All documentation associated with the original recording of analytical results pertinent to a specific sample or set of samples. This may include laboratory worksheets, calculation forms, instrument-generated output, analyst notes, etc., from sample receipt through final reporting.

**reagent water**
Water in which an interferant is not observed at or above the minimum quantitation limit of the parameters of interest. The reagent water's purity and acceptability is verified by analysis with each set of samples.

# Glossary (continued)

**recovery**
See percent recovery.

**reference method**
A method of known and demonstrated accuracy.

**regression coefficients**
The quantities describing the slope and intercept of a regression line.

**relative error**
An error expressed as a percentage of the true value or accepted reference value.

**relative percent different (RPD)**
Statistic for evaluating the precision of a replicate set. For replicate results:

$$RPD = \left[ \frac{|X_1 - X_2|}{\left( \frac{X_1 + X_2}{2} \right)} \right] x\ 100$$

where: $X_1$ = first observed concentration
$X_2$ = second observed concentration

**relative response factor (RRF)**
A measure of the relative mass spectral response of a compound compared to its internal standard. RRFs are determined by analysis of standards and are used in the calculation of concentrations of analytes in samples. Because a RRF is the comparison of two responses, it is a unitless number. RRFs are determined by the following equation:

$$RRF = \frac{A_x}{A_{IS}} x \frac{C_{IS}}{C_x}$$

# Glossary (continued)

where: $A$ = area of the characteristic ion measured
$C$ = concentration
$IS$ = internal standard
$x$ = analyte of interest

**relative standard deviation (RSD)**
See coefficient of variation.

**reporting limit (RL)**
One of two types of reporting limit conventions within STL®. The Reporting Limit (RL) is a uniform, STL® -wide reporting limit based on an evaluation of the PQLs at STL® laboratories and the expected method performance in routine water and soil matrices. Project Specific Reporting Limits (PSRLs) are reporting limits that are defined by project requirements.

**representative sample**
A sample taken to represent a lot or population as accurately and precisely as possible.

**representativeness**
Representativeness is the degree to which data accurately and precisely represent a characteristic of a population, a variation in a physical or chemical property at a sampling point, or an environmental condition. Data representativeness is primarily a function of sampling strategy; therefore, the sampling scheme must be designed to maximize representativeness. Representativeness also relates to ensuring that, through sample homogeneity, the sample analysis result (concentration) is representative of the constituent concentration in the sample matrix. At each STL® laboratory, every effort must be made to analyze an aliquot that is representative of the original sample, and to ensure the homogeneity of the sample before subsampling.

**reproducibility**
The precision, usually expressed as a standard deviation, measuring the variability among results of measurements of the same sample at different laboratories.

**response factor (RF)**

# Glossary (continued)

A factor derived from the calibration of a compound that is used in the quantitation calculation of sample analytes. A response factor may be derived from an external standard calibration (then called a Calibration Factor) or from an internal standard calibration (then called a Relative Response Factor).

**secondary standard**
A material having a property that is calibrated against a primary standard.

**self assessment**
Assessments of work conducted by individuals, groups, or organizations directly responsible for overseeing or performing the work.

**shall**
Denotes a requirement that is mandatory and has to be met.

**should**
Denotes a guideline or recommendation.

**standard addition**
The procedure of adding known increments of the analyte of interest to a sample to cause increases in detection response to subsequently establish, by extrapolation of the plotted responses, the level of the analyte of interest present in the original sample.

**standard deviation**
A measure of the dispersion about the mean of the elements in a population. The square root of the variance of a set of values:

$$s = \sqrt{\frac{\sum_{i=1}^{n}(x_i - \bar{x})^2}{n-1}}$$

where: $s$ = standard deviation
$\Sigma$ = sum of

# Glossary (continued)

$X$ = observed values
$n$ = number of observations

**standardization**
The establishment of the value of a potential standard with respect to an established or known standard.

**standard method**
A method of known and demonstrated precision issued by an organization generally recognized as competent to do so.

**standard operating procedure (SOP)**
A written document that details an operation, analysis, or action, with prescribed techniques and steps, that is officially approved as the method for performing certain routine or repetitive tasks.

**standard reference material (SRM)**
A material produced in quantity, of which certain properties have been certified by the National Institute of Standards and Technology (NIST), formerly NBS, or other agencies to the extent possible to satisfy its intended use.

**standard verification**
Standard is checked by STL® or the vendor versus a known specification. See Section 8.5.4.3.

**statistic**
A constant or coefficient that describes some characteristic of a sample. Statistics are used to estimate parameters of populations.

**stock solution**
A concentrated solution of analyte(s) or reagent(s) prepared and verified by prescribed procedure(s), and used for preparing working standards or standard solutions.

# Glossary (continued)

**subsample**
A portion taken from a sample. A laboratory sample may be a subsample of a gross sample; similarly, a test portion may be a subsample of a laboratory sample.

**supplier**
See vendor.

**surrogate (surrogate standard)**
Compounds, when required by a method, that are used added to every blank, sample, LCS, matrix spike, matrix spike duplicate, and standard. They are used to evaluate analytical efficiency by measuring recovery. Surrogates include brominated, fluorinated, or isotopically-labeled compounds that are not expected to be detected in environmental media.

**systematic error**
The condition of a consistent deviation of the results of a measurement process from the reference or known level.

**systems audit or evaluation**
A systematic on-site qualitative review of facilities, procedures, equipment, training, record keeping, data verification, and reporting aspects of a quality assurance system to arrive at a measure of the capability of the system. Within STL®, system audits or evaluations are performed on a periodic basis under the direction of the STL® Corporate Director of Quality Assurance.

