# CASE NARRATIVE

A4B190299

The following report contains the analytical results for eighteen solid samples submitted to STL North Canton by Draper Aden & Associates Inc from the RAAP, Radford, Virginia Site, project number BN02271-01. The samples were received February 19, 2004, according to documented sample acceptance procedures.

STL utilizes USEPA approved methods in all analytical work. The samples presented in this report were analyzed for the parameter(s) listed on the analytical methods summary page in accordance with the method(s) indicated. Preliminary results were provided to Janet Frazier on March 01, 2004. A summary of QC data for these analyses is included at the back of the report.

STL North Canton attests to the validity of the laboratory data generated by STL facilities reported herein. All analyses performed by STL facilities were done using established laboratory SOPs that incorporate QA/QC procedures described in the applicable methods. STL's operations groups have reviewed the data for compliance with the laboratory QA/QC plan, and data have been found to be compliant with laboratory protocols unless otherwise noted below.

This report is sequentially paginated. The final page of the report is labeled as "END OF REPORT."

## SUPPLEMENTAL QC INFORMATION

### SAMPLE RECEIVING

The temperature of the cooler upon sample receipt was 3.3°C.

See STL's Cooler Receipt Form for additional information.

### METALS

The sample(s) that contain results between the MDL and the RL were flagged with "B". There is the possibility of false positive of mis-identification at these quantitation levels. The acceptance criteria for the ICB, CCB, and Method Blank are +/- the standard reporting limit (SRL).

Serial dilution of a sample in this lot indicates that physical and chemical interferences were present. Refer to the sample report pages for the affected analytes flagged with "E".

# CASE NARRATIVE (continued)

## METALS (continued)

The sample(s) that contained concentrations of target analyte(s) at a reportable level in the associated Method Blank(s) were flagged with "J". Refer to the sample report pages for the affected analyte(s).

Matrix spike recovery and relative percent difference (RPD) data were not calculated for some analytes for 5GP-20 (14') and 7GP-20 (14.5')due to the sample concentration reading greater than four times the spike amount. See the Matrix Spike Report for the affected analytes which will be flagged with "NC, MSB".

The matrix spike/matrix spike duplicate(s) for 5GP-20 (14') and 7GP-20 (14.5') had RPD's and/or recoveries outside acceptance limits. However, since the associated method blank(s) and laboratory control sample(s) were in control, no corrective action was necessary.

## GENERAL CHEMISTRY

The sample(s) that contain results between the MDL and the RL were flagged with "B". There is the possibility of false positive of mis-identification at these quantitation levels. The acceptance criteria for the ICB, CCB, and Method Blank are +/- the standard reporting limit (SRL).

## QUALITY CONTROL ELEMENTS OF SW-846 METHODS

STL North Canton conducts a quality assurance/quality control (QA/QC) program designed to provide scientifically valid and legally defensible data. Toward this end, several types of quality control indicators are incorporated into the QA/QC program, which is described in detail in QA Policy, QA-003. These indicators are introduced into the sample testing process to provide a mechanism for the assessment of the analytical data.

### QC BATCH

Environmental samples are taken through the testing process in groups called QUALITY CONTROL BATCHES (QC batches). A QC batch contains up to twenty environmental samples of a similar matrix (water, soil) that are processed using the same reagents and standards. STL North Canton requires that each environmental sample be associated with a QC batch.

Several quality control samples are included in each QC batch and are processed identically to the twenty environmental samples. These QC samples include a METHOD BLANK (MB), a LABORATORY CONTROL SAMPLE (LCS) and, where appropriate, a MATRIX SPIKE/MATRIX SPIKE DUPLICATE (MS/MSD) pair or a MATRIX SPIKE/SAMPLE DUPLICATE (MS/DU) pair. If there is insufficient sample to perform an MS/MSD or an MS/DU, then a LABORATORY CONTROL SAMPLE DUPLICATE (LCSD) is included in the QC batch.

