acid | 6.1-6.5 |
| Neutral | 6.6-7.3 |
| Slightly alkaline | 7.4-7.8 |
| Moderately alkaline | 7.9-8.4 |
| Strongly alkaline | 8.5-9.0 |
| Very strongly alkaline | >9.0 |

The pH of forest soils is important, because it influences the microbial population of the soil, the availability of phosphorus, calcium, magnesium, and trace elements, and the rate of nitrification. Because tree litter is commonly acidic and releases hydrogen ions upon decomposition, forest soils are often more acidic than grassland or agricultural soils. In addition, trees may naturally acidify the soil by taking up calcium, magnesium, and other elements that form bases in the soil (Bockheim 1990). A review of pH results across soil types did not yield outstanding trends. High soil pH results were generally associated with limestone and shale parent material.

**Organic Matter Content.** Organic matter content is expressed as a percentage, by weight, of the soil material that is a composition of plant and animal residues in the soil at various stages of decomposition. Available water capacity and infiltration rate are affected by organic matter content.

Raw plant residues, on the surface, help reduce surface wind speed and water runoff. Removal, incorporation, or burning of residues predisposes the soil to serious erosion. The resistant or stable fraction of soil organic matter contributes mainly to nutrient holding capacity (cation exchange capacity) and soil color. This fraction of organic matter decomposes very slowly and therefore, has less influence on soil fertility than the "active" organic fraction (Alberta 1985).

# 2.0 Background Sampling

## 2.1 PREVIOUS INVESTIGATION REVIEW

A previous attempt was made to identify site-specific background concentrations within the MMA (Parsons 1996). Accuracy issues associated with sampling location and data variability precluded the quantitative use of this information. Shortcomings identified from the previous attempt were incorporated into the design of this background study to ensure the production of defensible and statistically significant data.

## 2.2 SAMPLE LOCATION SELECTION

Aerial photographs, facility base maps, and topographic maps were evaluated to ensure background sampling locations were representative of areas that were impacted minimally by facility operations. Aerial photographs dating from 1949 to 1986 were reviewed to evaluate facility activities. Topographic and facility base maps were evaluated to provide additional information, including ground elevation, land features, water bodies, and associated physical features of the study area.

### 2.2.1 Aerial Photographs

Aerial photographs (EPIC 1992) were used to evaluate construction and SWMU activities occurring between 1949 and 1986 and to identify physical features potentially affecting environmental conditions at the MMA and NRU.

Environmental Photographic Interpretation Center (EPIC) interpretive results indicated specific signature features and environmental conditions. The certainty associated with these signatures were further qualified by the terms "possible" and "probable" when definite feature identification was not discernible. Because these interpretations were performed on the full-size original aerial photographs, the level of resolution associated with the photographic prints presented in the report, in some instances, does not provide the same level of detail necessary to verify the annotation. Aerial photograph interpretations were used to locate tree stands that predated construction activities to ensure background sampling locations were positioned in areas that had not been impacted by previous installation activities.

### 2.2.2 Facility Base and Topographic Maps

Facility base and topographic maps were evaluated to further refine the understanding of construction activity, land use, and associated physical features of the study area. The topographic maps used to provide information on ground elevation, land features, water bodies, and minimally impacted areas included the Radford North (MMA) and Dublin (NRU) quadrangles. This information was used to position sample locations upgradient and upslope of SWMUs, hazardous waste management units (HWMUs), and areas of concern.

### 2.2.3 Accessibility

Sampling locations were positioned in tree stands to ensure associated soil samples were representative of areas that had not been affected by previous site activities or SWMU releases. Wherever possible, background sample locations were placed in tree stands estimated to predate potential construction activity at each location. Potential issues affecting or limiting accessibility to sampling locations included, the density or thickness of tree stands, drainage ditches, and slope grade. Grubbing and clearing activities were required at both the MMA and NRU to provide access of direct push sampling equipment to sample locations positioned within dense growth tree stands. Activities consisted of tree, ground cover, and debris removal to clear paths for direct push equipment access and maneuverability (Photo. 15).

Photo. 15 Grubbing and clearing activities within the MMA

Soil borings were advanced using a truck-mounted or Bobcat-mounted direct push (Geoprobe) rig, depending on accessibility of the equipment at a particular sample location. The truck-mounted rig was employed in more open and spacious areas where the terrain was relatively flat. The Bobcat-mounted rig was utilized in areas of dense woods, rugged terrain, and where maneuverability restricted the use of the truck-mounted equipment. Hand auger sampling methods were employed at two background sample locations at the MMA. This soil sampling method was used at these two locations because steep slope conditions prevented safe access of direct push sampling equipment.

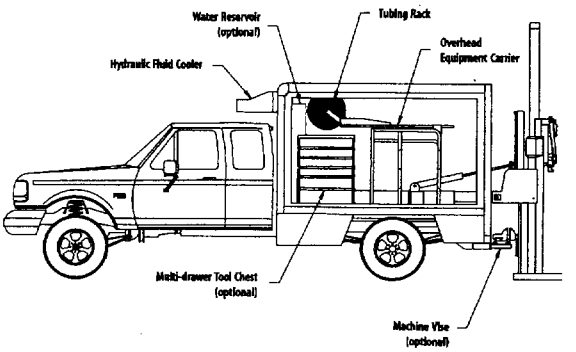
## 2.3 SAMPLE LOCATIONS

Background Study field investigation activities were conducted during the months of August and September of 2000 in accordance with the Addendum No. 10, as approved by USEPA Region III. Field activities were performed at both the MMA and the NRU and consisted of soil sampling, IDM management, and Global Positioning System (GPS) activities. The primary objective of the study was to collect samples representative of background conditions to establish a baseline for inorganic compounds of concern at RFAAP.

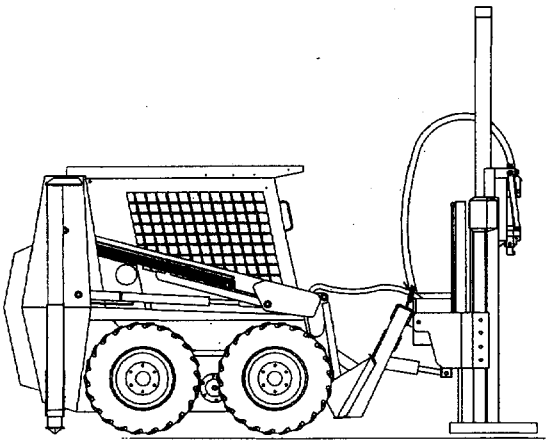
Thirty-four environmental samples were collected from three of the proposed soil types (Braddock Loam, Wheeling Sandy Loam, and the Unison-Urban Land Complex) at the MMA. Twelve of the 34 samples were collected from the surface (A horizon) and 22 of the 34 samples were collected from the subsurface soil (B and, when available, C horizon).

Forty-five environmental samples were collected from four soil groupings, including Carbo Silty Clay Loam (very rocky), Groseclose and Poplimento Silt Loam, Lowell Silt Loam, and the Wurno-Newbern-Faywood Silt Loam. Sixteen soil samples were collected from the surface (A horizon), and 29 soil samples were collected from the subsurface (B and, when available, C horizon).

Sampling locations at the MMA and NRU are presented on Figures 2-1 and 2-2, respectively. A complete list of samples collected, including sample matrices, depths dates, and analyses is presented in Table 2-1. Specific sample location descriptions and associated photographs are included in Appendix C.



Sketch of truck-mounted Geoprobe



Sketch of Bobcat-mounted Geoprobe

## 2.4 FIELD SAMPLING

Twenty-eight soil borings were advanced and sampled during background study field investigation activities. Twelve of the borings were completed at the MMA, and 16 of the locations were advanced at the NRU. Soil borings were advanced using a truck-mounted direct push Geoprobe, Bobcat-mounted direct push Geoprobe, or hand auger, depending upon accessibility of the soil sampling location.

Seventy-nine environmental samples were collected during the study: 34 were collected at the MMA, and 45 samples were collected from the NRU. A complete listing of samples collected in support of the field investigation effort is presented in Table 2-1.

### 2.4.1 Soil Sampling

Three soil types at the MMA (Braddock Loam, Wheeling Sandy Loam, Unison-Urban Land Complex) and four soil groupings at the NRU (Carbo Silty Clay Loam [very rocky], Groseclose and Poplimento Silt Loam, Lowell Silt Loam, Wurno-Newbern-Faywood Silt Loam) were sampled and analyzed as part of the background study. One surface (A horizon) and up to two subsurface soil samples (one each from the B horizon and, when available, C horizon) were collected at each boring location and analyzed for metals and pH.

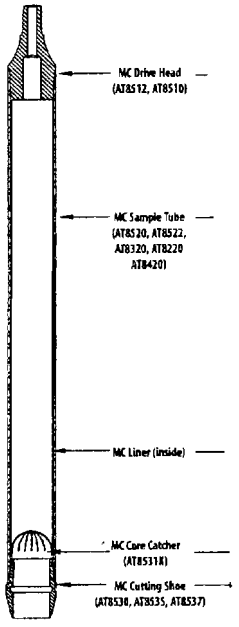
bgs = below ground surface.

Two sample locations from each soil type were clustered within a ½-acre radius of each other to evaluate organic concentrations and demonstrate that sample locations were representative of background conditions. One sample was collected from each soil horizon of the cluster and screened for the presence/absence of explosive constituents (RDX and TNT). Once field screening results indicated the absence of explosive constituents, a surface soil sample was collected from the A soil horizon and analyzed for semivolatile organic compounds (SVOCs), TAL metals, and pH. Subsurface soil samples from the B and C horizons (as applicable) were then collected and analyzed for volatile organic compounds (VOCs), SVOCs, TAL metals, and pH.

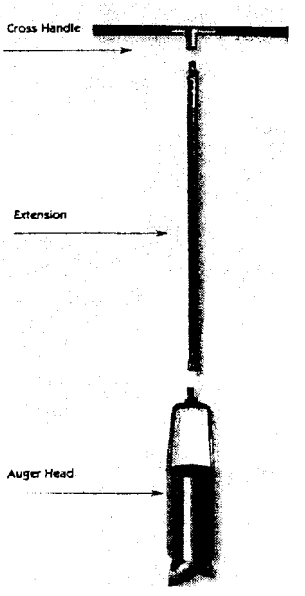
Borings were field screened using a MiniRae 2000 photoionization detector (PID) for the presence of organic vapors. PID field screening levels were not observed above background levels in the borings. No other significant field observations were noted during sampling activities.



Sketch of open-tube Macro-Corer

Stratigraphic characterization of the soils was completed by the project geologist using the Unified Soil Classification System following the procedures outlined in SOP 20.6 of the MWP. Soil characterization information was then transferred to electronic lithologic boring logs and are presented in Appendix A.

**2.4.1.1 Direct Push Sampling Equipment.** Twenty-six of the 28 soil borings were advanced with a truck- or Bobcat-mounted Geoprobe equipped with 1.25-in.-diam. push rods; 4-ft-long, 2-in.-diam. stainless steel open-tube Macro-Core samplers; and stainless steel cutting shoes. The Macro-Core samplers were lined with a dedicated 4-ft-long, 1.5-in.-diam. Teflon sample tube. Using a hydraulic percussion hammer, the Geoprobe drove the open-tube Macro-Core sampler to the proposed sampling depth. Following the withdrawal of the Macro-Core and the removal of the Teflon tube, a cutting device was used to remove a 1-3/8-in. section along the length of the tube for soil stratigraphic characterization and sample processing. Once adequate sample volume was achieved, the boring hole was backfilled with bentonite chips. Excess soil cuttings remaining after sample processing were temporarily stored in a 55-gal drum.



Sketch of hand auger sampling equipment

**2.4.1.2 Hand Auger Sampling Equipment.** Soil samples were collected from two locations using a stainless steel hand auger. Hand auger equipment consisted of either a 2- or 4-in. stainless steel auger head, 4-ft stainless steel extension rods, and a plastic-coated cross handle. The auger head was slowly advanced to the desired sampling depth by manually applying pressure and turning the cross handle in a clockwise direction. This process was used to stratigraphically characterize the soil cuttings for an accurate assessment of the soil horizons. Once the desired depth was achieved, the auger head was extracted from the borehole. The soil sample was then recovered from the auger head using a decontaminated stainless steel trowel. Soil cuttings were staged on plastic in 6-inch depth intervals to assist in the assessment and positive identification of each soil horizon (Photo. 16). Once adequate sample volume was achieved, the boring hole was backfilled with bentonite chips. Excess soil cuttings remaining after sample processing were transferred and temporarily stored in a 55-gal drum.

### 2.4.2 RDX/TNT Field Screening

One sample was collected from each soil horizon of a clustered boring from each soil type and screened for the presence/absence of explosive constituents (RDX and TNT). Samples were field screened using RDX and TNT immunoassay test kits following the procedures outlined in SOP 30.13 of Work Plan Addendum 10 (IT Corp 2000). Sample results were below 0.5 mg/kg, indicating neither RDX or TNT were present. Table 2-1 presents a complete list of samples screened for explosive constituents.

Photo. 16 View of MMAB4 hand auger soil cuttings

Samples were analyzed for RDX for field screening using immunoassay method U.S. Environmental Protection Agency (USEPA) SW-846 4051. This method is a test kit procedure for screening soils to assess when RDX is present at concentrations above 0.5 mg/kg and provides an estimate of the concentration of RDX by comparison with a reference. The method is performed using an extract of a soil sample. Samples and an enzyme conjugate reagent are added to immobilized RDX antibody. The enzyme-RDX conjugate "competes" with RDX present in the sample for binding to an immobilized RDX antibody. The enzyme-RDX conjugate bound to the antibody then catalyzes a colorless substrate to a colored product. The test was interpreted by comparing the color produced by a sample to the response produced by a reference reaction.

Samples were analyzed for TNT for field screening using immunoassay method USEPA SW-846 4050. This method involved a test kit procedure for screening soils to assess when TNT was present at concentrations above 0.5 mg/kg and provide an estimate for the concentration of TNT by comparison with a reference. The method was performed using an extract of a soil sample. Samples and an enzyme-TNT conjugate reagent were added to an immobilized TNT antibody. The enzyme-TNT conjugate "competed" with TNT present in the sample for binding to the immobilized TNT antibody. The enzyme-TNT conjugate bound to the TNT antibody then catalyzed a colorless substrate to a colored product. The test was interpreted by comparing the color produced by a sample to the response produced by a reference reaction.

### 2.4.3 Investigative Derived Material

Activities were performed in accordance with Work Plan Addendum No. 10, as approved by USEPA Region III, regarding the identification, handling, and disposal of nonhazardous investigative-derived materials (IDM). Material disposal was documented in the field logbook. Specific compliance issues that were confronted during investigative activities included the following:

- **Accumulation and storage.** IDM accumulated during field sampling activities included soil cuttings, decontamination water, direct push acetate liners, and PPE. Soil cuttings and decontamination water were stored in separate appropriately labeled 55-gallon steel drums. Direct push acetate liners and used PPE were stored together in 55-gallon drums. Containerized materials were stored at ATK-approved areas.
- **Material characterization.** Soil cuttings and decontamination water were sampled before disposal to assess waste characteristics, in accordance with 40 Code of Federal Regulations (CFR) 264 and Virginia Hazardous Waste Management Regulations. Based on analytical results, soil and decontamination water sampled were classified as nonhazardous materials.
- **Transporter, storage, and disposal facility.** Soil cuttings, acetate liners, and PPE were disposed of at Tazewell County Landfill in Tazewell, VA. Before disposal, waste profile results were provided to the installation, IDM management subcontractor, and the disposal facility for review and approval. An alternate straight bill of lading was obtained before transport of IDM from the accumulation and storage areas to the disposal facility. Disposal records were provided to the Installation and are also kept on file by the IT Corporation.
- **Decontamination water.** Following analysis, the Installation and RFAAP Wastewater Treatment Plant engineer were provided with a copy of the decontamination water sample results for review.

After receiving approval, decontamination water from both the MMA and the NRU was disposed into the collection system of the Wastewater Treatment Plant.

### 2.4.4 Global Positioning System Activities

Sample location coordinates and elevations were obtained using a Trimble Pathfinder Pro XRS GPS. The Pathfinder Pro XRS system was used to obtain real-time position information with submeter accuracy and elevations at 1.5 to 2 times the horizontal accuracy. Position information was recorded in the U.S. State [Virginia (South)] Plane Coordinate System (measured in U.S. survey feet) using the North American Datum 1927. Position information will be entered into the Environmental Restoration Information System (ERIS) database when available.