**technique**
Physical or chemical principle for characterizing materials of chemical systems.

**traceability of data**
The entire documented chain of acquired data from the original acquisition effort through to the final tabulation, synthesis, reduction, and storage activities. The documentation will allow complete reconstruction of the data.

**traceability of samples**

# Glossary (continued)

During all environmental monitoring field efforts, acquired samples will be assigned specific and unique identification numbers. These sample numbers shall be accompanied by documentation (chain-of-custody form) which clearly identifies all parameters associated with sample acquisition. All additional sample numbering systems applied to the sample must be clearly cross-referenced to the field sample number to provide for traceability of samples from acquisition to reporting of sample results.

**traceability of standards**
The ability of an analytical standard material used for calibration purposes to be traced to its source. The standards used by STL® must be traceable via written documentation to sources which produce or sell verified or certified standards, i.e., National Institute for Standards and Technology, or vendors preparing standards from those sources which they have certified.

**validation - computer software**
The process of establishing documented evidence which provides a high degree of assurance that a specific process will consistently produce a product meeting predetermined specifications and quality attributes. This process demonstrates and documents that the software performs correctly and meets all specified requirements.

**validation - data**
The process of a second party performing a systematic review of the raw and final data produced by a laboratory using predetermined criteria to ascertain the validity of the data with respect to the criteria (e.g., HAZWRAP data validation).

**vendor**
Any individual or organization furnishing items or services or performing work according to a procurement document. This is an all-inclusive term used in place of any of the following: supplier, seller, contractor, subcontractor, or consultant.

**verification - computer software**
The process of checking the accuracy of manually entered or automatically (electronically) calculated information.

**verification - data**

# Glossary (continued)

The process of reviewing data to ensure that data reduction has been correctly performed and that analytical results to be reported correspond to the data acquired and processed.

RE: SWMU 6 Sampling Results Report
Radford Army Ammunition Plant
Radford, Virginia, January 2001

Dear Mr. McKenna:

Thank you for the opportunity to review the above referenced document. There is only one minor comment at this time.

- Page ii, first full paragraph, second sentence – I believe that there is a typographical error and that the intent was to state that aluminum detections were above residential RBCs and below industrial RBCs.

As an additional note, I have forwarded the soil background study to our staff statistician for additional review. Please contact me at 804-698-4143 if you have any questions.

Very truly,

Sharon Wilcox

Re: Radford Army Ammunition Plant
SWMU 6
Draft *Site Screening Document* submittal and review

Dear Mr. McKenna and Ms. Jake:

The U.S. Environmental Protection Agency (EPA) has reviewed the Army's revised draft Site Screening *Sampling Results Report* for soil sampling at SWMU 6, located at the Radford Army Ammunition Plant (RFAAP). Based upon our review, the revised draft *Sampling Results Report* is approved. In accordance with Part II.(G)(2) of RFAAP's Corrective Action Permit, the schedule contained within Section 7, Figure 11 of the *Sampling Results Report* is now considered final and is henceforth incorporated into the Permit, via the Installation Action Plan.

RE: Work Plan Addendum No. 18, SWMU 41
Soil Screening Report SWMU 8
Soil Screening Report SWMU 36

Dear Mr. McKenna:

Thank you for providing the staff the opportunity to review and comment on the referenced documents. The staff has the following comments:

Work Plan Addendum No. 18, SWMU 41

Figure 1-16. The symbol for soil boring in the legend (closed black circle) does not correspond to the symbol used in the figure (open circle). Also, Table 1-9 indicates that soil samples SB 6, 7 and 8 will be taken outside Area B, while the figure clearly shows the samples to be within the inferred boundary line.

Figure 1-15. Table 1-9 indicates that soil samples SB 3, 4 and 5 will be taken outside Area A, while Figure 1-15 shows the samples within the inferred boundary line. Please explain.

Soil Screening Reports SWMUs 8 and 36

There are no additional comments on the Soil Screening Reports for SWMUs 8 and 36.

Please do not hesitate to contact Jennifer Jones, 804-698-4328, or myself if you have questions concerning these comments.

Sincerely,

Durwood Willis
Federal Facilities Program Manager

Re: Radford Army Ammunition Plant
SWMUs 8 and 36
Draft *Soil Screening Report*
Review of the Army's 2/6/04 response to EPA's 12/11/03 comment letter

Dear Mr. McKenna and Ms. Jake:

The U.S. Environmental Protection Agency (EPA) has reviewed the Army's February 6, 2004 response to EPA's December 11, 2003 letter concerning the review of the Army's draft *Soil Screening Report* for SWMUs 8 and 36, located at the Radford Army Ammunition Plant (RFAAP). Outlined below, please find EPA's comments based upon that review:

***EPA General Comment 2***

2. As concluded in Section 5.0 of the Report, the soil screening at Solid Waste Management Units (SWMUs) 8 and 36 indicated the presence of "selected targeted constituents." However, it is concluded in this section that "point comparisons of the discrete data to Residential RBCs [risk-based concentrations], Industrial RBCs, and

RFAAP background did not indicate a potential to human health." There are potential flaws in this conclusion, among them:

- The screening process was not completed in accordance with the RFAAP *Site Screening Process* (SSP [October 26, 2001]). At this stage, the chemicals of potential concern (COPCs) should have been identified (COPC identification step in Section 6.1.1.1 of the SSP). Based on the data presented in the report, it appears manganese, lead, mercury, zinc, and antimony are the COPCs.

***RFAAP Response***

In order to achieve the project objectives of assessing for the presence or absence of hazardous constituents in soil and characterizing site materials for RCRA characteristics, particular elements enumerated in the RFAAP SSP were used to perform qualitative risk screening for the SWMUs 8 and 36 Soil Screening. There was no intent within the Report to identify COPCs for purposes of conducting an RFI risk assessment, thus the screening process for SWMUs 8 and 36 did not follow every element within the SSP developed at RFAAP for Site Screening Areas.