### LABORATORY CONTROL SAMPLE

The Laboratory Control Sample is a QC sample that is created by adding known concentrations of a full or partial set of target analytes to a matrix similar to that of the environmental samples in the QC batch. The LCS analyte recovery results are used to monitor the analytical process and provide evidence that the laboratory is performing the method within acceptable guidelines. All control analytes indicated by a bold type in the LCS must meet acceptance criteria. Failure to meet the established recovery guidelines requires the repreparation and reanalysis of all samples in the QC batch. The only exception is that if the LCS recoveries are biased high and the associated sample is ND (non-detected) for the parameter(s) of interest, the batch is acceptable.

At times, a Laboratory Control Sample Duplicate (LCSD) is also included in the QC batch. An LCSD is a QC sample that is created and handled identically to the LCS. Analyte recovery data from the LCSD is assessed in the same way as that of the LCS. The LCSD recoveries, together with the LCS recoveries, are used to determine the reproducibility (precision) of the analytical system. Precision data are expressed as relative percent differences (RPDs). If the RPD fails for an LCS/LCSD and yet the recoveries are within acceptance criteria, the batch is still acceptable.

### METHOD BLANK

The Method Blank is a QC sample consisting of all the reagents used in analyzing the environmental samples contained in the QC batch. Method Blank results are used to determine if interference or contamination in the analytical system could lead to the reporting of false positive data or elevated analyte concentrations. All target analytes must be below the reporting limits (RL) or the associated sample(s) must be ND except under the following circumstances:

- Common organic contaminants may be present at concentrations up to 5 times the reporting limits. Common metals contaminants may be present at concentrations up to 2 times the reporting limit, or the reported blank concentration must be twenty fold less than the concentration reported in the associated environmental samples. (See common laboratory contaminants listed below.)

| Volatile (GC or GC/MS) | Semivolatile (GC/MS) | Metals |
|---|---|---|
| Methylene chloride | Phthalate Esters | Copper |
| Acetone | | Iron |
| 2-Butanone | | Zinc |
| | | Lead* |

- *for analyses run on TJA Trace ICP, ICPMS or GFAA only*

## QUALITY CONTROL ELEMENTS OF SW-846 METHODS
## (Continued)

- Organic blanks will be accepted if compounds detected in the blank are present in the associated samples at levels 10 times the blank level. Inorganic blanks will be accepted if elements detected in the blank are present in the associated samples at 20 times the blank level.

- Blanks will be accepted if the compounds/elements detected are not present in any of the associated environmental samples.

Failure to meet these Method Blank criteria requires the repreparation and reanalysis of all samples in the QC batch.

**MATRIX SPIKE/MATRIX SPIKE DUPLICATE**

A Matrix Spike and a Matrix Spike Duplicate are a pair of environmental samples to which known concentrations of a full or partial set of target analytes are added. The MS/MSD results are determined in the same manner as the results of the environmental sample used to prepare the MS/MSD. The analyte recoveries and the relative percent differences (RPDs) of the recoveries are calculated and used to evaluate the effect of the sample matrix on the analytical results. Due to the potential variability of the matrix of each sample, the MS/MSD results may not have an immediate bearing on any samples except the one spiked; therefore, the associated batch MS/MSD may not reflect the same compounds as the samples contained in the analytical report. When these MS/MSD results fail to meet acceptance criteria, the data is evaluated. If the LCS is within acceptance criteria, the batch is considered acceptable. The acceptance criteria do not apply to samples that are diluted for organics if the native sample amount is 4x the concentration of the spike.

For certain methods, a Matrix Spike/Sample Duplicate (MS/DU) may be included in the QC batch in place of the MS/MSD. For the parameters (i.e. pH, ignitability) where it is not possible to prepare a spiked sample, a Sample Duplicate may be included in the QC batch. However, a Sample Duplicate is less likely to provide usable precision statistics depending on the likelihood of finding concentrations below the standard reporting limit. When the Sample Duplicate result fails to meet acceptance criteria, the data is evaluated.

**SURROGATE COMPOUNDS**

In addition to these batch-related QC indicators, each organic environmental and QC sample is spiked with surrogate compounds. Surrogates are organic chemicals that behave similarly to the analytes of interest and that are rarely present in the environment. Surrogate recoveries are used to monitor the individual performance of a sample in the analytical system.