Because of the significant thickness of the tree canopy at three of the sample locations, coordinates were recorded from offset locations outside of the tree stands. The offsets were accurately measured with a measuring tape in the field and subsequently corrected. GPS coordinates and offset measurements were logged in the field logbook. Sample location coordinates and elevations presented in Table 2-2 have been entered into the project coordinate system and placed on the appropriate maps.

**Table 2-2**
**Facility-Wide Background Study Soil Sampling Location Coordinates**

| Sample ID | Northing[1] | Easting[1] | Elevation[2] |

[2]Feet above mean sea level.

# 3.0 Quality Assurance

Quality Assurance (QA) is defined as the overall system for assuring the reliability of data produced. The system integrates the quality planning, assessment, and improvement efforts of various groups in the organization to provide the independent QA program necessary to establish and maintain an effective system for collection and analysis of environmental samples and related activities. The program also encompasses the generation of usable and complete data as well as its subsequent review, validation, and documentation.

The accuracy and integrity of background data were ensured through the implementation of internal quality control measures in accordance with Work Plan Addendum No. 10, as approved by USEPA Region III. QA and quality control activities, including field quality control, laboratory quality control, and data management, were integrated into the background study program.

The analytical services for the background study were provided by the following USACE-validated laboratories:

- Envirosystems, Inc., Columbia, MD. Envirosystems, Inc., used USEPA-SW846, 3rd ed., Test Methods for Evaluating Solid Waste, Update III (USEPA 1996) methodologies in providing analytical support for pH and USEPA CLP SOW OLMO 4.2 (USEPA 1999) for VOCs and SVOCs. Metals analyses were subcontracted to Severn Trent Laboratories.
- Severn Trent Laboratories (STL), Sparks, MD. STL used USEPA-SW846, 3rd ed., Test Methods for Evaluating Solid Waste, Update III (USEPA 1996) methodologies in providing analytical support for TAL metals and Toxicity Characteristic Leachate Procedure (TCLP) metals.

## 3.1 ANALYTICAL METHODS

Analytical protocols used were in accordance with USEPA-approved methods for the analysis to include USEPA TAL metals, Target Compound List (TCL) VOCs, SVOCs, and pH. Samples collected to characterize investigative-derived materials were analyzed for hazardous waste characteristics. The methodologies are included below.

- **Inorganics.** Samples were analyzed for USEPA TAL metals using a combination of inductively coupled plasma emission spectroscopy (ICP) and cold vapor atomic absorption (CVAA). Trace metals were analyzed using USEPA SW-846 Method 3010A/6010B (USEPA 1996) for aqueous samples and Method 3050B/6010B (USEPA 1996) for solid samples. The pH was analyzed using USEPA SW-846 Method 9045C (USEPA 1996) for solid samples.
- **Organics.** Samples were analyzed for TCL VOCs using USEPA CLP SOW OLMO 4.2 (USEPA 1999) for aqueous and solid matrices using purge and trap technology. The EnCore sampling technique was used for the soil samples.

  Samples were analyzed for TCL semivolatiles using USEPA CLP SOW OLMO 4.2 (USEPA 1999).
- **TCLP Extraction.** Soil samples collected for material characterization were extracted using the TCLP SW-846 Method 1311 (USEPA 1996).

## 3.2 FIELD QUALITY CONTROL

### 3.2.1 Field Samples

Table 3-1 presents a summary of field quality control samples collected during background sampling activities, including the purpose of each quality control element and the required collection frequency that was adhered to during field sampling activities.

**Sample Management.** Sample management quality control consisted of the following field QA items. The number and types of environmental and quality control samples collected during the background sampling event are included in Table 3-2.

**Table 3-1**
**Field Quality Control Samples Collected During Background Study Sampling Activities**

| Control | Purpose of Sample | Frequency | Number of Samples Collected | | | | Total |
|---|---|---|---|---|---|---|---|
| | | | MMA | | NRU | | |
| | | | Aqueous | Solid | Aqueous | Solid | |
| Duplicate sample | Ensure precision in sample homogeneity | 10% | NA | 4 | NA | 6 | 10 |
| Rinse blank | Ensure the decontamination of sampling equipment has been adequately performed to assess cross-contamination and/or incidental contamination to the sample container | 5% | NA | 2 | NA | 3 | 5 |
| Temperature blank | Verify sample cooler temperature during transport | Per cooler | NA | 2 | NA | 2 | 4 |
| Trip blank | Assess if cross-contamination occurs during shipment or storage with aqueous VOC samples | Per cooler | 1 | NA | 1 | NA | 2 |

NA = not applicable.

**Table 3-2**
**Number and Type of Samples Collected During Background Study Sampling Activities**

| Sample | Area | | Total Samples |
|---|---|---|---|
| | MMA | NRU | |
| Surface Soil | 12 | 16 | 28 |
| Subsurface Soil | 22 | 29 | 51 |
| **Total Environmental** | **34** | **45** | **79** |
| Trip Blank | 1 | 1 | 2 |
| Rinse Blank | 2 | 3 | 5 |
| MS | 2 | 3 | 5 |
| MSD | 2 | 3 | 5 |
| Field Duplicate | 4 | 6 | 10 |
| **Total QC** | **11** | **16** | **27** |
| Investigative Derived Material (aqueous) | 1 | 1 | 2 |
| (solid) | 1 | 1 | 2 |
| **Total IDM** | **2** | **2** | **4** |
| **Total Samples** | **47** | **63** | **110** |

- **Sample identification.** The sample identification number was consistent with past nomenclature at RFAAP. The sample identification consisted of an alphanumeric designation related to the site location, soil group type, sampling location number, and sampled depth.
- **Site location code.** The first two characters were identified by the site location abbreviation. The identification included the following:

| | |
|---|---|
| MMA = | Main Manufacturing Area |
| NRU = | New River Unit |

- **Sample/media type.** The second two characters were the sample/media type. Sample types were designated by the following codes:
  - B = Braddock Loam
  - C = Carbo Silty Clay, Very Rocky
  - DW = IDM
  - G = Groseclose and Poplimento Silt Loam
  - L = Lowell Silt Loam
  - U = Unison-Urban Land Complex
  - W = Wheeling Sandy Loam or Wurno-Newbern-Faywood Silt Loam
- **Sampling location number.** The next one or two characters were the number of the sampling location (e.g., 1, 2, 3, . . . , 9, 10, 11, . . . ).
- **Sampled depth.** At sites where there were several samples to be collected at different horizons, the sequential collection order was followed by a letter in alphabetic order indicating shallow to deep depths (e.g., A, B, C), where A was the surface soil sample or A horizon.

Example sample container label

- **Duplicate.** Duplicate samples were identified with a "D" designation. A record of the samples that correspond to the duplicates was kept in the field logbook.
- **Quality control samples.** QC samples were identified by date (mo,day,yr), followed by QC sample type, and sequential order number at one digit. The QC sample types included:
  - R = Rinse Blank
  - T = Trip Blank

**Documentation.** Information pertinent to the sampling effort was recorded in a field logbook and the associated samples were traced by a Chain-of-Custody (COC) Form. Entries were made in indelible ink on consecutively numbered pages, and corrections consisted of line-out deletions that were initialed and dated.

Each sample container was labeled in waterproof ink with the sample identification, sampling date, required laboratory analyses, and preservatives. The sample labels were permanently affixed to the sample container using polyethylene tape.

**Chain-of-custody procedures.** Sampling was evidenced through the completion of a COC Form, which accompanied the samples in the field, during transit to the laboratory, and upon receipt by the laboratory. The COC form was filled out using indelible ink and annotated to indicate time and date that samples were relinquished to the shipping facility (Federal Express). In addition, shipping coolers were affixed with custody seals.

**Field Parameter Form procedures.** Documentation of collected samples was provided to the laboratory on electronic Field Parameter Forms. Field Parameter Forms were filled out based on information recorded in field logbooks and were completed at the end of each sampling week for every sample, including QC samples. The completed forms contained the following information fields for encoding chemical data into the ERIS database:

the i group

GENERAL COMMENTS:

ORIGINAL - Ship with Samples COPY - Retain with Sampling Records CS2040-3

**3.2.1.1 Field Performance Audit.** A field audit of site activities was conducted on September 7, 2000, by the QA/QC Manager and Project Chemist. During this audit current field practices were compared to the operating procedures outlined in the project work plans (i.e., Work Plan, QAP).

Two minor deficiencies were identified that were associated with project documentation. Field activities associated with the audited work phase were compliant and found satisfactory with work plan specifications. The matrix spike/matrix spike duplicate (MS/MSD) QC sample and soil horizons were not clearly identified in the logbook. This information was captured in other documentation associated with the project. Following audit completion, deficiencies were discussed with the field staff and corrective action was taken.

### 3.2.2 Laboratory Quality Control

**3.2.2.1 Data Review and Validation.** Data obtained from the laboratory was reviewed by the IT QA Manager to assess whether the project-specific data quality objectives, as defined in the Quality Assurance Plan Addendum (QAPA), were met. An in-depth discussion of the validation process and copies of the validation reports are presented in Appendix B.

**3.2.2.2 Data Reduction.** Data reduction procedures address the reliability of computations and the overall accuracy of the data reduction. Data reduction included computation of analytical results from raw instrument data and summary statistics, including standard errors, confidence intervals, test of hypotheses relative to the parameters, and model validation. The numerical transformation algorithms used for data reduction were verified against a known problem set to ensure that the reduction methods are correct.

**3.2.2.3 Data Quality Measurements.** Data quality objectives were developed concurrently with the work plan to ensure (1) the reliability of field sampling, chemical analyses, and physical analyses; (2) the collection of sufficient data; (3) the quality of data generated was acceptable for its intended use; and (4) valid assumptions could

be inferred from the data. Attainment of data quality objectives was assessed through evaluation of data collected using data quality indicators.

Table 3-3 outlines the data quality indicators as to their definitions, project goals, sampling and analytical assessments. Data quality was assessed through the evaluation of sampling activities and field measurements associated with the chemical analytical data in order to assess the reliability of the chemical analyses and the accuracy and precision of information acquired from the laboratory.

***Precision.*** Method or laboratory precision by the laboratory was evaluated during the validation process. Overall sampling or field precision was evaluated during the data review process. Precision is measured by calculating and evaluating the relative percent difference (RPD) between the results of field or laboratory duplicates. The RPD is calculated by the following equation:

$$\text{RPD}\ (\%) = \frac{/\text{XA} - \text{XB}/}{\text{XM} * 100} \qquad (1)$$

where

XA and XB = duplicate analyses, and
XM = the mean value of duplicate analyses (XA + XB)/2.

Field duplicates were collected on a 10% frequency per matrix to identify the cumulative precision of the sampling and analytical process, which includes the homogenization of soil and sediment samples. Precision was checked by regularly obtaining duplicate samples for each parameter and each media. Precision of field duplicates was assessed through calculation of the RPD between the positive results detected in the original sample and the field duplicate. The advisory limits were established by the USEPA Region III guidelines.

In instances where either the sample or the duplicate was non-detect "U," rejected "R," or blank contaminated "B" for a particular compound, a duplicate assessment was not performed. Sample results exceeding guidance values should be considered as estimated. Table 3-4 presents a summary of non-conformance field duplicate values. Sample values noted should be considered usable and estimated for the samples and compounds listed.

***Accuracy.*** Accuracy is the measure of bias in a system. The accuracy of the results are measured by percent recovery (%R):

$$\%\text{R} = \frac{\text{test value}}{\text{true value}} * 100 \qquad (2)$$

or

$$\%\text{R} = \frac{\text{spiked value - unspiked sample}}{\text{amount spiked}} * 100 \qquad (3)$$

**Table 3-3**
**Background Study Data Quality Indicators**

| Data Quality Indicator | Definition | Goal | Sampling Assessment | Analytical Assessment |
|---|---|---|---|---|
| Precision | Quantitative measure of the variability of a group of measurements in comparison to the average value | Low relative percent difference | Duplicate samples | MS/MSD |
| Accuracy | Bias in a measurement system | Low bias | Blank contamination | Analysis spike results |
| Representativeness | Degree to which the measured results accurately reflect the medium being sampled | 100% | Holding times, blanks, associated documentation | Inferred from accuracy, precision, and completeness evaluation |
| Completeness | Percentage of measurements which are judged to be usable | 98±2% | Records review | Data validation |
| Comparability | Qualitative parameter expressing the confidence with which one data set can be compared with another | High | Work plans, quality documents | Analytical methods |
| Sensitivity | Quantitative measure of the level of detection and quantitation. | High | Review of analytical method or procedures and instrumentation | Analysis of MDL studies and practical quantitation limits per analytical method |

Laboratory analytical accuracy was assessed through the use of laboratory blanks (method and instrument), laboratory control samples (LCS), and MSs. Laboratory analytical accuracy was reviewed during the validation of data. Sampling accuracy was assessed by evaluating the results of the rinse water. The data validation qualifiers would be applied for analytical non-conformances as outlined in the USEPA validation guidance.

- ***Method blanks.*** A method blank is a volume of analyte-free water or soil that is processed through the entire analytical scheme (i.e., extraction, digestion, concentration, and analysis) as with the actual samples. Method blanks monitor potential laboratory-induced contamination. Method blanks were found to be less than the method reporting limit (MRL).
- ***Laboratory control sample.*** The LCS was analyzed to assess general method performance by the ability of the laboratory to successfully recover the target analytes from a control matrix. LCS recoveries were found to be within acceptable limits during the validation process.
- ***Matrix Spikes.*** The MS was used to assess the performance of the method as applied to a particular project matrix. MS non-conformances were found in every sample delivery group. Antimony was found to produce low recoveries and was qualified bias low. In some cases, antimony was excessively low in recovery, and non-detects were rejected. Other bias low recoveries included the elements arsenic, selenium, chromium, potassium, vanadium, beryllium, cobalt, lead, and manganese for select spiked samples. Data were qualified "L" or "UL" in accordance with USEPA Region III guidance and were found to be estimated and usable.
- ***Rinse blanks.*** The blank contamination assessment was performed to assess the impact of contaminant contributions originating from non-point sources, such as field sampling equipment decontamination procedures. Rinse blank contamination assessment was completed through identifying appropriate sources of water and completing rinse blanks as required by the QAPA. In accordance with the USEPA data validation guidelines (USEPA 1995), the detected concentration in the sample was considered "B-qualified" if the sample concentration was within five times (10 times for common labo-

ratory contaminants such as acetone, 2-butanone, methylene chloride, phthalate esters) the concentration of the associated rinse blank.

*= duplicate analysis not within control limits.
E = reported value is estimated because of the presence of interferences.
J = analyte present. Reported value may not be accurate or precise (estimated).
L = analyte present. Reported value may be biased low (estimated).
N = laboratory spike sample recovery not within control limits.

Rinse blank 0083000R3 contained trace levels of arsenic and selenium. Associated samples within the five times action level were qualified "B" in accordance with USEPA Region III guidance (Appendix D). These samples were evaluated at one-half of each sample MRL.

A discussion of the blank results is provided within each validation report in Appendix B. Table 3-5 indicates those data that are "B" flagged due to blank contamination. The table summarizes samples qualified for the background study field investigation due to rinse blank contamination. Those compounds that were detected in both the blanks and the associated samples below the USEPA guidance blank action levels are listed.

***Completeness.*** Completeness is a measure of the amount of information that must be collected during the field investigation to allow for successful achievement of the objectives. An adequate amount and type of data must be collected for conclusions to be valid. Missing data may reduce the precision of estimates or introduce bias, thus lowering the confidence level of the conclusions. While completeness has been historically presented as a percentage of the data that is considered usable, this does not take into account critical sample locations or critical analytical parameters.

The amount and type of data that may be lost due to sampling or analytical error cannot be predicted or evaluated in advance. The importance of lost or suspect data will be evaluated in terms of the sample location, analytical parameter, nature of the problem, decision to be made, and the consequence of an erroneous decision. Critical locations or parameters for which data is found to be inadequate will either be re-sampled and re-analyzed or the data

will be appropriately qualified based on the decision of the project QA manager. The completeness goal percentage of usable data is set at 98±2%. Completeness was calculated using the following equation:

$$\% \text{ Completeness} = \frac{\text{No. of usable data}}{\text{No. of requested analyses}} \quad (4)$$

**Table 3-5**
**B-Qualified Data Summary**

[Units in mg/kg]

| FIELD ID | ANALYTE | RESULT | LAB QUALIF |
|---|---|---|---|
| NRUC2A | Arsenic | 2.6 | N |
| NRUC2B | Arsenic | 4.8 | N |
| NRUG3A | Arsenic | 3.6 | |
| NRUG3B | Arsenic | 3.8 | N |
| NRUG3C | Arsenic | 2.7 | N |
| NRUG4A | Arsenic | 2.8 | N* |
| NRUG4B | Arsenic | 3.2 | N* |
| NRUL2A | Arsenic | 5.1 | |
| NRUL2A | Selenium | 0.77 | N |
| NRUL2BD | Arsenic | 4.7 | |
| NRUL2C | Arsenic | 4.2 | |
| NRUW2B | Arsenic | 2.8 | |

* = duplicate analysis not within control limits.
B = the analyte or compound has been detected in the sample and laboratory method blank and/or associated field sample.
N = laboratory spike sample recovery not within control limits.