**EPA review**

Please note that the SSP, as envisioned, is not conducive towards the elimination of process steps within the SSP. It is not a "pick and choose" methodology. Either the SSP process is followed or it isn't. In the future, please follow the SSP process. The central questions that need to be answered BY THIS REPORT are: (a) which soil constituents failed the residential soil screening criteria and are above background values; (b) which soil constituents failed the industrial soil screening criteria and are above background values; (c) which soil constituents failed the BTAG soil screening criteria and are above background values; and (d) what soil constituents failed the SSL soil screening criteria and are above background values. The Report generally answers these questions, but not in a direct approach. Additionally, in the future, please differentiate between those soil constituents which exceed the residential RBC and background and those soil constituents which exceed the industrial RBC and background values. This is important in determining whether or not the site will need long-term monitoring, i.e. whether waste is left in-place. The conclusions section of the report should address this in future SSP documents.

***EPA General Comment 2 continued***

- No cumulative risk screening was conducted in accordance with the SSP. This evaluation includes uncertainty analysis of the cumulative risk screening. As the vertical and horizontal extent of contamination of all the chemicals detected in soil is not fully characterized, whether the data generated from this soil screening is sufficient to conduct a cumulative risk assessment will also need to be demonstrated.

***RFAAP Response***

The objectives of the Soil Screening did not include full characterization of the site for completion of a cumulative risk assessment. Characterization of the site, if necessary, will take place at some time after treatment activities cease at these locations.

**EPA review**

It is important to note that defining the full nature and extent of contamination is NOT part of the SSP, but is the function of the RFI. The uncertainty section of the SSP basically acknowledges this. The function of the SSP is to determine whether or not there has been a release at the site. To accomplish this, a proposed number of samples contained in an approved Work Plan is sufficient. Thus, the central questions that need to be answered revolve around (a) which soil constituents failed the residential soil screening criteria and are above background values; (b) which soil constituents failed the industrial soil screening criteria and are above background values; (c) which soil constituents failed the BTAG soil screening criteria and are above background values; and (d) what soil constituents failed the SSL soil screening criteria and are above background values. Defining nature and extent is left to the RFI phase, if needed.

***EPA General Comment 2 continued***

- Some potential exposure pathways were not evaluated. According to the conceptual site models (CSMs) presented in Figures 2-4 and 2-5, the potential impact from soil to groundwater and eventually surface water exists. However, the Report does not evaluate chemical migration of contaminants from soil to groundwater as required by the SSP. The SSP requires use of USEPA's *Soil Screening Guidance* (USEPA, 1996) as a source of information when conducting comparison to soil screening levels (SSLs). The Report did not compare soil concentrations to the USEPA Region 3 SSLs listed on the RBC Table. Based on the data provided in the Report, several metals (e.g., arsenic, chromium, manganese, vanadium, etc.) exceed their respective SSLs at dilution attenuation factor (DAF) 20.

***RFAAP Response***

The report will be revised to include a comparison of soil concentrations to the USEPA Region 3 soil to groundwater SSLs at DAF 20 listed on the most recent RBC Table.

**EPA review**

The Army's response is acceptable. However, in the future, please include the SSL screening in the text of the screening section of the report. Please note that the SSL screening was not discussed in Section 4 of the report.

***EPA comment 2 continued***

- In the Summary (Section 4.4) of the Report, only those metals with concentrations exceeding both the RBCs and the background concentrations are noted. Other metals that exceeded one or more screening criteria are dismissed

because their concentrations did not exceed the site background values. The risk conclusions, thus, consider only those metals noted in Section 4.4. At this stage, it appears inappropriate to eliminate metals from the risk assessment based solely on a comparison to background or ambient levels. In order to provide a more complete characterization of potential risks associated with exposures at the site, metals that exceed risk-based screening concentrations should not be excluded from quantitative consideration in the risk assessment. The contribution to the overall risk due to metals with high background concentrations should be presented in a risk characterization (EPA. 2002. *Role of Background in the CERCLA Cleanup Process.* Office of Solid Waste and Emergency Response. OSWER 9285.6-0P. April 26).

***RFAAP Response***

Per previous agreement with USEPA, investigations performed prior to WPA 016 would be allowed to screen out COPCs based on background comparison. Work at SWMUs 8 and 36 was performed under WPA 015. Also, please refer to the response to specific USEPA comment 18 below regarding the presentation of data for constituents exceeding relevant screening criteria but not their inorganic constituent background point estimates.

**EPA review**

The Army's response is acceptable.

This concludes EPA's review of the Army's February 6, 2004 response to EPA's December 11, 2003 letter concerning the review of the Army's draft *Soil Screening Report* for SWMUs 8 and 36, located at the RFAAP. All Army responses to EPA's December 11, 2003 letter were determined to be acceptable. The above comments reflect a need for refinement in the submittal of SSP documents in the future.

Based upon our review, the January, 2004 *Soil Screening Report* for SWMUs 8 and 36 is approved. In accordance with Part II.(G)(2) of RFAAP's Corrective Action Permit, the January, 2004 *Soil Screening Report* for SWMUs 8 and 36 is now considered final.

Based upon the above, please submit a draft *SWMU Decision Document* for SWMU 8 and 36, separately, to EPA for review. Please bear in mind the comments outlined above when preparing the text of the draft *SWMU Decision Documents.*

If you have any questions, please call me at 215-814-3357.