If surrogate recoveries are biased high in the LCS, LCSD, or the Method Blank, and the associated sample(s) are ND, the batch is acceptable. Otherwise, if the LCS, LCSD, or Method Blank surrogate(s) fail to meet recovery criteria, the entire sample batch is reprepped and reanalyzed. If the surrogate recoveries are outside criteria for environmental samples, the samples will be reprepped and reanalyzed unless there is objective evidence of matrix interference or if the sample dilution is greater than the threshold outlined in the associated method SOP.

For the GC/MS BNA methods, the surrogate criterion is that two of the three surrogates for each fraction must meet acceptance criteria. The third surrogate must have a recovery of ten percent or greater.

For the Pesticide, PCB, and PAH methods, the surrogate criterion is that one of two surrogate compounds must meet acceptance criteria.

**NOTE(S):**

- The analytical results of the samples listed above are presented on the following pages.
- All calculations are performed before rounding to avoid round-off errors in calculated results.
- Results noted as "ND" were not detected at or above the stated limit.

This report must not be reproduced, except in full, without the written approval of the laboratory.

- Results for the following parameters are never reported on a dry weight basis: color, corrosivity, density, flashpoint, ignitability, layers, odor, paint filter test, pH, porosity pressure, reactivity, redox potential, specific gravity, spot tests, solids, solubility, temperature, viscosity, and weight.

**NOTE(S):**

Calculations are performed before rounding to avoid round-off errors in calculated results.

Results and reporting limits have been adjusted for dry weight.

NC The recovery and/or RPD were not calculated.

MSB The recovery and RPD were not calculated because the sample amount was greater than four times the spike amount.

N Spiked analyte recovery is outside stated control limits.

* Relative percent difference (RPD) is outside stated control limits.

**NOTE(S):**

Calculations are performed before rounding to avoid round-off errors in calculated results.

Results and reporting limits have been adjusted for dry weight.

NC The recovery and/or RPD were not calculated.

MSB The recovery and RPD were not calculated because the sample amount was greater than four times the spike amount.

N Spiked analyte recovery is outside stated control limits.

Review Items

| A. Calibration/Instrument Run QC | Yes | No | N/A | 2nd Level |
|---|---|---|---|---|
| 1. Instrument calibrated per manufacturer's instructions and at SOP specified levels? | ✓ | | | ✓ |
| 2. ICV/CCV analyzed at appropriate frequency and within control limits? | ✓ | | | ✓ |
| 3. ICB/CCB analyzed at appropriate frequency and within +/- RL? | ✓ | | | ✓ |
| 4. CRA run? | ✓ | | | ✓ |
| **B. Sample Results** | | | | |
| 1. Were samples with concentrations > high calibration standard diluted and reanalyzed? | ✓ | | | ✓ |
| 2. All reported results bracketed by in control QC? | ✓ | | | ✓ |
| 3. Sample analyses done within holding time? | ✓ | | | ✓ |
| **C. Preparation/ Matrix QC** | | | | |
| 1. LCS done per prep batch and within QC limits? | ✓ | | | ✓ |
| 2. Method blank done per prep batch and < RL? | ✓ | | | ✓ |
| 3. MS run at required frequency and within limits? | ✓ | | | ✓ |
| 4. MSD or DU run at required frequency and RPD within SOP limits? | ✓ | | | ✓ |
| **D. Other** | | | | |
| 1. Are all nonconformances documented appropriately? | ✓ | | | ✓ |
| 2. Current IDL/MDL data on file? | ✓ | | | ✓ |
| 3. Calculations and Transcription checked for error? | ✓ | | | ✓ |
| 4. All client/project specific requirements met? | ✓ | | | ✓ |
| 5. Date of analysis verified as correct? | ✓ | | | ✓ |