The number of samples actually collected with acceptable results were compared to the number of samples proposed in the QAPA. The percent completeness was with the acceptable range relative to the number of samples planned.

***Representativeness.*** Representativeness is a measure of the degree to which the measured results accurately reflect the medium being sampled. It is a qualitative parameter that is addressed through the proper design of the sampling program in terms of sample location, number of samples, and actual material collected as a "sample" of the whole.

Sampling protocols were developed to assure that samples collected are representative of the media. Field handling protocols (e.g., storage, handling in the field, and shipping) were designed to protect the representativeness of the collected samples. Proper field documentation and QC inspections were used to establish that protocols were followed and that sample identification and integrity was maintained.

***Comparability.*** Comparability is the confidence with which one data set can be compared to another. Comparability was controlled through the use of SOPs that have been developed to standardize the collection of measurements and samples and approved analytical technique with defined QC criteria. USEPA-SW846, 3rd ed., *Test Methods for Evaluating Solid Waste,* Update III (USEPA 1996) methodologies for inorganics and USEPA CLP SOW OLMO 4.2 (USEPA 1999) for organics were used in providing laboratory analytical support for this project. Laboratory SOPs were developed from these methods. Consistent and proper calibration of equipment throughout the field exercises, as described in the Master Quality Assurance Plan and QAPA, will assist in the comparability of measurements. Field documentation and QA audits were used to establish that protocols for sampling and measurement follow appropriate SOPs.

***Sensitivity (quantitation and detection limits).*** The term sensitivity is used broadly to describe the method detection, quantitation, and reporting limits established to meet project-specific data quality objectives; and not limited to the definition which describes the capability of a method or instrument to discriminate between measurement responses. The method detection limits (MDLs) and the minimum quantitation limits (MQLs)

published within USEPA methods are based upon a reagent water matrix, and are not necessarily reflective of typical sample matrices; therefore, care will be taken in establishing limits for laboratory analysis. Methods were selected based upon their sensitivity, technological, and economical considerations while keeping the screening values and available methodology in mind. The published limits may not be achievable for environmental samples, but they should compare reasonably with control samples. This compliance is verified during data validation process. Each target compound for every sample was reported at a specific MRL or Contract Required Quantitation Limit (CRQL). The target analytes detected above the MDL but less than the MRL (inorganics) or CRQL (organics) were reported as estimated values. Target analytes detected above the upper calibration standard were diluted and analyzed within established calibration windows.

The MQLs and MDLs were compared at the onset of the project. The MDL is the minimum concentration of an analyte that can be measured and reported with a 99% confidence that the analyte is above zero and is identified from the analysis of a sample in a given matrix containing the analyte. The MDLs are derived by the method based upon 40 CFR (Code of Federal Regulations) Chapter 136 Appendix B. The MDL established using this procedure was used to assess the importance of the measurement of a future sample. The laboratory MDLs derived were less than the MQLs. The laboratory has statistically derived MDLs below the MQLs. The MDL values are different and change periodically because each MDL is laboratory, instrument, analyst, matrix, and method specific.

The MQL and the CRQL are the values at which the laboratory has demonstrated the ability to reliably quantitate the target value of an analyte for the method performed. The MQL and the CRQL are based upon the lowest calibration standard used for the initial calibration curve or the lowest verification standard performed. Data is calculated over a linear range. The highest concentration of the standards is truncated until linearity is achieved (minimum of three concentration levels must remain). The resulting highest concentration within the linear range represents the upper quantitation limit.

The laboratory used a MRL for each sample. The MRL is the USACE term for sample quantitation limit (USACE 1998). The reporting limit is the threshold value below which the laboratory reports non-detected values as "U," "ND," or "<" and will vary for each sample based upon dilution, sample volumes, percent moistures (for solids), and the method performed. Positive values found in blanks (method, rinse, trip) above the MDL were reported. Positive results below the MRL and above the MDL are to be reported as estimated for organics. For inorganics, results below the Contract Required Detection Limit and above the MDL are reported as estimated. Non-detects were reported at the reporting limit for organics and the MDL for inorganics. The units for aqueous samples were µg/L and for solid samples were µg/g.

**3.2.2.4 Laboratory Systems Audit.** Laboratory activities performed under contract to IT are required to meet applicable contractual and project requirements. Before the submittal of project samples to the laboratory, the QA/QC Manager and the Project Chemist verified that technical requirements were planned and work pre-requisites were identified and met. Within the scope of laboratory system audits, definable features of work included analytical support for soil analysis and verification of the following:

- The requisite validations were achieved;
- The Laboratory Quality Assurance Plan was reviewed and accepted by IT;
- Laboratory equipment was of appropriate type, sensitivity, and quantity for its intended use;
- Facilities were appropriate for the expected sample load;
- Responsibilities were assigned and communicated;
- Laboratory staff were qualified to perform their jobs;
- Subcontracting restrictions were not been violated; and
- Approved procedures and controls were in place.

Discrepancies between actual conditions and approved plans or procedures were resolved, and corrective actions for unsatisfactory and nonconforming conditions were verified by the Project QA/QC Manager before granting approval to begin work.

The laboratory was evaluated by the Project QA Manager and Chemist to evaluate each definable feature of work including, but not limited to, the following:

- Size and appearance of the facility;
- Quantity, age, availability, scheduled maintenance, and performance of instrumentation;
- Availability, appropriateness, utilization, and adherence to the SOPs and methods;

- Staff qualifications, experience, and personnel training programs;
- Reagents, standards, and sample storage facilities;
- Standard preparation logbooks and raw data;
- Bench sheets and analytical logbook maintenance and review; and
- Review of the laboratory's sample analysis/data package inspection procedures.

A formal audit report was provided to the IT Project Manager and support staff. Results of the onsite audit were documented and maintained as part of the QA documentation. Discrepancies between actual practices and approved plans/procedures were resolved and corrective actions for unsatisfactory and non-conforming conditions or practices were verified by the Project QA/QC Manager before granting approval to continue work.

# 4.0 Data Analysis

## 4.1 DATA EVALUATION

### 4.1.1 Analytical Methodology

Environmental samples collected in support of the background study were analyzed using a suite of USEPA-approved methodologies to attain project DQOs, as specified in Work Plan Addendum 10. Site reconnaissance, field screening, and analytical methodologies for background markers were used to demonstrate the selected background locations did not exhibit contamination from previous facility operations.

Explosives were selected as background markers because of past practices and chemicals of concern were likely to be explosives. A review of potential explosives associated with the installation identified TNT and RDX as viable indicator compounds for explosives screening. Explosive immunoassay analyses were conducted for surface and subsurface soil samples using USEPA SW-846 methods 4050 and 4051. Results indicated that selected locations did not exhibit explosive contamination or were not impacted by previous facility operations associated with releases. Specific details associated with field screening activities are presented in Section 3.1.2.

PID screening was used to monitor organic compounds and relocate the borings as necessary. A PID reading above background levels would have necessitated that a boring be relocated. PID readings were not observed above background levels in the borings; therefore, no borings were relocated as a result of PID readings. Borings were also clustered in ¼- to ½-acre groupings to discern potential organic compound contamination.

USEPA SW-846, 3rd ed., *Test Methods for Evaluation Solid Waste,* Update III (USEPA 1996) were used to assess the inorganic soil composition. Trace metals were analyzed using a combination of ICP, graphite furnace atomic absorption (GFAA), and CVAA for mercury. Tables 4-1 through 4-7 presents the metals data results, reporting limits for non-detects, and associated validation qualifiers.

USEPA *Contract Lab Program Statement of Work OLM 4.2* (USEPA 1999) methodologies were employed to assess the semivolatile and volatile organic characterization of soil locations. Volatile organic compounds (VOCs) and semivolatile organic compounds (SVOCs) were analyzed using gas chromatography mass spectrometry. The data results and associated validation qualifiers can be found within the validation reports in Appendix B.

### 4.1.2 Data Validation and Qualifiers

Data were validated using the SW–846 method-specific criteria and laboratory SOPs. The *Innovative Approaches to Data Validation for USEPA Region III* (USEPA 1995) was used to provide validation qualification scheme. Validation reports include a tabular listing of sample IDs, parameters qualified, and specific information on why the qualification was performed. Reports are categorized in accordance with sample delivery groups and are located in Appendix B. Data qualifiers are included in the data tables as appropriate. Qualifiers that resulted in the use of data included the following:

J — results estimated analyte is present and reported values may not be accurate or precise
K — results estimated biased high analyte is present and reported values may be biased high
L — results estimated biased low analyte is present and reported values may be biased low
B — not detected substantially above the level reported in laboratory or field blanks
U — results not detected, presented as < reporting limits in data tables
UJ — results estimated not detected and quantitation limit may be inaccurate or imprecise
UL — results estimated biased low not detected and quantitation limit is probably higher
R — results rejected due to quality control issues

**4.1.2.1 Metals Validation Criteria.** Laboratory performance criteria were evaluated for inorganics included the following. Further discussion may be found in the validation reports in Appendix B.

- **Holding times.** 180 days for metals and 28 days for mercury. Preservation: Cool, 4°C ± 2°C for soil samples and cool, 4°C ± 2°C and $HNO_3$ pH<2 for aqueous samples.

- **Initial and continuing calibration.** Performed at the beginning of sample analysis and at a frequency of 10% or every 2 hours to assess calibration frequency and accuracy. MRL standards were evaluated for ICP and for CVAA. Concentration was evaluated at 2 times the greater of MRL or MDL for analytes (except Al, Ba, Ca, Fe, Mg, Na, and K) at the beginning and at the end (for ICP) of a sample run or a minimum of twice per 8 hours. For GFAA/CVAA, concentration was evaluated at the MRL at the beginning of the run. Recovery range was evaluated between 90% and 110%.
- **Blanks assessment.** Evaluated to assess the existence and magnitude of contamination problems. No contaminant should be detected in the blank > the MRL. Sample values < five times (5×) the maximum concentration detected in the QC blanks and > the MRL were qualified "B."
- **ICP Interference Check Sample.** Verified interelement and background correction factors. Interference check samples run at the beginning and end of each sample analysis run with control limits between 80% and 120%.
- **Matrix spike sample analysis.** Designed to provide information about the effect of each sample matrix on the sample preparation procedures and the measurement methodology. The spike recoveries must be within 75%–125% or established recoveries, with the exception of samples that have concentrations exceeding the spike concentration by a factor of four or more. When MS recovery limits are not met, a post-digestion spike addition should produce a minimum level of 10 to 100 times the MDL.
- **Duplicate sample analysis.** Demonstrated acceptable method precision by the laboratory at the time of analysis. Duplicate analyses are also performed to generate data in order to assess the long-term precision of the analytical method on various matrices. A control limit of 20% RPD was used.
- **Laboratory Control Samples.** Monitored overall performance of each step during the analysis, including the sample preparation. Solid LCS results must fall within the established limits, depending upon the LCS lot standard used.
- **ICP serial dilution.** Assessed whether or not significant physical or chemical interferences exist due to sample matrix during ICP analysis. If the analyte concentration in the original sample is a factor of 10 above MDL, then an analysis of a 5-fold dilution should agree within 10% difference of the original result.
- **Calculation verification.** The percent difference (%D) between calculated and reported results should be <10%. Samples below the MRL and above the MDL were qualified "J," estimated.

**4.1.2.2 VOC Validation Criteria.** Laboratory performance criteria evaluated for VOCs included the following. Further discussion may be found in the validation reports in Appendix B.

- **Holding times.** 14 days for VOCs. Preservation: Cool, 4°C ± 2°C for soil samples and cool, 4°C ± 2°C and HCl pH<2 for aqueous samples.
- **Initial calibration.** Performed at the beginning of sample analysis to assess calibration frequency and accuracy. Compliance requirements for satisfactory instrument calibration were established to ensure that the instrument used was capable of producing acceptable qualitative and quantitative data for volatile target compounds. Initial calibration demonstrates that the instrument was capable of acceptable performance in the beginning of the analytical run and of producing a linear calibration curve. The minimum relative response factor (RRF) must be ≤ 0.05. Percent relative standard deviation (%RSD) must be ≤ 15% for each target compound and must be ≤ 30% for each calibration check compound.
- **Continuing calibration.** Compliance requirements for satisfactory instrument calibration are established to ensure that the instrument used was capable of producing acceptable qualitative and quantitative data for volatile target compounds. Continuing calibration establishes the 12-hour relative response factors on which the quantitations are based and checks satisfactory performance of the instrument on a day-to-day basis. The %D between the initial calibration RRF and the continuing calibration RRF must be within 20% for target compounds.

- **Blanks assessment.** The purpose of blank analyses was to identify the presence and magnitude of contamination problems resulting from field (rinse blanks) and laboratory activities. A method blank analysis must be performed after the calibration standards and once every 12-hour time period beginning with the injection of bromofluorobenzene (BFB). No contaminants should be detected in the associated blanks > MRL. Positive sample results were reported and qualified "B" if the concentration of the compound in the sample was ≤ 10 times (10x) the maximum amount in a blank for the common laboratory contaminants methylene chloride, acetone and 2-butanone, or 5 times (5x) the maximum amount for other volatile target compounds.
- **Instrument performance check.** The analysis of the instrument performance check solution was performed at the beginning of each 12-hour period during which samples are analyzed. The instrument performance check solution, BFB, must meet the specified ion abundance criteria.
- **Matrix spike and spike duplicate sample analysis.** Designed to provide information about the effect of each sample matrix on the sample preparation procedures and the measurement methodology as well as acceptable method precision by the laboratory at the time of analysis. The spike recoveries must be within established limits, with the exception of samples that have concentrations exceeding the spike concentration by a factor of four or more. Matrix spike duplicate analyses are also performed to generate data in order to assess the long-term precision of the analytical method on various matrices using RPD. RPD recoveries must be within established limits.
- **Laboratory control samples.** Monitored overall performance of each step during the analysis, including the sample preparation. LCS results must fall within the established recovery limits.
- **System monitoring compounds (Surrogates).** Laboratory performance on individual samples is established by means of spiking activities. The system monitoring compounds were added to the samples and blanks to measure their recovery. %Rs must be within the specified control limits.
- **Internal standards.** Internal standards performance check ensures that gas chromatography/mass spectroscopy (GC/MS) sensitivity and response are stable during each analytical run. Specific criteria include area count of –50% to +100% and retention time of ± 30 seconds from the associated calibration standards.
- **Calculation verification.** The %D between calculated and reported results should be < 10%. Samples below the MRL and above the MDL were qualified "J," estimated. Tentatively identified compounds (TICs) were qualified as estimated "J".

**4.1.2.3 SVOC Validation Criteria.** Laboratory performance criteria evaluated for SVOCs included the following. Further discussion may be found in the validation reports in Appendix B.

- **Holding times.** 7 days to extract/40 days analysis for aqueous and 14 days to extract/40 days analysis for soils for SVOCs. Preservation: Cool, 4°C ± 2°C for soil and aqueous samples.
- **Initial calibration.** Performed at the beginning of sample analysis to assess calibration frequency and accuracy. Compliance requirements for satisfactory instrument calibration were established to ensure that the instrument used was capable of producing acceptable qualitative and quantitative data for compounds on the semivolatile TCL. Initial calibration demonstrates that the instrument was capable of acceptable performance in the beginning of the analytical run and of producing a linear calibration curve. The minimum RRF criteria must be ≤ 0.05. Initial calibration %RSD must be ≤ 15% on the average for compounds (≤ 30% for continuing calibration checks).
- **Continuing calibration.** Compliance requirements for satisfactory instrument calibration are established to ensure that the instrument used was capable of producing acceptable qualitative and quantitative data for semivolatile target compounds. Continuing calibration standards containing both target and surrogates compounds are analyzed at the beginning of each 12-hour analysis period following the analysis of the instrument performance check and prior to the analysis of blanks and samples. The minimum RRFs for semivolatile target compounds and surrogates must be ≤ 0.05. The %D between the initial calibration RRF and the continuing calibration RRF must be within ≤ 20% for target compounds.