Sincerely,

Robert Thomson

Re: Radford Army Ammunition Plant
SWMU 58
Rubble Pile
Document submittal and review

Dear Mr. McKenna and Ms. Jake:

The U.S. Environmental Protection Agency (EPA) has reviewed the U.S. Army's (Army's) March 2004 response to EPA's September 18, 2003 review comments pertaining to the draft *RCRA Facility Investigation Report* (RFI) for SWMU 58, located at the Radford Army Ammunition Plant (RFAAP). Based upon that review, EPA finds the Army's March 2004 response to be acceptable.

Given the above, the referenced draft *RCRA Facility Investigation Report* (RFI) is conditionally approved by EPA, provided that EPA's comments are satisfactorily addressed in the final RFI Report. Please forward two copies of the final SWMU 58 RFI Report to EPA for review and approval.

If you have any questions, please call me at 215-814-3357.

Sincerely,

Robert Thomson

## 1.0 PURPOSE

In order for the Radford Army Ammunition Plant (AAP) to achieve clean closure of HWMU-7 with the residual material remaining in-place, the Virginia Department of Environmental Quality (VDEQ) indicated that Radford AAP must demonstrate that the residual material in the Unit does not exceed the clean closure standards. The residual material includes all material above the bottom of the Unit (including any sand and rip-rap) and below any clean material placed on top of the residual material. The bottom six inches of clean material contacting the residual material will be included with the residual material because of possible mixing with the residual material during its placement. Closure procedures addressing the residual material will include all materials from six inches below the residual material up to the first six inches of clean material placed above the residual material.

In accordance with the *Amended Closure Plan* for HWMU-7, the clean closure decontamination standards are as follows:

Option 1: Clean closure with the residual material remaining in-place can be successfully demonstrated in accordance with the clean closure standards.

Option 2: Clean closure cannot be achieved with the residual material remaining in-place. The Unit will remain closed with the residual material in-place in accordance with the VDEQ-approved May 1988 Closure Plan, and the Unit will remain in post-closure care in accordance with the Final Permit (October 4, 2002). Radford AAP will retain the option to attempt to demonstrate clean closure in the future by excavation and removal of the residual material.

Option 3: Clean closure cannot be achieved with the residual material remaining in-place. The residual material will be excavated and transported off-site for disposal. Composite sample(s) of the excavated material will be submitted for waste characterization analyses to determine the proper disposal method (hazardous vs. non-hazardous). Following excavation, confirmation samples will be collected to ensure removal of all contaminated materials.

This Excavation Plan was developed to define the activities that Radford AAP will perform in the event that clean closure with the residual material remaining in-place cannot be successfully demonstrated, and Radford AAP chooses to excavate and remove the residual material from the Unit. Radford AAP prepared this Excavation Plan in accordance with the *Draft Guidance Manual for Closure Plans and Post-Closure Plans* (*Draft Guidance*) dated September 28, 2001.

## 2.0 CONDITIONS TRIGGERING EXCAVATION

The hazardous constituents of concern (HCOC) list for HWMU-7 was developed based on the following:

- The results of the analysis of influent water in 1981 (previously presented in the VDEQ-approved May 1988 Closure Plan);

- The quarterly groundwater monitoring constituents for the Unit listed in Appendix E of Permit Attachment 2 of the Final Permit (October 4, 2002), as revised by subsequent detections of additional 40 CFR Part 264 Appendix IX constituents; and

- Any hazardous constituents detected in soil samples collected from within and around the Unit during the 2002 Field Investigation.

In the event that the residual material and underlying soils at HWMU-7 do not meet the clean closure decontamination standards (analytical non-detection, below background, or below risk assessment values), the residual material and soils will be excavated to a depth at which the soils and subsoils demonstrate compliance with the clean closure decontamination standards. In addition, composite samples of the excavated material will be analyzed by the Toxicity Characteristic Leaching Procedure (TCLP) for waste characterization analysis and to demonstrate compliance with the land disposal restriction (LDR) treatment standards specified in 40 CFR 268 Subpart D.

## 3.0 EXTENT OF EXCAVATION

Additional soil samples will be collected in order to evaluate the vertical and horizontal extent of soil that requires excavation.

### 3.1 Vertical Extent

The vertical extent of impact will be established based upon the following:

- The vertical extent of excavation will be based upon the extent of soil impact that will be established by systematic vertical sampling of migration pathways and data evaluation using the clean closure decontamination standards.
- Soil samples will be collected at six-inch depth intervals from the bottom of the Unit to a depth of two feet below the Unit. Soil sampling intervals beneath the Unit are as follows: 0-6, 6-12, 12-18, and 18-24 inches.
- Samples will be collected from a minimum of eight discrete sample locations.
- If sampling and analyses of soils shows HCOCs at levels that exceed decontamination standards, then the soil will be removed to the bottom depth of the first six-inch sample interval that shows compliance with the decontamination standards. That is, soils will be excavated to the bottom of

the first clean sample depth interval to ensure removal of all soil that does not meet the clean closure standards.

- If the initial sampling does not show compliance with decontamination standards at the deepest depths of the initially proposed sampling scheme (that is, two feet), then additional vertical samples will be collected and analyzed until samples show concentrations of HCOCs that are within the decontamination standards.
- If soil contains HCOCs at concentrations above the decontamination standards specified in the ***Amended Closure Plan***, then soil excavation will be conducted down to the maximum depth of one of the following:
    - The bottom of the first soil sampling interval depth where sampling analytical data indicates compliance with the clean closure decontamination standards.
    - The local seasonal high water table, if less than five feet.
    - The local bedrock, if less than five feet.
- If soil contamination exists above the decontamination standard at depths greater than five feet, then the VDEQ will be formally notified for the potential need to revise the approved ***Amended Closure Plan*** as to achieve clean closure or to close the Unit with hazardous waste closed in-place in accordance with the Virginia Hazardous Waste Management Regulations (VHWMR). Any remaining impact would be addressed under the U.S. Environmental Protection Agency (USEPA) Resource Conservation and Recovery Act (RCRA) Corrective Action Program at Radford AAP.
- The sampling protocol will follow the procedures established in the ***Amended Closure Plan.***