## Problem Description / Root Cause

| Name | Date | Description |
|---|---|---|
| Patrick OMeara | 04/03/2001 | Stock standard solutions used for ICP ICSA solutions commonly have low level contamination for certain elements, especially zinc.<br><br>Verified contamination is not corrected by interelement correction factors (IEC's) since instrumental determination of the presence of the analyte is due not to spectral interference but due to actual presence of the element in the solution. Contamination can be verified by performing a wavelength scan of the standard solution. If contamination exists, the peak apex will be directly at the expected wavelength for the element of concern. If the presence of the analyte is due to interference from another analyte which produces a peak near the element of concern, the peak apex of the interfering analyte will not be exactly at the wavelength for the element of concern, and an IEC would be generated.<br><br>If contamination for an element such as zinc is suspected, an IEC would be inappropriate, and the concentration during analysis of the daily ICSA solution may exceed SOP criteria. In these cases, this NCM will be referenced and a copy of this NCM will be included with the run.<br><br>Zinc contamination in ICSA stock solutions has been verified in this lab at various times with wavelength scans. An example scan is included with the I6 ICP analytical run from 4/3/01. |

# METALS PREPARATION REAGENTS

Reagents listed on this form are used for the entire day's prep batches unless otherwise noted on the individual prep log.

| REAGENT NAME | REAGENT NUMBER |
|---|---|
| 1:1 $HNO_3$ (nitric acid) | 4MR109 |
| 1:1 HCl ( hydrochloric acid) | 4MR40 |
| $HNO_3$ (nitric acid) | 4MR84 |
| HCl (hydrochloric acid) | 4MR85 |
| $KMnO_4$ (potassium permanganate) | 4MR96 |
| $K_2S_2O_8$ (potassium persulfate) | 4MR44 |
| $H_2O_2$ (hydrogen peroxide) | 4MR58 |
| $H_2SO_4$ (sulfuric acid) | 3MR743 |
| $HCl/HNO_3$ (aqua regia) | 4MR110 |

# METHODOLOGY SUMMARY/REFERENCE

## *1163 GC/MS Volatiles Water Preparation*

An undiluted aliquot of the water sample is purged and the volatile compounds are collected on a sorbent trap that is subsequently desorbed onto a gas chromatographic column.

Reference: Test Methods for Evaluating Solid Waste, SW-846, Method 5030B, Revision 2, December 1996.

**********

## *6292 TCL by 8260 (soil)*

The sample or extract of the sample is analyzed by purge and trap GC/MS.

Reference: Test Methods for Evaluating Solid Waste, SW-846, Method 8260B, Revision 2, December 1996

**********

## *3636 TCLP Volatiles (leachate)*

The zero headspace extracted sample is purged and the volatile compounds are collected on a sorbent trap which is subsequently desorbed onto the GC/MS system for chromatographic and mass spectral analysis.

Reference: Test Methods for Evaluating Solid Waste SW-846, Method 8260B, Revision 2, December 1996

**********

## *0371 ICP Metals (water/soil)*

The solution resulting from the metals digestion is analyzed by ICP.

Reference: Test Methods for Evaluating Solid Waste SW-846, Method 6010B, December 1996

## 0259 Mercury (water)

The solution resulting from the mercury digestion is analyzed by Cold Vapor AA.

Reference: Test Methods for Evaluating Solid Waste
SW-846, Method 7470A, September 1994

**********

## 5713 Mercury Digestion (water, SW-846)

The sample is heated at 95 C with nitric acid, sulfuric acid, potassium persulfate, and potassium permanganate. Excess potassium permanganate is reduced with sodium chloride/hydroxylamine hydrochloride. Mercuric ions are reduced to mercury metal using stannous chloride.

Reference: Test Methods for Evaluating Solid Waste
SW-846, Method 7470A, September 1994

**********

## 5705 Metals Digestion (water, total, SW-846)

The sample is digested with nitric and hydrochloric acids.

Reference: Test Methods for Evaluating Solid Waste
SW-846, Method 3010A, July 1992

**********

## 0816 Water Sample Herbicide Extraction

The water sample is hydrolyzed, acidified and solvent extracted. The acids are converted to methyl esters using derivatization. Florisil cleanup is used to minimize interference.

SW-846, Method 8151A, December 1996

## 0817 Water Sample Pesticide Extraction

Pesticides are extracted from the water with methylene chloride. The extract is then dried and concentrated. If necessary, florisil cleanup is used to minimize interferences.

Reference: Test Methods for Evaluating Solid Wastes,
SW-846, Method 3510C, December 1996

## 0949/4731 TCLP Semivolatiles

The sample is leached by the TCLP method. The leachate is then solvent extracted and analyzed by GC/MS.