- **Blanks assessment.** The purpose of blank analyses was to identify the presence and magnitude of contamination problems resulting from field (rinse blanks) and laboratory activities. A method/extraction blank analysis must be performed after the calibration standards and once every 12-hour time period beginning with the injection of decafluorotriphenylphosphine (DFTPP). No contaminants should be detected in associated blanks > MRL. Positive sample results were reported and qualified "B" if the concentration of the compound in the sample was ≤ 10 times (10x) the maximum amount in a blank for the common laboratory contaminants phthalate esters, or 5 times (5x) the maximum amount for other semivolatile target compounds.
- **Instrument performance check.** The analysis of the instrument performance check solution was performed at the beginning of each 12-hour period during which samples are analyzed. The instrument performance check solution, DFTPP, must meet the specified ion abundance criteria.
- **Matrix spike and spike duplicate sample analysis.** Designed to provide information about the effect of each sample matrix on the sample preparation procedures and the measurement methodology as well as acceptable method precision by the laboratory at the time of analysis. The spike recoveries must be within established limits, with the exception of samples that have concentrations exceeding the spike concentration by a factor of four or more. Matrix spike duplicate analyses are also performed to generate data in order to assess the long-term precision of the analytical method on various matrices using RPD. RPD recoveries must be within established limits.
- **Laboratory Control Samples.** Monitored overall performance of each step during the analysis, including the sample preparation. LCS results must fall within the established recovery limits.
- **System Monitoring Compounds (Surrogates).** Laboratory performance on individual samples is established by means of spiking activities. The system monitoring compounds were added to the samples and blanks to measure their recovery. %Rs must be within the specified control limits.
- **Internal Standards.** Internal standards performance check ensures that GC/MS sensitivity and response are stable during each analytical run. Specific criteria include area count of –50% to +100% and retention time of ± 30 seconds from the associated calibration standards.
- **Calculation verification.** The %D between calculated and reported results should be < 10%. Samples below the MRL and above the MDL were qualified "J," estimated. TICs were qualified as estimated "J".

### 4.1.3 Data Grouping

An iterative screening approach was used to identify inorganic elements that would be included in the statistical evaluation. This preliminary screening was designed to ensure the adequacy of data grouping within both the MMA and NRU.

Macronutrients were eliminated because these elements generally are not risk drivers and have associated average daily intakes. Elements classified as macronutrients included calcium, magnesium, potassium, and sodium. Data were then reviewed from each area to discern elements that were not detected above the MRL. A target value of 80% was used to eliminate analytes that were not detected in the samples.

Further refinement of the data screening process yielded additional elements that were eliminated. These elements were detected either once or twice across the respective soil type. Additional rationale was integrated into the decisionmaking process to validate initial assumptions. For example, mercury was detected twice (0.07, 1.2 mg/kg) within the MMA Braddock Loam surface soil type. Because the mercury concentration for the Braddock Loam soil in the Eastern United States is in the range 0–1.2 mg/kg, the decision to eliminate mercury from the background evaluation was verified. A comparison of surface and subsurface soil concentrations within the MMA and NRU against the Eastern U.S. is presented in Appendix E. Additionally, graphical presentations for the distribution of mean soil concentrations within MMA and NRU soil types are included in Appendix E.

The coefficient of variation (CV), defined as the standard deviation divided by the mean, was used to evaluate the data variability for element distribution across soil types. Although CVs were not applied in the screening process, these values were used for comparison purposes. Elements with CVs less than 1.00 were combined into one data grouping. Elements with CVs greater than 1.00 were further evaluated to address the causes of variability.

## 4.2 STATISTICAL APPROACH

The statistical approach designed for RFAAP is depicted graphically in Figure 4-1. Equations associated with specific tests are presented in Table 4-8. Frequency of detects were calculated by element grouped within the MMA and NRU in accordance with Figure 4-2. Statistical criteria were established in conjunction with the percentage of calculated non-detects.

Elements that contained non-detects at a frequency greater than 80 percent were eliminated from further processing. These elements were not evaluated because no meaningful statistic can be generated from data sets that contain a large percentage of non-detected values. Additionally, one-half the reporting level was used as the concentration for non-detects.

Elements that contained non-detects at a frequency less than 50% were first evaluated using the Shapiro-Wilk test. Data sets from the MMA and NRU were individually tested to assess whether they were normally distributed. When the data sets did not follow a normal distribution, data points were log transformed and the Shapiro-Wilk test was used to assess whether the data were lognormally distributed. When data from both the MMA and NRU were both normally distributed, the F-test was applied to assess whether there was a statistical difference between the variances of the two groups. When data from both the MMA and NRU were both lognormally distributed, then the F-test was applied to the log transformed data. When the elements from the MMA and NRU had different distributions or did not pass either the normal and lognormal distribution test, the Mann-Whitney U test was used to assess the statistical significance between the data sets.

Results from the F-test were used to assess the appropriate Student's t-test. For example, when the variances were found to be similar, the Student's t-test was calculated using equal variances. Conversely, t-tests were calculated using unequal variances when the F-test demonstrated that the variances between the data sets were not similar.

The Student's t-test was used to assess statistical differences between the means of the data groups. No statistical differences between the means of the two groups demonstrated that the data could be combined into one set. Statistical differences between the group means would necessitate the use of separate background comparison values for each area.

Statistical comparisons were performed separately for surface and subsurface soil samples within the MMA and NRU in accordance with Work Plan Addendum No. 10. The decision to segregate the data by surface versus subsurface soil took into account the treatment of background concentrations during risk assessment activities. For example, surface soil samples directly impact ecological risk management decisions, whereas subsurface soils are factored heavily into human health risk decisions.

Table 4-9 presents the statistical summary for elements evaluated in the surface soil. The output from the statistical comparisons is included as Appendix F. Thallium results were reassessed and eliminated because there were not enough detected results to demonstrate statistical significance. Although thallium was detected in 4 of 12 samples in the MMA, there were no detections of thallium in the 16 samples for the NRU. Therefore, the statistical comparison between the groups could not be performed. The Shapiro-Wilk test was used to assess the distribution of elements. Seven of the remaining thirteen inorganic surface soil elements (Figure 4-2) passed the test for normality or lognormality, including:

- Aluminum
- Chromium
- Copper
- Iron
- Manganese
- Vanadium
- Zinc

(a) MMA = Main Manufacturing Area
(b) NRU = New River Unit
(c) T-Test - Normal = F and T-test using the data
T-Test - Lognormal = F and T-test using the log transformed data
MMU = Mann Whitney U test using the data
(d) Same = Indicates that there is not a statistically significant difference between the MMA and NRU groups based on a 5% significance level.
Different = Indicates that there is a statistically significant difference between the MMA and NRU groups based on a 5% significance level.

The F-test was used to assess that the Student's t-test for elements with similar variances could be used for the elements with the exception of copper. The Student's t-test for unequal variances was used for copper. T-test results indicated that the following elements were similar as indicated by the test result being greater than the 0.05 significance level (p):

- Aluminum
- Chromium
- Copper
- Iron
- Manganese
- Vanadium
- Zinc

The Mann Whitney U test was used to assess whether there was a statistically significant difference between the means for elements with distributions that were neither normal nor lognormal or in cases where each data set exhibited a different distribution (e.g., one set normal, the second set lognormal). Elements that were evaluated included:

- Arsenic
- Barium
- Beryllium
- Cobalt
- Lead
- Nickel

Barium, cobalt, and iron were the three elements that were demonstrated to be statistically significantly different. The significance levels for barium and iron were both 0.02. The significance level for cobalt was 0.04. An evaluation of the test results indicated that there was no statistical difference between the means for 77% (10 out of 13 elements) at a 0.05 significance level. The elements were further evaluated at the 0.02 significance level, and the 13 elements indicated that there was no statistically significant difference between the means. Because 85% of the elements were statistically similar at the 0.05 significance level and the remaining elements were statistically similar at the 0.02 significance level, MMA and NRU results will be combined to obtain one background surface soil data set.

Table 4-10 presents the statistical summary for elements evaluated in the subsurface soil. The output from the statistical comparisons is included as Appendix F. The Shapiro-Wilk test was used to assess the distribution of elements. Ten of the 13 subsurface elements (Figure 4-2) passed the test for normality or lognormality and included:

- Aluminum
- Arsenic
- Chromium
- Cobalt
- Copper
- Iron
- Manganese
- Nickel
- Vanadium
- Zinc

The F-test was used to assess whether there was a statistical significance between the variances for each element. The F-test indicated that the variances were similar for aluminum, chromium, cobalt, copper, iron, manganese, and nickel while the variances were different for arsenic, vanadium, and zinc. The Student's t-test for equal variances was used for the elements that were similar using the results from the F-test while the Student's t-test for unequal variances was used for the elements that were different. The Student's t-test (equal and unequal variances) results indicated that the following elements did not have a statistically significant difference between the means:

ESPS08-34
December 2001

- Arsenic
- Chromium
- Cobalt
- Copper
- Iron
- Manganese
- Nickel

Aluminum, vanadium, and zinc results from the Student's t-test indicated there was a statistically significant difference between the means at a 0.05 significance level. The significance levels for aluminum, vanadium, and zinc were 0.008, 0.005, and <0.001, respectively.

The Mann Whitney U test was used to assess whether there was a statistical significance difference between the means for elements:

- Barium
- Beryllium
- Lead

Beryllium was the one element from this group that exhibited no statistically significant difference between the groups based on the Mann Whitney U test results with a 0.05 significance level. The significance levels for barium and lead were <0.001 and 0.007, respectively.

Test evaluation results indicated that there was no statistically significant difference between the means for 62% of the elements (8 out of 13) at a 0.05 significance level. For the remaining five elements, the means were higher for the MMA as compared to the NRU. Because the majority of the elements were statistically similar at the 0.05 significance level, MMA and NRU results will be combined to obtain one background subsurface soil data set.

Beryllium was found to be the sole element from this group that was statistically similar based on Mann Whitney U test results.

Test evaluation results suggested that there was no statistical difference between the means for 62% of the elements. Since the majority of these elements are statistically similar, the MMA and NRU results will be combined to obtain one background subsurface soil data set at the site. Cadmium, mercury, and thallium were the elements that were non-detected in the data combination for NRU subsurface soils. Although these three elements were not statistically tested, 95%UCLs were calculated based on available data.

Point estimate values were used to represent the background concentration for future comparisons between site and background data. The 95 percent upper confidence limit (UCL) was selected as the statistic to assess background point estimate values. The requisite equation for determining the point estimate for the background value is based on distribution of the combined data set.

Point estimates were established for the 13 elements from the analysis of the surface and subsurface soil data sets. Cadmium, mercury, and thallium were not detected in the NRU subsurface soil data set; however, the combined data set contains greater than 20 percent detects. Since the subsurface soil data sets were combined, point estimates were also established for these three elements.

## 4.3 CONFIDENCE LIMITS

The Shapiro-Wilk test was used to assess the distribution of the combined data. When the combined data set (MMA and NRU) passed the test for normality, the equation for 95% UCL for normal distributions was used. When the combined data set was lognormal, the 95% UCL for lognormal distributions was used. When the combined data set did not pass either test or the initial distributions were not normally or lognormally distributed, the 95% UCL based on a nonparametric distribution was calculated. (Refer to Table 4-8 for 95% UCL equations.) Background 95% UCLs for surface soil values are presented in Table 4-11 and subsurface soil samples are presented in Table 4-12, including the associated distribution for combined data. The output for the summary statistics for Tables 4-11 and 4-12 is included in Appendix G.

**Table 4-11**
**Occurrence and Distribution of Chemicals**
**Combined Surface Soil (MMA and NRU)**

[Units in mg/kg]

| Chemical | Frequency of Detection | Minimum Concentration | Maximum Concentration | Arithmetic Mean Concentration | Coefficient of Variation | Distribution | 95% UCL of the Mean |
|---|---|---|---|---|---|---|---|
| Aluminum | 28 / 28 | 3,620 | 20,100 | 8,300 | 0.515 | Lognormal | 9,896 |
| Arsenic | 28 / 28 | 1.50 | 10.2 | 3.73 | 0.624 | Lognormal | 4.53 |

## 4.4 COMPARISON TO PREVIOUS STUDY ATTEMPT

Data from the previously attempted background study were reviewed to evaluate accuracy and precision and evaluate the use of this data in the new data set. Several shortcomings were identified in the previous data set, including the following:

- The previous background attempt focused on the collection of site-specific background concentrations
- Background samples were collected at the MMA and were not collected at the NRU
- Surface soil samples had not been included in the background study design
- Data were not statistically evaluated to assess the potential for combining data sets
- Point estimates were developed for the Wheeling Sandy Loam and Unison-Urban Complex for each soil horizon resulting in four estimates
- Tolerance limits were used to develop point estimates as opposed to the 95% UCL
- Copper, iron, and manganese were eliminated from the data set without supporting rationale
- Uncertainty associated with the actual position of sampling locations
- High data variability

The uncertainty inherent in the previous background data set demonstrated that data results could not be incorporated into the study without compromising the current data set.

## 4.5 COMBINED DATA SET AND TOLERANCE LIMITS

As a result of subsequent discussions with USEPA and VDEQ, this Final Facility-Wide Background Study reflects two major revisions: 1) facility-wide point estimates for background soil data are calculated as tolerance limits rather than confidence limits, and 2) background data for soil (surface and subsurface, MMA and NRU) are combined into a single data set. The rationale for these changes is summarized in the following text.

The use of tolerance limits rather than confidence limits evolved from comments questioning the use of the 95% UCL as the point estimate for the background value. The 95% UCL was originally included in the Facility-Wide Background Study as a general point of reference. At the time the Work Plan for this Facility-Wide Background Study was developed, the intent was to use hypothesis testing for RFI sites. An additional use of the data set would include the use of point-by-point comparisons.

A confidence interval is used for comparisons within a single population. A compliance data set is then typically compared to a known standard (USEPA, 1989, 1992). Using the 95% UCL as a single point comparison or background value, however, is likely to result in classifying many chemicals as greater than background when they are not. These misclassifications would be due to the 95% UCL representing an estimate of the mean. Such misclassifications could occur as often as 50% of the time.

A tolerance limit is used for comparisons of similar but distinct populations. A concentration range is defined from a background data set, within which a large proportion of compliance data should fall with high probability (USEPA 1989, 1992). Therefore, it was recommended that a 95% upper tolerance limit (UTL) be developed in the Background Study for use as point-by-point comparisons. For reference, the 95% UTL values for each stratum (surface and subsurface soil) and each area of the study (MMA and NRU) are presented in Tables 4-13 through 4-16. The output for the summary statistics is provided in Appendix G. For comparison, the 95% UCLs calculated for this study are also presented in the table. For those constituents with CVs greater than 1, the use of the UTL will better accommodate the variability in the data set.

Background soil data sets were combined after evaluating various data groups. During discussions there were concerns about combining the MMA and NRU surface soil data because barium and iron demonstrated a statistically significant difference in the original statistical evaluation (see Section 4.2 and Table 4-9). Similarly, aluminum, barium, lead, vanadium, and zinc demonstrated statistically significant difference for the MMA and NRU subsurface soil data sets (see Section 4.2 and Table 4-10). The hypothesis that within each stratum (surface and subsurface), data for each chemical constituent could be grouped into either one or two groups by soil type was investigated.

A new set of background numbers was generated to assess whether the numbers calculated using this approach were similar to those calculated using the original approach. These comparisons demonstrated that the calculated UTLs were similar between the data groups and generally within the same order of magnitude. In addition, there was no particular trend in the UTLs for a given group, e.g., the highest UTL values are not consistently from the same group.

After further discussion and analysis of these comparisons it was agreed that combining the data sets would be appropriate because each potentially contaminated site at the facility is located in an area where excavation of surface soils has occurred at some point during facility operations. The combined surface and subsurface soil data set would most likely represent the conditions of mixed surface and subsurface soil at these sites. The final set of point estimates for the background data set was based on calculated 95% UTLs for a single data set that represented surface and subsurface soil from the MMA and NRU areas. These values are provided in Table 4-17. The output for the summary statistics is provided in Appendix G. For several constituents, the 95% UTLs are below the RBCs, which will be used to screen chemicals of potential concern (COPCs) at the sites. Those chemicals detected at concentrations below RBCs would be "screened out" of the risk assessment process and would not be carried forward for further quantitative evaluation. Thus, the potential for carrying naturally occurring elements through the quantitative risk assessment would be minimized. In addition, combining the data sets will result in greater statistical power for the comparisons due to the increased sample size and will better accommodate variability in the data set.