### 3.2 Horizontal Extent

The horizontal extent of impact will be established based upon the following:

- The horizontal extent of excavation will be based on the extent of impact that will be established by systematic sampling of migration pathways and data evaluation using the clean closure decontamination standards.
- If soils beneath the Unit are impacted and require removal to comply with decontamination standards and regulations and if the secondary containment is insufficient to prevent runoff from the Unit, then the horizontal extent of impacted soil will be determined by systematic soil sampling.
- Should impacted soil be detected beneath the Unit that exceeds the clean closure decontamination standards, the horizontal extent of potential impact outside the Unit boundary will be evaluated by systematic soil sampling. Soil samples will be collected from an area that is laterally extended beyond the Unit boundary by incremental two feet distances in each direction of the Unit boundary until soil contamination is either not detected or is shown to be in compliance with clean closure standards.

- Eight randomly selected sample locations will be established at the perimeter of each incremental two feet distance outside the original designated Unit boundary. The eight samples will include two samples per side of the Unit.
- The sampling protocol will follow the procedures established in the *Amended Closure Plan*.
- Each set of sampling data from each additional two feet of extended sampling area will be statistically evaluated separately from the original data set and any subsequent data sets created by the incremental sampling protocol.

## 4.0 STORAGE, TREATMENT, AND DISPOSAL

After excavation and prior to disposal, excavated soils, subsoils, construction debris, and residues will be stored in large roll-off containers. Composite samples will be analyzed by TCLP to demonstrate compliance with the LDRs to determine appropriate disposal practices. Excavated material will be properly disposed at a permitted disposal facility as soon as possible after excavation.

## 5.0 BACKFILLING AREAS OF EXCAVATION

Following excavation, Radford AAP will schedule a closure site inspection with VDEQ. Backfilling and reclamation of the Unit will not proceed until VDEQ formally approves clean closure of the Unit. Excavated areas will be backfilled with clean fill or soil to the original grade of the site prior to termination of closure activities. In addition, the site will be seeded, and vegetative cover will be established, as appropriate. The site will be reclaimed to conditions that are similar to the surrounding areas.

## 6.0 TEMPORARY DECONTAMINATION AREAS AND PROCEDURES

### 6.1 Temporary Decontamination Areas

Construction of temporary decontamination areas is necessary to decontaminate all substantial equipment to be used during decontamination of the Unit. Generally, separate decontamination areas are needed for large and small equipment. The nature and size of temporary decontamination areas is dependent on the nature of the equipment that may be used in the decontamination and/or excavation process. The proposed decontamination areas will be designed so as not to be defined as a surface impoundment under the VHWMR and/or RCRA.

All equipment will be washed in containers or in equipment decontamination areas. All equipment decontamination areas will be constructed of sufficient materials and thickness, and will contain a sufficient number of layers in order to create an impervious surface that allows for the collection of all washwater, rinsate, and residues in tanks or containers.

Prior to decontamination of the Unit, sampling, and/or excavation activities, temporary decontamination areas will be constructed as follows:

#### *6.1.1 Small Equipment*

The small equipment decontamination areas will be used for decontaminating sampling equipment, personal protective equipment (PPE), and any other small tool or equipment used for decontamination of the Unit and related areas. The small equipment decontamination area will effectively contain all washwater, rinsewater, and residues generated during the decontamination process.

#### *6.1.2 Large Equipment*

The large equipment decontamination area will be constructed of sufficient size to contain the entire size of the largest piece of equipment used to decontaminate the Unit. The decontamination area will be graded with at least a 2% slope toward one corner of the area. A berm constructed with sandbags or an equivalent material will be constructed around the edges of the decontamination area. The berm will effectively contain all washwater, rinsewater, and residues generated during the decontamination process.

The decontamination area will drain into either a constructed sump or the low corner area where all washwater, rinsate, and residues will be removed by pumping or bailing to appropriate containers for storage, sampling, testing, and disposing in accordance with appropriate regulations. The decontamination area will be lined with an appropriate number of synthetic plastic liners of sufficient gauge thickness to prevent loss of the washwater, rinsewater, and residues from the area. In addition, the constructed liner will have sufficient thickness and number of layers to be able to sustain the stresses caused by moving heavy equipment in and out of the decontamination area.

### 6.2 Decontamination Procedures

All equipment will be decontaminated upon the completion of work at the Unit and whenever the equipment is removed from the HWMU-7 site. Equipment will be decontaminated as follows in accordance with the *Amended Closure Plan*.

All reusable, non-dedicated sampling equipment will be decontaminated prior to initiating field activities, between each sample location, and prior to demobilization from the site using a non-phosphate detergent/distilled water solution wash followed by a distilled water rinse. Decontamination procedures for reusabe sampling equipment were established per the VDEQ *Draft Closure Guidance* and are as follows.

- Between soil samples and sampling locations, material will be physically removed from the sampling equipment with brushes or water.
- Then, the sampling equipment will be washed using a non-phosphorous detergent/distilled water solution followed by a distilled water rinse.

- If constituents to be analyzed include trace metals, the sampling equipment will be rinsed with a 10% nitric acid solution followed by a distilled water rinse.
- If samples will be analyzed for trace organics, the sampling equipment will be rinsed with a pesticide grade solvent followed by a distilled water rinse.
- Following decontamination, the sampling equipment will be allowed to air-dry completely.