Reference: Test Methods for Evaluating Solid Waste
SW-846, Method 8270C, December 1996

## 1123 Cyanide (reactivity) SW-846 Interim Method (water/solid)

The sample is acidified with sulfuric acid in a closed system. The hydrogen cyanide gas is trapped in a sodium hydroxide solution and quantitatively analyzed using an automated colorimetric procedure. Prep # is 1121.

## 0946 TCLP Zero Headspace Extraction

For liquid wastes (containing <0.5% solids), the TCLP volatile extract is defined as the filtrate resulting from filtration of the waste in a zero headspace extractor through a 0.6 to 0.8 um glass fiber filter.

For wastes containing >0.5% solids (and free standing liquid), the waste is filtered through a glass fiber filter in a zero headspace extractor into a Tedlar bag. The solid portion is then extracted for 18 hours with extraction fluid 1 (pH of 4.93 +0.05) at a volume 20 times the weight of the solid. Following the extraction, the leachate is filtered through a glass fiber filter into the Tedlar bag containing the initial filtrate and these filtrates are combined for the final leachate.

For waste not containing any free standing liquid, the sample is extracted with a volume of extraction fluid 1 at a volume 20 times the sample weight for 18 hours in a zero headspace extractor. The extract is then filtered into zero headspace vials and the leachate is defined as the filtrate.

Reference: Test Methods for Evaluating Solid Waste1
SW-846, Method 1311, July 1992

## 0947 TCLP Non-volatile Extraction

For the liquid wastes (containing <0.5% solids), the TCLP non-volatile extract is defined as the filtrate resulting from filtration of the waste through a 0.6 to 0.8 um glass fiber filter.

For wastes containing >0.5% solids (and free standing liquid), the waste is filtered through a glass fiber filter and the filtrate is stored for later use. The solid portion is then evaluated for buffering capacity and extracted for 18 hours with the appropriate extraction fluid (pH of 4.93 +0.05 or pH of 2.88 +0.05) at a volume 20 times the weight of the solid. Following the extraction, the leachate is filtered through a glass fiber filter and the final and initial filtrates are combined.

For waste not containing any free standing liquid, the sample is extracted with a volume of the appropriate extraction fluid at a volume 20 times the sample weight for 18 hours. The extract is then filtered and the leachate is defined as the filtrate.

## 0496 Corrosivity (water/solids)

Determination of corrosivity is based on the pH value.

Reference: Test Methods for Evaluating Solid Waste
SW-846, Chapter 7, September 1994

**********

## 0542 Ignitability (solid)

Ignitability is determined empirically by exposing the sample to air, water, and friction. The vapors of the sample are then exposed to a flame using a closed cup apparatus.

Reference: 40 CFR, Part 261.21

**********

## 0111 Moisture (solid)

A well mixed sample is placed in a tared container and dried to constant weight in an oven at 103-105C. The decrease in weight is the total moisture.

Reference: Methods for Chemical Analysis of Water and
Wastes USEPA 600/4-79-020, Method 160.3 (modified)

## 0118 Moisture (solid)

This value reflects the background moisture value. It is used to calculate dry weight reports for matrix spike and matrix spike duplicate samples.

Reference: See background sample moisture method reference

**********

## 0121 Moisture Duplicate (solid)

This analysis is required to check the precision of the moisture analysis. The value is not used in report calculations.

Reference: See background sample moisture method reference

**********

## 1121 Reactivity Prep (water/solid)

The sample is acidified to pH 2, and gases are collected in a scrubber containing sodium hydroxide. This is followed by analysis for sulfide and/or cyanide content.

Reference: Test Methods for Evaluating Solid Waste
SW-846, Chapter 7.3, December 1996

**********

## 1122 Sulfide (Reactivity)

Excess iodine is added to a portion of the scrubber solution which contains sodium hydroxide. The iodine oxidizes the sulfide to sulfur under acidic conditions. The excess iodine is back titrated with sodium thiosulfate.

Reference: Test Methods for Evaluating Solid Waste
SW-846, Chapter 7 and Method 9034

**********

## 0394 pH (solids)

The activity of hydrogen ions in the sample is measured on a 1:1 slurry of sample and deionized water using a glass electrode and a reference electrode.