# 5.0 Conclusions

## 5.1 BACKGROUND SAMPLE LOCATIONS

Pre-selected background sample locations were positioned in the MMA and NRU in areas that had not been impacted by previous site operations. Explosives were selected as primary background markers given the history of installation propellant manufacturing activities. Field screening immunoassays were processed for RDX and TNT to evaluate potential explosive contamination. Explosives results were negative, indicating background sampling locations had not been impacted by RFAAP operations. Additionally, semivolatile and volatile organic compounds were evaluated as secondary markers to substantiate the selection of true background locations. Analytical results demonstrated that organic contaminants had not impacted the selected locations, indicating that sample locations represented background conditions.

## 5.2 STATISTICAL EVALUATION

Background sample results were validated in accordance with Work Plan Addendum No. 10, to assess analytical data limitations and report scientifically based and statistically valid data. Elements were eliminated from statistical testing that did not result in significant contributions to background evaluation. For example, macronutrients (calcium, potassium, magnesium, and sodium) were not evaluated statistically because they are not chemicals that drive remedial decisions. Non-detects greater than 80% were also eliminated because there was not enough data to perform statistical analysis.

Statistical testing was performed on the remaining elements to assess data distributions and evaluate the potential for combining the data into one data set. Testing results indicated that surface soils from both the MMA and NRU could be combined into one data set and subsurface soils from both areas could be combined into one data set.

Point estimates were then evaluated against the previously attempted background study (Parsons 1996) to assess the integration of prior data into the existing data set. Shortcomings identified in the previous data set, as specified in Section 4.4, precluded its use because of the high potential for compromising the current (year 2000) data.

As a result of subsequent discussions with USEPA and VDEQ, this Final Facility-Wide Background Study reflects two major revisions: 1) facility-wide point estimates for background soil data are calculated as tolerance limits rather than confidence limits, and 2) background data for soil (surface and subsurface, MMA and NRU) are combined into a single data set. The final set of point estimates for the background data set, therefore, are based on calculated 95% UTLs for a single facility-wide data set that represents surface and subsurface soil from the MMA and NRU areas. These values are included as a point of reference for point-by-point comparisons for site screening. These point estimates are summarized in Table 5-1.

**Table 5-1**
**Facility-Wide Point Estimates for Radford AAP Soil**

[Units in mg/kg]

| Chemical Name | Range of data (mg/kg) | Background Concentration 95 % UTL (mg/kg) |
|---|---|---|
| Aluminum | 3,620 - 47,900 | 40,041 |
| Arsenic | 1.2 - 35.9 | 15.8 |
| Barium | 23.4 - 174 | 209 |
| Beryllium | 0.61 - 5.4 | 1.02 |
| Cadmium | 0.62 - 2.5 | 0.69 |
| Chromium | 6.3 - 75.8 | 65.3 |
| Cobalt | 5.9 - 130 | 72.3 |
| Copper | 1.6 - 38.7 | 53.5 |
| Iron | 7,250 - 67,700 | 50,962 |
| Lead | 2.1 - 256 | 26.8 |
| Manganese | 16.7 - 2,040 | 2,543 |
| Mercury | 0.038 - 1.2 | 0.13 |
| Nickel | 4.6 - 94.2 | 62.8 |
| Thallium | 1.3 - 5.0 | 2.11 |
| Vanadium | 12.2 - 114 | 108 |
| Zinc | 4.7 - 598 | 202 |

# Appendix B

# Data Validation Reports

## Appendix B
## Data Validation Reports

Data packages were validated to ensure compliance with specified analytical, QA/QC requirements, data reduction procedures, data reporting requirements, and required accuracy, precision, and completeness criteria.

Please note the following about the Form 1's in Appendix B.

- Laboratory software limitations resulted in select compounds being manually calculated and changed during the data validation process to reflect the correct reporting limits. Since this was only done for non-detects, these changes had no affect on the contamination assessment. Changes by the analytical laboratory were initialed on the forms while un-initialed changes were made by the IT data validation team.
- Also, the line noted on the metals Form 1's through aluminum or barium is an artifact from laboratory reproduction. Aluminum and/or barium were not rejected during the validation process.

# Appendix B
# Data Validation Reports

Data validation assesses the acceptability or unacceptability of the data quality based on a set of pre-defined criteria. Data validation is defined as the systematic process for reviewing a data package against a set of criteria to provide assurance that the data is adequate for its intended uses. These criteria depend upon the type(s) of data involved and the purpose for which data are collected. The intended use of the data and the associated acceptance criteria for data quality is assessed before the data collection effort begins.

Data packages were validated to ensure compliance with specified analytical, QA/QC requirements, data reduction procedures, data reporting requirements, and required accuracy, precision, and completeness criteria.

The data obtained using USEPA performance based methods were validated by the project chemist. Samples analyzed for physical characterization and disposal characterization following TCLP and pH procedures do not require validation. Results were assessed for accuracy and precision of laboratory analysis to identify the limitations and quantity of data. The quality of the data collected in support of the sampling activity was considered acceptable, unless qualified rejected "R" or blank qualified "B" during the validation process. Samples qualified "J," "UJ," "L," "UL," or "K" were considered acceptable as estimated. These qualifiers and common laboratory are defined in Tables B-1 and B-2, respectively.

**Table B-1**
**USEPA Region III Validation Qualifiers**

| Qualifier | Definition |
|---|---|
| No Code | Confirmed identification. |
| J | Analyte present, bias estimated. Reported value may not be accurate or precise. |
| K | Analyte present, bias high estimated. Reported value may be biased high. |
| L | Analyte present, bias low estimated. Reported value may be biased low. |
| UJ | Not detected, bias estimated. Reporting limit may be inaccurate or imprecise. |
| UL | Not detected, bias low estimated. Reporting limit is probably higher. |
| B | The compound has been detected in the associated sample and laboratory method blank and/or associated field sample. The compound reported is considered not detected substantially above the level reported in the laboratory and/or field blanks. |
| R | Unreliable result. Analyte may or may not be present in the sample. |

**Table B–2**
**Common Laboratory Qualifiers**

| Qualifier | Parameter Group | Definition |
|---|---|---|
| No Code | All | Confirmed identification. |
| U | All | Not detected. The associated number indicates the reporting limit for the sample. |
| B | Inorganics | The reported value was obtained from a reading <CRDL and ≥ MDL or IDL and is considered estimated. |
| B | Organics | The analyte or compound has been detected in the sample and laboratory method blank and indicates probable blank contamination. |
| J | Organics | Indicates an estimated value for (1) estimating a concentration as a tentatively identified compound as indicated by the mass spectral and retention time data, or (2) estimating a concentration <CRQL or MRL and ≥ MDL. |
| S | Dioxins | The response of a specific PCDD/PCDF isomer has exceeded the normal dynamic range. The corresponding signal is saturated and the reported analyte concentration is a "minimum estimate." |
| S | Inorganics | The reported value was identified by the Method of Standard Additions. |
| Q | Mass Spec | Presence of QC ion instabilities caused by quantitative interferences. |
| P | Gas Chromatography | Target analyte confirmation >40% difference for detected compound between the two GC columns. The lower of the two values was reported. |
| N | Organics | Indicates presumptive evidence of a compound for tentatively identified compounds using a library search. |
| N | Inorganics | Laboratory spike sample recovery not within control limits. |
| * | Inorganics | Duplicate analysis not within control limits. |
| + | Inorganics | Correlation coefficient for MSA is less than 0.995. |
| E | Organics | Identifies compounds whose concentrations exceed the upper level of the calibration range. |
| E | Inorganics | Reported value is estimated because of the presence of interferences. |
| D | Organics | Indicates sample was analyzed at a dilution. |
| W | Inorganics | Post-digestion spike for furnace AA analysis is outside of control limits with the sample absorbance less than 50% of spike absorbance. |
| EMPC | Dioxins | The ion-abundance ratio between the two characteristic PCDD/F ions is outside accepted ranges. The detected PCDD/F is reported as an estimated maximum possible concentration (EMPC). |
| R | Dioxins | To reject data for analytes whose extraction standard recoveries are considered unacceptable, or when other circumstances require its use. |
| V | Dioxins | To validate the data for analytes whose extraction standard recoveries are lower than the method's minimum requirement. |

**TO:** Davida Trumbo

**FROM:** Kweku Acquah

**SUBJECT:** Radford Army Ammunition Plant Data Validation – TAL Metals
STL St. Louis, SDG F0I130290 (001166)

**DATE:** November 24, 2000

---

The purpose of this memorandum is to present the data validation report for the samples collected at the Radford Army Ammunition Plant during the September 5-7, 2000 sampling events. Samples were analyzed for metals using methods SW-846 7471A (CVAA) for Mercury and SW-846 6010B (ICP) for all other metals. A total of twenty-eight soil samples were validated. The sample IDs are:

| Field ID | Field ID | Field ID |
|---|---|---|
| MMAB2BD | MMAU1A | MMAW4B |
| MMAB3A | MMAU1B | MMAW4C |
| MMAB3B | MMAU1C | MMAW1A |
| MMAW2A | MMAW3A | MMAW1B |
| MMAW2B | MMAW3B | MMAW1C |
| MMAW2C | MMAW3C | MMAU4A |
| MMAW2CD | MMAW3CD | MMAU4B |
| MMAU2A | MMAB2A | MMAU4C |
| MMAU2B | MMAB2B | |
| MMAU2C | MMAW4A | |

Data were reviewed by Kweku Acquah and validated using a combination of method-specific criteria, laboratory SOP, and the *Innovative Approaches to Data Validation for USEPA Region III* (June 1995). Parameters were validated at USEPA Region III Level IM2 and are presented in Table 1. Data associated with parameters in compliance with quality control specifications have not been qualified. Data associated with parameters that did not comply with quality control specifications and directly impacted project data have been qualified in accordance with USEPA Region III specifications.

**Table 1. Laboratory Performance Criteria**

| Qualified | | Parameter |
|---|---|---|
| Yes | No | |
| | X | Holding Times |
| | X | Initial and Continuing Calibration |
| | X | Blank Analysis |
| | X | ICP Interference Check Sample (ICS) |
| X | | Matrix Spike/Matrix Spike Duplicate |
| | X | Laboratory Control Sample (LCS) |
| X | | ICP Serial Dilution |
| | X | Quantitation Verification |

The quality data collected in support of this sampling activity is considered acceptable with the noted qualifications.

cc: Eric Malarek
Project File

**RADFORD ARMY AMMUNITION PLANT**
**VALIDATION REPORT**
**TAL METALS REVIEW**
**SDG 001166 (F0I130290)**

**I-Holding Times**
*Form I, shipping and run logs.*
The primary objective is to ascertain the validity of results based on the holding time of the sample from time of collection to time of sample extraction and analysis. Holding time criteria: Cool @4 °C ± 2 °C, the maximum holding time is 180 days for metals and 28 days for mercury.

- All criteria were met. No qualifiers were applied.

**II-Initial and Continuing Calibration**
*Form II*
Requirements for satisfactory instrument calibration are established to ensure that the instrument is capable of producing acceptable quantitative data. Initial calibration demonstrates that the instrument is capable of acceptable performance at the beginning of the analysis run, and continuing calibration verification documents that the initial calibration is still valid.

| | | | |
|---|---|---|---|
| ICP: | 1- blank | Hg: | 1 – blank |
| | 3 – standards ($r \geq 0.995$) | | 5 – standards ($r \geq 0.995$) |
| | %R – 90-110% | | %R – 80-120% |

- ICP analysis for metals was run on 09/18-21/00. Mercury was analyzed on 09/19/00 with a correlation coefficient of 0.9999. All criteria were met. No qualifiers were applied.

**III-Blank Analysis**
Blanks are assessed to determine the existence and magnitude of contamination problems. No contaminant should be detected in the blank > the MRL. Any sample value < five times (5X) the maximum concentration detected in the QC blanks and > the MRL is qualified "B". Soil sample results and action levels were appropriately adjusted for moisture content during the blank analysis study. The associated rinse blanks are samples 083100R4 and 090700RB.

- There was no contaminant detected in any of the blanks >MRL. No qualifiers were applied.

**IV-ICP Interference Check Sample (ICS)**
*Form IV*
The ICP Interference Check Sample (ICS) verifies interelement and background correction factors. ICP Interference Check is performed at the beginning and end of each sample analysis run. Control limits are 80-120%.

- All criteria were met. No qualifiers were applied.

**V-Matrix Spike/Matrix Spike Duplicate Analysis**
The matrix spike sample analysis provides information about the effect of each sample matrix on the digestion and measurement methodology. Spike recovery (%R) must be within the specified control limits of 75-125%. However, spike recovery limits do not apply when sample concentration exceeds the spike added concentration by a factor of four or more. If the spike recovery is < 75% but > 30%, positive sample results are qualified as biased low, "L" and non-detects as biased low, "UL".

**V-Matrix Spike/Matrix Spike Duplicate Analysis, Continued**

- Samples MMAW2BS (DKA7E), MMAB3AS (DKA76) and MMAW2BD (DKA7E) were used for the MS/MSD analysis. %R for Aluminum (126.4%, 565.8%, -682.2%, 475.2%), Iron (619.0%, -28.0%, 383.5%, -124.1%) and Manganese (-4.6%, -115.7%, -64.2%) were outside the control limits. Since the sample concentrations for these elements exceeded the spike added concentration by a factor of four or more, no qualifiers were applied based on these outliers.

- %R for Antimony (56.3%, 66.2%, 57.1%, 63.2%) were below the control limits. Positive samples for this element were qualified as biased low, "L" and non-detects "UL".

**VI-Laboratory Control Samples (LCS)**
*Forms VII, XIII*
The laboratory Control Sample (LCS) serves as a monitor of the overall performance of each step during the analysis, including the sample preparation. All LCS results must fall within the specified control limits.

- All criteria were met. No qualifiers were applied.

**VII-ICP Serial Dilution**
*Forms I, IX*
The serial dilution of samples quantitated by ICP determines whether or not significant physical or chemical interferences exist due to sample matrix. If the analyte concentration in the original sample is a factor of 10 above MDL, then an analysis of a 5-fold dilution should agree within 10% difference of the original result.

- Percent difference (%D) for Zinc (23.2%, 14.7%) was above the control limit. Positive values for this element was qualified as estimated, "J" and non-detects had no qualifiers applied.

**VIII-Quantitation Verification**
*Raw Data.*
The accuracy of analytical results is verified through the calculation of several parameters. The percent difference (%D) between the calculated and the reported values should be within 10%. The following calculations were performed for verification:

**ICP Sample: MMAB2BD (DKA5M), Lead**

Conc. mg/kg = (conc. μg/mL) * (Final Volume mL)/(Weight g* % Solids as a fraction)

Conc. mg/kg = (0.07301 μg/mL)*(100 mL)/(1 g* 0.861) = 8.50 μg/g = 8.5 mg/kg

Reported concentration = 8.5 mg/kg
%D =0%.
Values were within 10% difference

**VIII-Quantitation Verification, Continued**

**CVAA Sample: MMAB2BD (DKA5M), Hg**

Conc. mg/kg = (conc. μg/L) * (Final Volume L)/(Weight g* % Solids as a fraction)

Conc. mg/kg = (0.630 μg/L)*(0.03 L)/(0.18 g* 0.861) = 0.122 μg/g = 0.122 mg/kg

Reported concentration = 0.13 mg/kg
%D = 6.15%.
Values were within 10% difference

**MEMORANDUM**

**TO:** Davida Trumbo

**FROM:** Kweku Acquah

**SUBJECT:** Radford Army Ammunition Plant Data Validation – TAL Metals
STL Baltimore, SDG 001139 (T09852)

**DATE:** November 24, 2000

---

The purpose of this memorandum is to present the data validation report for the samples collected at the Radford Army Ammunition Plant during the August 29, 2000 sampling event. Samples were analyzed for metals using methods SW-846 7841(GFAA) for Thallium, SW-846 7471A (CVAA) for Mercury, and SW-846 6010B (ICP) for all other metals. A total of fifteen soil samples were validated. The sample IDs are:

| Field Sample ID | Field Sample ID |
|---|---|
| NRUW4A | NRUG1B |
| NRUW4B | NRUG1C |
| NRUW4C | NRUL4A |
| NRUW4CD | NRUL4B |
| NRUL3A | NRUL4BD |
| NRUL3B | NRUL4C |
| NRUL3C | NRUW3A |
| NRUG1A | |

Data were reviewed by Kweku Acquah and validated using a combination of method-specific criteria, laboratory SOP, and the *Innovative Approaches to Data Validation for USEPA Region III* (June 1995.) Parameters were validated at USEPA Region III Level IM2 and are presented in Table 1. Data associated with parameters in compliance with quality control specifications have not been qualified. Data associated with parameters that did not comply with quality control specifications and directly impacted project data have been qualified in accordance with USEPA Region III specifications.