Small equipment used for excavation of the Unit will be decontaminated by washing with non-phosphate detergent and brushes and then rinsing with potable water. Decontamination of heavy equipment that comes in contact with material from the Unit will involve scraping, heavy brushing, and high pressure washing with non-phosphate detergent and rinsing with potable water.

Decontamination activities will take place in the constructed decontamination areas. All decontamination washwater, residues, and final rinsates will be properly segregated, containerized, and tested in accordance with the *Amended Closure Plan* and properly disposed in accordance with the *Amended Closure Plan* and RCRA regulations.

Decontamination washwater, rinsate, soil, and residue collected in the decontamination areas will be managed as potentially contaminated with hazardous waste and will be tested for the hazardous waste HCOCs and TCLP constituents as specified in the *Amended Closure Plan.* Proper management procedures of wastes generated during closure activities are discussed in Section 7.0 of this plan.

Any disposable items, such as protective clothing, sampling equipment, filters, cleanup materials, decontamination liner materials, etc., will be containerized and disposed of as hazardous waste.

## 7.0 MANAGEMENT OF CLOSURE-GENERATED WASTES

Closure procedures require that all closure-generated wastes be segregated from one another, stored in separate containers, and representatively sampled and analyzed to assure compliance with VHWMR and RCRA.

### 7.1 Proper Storage of All Closure-Generated Wastes

All waste, washwater, rinsate, wastewater, leachate, waste residue, aggregate, soil and subsoil, and construction debris that are generated from the closure activities of the Unit will be segregated from one another and stored on-site in storage containers in accordance with VHWMR and RCRA. All waste will be containerized. No waste piles will be created during closure activities.

### 7.2 Notification of VDEQ Regarding Temporary Storage

The VDEQ West Central Regional Office will be notified of the temporary (less than 90 day) storage of hazardous waste and other wastes associated with closure of the Unit. VDEQ will be notified at least 15 days prior to establishment of the temporary waste accumulation area. All wastes generated by closure activities will be stored in a designated waste storage area on-site.

### 7.3 Management of All Wastes

All waste generated from closure of the Unit will be managed as residue or media that is potentially contaminated with hazardous waste constituents.

### 7.4 Contained in Policy

Any debris, waste, washwater, rinsate, wastewater, leachate, soil, subsoil, residue, and equipment contaminated with waste from the Unit are required to be managed as hazardous waste in accordance with VHWMR and RCRA. These waste materials are required to be disposed of in a permitted hazardous waste landfill or a RCRA-permitted treatment storage disposal (TSD) facility unless testing demonstrates that the materials are not hazardous in accordance with specified decontamination standards listed in the *Amended Closure Plan* and analytical requirements for generated wastes specified in VHWMR and RCRA.

According to the VDEQ *Draft Closure Guidance*, contaminated residues and/or environmental media contain hazardous waste when the following occurs:

- The residues or media (e.g., aggregate, wastewater, soil, groundwater, etc.) exhibit a characteristic of hazardous waste in accordance with 40 CFR Part 261, Subpart C, Characteristics of hazardous Waste, § 261.20.
- A residue, waste, or wastewater removed from the Unit, which manages a listed waste under 40 CFR Part 261, Subpart D, Lists of Hazardous Wastes, contains a hazardous constituent from Part 261 Appendices VI or VIII.
- Media (i.e., debris, soil, sediments, or groundwater) are contaminated with concentrations of hazardous waste constituents that are above health or risk-based levels.

As the USEPA has not issued definitive guidance regarding when or at what levels environmental media contaminated with hazardous waste no longer contains the hazardous waste, Radford AAP will use a risk assessment approach to address the public health and environmental impacts of the hazardous constituents remaining in the waste material in accordance with the VDEQ *Draft Closure Guidance*.

### 7.5 Demonstration by Testing

The demonstration by testing includes analyses for all HCOCs or underlying hazardous constituents (UHCs) managed at the facility that are identified in Part 261, Appendices VI and VIII, and analyses to demonstrate that the wastes or media do not exhibit a hazardous characteristic in accordance with Part 261, Subpart C, Characteristics of Hazardous Waste. The demonstration also includes analysis of composite samples to determine compliance with the characteristics of ignitability, corrosivity, and reactivity and the toxicity characteristic by TCLP.

### 7.6 Disposal of Hazardous Wastes

All waste (solid and liquid) generated during closure that is demonstrated to be hazardous will be disposed in a permitted hazardous waste landfill or RCRA-permitted TSD facility. Disposal of regulated waste will comply with 40 CFR Part 268, LDRs, Subpart D, Treatment Standards, § 268.40, Applicability of Treatment Standards, and comply with § 268.48, Universal Treatment Standards, for wastewater and non-wastewater. Contaminated soil will be handled in accordance with land disposal treatment standards for contaminated soil that are delineated under § 268.49, Alternative LDR Treatment Standards for Contaminated Soil.

Hazardous wastes will be disposed at permitted TSD facilities. Disposal will be documented on waste manifests. Transportation of hazardous waste generated during closure activities will be by a transporter with a current Hazardous Waste Transporter Permit and in accordance with VHWMR.

### 7.7 Disposal of Non-Hazardous Solid Wastes

All waste materials (with the exception of non-hazardous wastewater) generated in the closure process that are demonstrated as non-hazardous will be disposed as solid waste in accordance with VHWMR. Disposal of non-hazardous wastes will be documented from the solid waste disposal facility regulated under Virginia Solid Waste Management Regulations (VSWMR).

### 7.8 Non-Hazardous Wastewaters

Wastewater generated in the closure process that is demonstrated as non-hazardous will be emptied into the Biological Wastewater Treatment Plant at Radford AAP.