Reference: Test Methods for Evaluating Solid Waste
SW-846, Method 9045C, (modified) September 1994

## 0950 TCLP Pesticides (leachate)

The leachate sample is solvent extracted and quantitatively analyzed by gas chromatography with an electron capture detector.

Reference: Test Methods for Evaluating Solid Wastes, SW-846, Method 8081A, December 1996

**********

## 0952 TCLP Herbicides (leachate)

The leachate sample is hydrolyzed, acidified, solvent extracted and converted to the methyl esters. The resulting extract is quantitatively analyzed by gas chromatography with an electron capture detector.

The metal analyses were performed on a non-volatile leachate prepared according to the procedure specified in SW-846, Chapter 7.4 (Revision 3, December, 1994). A sample is considered to have failed the Toxicity Characteristic (TC) test and is considered a hazardous waste if any of the metal concentrations (mg/l) in the leachate exceed the following maxima (100 times the Primary Drinking Water Standards):

The pesticide/herbicide analyses were performed on a non-volatile toxicity characteristic leachate of the submitted waste. The leachate was prepared according to the procedure specified in the March 29 and the June 29, 1990 Federal Registers.
A sample is considered to have failed the Toxicity Characteristic (TC) test and is therefore considered a hazardous waste if any of the contaminant concentrations (mg/l) in the leachate exceed the following maxima:

| | | | |
|---|---|---|---|
| Chlordane | 0.03 | Methoxychlor | 10.0 |
| Endrin | 0.02 | Toxaphene | 0.5 |

## SAMPLE PREPARATION:

The soil samples were collected in the field using EnCore™ samplers. Once submitted to Lancaster Laboratories, the samples were transferred into the appropriate pre-weighed containers and were re-weighed to determine the weight of the sample. Since an approximate amount of sample is collected in the field, the dilution factors may vary from sample to sample.

The weights for several samples were found to be outside the SW-846 Method 5035 requirement of 4.5g to 5.5g (EnCore™ sampler) when these samples were re-weighed at the laboratory. Please see the Vial Preparation sheets following the QC Raw Data section for more information.

No other problems were encountered during the sample preparation for the VOA fraction.

## ANALYSIS:

The method used for analysis was EPA SW846 Method 8260B.

All field samples for TCLP were analyzed at a twenty times dilution due to the leachate matrix and the action reporting limits of the TCLP.

No other problems were encountered during the analysis of these samples.

## QUALITY CONTROL and NONCONFORMANCE SUMMARY:

Only client requested compounds are addressed in this narrative.

The relative percent difference (RPD) for toluene between 7GP20MS and 7GP20MSD was outside QC limits. RPDs are laboratory advisory limits only for this method.

All other QC was within specifications.

## DATA INTERPRETATION:

No further interpretation is necessary for the data submitted.

RT Summary

| Internal Standard Name | File ID: xf23c06.d | ICAL RT | In Spec |
|---|---|---|---|
| t-Butyl Alcohol-d10 | 4.492 | 4.498 | Yes |
| Fluorobenzene | 7.955 | 7.951 | Yes |
| Chlorobenzene-d5 | 11.343 | 11.343 | Yes |
| 1,4-Dichlorobenzene-d4 | 13.201 | 13.201 | Yes |

A "No" indicates the retention time is greater than 30 seconds from the average RT.

RT Summary

File ID:
nf24c03.d

| Internal Standard Name | nf24c03.d | ICAL RT | In Spec |
|---|---|---|---|
| Fluorobenzene | 7.970 | 7.975 | Yes |
| Chlorobenzene-d5 | 11.349 | 11.355 | Yes |
| 1,4-Dichlorobenzene-d4 | 13.200 | 13.205 | Yes |

A "No" indicates the retention time is greater than 30 seconds from the average RT.

Area Summary

File ID:
nf24c03.d

| Internal Standard Name | nf24c03.d | ICAL Area | Low Limit | High Limit | In Spec |
|---|---|---|---|---|---|
| Fluorobenzene | 1037153 | 1041751 | 520876 | 2083502 | Yes |
| Chlorobenzene-d5 | 814583 | 812951 | 406476 | 1625902 | Yes |
| 1,4-Dichlorobenzene-d4 | 443611 | 456044 | 228022 | 912088 | Yes |

A "No" indicates the internal standard area is outside acceptable QC limits.