**Table 1. Laboratory Performance Criteria**

| Qualified | | Parameter |
|---|---|---|
| **Yes** | **No** | |
| | **X** | Holding Times |
| | **X** | Initial and Continuing Calibration |
| | **X** | Blank Analysis |
| | **X** | ICP Interference Check Sample (ICS) |
| **X** | | Matrix Spike/Matrix Spike Duplicate |
| **X** | | Duplicate Sample Analysis |
| | **X** | Laboratory Control Sample (LCS) |
| **X** | | ICP Serial Dilution |
| | **X** | Quantitation Verification |

The quality of data collected in support of this sampling activity is considered acceptable with the noted qualifications.

cc: Eric Malarek
Project File

**RADFORD ARMY AMMUNITION PLANT**
**VALIDATION REPORT**
**TAL METALS REVIEW**
**SDG 001139 (T09852)**

**I-Holding Times**

*Form I, shipping and run logs.*

The primary objective is to ascertain the validity of results based on the holding time of the sample from time of collection to time of sample extraction and analysis. Holding time criteria: Cool @4 °C ± 2 °C, the maximum holding time is 180 days for metals and 28 days for mercury.

- All criteria were met for all the samples. No qualifiers were applied.

**II-Initial and Continuing Calibration**

*Form II*

Requirements for satisfactory instrument calibration are established to ensure that the instrument is capable of producing acceptable quantitative data. Initial calibration demonstrates that the instrument is capable of acceptable performance at the beginning of the analysis run, and continuing calibration verification documents that the initial calibration is still valid.

| | | | | | |
|---|---|---|---|---|---|
| ICP: | 1- blank | Hg: | 1 – blank | AA: | 1 - blank |
| | 3 – standards ($r \geq 0.995$) | | 5 – standards ($r \geq 0.995$) | | 5 – standards ($r \geq 0.995$) |
| | %R – 90-110% | | %R – 80-120% | | %R – 90-110% |

- ICP analysis for metals was run on 09/26-27/00. Thallium was analyzed on 09/26/00 with a correlation coefficient of 0.9964. Mercury was analyzed on 09/21/00 with a correlation coefficient of 0.9999. All criteria were met. No qualifiers were applied.

**Continuing Calibration for MRL**

The instrument calibration near the method reporting limit (MRL) must be verified for each analyte MRL standards are evaluated using the following criteria:

CRI –MRL criteria for ICP:

A CRI must be run at a concentration of 2X MRL, or 2X the MDL, whichever is greater, for each ICP analyte (except Al, Ba, Ca, Fe, Mg, Na and K) at the beginning and end of each sample run or a minimum of twice per 8 hours.

CRA –MRL criteria for GFAA/CVAA:

The linearity of the analytical curve must be verified near the MRL for Graphite Furnace AA (GFAA). A CRA must be run at a concentration equal to the MRL, or the MDL, whichever is greater, at the beginning of each sample run.

The MRL standard recoveries should be between 90-110% of the true values. If the recovery for the CRI or CRA is > 110% and the reported sample result is > MDL or MRL, but < 2X MRL, the result is qualified as biased high, "K" and no qualifiers for non-detects. Table 2 summarizes the MRL standards study.

**TABLE 2. MRL STANDARDS STUDY.**

| Elements | Samples Affected |
|---|---|
| Antimony (114.8%) | None |
| Chromium (148.7%) | None |
| Mercury (1025%) | None |

**III-Blank Analysis**

*Form III*

Blanks are assessed to determine the existence and magnitude of contamination problems. No contaminant should be detected in the blank > the MRL. Any sample value < five times (5X) the maximum concentration detected in the QC blanks and > the MRL is qualified "B". Soil sample results and action levels were appropriately adjusted for moisture content during the blank analysis study. The associated rinse blank is sample 083000R2.

- There was no contaminant detected in any of the blanks >MRL. No qualifiers were applied.

**IV-ICP Interference Check Sample (ICS)**

*Form IV*

The ICP Interference Check Sample (ICS) verifies interelement and background correction factors. ICP Interference Check is performed at the beginning and end of each sample analysis run. Control limits are 80-120%.

- All criteria were met. No qualifiers were applied.

**V-Matrix Spike/Matrix Spike Duplicate Analysis**

The matrix spike sample analysis provides information about the effect of each sample matrix on the digestion and measurement methodology. Spike recovery (%R) must be within the specified control limits of 75-125%. However, spike recovery limits do not apply when sample concentration exceeds the spike added concentration by a factor of four or more. If the spike recovery is < 75% and the sample results are > MDL, the data for these samples are qualified as biased low, "L". If the spike recovery falls within the range of 30-74% and the sample results are < MRL, the data for these samples are qualified as detection limits biased low, "UL".

- Sample NRUW4A (T09852) was used for the MS/MSD analysis. %R for Aluminum (-577.2%, -597.9%), Iron (-1474.8%, -4757.9%) and Manganese (-2562.5%, -2325.6%) were grossly below the control limits. Since the sample concentrations for these elements exceeded the spike added concentration by a factor of four or more, no qualifiers were applied based on these outliers.

- %R for Antimony (28.2%, 32.4%), Beryllium (73.5%), Chromium (31.1%, 65.0%), Cobalt (57.7%, 57.6%), Lead (61.2%, 68.8%), Magnesium (70.6%, 71.5%) and Vanadium (60.44%) were below the control limits. Positive sample results for these elements were qualified as biased low, "L" and non-detects "UL".

**VI-Duplicate Sample Analysis**

Duplicate sample determinations are used to demonstrate acceptable method precision by the laboratory at the time of analysis. Duplicate analyses are also performed to generate data in order to determine the long-term precision of the analytical method on various matrices. The relative percent difference (RPD) should be ±20% for sample values > 5X MRL. A control limit of ± 2X MRL is used for sample values < five times MRL

- Sample NRUW4A (T09852) was used for the duplicate analysis. Relative percent difference (RPD) for Chromium (117.9%) and Vanadium (49.7%) were grossly above the control limit of 20%. Positive values for these elements were qualified as estimated, "J" and non-detects "UJ".

**VII-Laboratory Control Samples (LCS)**
*Forms VII, XIII*
The Laboratory Control Sample (LCS) serves as a monitor of the overall performance of each step during the analysis, including the sample preparation. All LCS results must fall within the specified control limits.

- All criteria were met. No qualifiers were applied.

**VIII-ICP Serial Dilution**
*Forms I, IX*
The serial dilution of samples quantitated by ICP determines whether or not significant physical or chemical interferences exist due to sample matrix. If the analyte concentration in the original sample is a factor of 10 above MDL, then an analysis of a 5-fold dilution should agree within 10% difference of the original result.

- Percent difference (%D) for elements Arsenic (15.4%), Beryllium (32.0%), Copper (49.3%) and Cobalt (14.3%) were above the control limit. Positive values for these elements were qualified as estimated, "J" and non-detects had no qualifiers applied.

- Percent difference (%D) for elements Nickel (100.0%), Selenium (170.3%) and Silver (100.0%) were grossly above the control limit. Since the initial sample results for these elements were < a factor of 10 above their corresponding MDLs, no qualifiers were applied based on these outliers.

**IX-Quantitation Verification**
*Raw Data.*
The accuracy of analytical results is verified through the calculation of several parameters. The percent Difference (%D) between the calculated and the reported values should be within 10%. The following calculations were performed for verification:

**ICP Sample: NRUW4CD (T09855), Aluminum**

Conc. mg/kg = (conc. μg/L) * (Final Volume L)/(Weight g* % Solids as a fraction)

Conc. mg/kg = (140070 μg/L)*(0.1 L)/(1.0079 g* 0.753 )= 18,455 μg/g = 18,455 mg/kg

Reported concentration = 18,500 mg/kg
%D =0.24%.
Values were within 10% difference

**AA Sample : NRUW4CD (T09855), Thallium**

Conc. mg/kg = (conc. μg/L) * (Final Volume L)/(Weight g* % Solids as a fraction)

Conc. mg/kg = (1.539 μg/L)*(0.1 L)/(1.0077 g* 0.753) = 0.20 μg/g = 0.20 mg/kg

Reported concentration = 0.20 mg/kg
%D = 0%.
Values were within 10% difference.

**IX-Quantitation Verification (Cont.)**

**CVAA Sample: NRUW4CD (T09855), Hg**

Conc. mg/kg = (conc. µg/L) * (Final Volume L)/(Weight g* % Solids as a fraction)

Conc. mg/kg = (0.256 µg/L)*(0.1 L)/(0.2083 g* 0.753) = 0.16 µg/g = 0.16 mg/kg

Reported concentration = 0.16 mg/kg
%D = 0%.
Values were within 10% difference

**MEMORANDUM**

**TO:** Davida Trumbo

**FROM:** Kweku Acquah

**SUBJECT:** Radford Army Ammunition Plant Data Validation – TAL Metals
STL Baltimore, SDG 001139 (T09869)

**DATE:** November 25, 2000

---

The purpose of this memorandum is to present the data validation report for the samples collected at the Radford Army Ammunition Plant during the August 29, 2000 sampling event. Samples were analyzed for metals using methods SW-846 7841(GFAA) for Thallium, SW-846 7471A (CVAA) for Mercury, and SW-846 6010B (ICP) for all other metals. A total of ten soil samples were validated. The sample IDs are:

| Field Sample ID | Field Sample ID |
|---|---|
| NRUW3B | NRUC3A |
| NRUW3C | NRUC3B |
| NRUC4A | NRUG4A |
| NRUC4B | NRUG4B |
| NRUC4C | NRUG4C |

Data were reviewed by Kweku Acquah and validated using a combination of method-specific criteria, laboratory SOP, and the *Innovative Approaches to Data Validation for USEPA Region III* (June 1995.) Parameters were validated at USEPA Region III Level IM2 and are presented in Table 1. Data associated with parameters in compliance with quality control specifications have not been qualified. Data associated with parameters that did not comply with quality control specifications and directly impacted project data have been qualified in accordance with USEPA Region III specifications.

**Table 1. Laboratory Performance Criteria**

| Qualified | | Parameter |
|---|---|---|
| Yes | No | |
| | X | Holding Times |
| X | | Initial and Continuing Calibration |
| X | | Blank Analysis |
| | X | ICP Interference Check Sample |
| X | | Matrix Spike/Matrix Spike Duplicate |
| X | | Duplicate Sample Analysis |
| | X | Laboratory Control Sample |
| X | | ICP Serial Dilution |
| | X | Quantitation Verification |

All of the data collected in support of this sampling activity is acceptable with the noted qualifications, except for antimony non-detects. Antimony non-detects were rejected due to extremely low spike recoveries in accordance with USEPA Region III guidance.

cc: Eric Malarek
Project File

**RADFORD ARMY AMMUNITION PLANT**

**VALIDATION REPORT**
**TAL METALS REVIEW**
**SDG 001139 (TO9869)**

**I-Holding Times**

*Form I, shipping and run logs.*

The primary objective is to ascertain the validity of results based on the holding time of the sample from time of collection to time of sample extraction and analysis. Holding time criteria: Cool @4 °C ± 2 °C, the maximum holding time is 180 days for metals and 28 days for mercury.

- All criteria were met for all the samples. No qualifiers were applied.

**II-Initial and Continuing Calibration**

*Form II*

Requirements for satisfactory instrument calibration are established to ensure that the instrument is capable of producing acceptable quantitative data. Initial calibration demonstrates that the instrument is capable of acceptable performance at the beginning of the analysis run, and continuing calibration verification documents that the initial calibration is still valid.

| | | | | | |
|---|---|---|---|---|---|
| ICP: | 1- blank | Hg: | 1 – blank | AA: | 1 - blank |
| | 3 – standards ($r \geq 0.995$) | | 5 – standards ($r \geq 0.995$) | | 5 – standards ($r \geq 0.995$) |
| | %R – 90-110% | | %R – 80-120% | | %R – 90-110% |

- ICP analysis for metals was run on 09/26-27/00. Thallium was analyzed on 09/26/00 with a correlation coefficient of 0.9964. Mercury was analyzed on 09/21/00 with a correlation coefficient of 0.9999. All criteria were met. No qualifiers were applied.

**Continuing Calibration for MRL**

The instrument calibration near the method reporting limit (MRL) must be verified for each analyte MRL standards are evaluated using the following criteria:

CRI –MRL criteria for ICP:

A CRI must be run at a concentration of 2X MRL, or 2X the MDL, whichever is greater, for each ICP analyte (except Al, Ba, Ca, Fe, Mg, Na and K) at the beginning and end of each sample run or a minimum of twice per 8 hours.

The MRL standard recoveries should be between 90-110% of the true values. If the recovery for the CRI is > 110% and the reported sample result is > MDL or >MRL, but < 2X MRL, the result is qualified as biased high "K" and no qualifiers for non-detects. If the recovery for the CRI is between 50-89%, results > MDL or > MRL, but < 2X MRL are qualified as biased low, "L" and result < MDL or <MRL are qualified "UL". If the recovery for an element is < 50%, sample results > MDL or > MRL, but < 2X MRL are qualified as biased extremely low, "L" and results < MDL or < MRL are qualified as unusable, "R". Table 2 summarizes the MRL standards study.

**TABLE 2. MRL STANDARDS STUDY.**

| Elements | Samples Affected |
|---|---|
| Antimony (114.8%) | None |
| Chromium (286.6%) | None |
| Cobalt (86.6%) | NRUW3B, NRUC4A, NRUC4B, NRUC4C, NRUC3A, NRUC3B, NRUG4A, NRUG4B |
| Copper (86.8%) | None |
| Manganese (49.3%) | None |
| Selenium (82.0, 70.0%) | All Samples |

**III-Blank Analysis**

*Form III*

Blanks are assessed to determine the existence and magnitude of contamination problems. No contaminant should be detected in the blank > the MRL. Any sample value < five times (5X) the maximum concentration detected in the QC blanks and > the MRL is qualified "B". Table 3 summarizes the blank analysis study. Soil action levels cited are unadjusted for moisture content. Sample results and action levels are appropriately adjusted for moisture content during the blank analysis study. The associated rinse blanks are sample numbers 083000R2 and 083000R3.

**Table 3. Blank Contamination Summary.**

| Element | Blank Source | Max. Equivalent Conc. mg/kg | 5X Max Equivalent Conc. mg/kg | Affected Qualified B Samples |
|---|---|---|---|---|
| Arsenic | 083000R3 | 1.05 | 5.25 | NRUG4A, NRUG4B |

**IV-ICP Interference Check Sample (ICS)**

*Form IV*

The ICP Interference Check Sample (ICS) verifies interelement and background correction factors. ICP Interference Check is performed at the beginning and end of each sample analysis run. Control limits are 80-120%.

- All criteria were met. No qualifiers were applied.

**V-Matrix Spike/Matrix Spike Duplicate**

The matrix spike sample analysis provides information about the effect of each sample matrix on the digestion and measurement methodology. Spike recovery (%R) must be within the specified control limits of 75-125%. However, spike recovery limits do not apply when sample concentration exceeds the spike concentration by a factor of four or more. If the spike recovery is < 75% and the sample results are > MRL, the data for these samples are qualified as biased low, "L". If the spike recovery falls within the range of 30-74% and the sample results are < MRL, the data for these samples are qualified as detection limits biased low, "UL". If spike recovery results fall < 30% and the sample results are < MRL, data for these samples are qualified as unusable, "R" and results > MRL are qualified as biased extremely low, "L".

- Sample NRUW3B (T09869) was used for the MS/MSD analysis. MS/MSD %R for Aluminum (283.4%, 720%) and Iron (-398.5%, 2415.3%) were grossly outside the control criteria. Since sample concentration for these elements exceeded the spike added concentration by a factor of four or more, no qualifiers were applied based on these outliers.

- %R for Arsenic (72.0%) and Selenium (59.0%, 61.7%) were below the control limits. Positive values for these elements were qualified as biased low, "L" and non-detects "UL".

- %R for Antimony (25.0%, 24.7%) was < 30%. Positive sample values for this element were qualified as biased extremely low, "L" and non-detects as unusable, "R".

**VI-Duplicate Sample Analysis**
Duplicate sample determinations are used to demonstrate acceptable method precision by the laboratory at the time of analysis. Duplicate analyses are also performed to generate data in order to determine the long-term precision of the analytical method on various matrices. The relative percent difference (RPD) should be ±20%.

- Sample NRUW3B (T09869) was used for the duplicate analysis. Relative percent difference (RPD) for Aluminum (29.5%), Beryllium (37.7%), Chromium (37.3%), Copper (44.6%), Iron (42.5%), Magnesium (39.1%), Potassium (28.5%), Vanadium (37.1%), and Zinc (43.1%) were above the control limit. Positive values for these elements were qualified as estimated, "J" and non-detects "UJ".