### 7.9 Reusable Equipment

All reusable equipment that is used in the decontamination and closure process, including large equipment, wet-dry vacuum, pressure washers, steam cleaners, sampling equipment, shovels, buckets, brooms, etc., will be thoroughly washed with a detergent solution and rinsed twice with clean potable water. A final rinsate using analyte-free

deionized water will be collected and tested for compliance with decontamination standards, or the items will be disposed as hazardous waste.

### 7.10 Expendable and Disposable Items

Expendable or disposable items used in the decontamination process of the Unit, such as mops, brooms, gloves, coveralls, and boots, will be containerized and properly disposed as hazardous waste. Expendable items that have only been in contact with wash solutions and/or rinsate that subsequent analyses have shown do no display a hazardous characteristic or do not contain any listed hazardous constituents will be disposed as non-hazardous waste.

### 7.11 Management of Personal Protective Equipment

Personal protective equipment (PPE) is required for workers that decontaminated HWMUs under the Occupational Safety and Health Administration (OSHA) regulations. The extent of PPE worn by workers will be in accordance with the Radford AAP's *Master Health and Safety Plan* and *Safety Rules for Contractors and Subcontractors*.

In order to prevent migration of HCOCs via unclean PPE, PPE will be managed as follows:

- PPE will be decontaminated between uses/areas and upon completion of work.
- All decontamination will take place in the temporary decontamination area.
- Wastewater, rinse water, and residue generated from PPE decontamination will be handled, managed, and disposed as hazardous waste unless tests indicate disposal as non-hazardous solid waste is acceptable. PPE will also be handled, managed, and disposed as hazardous waste at the end of closure unless tests indicates disposal to a Subtitle D sanitary landfill is acceptable.

## 8.0 CONCLUSIONS

In order for the Radford Army Ammunition Plant (AAP) to achieve clean closure of HWMU-7 with the residual material remaining in-place, Radford AAP must demonstrate that the residual material in the Unit does not exceed the clean closure standards. If HWMU-7 cannot be clean closed with residual material in-place, the residual material will be excavated and transported off-site for disposal. Excavation and decontamination activities will be performed in accordance with this Excavation Plan.

# RISK-BASED CLOSURE

## 1. Introduction

This document discusses the protocol for conducting a risk assessment to implement closure of hazardous waste management unit (HWMU) in accordance with Title 9 of the Virginia Administrative Code, Section 20-60-10 et seq. (Formerly the Virginia Hazardous Waste Management Regulations).

**1. Risk-Based Evaluation** In order to estimate the risk for chemicals of concern (COCs) a risk assessment will be conducted according to the Virginia DEQ document titled "Guidance for development of health based cleanup goals using decision tree/REAMS program (herein after "Virginia Risk Guidance") (November 1, 1994) prepared by Old Dominion University and the approved closure plan. The risk assessment report will contain the following sections:

- site evaluation,
- development of a site conceptual model,
- identification of contaminants of concern,
- identification of media and exposure pathways,
- toxicity assessment,
- estimation of contaminant concentration at the point of exposure, and
- summary of health risks.

The submission instructions contained in Appendix IX of the Virginia Risk Guidance will be reviewed prior to submitting the report to confirm that all necessary risk issues have been addressed. The risk goals/performance standards will be a hazard index of 1.0 for non-carcinogens and an individual carcinogenic risk of 1E-06 and cummulative carcinogenic risk of 1E-04.

Compliance with the closure standard will be verified by comparing the calculated individual and cumulative risk/hazard for all the contaminants of concern (COC) that failed background comparison to the risk-based performance standards.

The risk assessment will be conducted assuming a future residential/industrial use of the property. The methodology/equation for estimating the exposure concentration is presented in subsequent sections.

The initial step in the risk assessment will be to develop a site conceptual exposure model (SCEM) which depicts all potential exposure routes and media for the site and the receptors which may be exposed. The procedure for identification of contaminants of concern for health based is presented in section 2.... (from other section in the closure plan)

Once the SCEM is completed, the exposure assumptions outlined in the Virginia Risk Guidance will be employed to estimate the health risks and develop a cleanup criteria. Information will also be taken as needed from U.S. EPA documents and databases (e.g., the Risk Assessment Guidance for Superfund (RAGS), and the Integrated Risk Information System (IRIS)). The chemical intake equations and exposure parameter assumptions used to calculate estimate risks (obtained from Virginia risk assessment guidance/REAMS) are shown in Tables 1 through 4. Additional details on the approach and assumptions used for each potential exposure pathway are provided below.

As a part of the Risk Exposure and Analysis Modeling System (REAMS) evaluation, fate and transport modeling is necessary to demonstrate that the residual soil concentrations of contaminants of concern would not result in contamination of other environmental media of concern including the groundwater underneath the closure unit. For this purpose, representative soil sample(s) will be collected around the unit (subjected to closure) for analysis of the properties listed on page 62 of the REAMS document. [It is often less expensive to obtain this information from an agriculture lab rather than from an environmental lab]. In certain situations, groundwater sampling may be preferable.

## 2. Identification of Contaminants of Concern

Contaminants of concern includes those constituents detected during the closure soil and groundwater sampling which may be related to past waste management practices and whose concentrations statistically exceeded background levels. Please note that if the concentration of contaminants detected in the soil and groundwater did not exceed the background levels, no further risk-based evaluation will be required. Only those constituents of concern having concentrations that are statistically greater than background concentrations will be subject to REAMS evaluation to estimate the risks.

Also, for the purpose of evaluating the impact to groundwater, only those constituents which statistically exceeded the upgradient or background well concentration will be subjected to REAMS evaluation.

## 3. Exposure Assessment

The exposure assessment will identify transport mechanisms for the contaminants of concern that may potentially impact human receptors. The results of this assessment will be used to document the current and future exposure potential posed by the site.