## CASE NARRATIVE

**Client: Draper Aden Associates, Inc.**
**SDG #: RAV02**

LANCASTER LABORATORIES
SEMIVOLATILES BY GC/MS

**SAMPLE NUMBER(S) :**

| LL #'s | Sample Code | Matrix Water | Comments |
|---|---|---|---|
| 4219022 | UN7NV | X | Unspiked |
| 4219022 | UN7NVMS | X | Matrix Spike |
| 4219022 | UN7NVMSD | X | Matrix Spike Dup |

**LABORATORY SUBMITTED QC:**

| | | | |
|---|---|---|---|
| SBLKWC055 | SBLKWC055M | X | Method Blank |
| 055WCLCS | 055WCLCSM | X | Lab Control Sample |

**SAMPLE PREPARATION:**

All samples were leached by SW-846 Method 1311 and extracted according to SW-846 Method 3510C.

Due to insufficient sample, only 330 mls were used in the extractions of UN7NV, UN7NVMS and UN7NVMSD.

No other problems were encountered during the extraction of these samples.

**ANALYSIS:**

The method used for analysis was SW-846 8270C.

All samples were analyzed for the semivolatile TCLP (toxicity characteristic leaching procedure) compounds.

**Case Narrative (continued)**
**SDG#: RAV02**

3-Methylphenol and 4-methylphenol cannot be resolved under the chromatographic conditions used for sample analysis. The 4-methylphenol value is a combination of results from both compounds.

No problems were encountered during the analysis of these samples.

## QUALITY CONTROL AND NONCONFORMANCE SUMMARY:

All QC was within specifications.

## DATA INTERPRETATION:

Only non-conformances for client requested compounds are addressed in this case narrative.

No further interpretation is necessary for the data submitted.

Average %RSD 6

+ %RSD is less than or equal to 15%; however, value rounds to 15.

4,6-Dinitro-2-methylphenol and 4-Nitrophenol are at 10 ng/ul in the 5 standard.
Benzoic acid, Pentachlorophenol and 2,4-Dinitrophenol are at 15 ng/ul in the 5 standard.
Benzidine Levels in the 5,15,30,50,80,120 standards are 15,45,90,150,240,360 ng/ul, respectively.
Benzoic acid, Pentachlorophenol and 2,4-Dinitrophenol are at 15 ng/ul, 30 ng/ul,40 ng/ul in the 5 ,15, 30 standards.

### A. Sample Preparation:

Florisil cleanup was used to minimize interferences. No other problems were encountered with the preparation of the samples.

### B. Analysis:

The analysis was performed using the following runs:

- 1C13051, 1C13051B, 2C13051, 2C13051B

No problems were encountered. All continuing calibration data are within method specifications since if any individual target analytes have a %D value outside the 15% criteria, then the average %D value of the standard is within the 15% criteria.

An SW-846 method update was performed using the initial calibration files from 1C13051 and the calibration name was changed to 2C13051.

### C. Quality Control:

All reported surrogates are within the QC limits.

The matrix spike data are within the QC limits.

The LCS data are within the QC limits.

### D. Data Interpretation:

The method blank was evaluated to the MDL. Values between the MDL and the LOQ are reported with a "J" qualifier.

8516

Lancaster Laboratories

No further interpretation is needed.

**Data codes:**

Detected analytes are reported using the higher of the two column results in accordance with the method. Data with analytes showing disparity >40% are further evaluated for reporting based on chromatographic appearance. The analytes will be coded with a comment number on the data sheet. The comments are explained below:

- 1569 - A disparity of >40% between the primary and confirmatory analysis occurred. Due to suspected interference, the lower result was reported.
- 1570 - A disparity of >40% between the primary and confirmatory analysis occurred. Since no chromatographic anomalies were apparent, the higher result was reported.

Data that indicates that manual integration was required would include the following codes:
1 = missed peak and 2 = improper baseline. The peaks that have been manually changed are indicated with an "M" on the raw data.