**VII-Laboratory Control Samples (LCS)**
*Forms VII, XIII*
The laboratory Control Sample (LCS) serves as a monitor of the overall performance of each step during the analysis, including the sample preparation. All LCS results must fall within the specified control limits.

- All criteria were met. No qualifiers were applied.

**VIII-ICP Serial Dilution**
*Forms I, IX*
The serial dilution of samples quantitated by ICP determines whether or not significant physical or chemical interferences exist due to sample matrix. If the analyte concentration in the original sample is a factor of 10 above MDL, then an analysis of a 5-fold dilution should agree within 10% difference of the original result.

- Percent difference (%D) for elements Arsenic (40.0%), Barium (10.7%) and Copper (39.2%) were either above or grossly above the control limit. Positive values for these elements were qualified as estimated, "J".

- Percent difference (%D) for elements Beryllium (46.4%), Cobalt (100.0%) and Nickel (100.0%) were also grossly above the control limit. Since the initial sample results for these elements were < a factor of 10 above their corresponding MDLs, no qualifiers were applied based on these outliers.

**IX-Quantitation Verification**
*Raw Data.*
The accuracy of analytical results is verified through the calculation of several parameters. The percent Difference (%D) between the calculated and the reported values should be within 10%. The following calculations were performed for verification:

**ICP Sample: NRUW3C (T09870), Iron**

Conc. mg/kg = (conc. μg/L) * (Final Volume L) / (Weight g * % Solids as a fraction)

Conc. mg/kg = (139330 μg/L) * (0.1 L) / (1.0059 g* 0.82) = 16,891 μg/g = 16,891 mg/kg

Reported concentration = 18,500 mg/kg
%D = 8.70%.
Values were within 10% difference

**IX-Quantitation Verification (Cont.)**

**AA Sample: NRUW3C (T09870), Thallium**

Conc. mg/kg = (conc. µg/L) * (Final Volume L) / (Weight g * % Solids as a fraction)

Conc. mg/kg = (1.433 µg/L) * (0.1 L) / (1.0059 g * 0.82) = 0.17 µg/g = 0.17 mg/kg

Reported concentration = 0.18 mg/kg
%D = 5.56%.
Values were within 10% difference.

**CVAA Sample: NRUW3B (T09869), Hg**

Conc. mg/kg = (conc. µg/L) * (Final Volume L) / (Weight g* % Solids as a fraction)

Conc. mg/kg = (0.108 µg/L) * (0.1 L) / (0.2084 g * 0.815) = 0.06 µg/g = 0.06 mg/kg

Reported concentration = 0.06 mg/kg
%D = 0%.
Values were within 10% difference

**MEMORANDUM**

**TO:** Davida Trumbo

**FROM:** Kweku Acquah

**SUBJECT:** Radford Army Ammunition Plant Data Validation – TAL Metals
STL Baltimore, SDG 001145 (T09934)

**DATE:** November 24, 2000

---

The purpose of this memorandum is to present the data validation report for the samples collected at the Radford Army Ammunition Plant during the August 29-30, 2000 sampling events. Samples were analyzed for metals using methods SW-846 7841(GFAA) for Thallium, SW-846 7471A (CVAA) for Mercury, and SW-846 6010B (ICP) for all other metals. A total of sixteen soil samples were validated. The sample IDs are:

| Field Sample ID | Field Sample ID |
|---|---|
| NRUC1A | NRUC2A |
| NRUC1B | NRUC2B |
| NRUL1C | NRUG3B |
| NRUL1A | NRUW1B |
| NRUL1B | NRUW1C |
| NRUW1A | NRUG3C |
| NRUG2B | NRUG2C |
| NRUG2A | NRUW2A |

Data were reviewed by Kweku Acquah and validated using a combination of method-specific criteria, laboratory SOP, and the *Innovative Approaches to Data Validation for USEPA Region III* (June 1995.) Parameters evaluated under data validation procedure Level IM2 are presented in Table 1. Data associated with parameters in compliance with quality control specifications have not been qualified. Data associated with parameters that did not comply with quality control specifications and directly impacted project data have been qualified in accordance with USEPA Region III specifications.

**Table 1. Laboratory Performance Criteria**

| Qualified | | Parameter |
|---|---|---|
| **Yes** | **No** | |
| | X | Holding Times |
| X | | Initial and Continuing Calibration |
| X | | Blank Analysis |
| | X | ICP Interference Check Sample (ICS) |
| X | | Matrix Spike/Matrix Spike Duplicate |
| X | | Duplicate Sample Analysis |
| | X | Laboratory Control Sample (LCS) |
| X | | ICP Serial Dilution |
| | X | Quantitation Verification |

All of the data collected in support of this sampling activity is acceptable with the noted qualifications, except for antimony non-detects. Antimony non-detects were rejected due to extremely low spike recoveries in accordance with USEPA Region III guidance.

cc: Eric Malarek
Project File

**RADFORD ARMY AMMUNITION PLANT**
**VALIDATION REPORT**
**TAL METALS REVIEW**
**SDG 0001145 (T09934)**

**I-Holding Times**

*Form I, shipping and run logs.*

The primary objective is to ascertain the validity of results based on the holding time of the sample from time of collection to time of sample extraction and analysis. Holding time criteria: Cool @4 °C ± 2 °C, the maximum holding time is 180 days for metals and 28 days for mercury.

- All criteria were met. No qualifiers were applied.

**II-Initial and Continuing Calibration**

*Form II*

Requirements for satisfactory instrument calibration are established to ensure that the instrument is capable of producing acceptable quantitative data. Initial calibration demonstrates that the instrument is capable of acceptable performance at the beginning of the analysis run, and continuing calibration verification documents that the initial calibration is still valid.

| | | | | | |
|---|---|---|---|---|---|
| ICP: | 1- blank | Hg: | 1 – blank | AA: | 1 - blank |
| | 3 – standards ($r \geq 0.995$) | | 5 – standards ($r \geq 0.995$) | | 5 – standards ($r \geq 0.995$) |
| | %R – 90-110% | | %R – 80-120% | | %R – 90-110% |

- ICP analysis for metals was run on 10/05/00. Thallium was analyzed on 10/03/00 with a correlation coefficient of 0.9993. Mercury was analyzed on 09/25/00 with a correlation coefficient of 0.9999. All criteria were met. No qualifiers were applied.

**Continuing Calibration for MRL**

The instrument calibration near the method reporting limit (MRL) must be verified for each analyte MRL standards are evaluated using the following criteria:

CRI –MRL criteria for ICP:

A CRI must be run at a concentration of 2X MRL, or 2X the MDL, whichever is greater, for each ICP analyte (except Al, Ba, Ca, Fe, Mg, Na and K) at the beginning and end of each sample run or a minimum of twice per 8 hours.

CRA –MRL criteria for GFAA/CVAA:

The linearity of the analytical curve must be verified near the MRL for Graphite Furnace AA (GFAA).A CRA must be run at a concentration equal to the MRL, or the MDL, whichever is greater, at the beginning of each sample run.

The MRL standard recoveries should be between 90-110% of the true values. If the recovery for the CRI or CRA is > 110% and the reported sample result is > MDL or >MRL, but < 2X MRL, the result is qualified as biased high "K" and no qualifiers for non-detects. If the recovery for the CRI or CRA is between 50-89%, results > MDL or > MRL, but < 2X MRL is qualified as biased low "L" and result < MDL or <MRL is qualified "UL". If the recovery for an element is < 50%, results > MDL or > MRL but < 2X MRL are qualified as biased extremely low, "L". Results < MDL or < MRL are qualified as unusable, "R". Table 2 summarizes the MRL standards study.

**Continuing Calibration for MRL (Cont.)**

**TABLE 2. MRL STANDARDS STUDY.**

| Elements | Samples Affected |
|---|---|
| Copper (82.8%) | None |
| Lead (85.3%) | None |
| Manganese (30.0%) | None |
| Nickel (73.8%) | NRUC1A, NRUL1A, NRUW1A, NRUG2B, NRUC2A, NRUG3B, NRUL1B |
| Selenium (71.4%, 80.0%) | All Samples |
| Vanadium (85.0%) | None |

**III-Blank Analysis**

*Form III*

Blanks are assessed to determine the existence and magnitude of contamination problems. No contaminant should be detected in the blank > the MRL. Any sample value < five times (5X) the maximum concentration detected in the QC blanks and > the MRL is qualified "B". Table 3 summarizes the blank analysis study. Soil action levels cited are unadjusted for moisture content. Sample results and action levels are appropriately adjusted for moisture content during the blank analysis study. The associated rinse blanks are sample numbers 082800R1 and 083000R3.

**TABLE 3. BLANK ANALYSIS STUDY.**
**SDG 001145 (T09934)**

| Element | Blank Source | Max. Equivalent Conc. mg/kg | 5X Max Equivalent Conc. mg/kg | Affected Qualified B Samples |
|---|---|---|---|---|
| Arsenic | 083000R3 | 1.05 | 5.25 | NRUC2A, NRUC2B, NRUG3B, NRUG3C |

**IV-ICP Interference Check Sample (ICS)**

*Form IV*

The ICP Interference Check Sample (ICS) verifies interelement and background correction factors. ICP Interference Check is performed at the beginning and end of each sample analysis run. Control limits are 80-120%.

- All criteria were met. No qualifiers were applied.

**V-Matrix Spike/Matrix Spike Duplicate Analysis**

The matrix spike sample analysis provides information about the effect of each sample matrix on the digestion and measurement methodology. Spike recovery (%R) must be within the specified control limits of 75-125%. However, spike recovery limits do not apply when sample concentration exceeds the spike added concentration by a factor of four or more. If the spike recovery is < 75% and the sample results are > MRL, the data for these samples are qualified as biased low, "L". If the spike recovery falls within the range of 30-74% and the sample results are < MRL, the data for these samples are qualified as detection limits biased low, "UJ". If spike recovery results fall < 30% and the sample results are < MRL, data for these samples are qualified as unusable, "R" and results > MRL are qualified as biased extremely low, "L".

**V-Matrix Spike/Matrix Spike Duplicate Analysis, Continued**

- Sample NRUC1B (T09935) was used for the MS/MSD analysis. %R for Aluminum (-213.4%, -692.7%) and Iron (309.7%, -4207.8%) were outside the control limits. Since the sample concentrations for these elements exceeded the spike added concentration by a factor of four or more, no qualifiers were applied based on these outliers.

- %R for Arsenic (73.5%), Chromium (63.0%), Selenium (73.8%, 62.7%), and Vanadium (73.9%) were below the control limits. Positive sample results for these elements were qualified as biased low, "L" and non-detects "UL".

- %R for Antimony (24.2%, 10.2%) was < 30%. Positive sample results were qualified as biased extremely low, "L" and non-detects as unusable, "R".

**VI-Duplicate Sample Analysis**

Duplicate sample determinations are used to demonstrate acceptable method precision by the laboratory at the time of analysis. Duplicate analyses are also performed to generate data in order to determine the long-term precision of the analytical method on various matrices. The relative percent difference (RPD) should be ±20%.

- Sample NRUC1B (T09935) was used for the duplicate analysis. Relative percent difference (RPD) for Cobalt (58.8%) was grossly above the control limit. Positive values for this element was qualified as estimated, "J" and non-detects "UJ".

- RPD for Copper (24.9%), Manganese (21.1%), Mercury (23.3%), and Zinc (23.3%) were above the control limit. Positive values for these elements were qualified as estimated, "J" and non-detects had no qualifiers applied.

**VII-Laboratory Control Samples (LCS)**

*Forms VII, XIII*

The Laboratory Control Sample (LCS) serves as a monitor of the overall performance of each step during the analysis, including the sample preparation. All LCS results must fall within the specified control limits.

- All criteria were met. No qualifiers were applied.

**VIII-ICP Serial Dilution**

*Forms I, IX*

The serial dilution of samples quantitated by ICP determines whether or not significant physical or chemical interferences exist due to sample matrix. If the analyte concentration in the original sample is a factor of 10 above MDL, then an analysis of a 5-fold dilution should agree within 10% difference of the original result.

- Percent difference (%D) for elements Arsenic (42.1%), Calcium (15.2%), and Copper (15.9%) were above the control limit. Positive values for these elements were qualified as estimated, "J" and non-detects had no qualifiers applied.

- Percent difference (%D) for elements Beryllium (20.0%), Cobalt (100.0%), Nickel (22.3%), and Potassium (100.0%) above the control limit. Since the initial sample results for these elements were < a factor of 10 above their corresponding MDLs, no qualifiers were applied based on these outliers.

**IX-Quantitation Verification**

*Raw Data.*

The accuracy of analytical results is verified through the calculation of several parameters. The percent difference (%D) between the calculated and the reported values should be within 10%. The following calculations were performed for verification:

**ICP Sample: NRUC1A (T09934), Lead**

Conc. mg/kg = (conc. μg/L) * (Final Volume L)/(Weight g* % Solids as a fraction)

Conc. mg/kg = (133.05 μg/L)*(0.1 L)/(1.0049 g* 0.858) = 15.4 μg/g = 15.4 mg/kg

Reported concentration = 15.4 mg/kg
%D =0%.
Values were within 10% difference

**AA Sample : MS (T09935S), Thallium**

Conc. mg/kg = (conc. μg/L) * (Final Volume L)/(Weight g* % Solids as a fraction)

Conc. mg/kg = (24.52 μg/L)*(0.1 L)/(1.0026 g* 0.7602) = 3.21 μg/g = 3.217 mg/kg

Reported concentration = 3.174 mg/kg
%D = 1.35%.
Values were within 10% difference.

**CVAA Sample: NRUC1A (T09934), Hg**

Conc. mg/kg = (conc. μg/L) * (Final Volume L)/(Weight g* % Solids as a fraction)

Conc. mg/kg = (0.116 μg/L)*(0.1 L)/(0.2072 g* 0.858) = 0.065 μg/g = 0.065 mg/kg

Reported concentration = 0.07 mg/kg
%D = 0.7%.
Values were within 10% difference

**MEMORANDUM**

**TO:** Davida Trumbo

**FROM:** Kweku Acquah

**SUBJECT:** Radford Army Ammunition Plant Data Validation – TAL Metals
STL Baltimore, SDG 001145 (T09950)

**DATE:** November 24, 2000

---

The purpose of this memorandum is to present the data validation report for the samples collected at the Radford Army Ammunition Plant during the August 30, 2000 sampling event. Samples were analyzed for metals using methods SW-846 7841(GFAA) for Thallium, SW-846 7471A (CVAA) for Mercury, and SW-846 6010B (ICP) for all other metals. A total of nineteen soil samples were validated. The sample IDs are:

| Field Sample ID | Field Sample ID | Field Sample ID | Field Sample ID |
|---|---|---|---|
| NRUW2B | NRUL2C | MMAU3BD | MMAU3B |
| NRUW2C | NRUL2BD | MMAB4A | MMAU3C |
| NRUG2BD | NRUG2CD | MMAB4B | MMAB1A |
| NRUL2A | NRUG3A | MMAB4C | MMAB1B |
| NRUL2B | MMAB1C | MMAU3A | |

Data were reviewed by Kweku Acquah and validated using a combination of method-specific criteria, laboratory SOP, and the *Innovative Approaches to Data Validation for USEPA Region III* (June 1995.) Parameters were validated at USEPA Region III Level IM2 and are presented in Table 1. Data associated with parameters in compliance with quality control specifications have not been qualified. Data associated with parameters that did not comply with quality control specifications and directly impacted project data have been qualified in accordance with USEPA Region III specifications.

**Table 1. Laboratory Performance Criteria**

| Qualified | | Parameter |
|---|---|---|
| Yes | No | |
| | X | Holding Times |
| X | | Initial and Continuing Calibration |
| X | | Blank Analysis |
| | X | ICP Interference Check Sample (ICS) |
| X | | Matrix Spike/Matrix Spike Duplicate |
| | X | Duplicate Sample Analysis |
| | X | Laboratory Control Sample (LCS) |
| X | | ICP Serial Dilution |
| | X | Quantitation Verification |

All of the data collected in support of this sampling activity is acceptable with the noted qualifications, except for antimony non-detects. Antimony non-detects were rejected due to extremely low spike recoveries in accordance with USEPA Region III guidance.

**VALIDATION REPORT**
**TAL METALS REVIEW**
**SDG 001145 (T09950)**

**I-Holding Times**

*Form I, shipping and run logs.*

The primary objective is to ascertain the validity of results based on the holding time of the sample from time of collection to time of sample extraction and analysis. Holding time criteria: Cool @4 °C ± 2 °C, the maximum holding time is 180 days for metals and 28 days for mercury.

- All criteria were met for all the samples. No qualifiers were applied.

**II-Initial and Continuing Calibration**

*Form II*

Requirements for satisfactory instrument calibration are established to ensure that the instrument is capable of producing acceptable quantitative data. Initial calibration demonstrates that the instrument is capable of acceptable performance at the beginning of the analysis run, and continuing calibration verification documents that the initial calibration is still valid.

| | | | | | |
|---|---|---|---|---|---|
| ICP: | 1- blank | Hg: | 1 – blank | AA: | 1 - blank |
| | 3 – standards ($r \geq 0.995$) | | 5 – standards ($r \geq 0.995$) | | 5 – standards ($r \geq 0.995$) |
| | %R – 90-110% | | %R – 80-120% | | %R – 90-110% |

- ICP analysis for metals was run on 10/05/00. Thallium was analyzed on 10/05/00 with a correlation coefficient of 0.9973. Mercury was analyzed on 09/25/00 with a correlation coefficient of 0.9999. All criteria were met. No qualifiers were applied.

**Continuing Calibration for MRL**

The instrument calibration near the method reporting limit (MRL) must be verified for each analyte MRL standards are evaluated using the following criteria:

CRI –MRL criteria for ICP:

A CRI must be run at a concentration of 2X MRL, or 2X the MDL, whichever is greater, for each ICP analyte (except Al, Ba, Ca, Fe, Mg, Na and K) at the beginning and end of each sample run or a minimum of twice per 8 hours.

CRA –MRL criteria for GFAA/CVAA:

The linearity of the analytical curve must be verified near the MRL for Graphite Furnace AA (GFAA). A CRA must be run at a concentration equal to the MRL, or the MDL, whichever is greater, at the beginning of each sample run. The MRL standard recoveries should be between 90-110% of the true values.

If the recovery for the CRI or CRA is > 110% and the reported sample result is > MDL or MRL, but < 2X MRL, the result is qualified as biased high, "K" and no qualifiers for non-detects. If the recovery for the CRI or CRA is between 50-89%, results > MDL or MRL, but < 2X MRL is qualified as biased low "L" and result < MDL or MRL is qualified "UL". If the recovery for an element is < 50%, results > MDL or MRL but < 2X MRL are qualified as biased extremely low, "L". Results < MDL or MRL are qualified as unusable, "R". Table 2 summarizes the MRL standards study.

**Continuing Calibration for MRL (Cont.)**

**TABLE 2. MRL STANDARDS STUDY.**

| Elements | Samples Affected |
|---|---|
| Copper (82.8%) | MMAB4A, MMAB1A |
| Lead (85.3%) | None |
| Manganese (30.0%) | None |
| Nickel (73.8%) | NRUG2BD, NRUL2B, NRUL2BD, NRUG3A, MMAB1C, MAU3BD, MMAU3B, MMAB4A, MMAB4B, MMAU3A, MMAU3C, MMAB1A, MMAB1B |
| Selenium (71.4%, 80.0%) | All Samples |
| Vanadium (85.0%) | None |

**III-Blank Analysis**

*Form III*

Blanks are assessed to determine the existence and magnitude of contamination problems. No contaminant should be detected in the blank > the MRL. Any sample value < five times (5X) the maximum concentration detected in the QC blanks and > the MRL is qualified "B". Table 3 summarizes the blank analysis study. Soil action levels cited are unadjusted for moisture content. Sample results and action levels are appropriately adjusted for moisture content during the blank analysis study. The associated rinse blanks are sample numbers 082800R1, 083000R3 and 090700RB.

**TABLE 3. BLANK ANALYSIS STUDY.**
**SDG 001145 (T09950)**

| Element | Blank Source | Max. Equivalent Conc. mg/kg | 5X Max Equivalent Conc. mg/kg | Affected Qualified B Samples |
|---|---|---|---|---|
| Arsenic | 083000R3 | 1.05 | 5.25 | NRUW2B, NRUL2A, NRUL2C, NRUL2BD, NRUG3A |
| Selenium | 083000R3 | 0.91 | 4.55 | NRUL2A |

**IV-ICP Interference Check Sample (ICS)**

*Form IV*

The ICP Interference Check Sample (ICS) verifies interelement and background correction factors. ICP Interference Check is performed at the beginning and end of each sample analysis run. Control limits are 80-120%.

- All criteria were met. No qualifiers were applied.

**V-Matrix Spike/Matrix Spike Duplicate Analysis**

The matrix spike sample analysis provides information about the effect of each sample matrix on the digestion and measurement methodology. Spike recovery (%R) must be within the specified control limits of 75-125%. However, spike recovery limits do not apply when sample concentration exceeds the spike added concentration by a factor of four or more. If the spike recovery is > 125%, positive sample results are qualified as biased high, "K" and non-detects are not qualified. If the spike recovery is < 75% and the sample results are > MDL, the data for these samples are qualified as biased low, "L". If the spike recovery falls within the range of 30-74% and the sample results are < MDL, the data for these samples are qualified as detection limits biased low, "UL". If spike recovery results fall < 30% and the sample results are < MDL, data for these samples are qualified as unusable, "R" and results > MDL are qualified as biased extremely low, "L".

**V-Matrix Spike/Matrix Spike Duplicate Analysis, Continued**

- Sample NRUW2B (T09950) was used for the MS/MSD analysis. %R for Aluminum (239.3%, -850.3%), Iron (-983.0%, -5409.5%) and Magnesium (195.5%, 73.2%) were outside of the control limits. Since the sample concentrations for these elements exceeded the spike added concentration by a factor of four or more, no qualifiers were applied based on these outliers.

- For Manganese, MS %R (204.4%) was above the control limit and MSD %R (0.4%) was grossly below the control limit. All sample results for this element were positive and were qualified as biased low, "L".

- %R for Chromium (71.8%), Potassium (71.9%), Selenium (39.7%) and Vanadium (70.5%) were < lower control limit of 75%. Positive sample values for these elements were qualified as biased low, "L" and non-detects "UL".

- %R for Antimony (24.9%, 26.7%) was < 30%. Positive sample results for this element were qualified as biased extremely low, "L" and non-detects as unusable, "R".

**VI-Duplicate Sample Analysis**

Duplicate sample determinations are used to demonstrate acceptable method precision by the laboratory at the time of analysis. Duplicate analyses are also performed to generate data in order to determine the long-term precision of the analytical method on various matrices. The relative percent difference (RPD) should be ±20%.

- Sample NRUW2B (T09950) was used for the duplicate analysis. All criteria were met. No qualifiers were applied.

**VII-Laboratory Control Samples (LCS)**

*Forms VII, XIII*

The laboratory Control Sample (LCS) serves as a monitor of the overall performance of each step during the analysis, including the sample preparation. All LCS results must fall within the control established control limits.

- All criteria were met. No qualifiers were applied.

**VIII-ICP Serial Dilution**

*Forms I, IX*

The serial dilution of samples quantitated by ICP determines whether or not significant physical or chemical interferences exist due to sample matrix. If the analyte concentration in the original sample is a factor of 10 above MDL, then an analysis of a 5-fold dilution should agree within 10% difference of the original result.

- Percent difference (%D) for elements Antimony (100.0%), Cobalt (100.0%), and Nickel (16.5%) were above the control limit. Since the analyte concentrations in the original sample were < a factor of ten above their corresponding MDLs, no qualifiers were applied based on these outliers.

- Percent difference (%D) for elements Arsenic (18.2%), Beryllium (100.0%), Calcium (12.1%), Copper (37.7%), Lead (14.8%), Magnesium (14.7%), and Zinc (11.4%) were above the control limit. Positive values for these elements were qualified as estimated, "J" and non-detects had no qualifiers applied.

**IX-Quantitation Verification**

*Raw Data.*

The accuracy of analytical results is verified through the calculation of several parameters. The percent difference (%D) between the calculated and the reported values should be within 10%. The following calculations were performed for verification:

**ICP Sample: NRUL2C (T09955), Aluminum**

Conc. mg/kg = (conc. μg/L) * (Final Volume L)/(Weight (g)*% Solids as a fraction)

Conc. mg/kg = (164090 μg/L)*(0.1 L)/(1.0007 g* 0.801) = 20,471 μg/g = 20,471 mg/kg

Reported concentration = 20,500 mg/kg
%D =0.14%.
Values were within 10% difference

**AA Sample: NRUL2C (T09955), Thallium**

Conc. mg/kg = (conc. μg/L) * (Final Volume mL)/(Weight g* % Solids as a fraction)

Conc. mg/kg = (2.206 μg/L)*(0.1 L)/(1.0012 g* 0.801) = 0.28 μg/g = 0.28 mg/kg

Reported concentration = 0.28 mg/kg
%D = 0%.
Values were within 10% difference.

**CVAA Sample: NRUL2C (T09955), Hg**

Conc. mg/kg = (conc. μg/L) * (Final Volume L)/(Weight g* % Solids as a fraction)

Conc. mg/kg = (0.107 μg/L)*(0.1 L)/(0.2088 g* 0.801) = 0.06 μg/g = 0.06 mg/kg

Reported concentration = 0.06 mg/kg
%D = 0%.
Values were within 10% difference

**MEMORANDUM**

**TO:** Davida Trumbo

**FROM:** Kweku Acquah

**SUBJECT:** Radford Army Ammunition Plant Data Validation - Volatiles
Envirosystems Lab, SDG IT2

**DATE:** November 28, 2000

---

The purpose of this memorandum is to present the data validation report for the samples collected at the Radford Army Ammunition Plant during the August 29-30, 2000 sampling events. Samples were analyzed for volatile organic compounds (VOCs) using USEPA SOW method OLM 04.2 (May 1999). A total of four soil samples were validated. The sample IDs are:

| Field Sample ID |
|---|
| NRUC1B |
| NRUL1C |
| NRUL1B |
| NRUG2B |

Data were reviewed by Kweku Acquah and validated using a combination of method-specific criteria, laboratory SOP and the *Innovative Approaches to Data Validation for USEPA Region III* (June 1995.) Parameters evaluated under data validation procedure Level M3 are presented in Table 1. Data associated with parameters in compliance with quality control specifications have not been qualified. Data associated with parameters that did not comply with quality control specifications and directly impacted project data have been qualified in accordance with USEPA Region III specifications.

**Table 1. Laboratory Performance Criteria**

| Qualified | | Parameter |
|---|---|---|
| Yes | No | |
| | X | Holding Times |
| | X | Instrument Performance Check |
| X | | Initial Calibration |
| X | | Continuing Calibration |
| X | | Blank Analysis |
| | X | System Monitoring Compounds |
| | X | Laboratory Control Sample |
| | X | Matrix Spike/Matrix Spike Duplicate |
| | X | Internal Standards |
| | X | Quantitation Verification |

The quality of data collected in support of this sampling activity is considered acceptable with the noted qualifications.

cc: Eric Malarek

**RADFORD ARMY AMMUNITION PLANT**
**VALIDATION REPORT**
**VOLATILES REVIEW**
**SDG IT2**

## I-Holding Times

*Form I.*

The objective is to ascertain the validity of results based on the holding time of the sample from time of collection to time of analysis. Holding time criteria: For soil samples preserved and cooled @ 4°C ± 2°C, the maximum holding time is 14 days from sample collection to analysis.

- Holding time criteria were met. No qualifiers were applied.

## II-Instrument Performance Check

*Form V*

The analysis of the instrument performance check solution must be performed at the beginning of each 12-hour period during which samples are analyzed. The instrument performance check solution, bromofluorobenzene (BFB), must meet the specified ion abundance criteria.

- All criteria were met. No qualifiers were applied.

## III-Initial Calibration

*Form VI and chromatograms.*

Compliance requirements for satisfactory instrument calibration are established to ensure that the instrument used is capable of producing acceptable qualitative and quantitative data for volatile target compounds. Initial calibration demonstrates that the instrument is capable of acceptable performance in the beginning of the analytical run and of producing a linear calibration curve. Minimum Relative Response Factor (RRF) must be ≥0.05. Percent Relative Standard Deviation (%RSD) must be ≤15% for each target compound and must be ≤30% for each calibration check compound.

- For initial calibration performed on 09/12/00 on instrument HP73F, compounds Bromomethane (22.2%), Chloroethane (27.2%), 1,1-Dichloroethene (16.2%), Methylene Chloride (25.4%), 2-Butanone (21.9%) and 2-Hexanone (16.8%) were above the control limit. Positive values were qualified as estimated, "J" and non-detects had no qualifiers applied.

- For initial calibration performed on 09/12/00 on instrument HP73F, compounds Chloromethane (36.6%) and Acetone (33.3%) grossly exceeded the control limit (i.e > 30%). Positive values for these compounds were qualified as estimated, "J" and non-detects "UJ".

## IV-Continuing Calibration

*Form VII and chromatograms.*

Compliance requirements for satisfactory instrument calibration are established to ensure that the instrument used is capable of producing acceptable qualitative and quantitative data for volatile target compounds. Continuing calibration establishes the 12-hour relative response factors on which the quantitations are based and checks satisfactory performance of the instrument on a day-to-day basis. The percent Difference (%D) between the initial calibration RRF and the continuing calibration RRF must be within 20% for all target compounds.

- For continuing calibration performed on 09/12/00 @15:30 on instrument HP73F, compound Chloromethane (21.6%) exceeded the control limit. Since this compound had already been qualified "UJ" from the initial calibration and since it was a non-detect in all the samples, no further qualifiers were necessary.

**IV-Continuing Calibration (Cont.)**

- For continuing calibration performed on 09/12/00 @10:14 on instrument HP73F, compounds Chloromethane (21.7%) and 4-Methyl-2-Pentanone (26.6%) were above the control limit. Chloromethane had already been qualified from the initial calibration and no further qualification was necessary. Positive values for 4-Methyl-2-Pentanone were qualified as estimated, "J" and non-detects had no qualifiers applied.

- For continuing calibration performed on 09/12/00 @10:14 on instrument HP73F, compounds Chloromethane (50.2%), Vinyl Chloride (50.5%), Acetone (49%) and 2-Butanone (39.7%) were grossly outside the control criteria. Positive values for these compounds were qualified as estimated, "J" and non-detects "UJ".

**V-Blank Analysis**

*Form I, IV and chromatograms*

The purpose of blank analyses is to determine the presence and magnitude of contamination problems resulting from field and laboratory activities. A method blank analysis must be performed after the calibration standards and once every 12-hour time period beginning with the injection of BFB. No contaminants should be detected in any of the associated blanks. Positive sample results are reported and qualified "B", if the concentration of the compound in the sample is ≤ 10 times (10x) the maximum amount in any blank for the common laboratory contaminants methylene chloride, acetone and 2-butnone, or 5 times (5X) the maximum amount for other volatile target compounds. The associated rinse blank is sample number 082800R1. Table 2 summarizes the blank contamination analysis.

**TABLE 2. BLANK CONTAMINATION SUMMARY.**

| Compound / Blank Sample # | 10X Max. conc. µg/kg | Sample Affected |
|---|---|---|
| Acetone / 082800R1 | 440 | NRUC1B |

**VI-System Monitoring Compounds (Surrogates)**

*Form II and chromatograms.*

Laboratory performance on individual samples is established by means of spiking activities. The system monitoring compounds are added to all samples and blanks to measure their recovery. Percent Recoveries (%Rs) must be within the specified control limits.

Control Limits: Toluene-d8 (84-138%)
4-Bromofluorobenzene (59-113%)
1,2-Dichloroethane-d4 (70-121%)

- All criteria were met. No qualifiers were applied.

**VII-Laboratory Control Samples**

*Form III and chromatograms.*

Data for laboratory control samples are generated to determine long-term precision and accuracy of the analytical method. Laboratory control samples should be analyzed at a frequency of 1 per 20 samples or analytical batch for each matrix. Percent Recoveries (%Rs) must be within the specified control limits of 60-140%.

- All criteria were met. No qualifiers were applied.

**VIII-Matrix Spike/Matrix Spike Duplicate**
*Form III and chromatograms.*
Data for Matrix Spike/Matrix Spike Duplicates are generated to determine long-term precision and accuracy of the analytical method on various matrices and to demonstrate acceptable compound recovery by the laboratory at the time of sample analysis. The percent recoveries (%Rs) and the relative percent difference (RPD) must be within the specified control limits.

- Sample NRUC1B (00092519) was used for the MS/MSD analysis. %RPD for Chlorobenzene (22%) was above the control limit of 21%. Since this compound was a non-detect for all the samples, no qualifiers were applied based on these outliers.

**IX-Internal Standards**
*Form VII and chromatograms.*