With regard to soil, the following exposure assumptions will apply. Initially, a residential exposure will be assumed for the purpose of attempting to document unrestricted closure of the soil. If the risk for potential residential exposure does not exceed the performance standards, unrestricted closure of soil will be documented/accepted. If the site cannot be clean closed for residential use, then the option to pursue restricted closure (commercial/industrial) will be exercised. Closure to commercial/industrial scenario will requirement the facility to enact a deed restriction that eliminates the possibility of future residential use of the site. The requirements for establishing such a deed restriction are detailed in VDEQ=s Guidelines for Developing Health-Based Cleanup Goals Using Risk Assessment at A Hazardous Waste Site Facility for Restricted Industrial Use, dated June 1995. (A copy of this document is attached.)

Exposure routes will include ingestion, dermal absorption, and inhalation of vapors and dust particles.

With regard to groundwater, REAMS fate and transport modeling[1] will be required to assess residual soil contamination impacts to the groundwater. If the groundwater does not qualify for clean closure, the scope of future groundwater monitoring will be discussed with VDEQ. The groundwater exposure routes to be evaluated include ingestion, dermal absorption, and inhalation of volatiles emitted from the contaminated groundwater.

The exposure assumptions presented in the following sections are based on residential exposure. These constitute a reasonable maximum exposure scenario (RME),

[1] REAMS includes the unsaturated zone fate and transport model SESOIL. The purpose of running the model is two fold: a) determine whether the contaminants will reach the groundwater table in next 30 years. b) calculate the risk associated with the estimated concentration in the groundwater. For constituents with a promulgated MCL, the estimated concentration will be directly compared against the MCL. However, prior to running the SESOIL model the facility should obtain all the information identified on page 62, of the Virginia guidance document. The closure report must include evaluation of model results (concentrations reaching the groundwater) and a copy of SESOIL output file.

an exposure which is unlikely to occur but is reasonably possible. The exposure pathways for residential exposure include ingestion of soil, dermal contact with soil, inhalation of resuspended soil particulates, and inhalation of volatile organic compounds. Exposure to groundwater at the site is discussed in Section xxx.

### 3.1.1 Ingestion of Soil

The equation for potential chemical intake by soil ingestion for residential scenario on site is included in Table 1. This scenario also assumes that weather or other conditions (e.g., frozen ground/ snow /other cover) do not affect exposure and that all soil ingested is from contaminated areas of the site. These assumptions are protective of human health and the environment.

### 3.1.2 Dermal Contact with Soil

The equation for calculating the potential absorbed chemical dose by dermal contact with contaminated soil is provided in table 1. This scenario assumes that weather or other conditions (e.g., frozen ground/ snow or other cover) do not affect exposure, that contaminated soil remains on the skin long enough for the COCs to be absorbed and that all soil adhering to the skin is from contaminated areas of the site.

The skin surface areas (SA) used in the dermal pathway have been identified in REAMS guidance as 4,860 $cm^2$ for adults, which is the 50th percentile value for the arms, hands and lower legs (U.S. EPA, 1989b - See Attachment A).

A skin-soil adherence factor of 1.45 $mg/cm^2$ will be used in the dermal intake calculations. The U.S. EPA guidance for dermal exposure assessment (*Dermal Exposure Assessment: Principles and Applications*, EPA/600/8-91/011B) states that a range of values from 0.1 $mg/cm^2$ to 1.5 $mg/cm^2$ per event appear possible for dermal adherence factors (AF). The
In order to estimate the amount of a particular COC which may potentially be absorbed through the skin, chemical-specific dermal absorption factors ($ABS_{derm}$) are used.

### 3.1.3 Inhalation of Resuspended Soil

The equation for potential chemical intake by inhalation of resuspended contaminated soil is included in Table 1. An inhalation rate of 0.83 $m^3/hr$ will be used as specified in the Virginia Risk Guidance. This scenario assumes that the concentration of COCs in indoor dust will be equal to that in outdoor soil and that weather or other conditions, (e.g., frozen ground/snow or other cover) do not affect resuspension or exposure.

However, an appropriate model or equations in table-1, will be used to estimate the potential amount of respirable particulate matter generated by wind erosion. The estimated generation rate for eroded particulate matter will then be used derive an ambient air particulate concentration. Documentation for these models will be presented to the Department.

### 3.1.4 Inhalation of Volatilized COCs in Soil

Since the COCs have appreciable vapor pressures, they are expected to volatilize from soil. Inhalation of COCs as volatilized vapors is considered for this risk assessment. The equations in Table-1 will be considered for estimating the intake for this condition.

## 4. Toxicity Assessment

The two principle indices of toxicity used in risk assessment are the reference dose (RfD) and the cancer slope factor (SF). An RfD is the intake or dose per unit of body weight (mg/kg-day) that is unlikely to result in toxic (non-carcinogenic) effects to human populations, including sensitive subgroups (e.g., the very young or elderly). The RfD allows for the existence of a threshold dose below which no adverse effects occur.

The SF is used to express the cancer risk attributable to a discrete unit of intake; that is, the cancer risk per milligram ingested per kilogram of bodyweight per day ($[mg/kg\text{-}day]^{-1}$). The SF is an estimate of the upper-bound probability of an individual developing cancer as a result of exposure to a particular carcinogen. Unlike the RfD, the SF assumes that there is no threshold dose below which the probability of developing cancer is zero. Note that SFs are only developed for those chemicals which have been shown to be carcinogens in man or in at least several animal species. A carcinogenic weight of evidence rating is used to describe the strength of the experimental evidence for carcinogenicity. The U.S. EPA has developed SFs for most chemicals with weight of evidence ratings of "A" (known human carcinogen) or "B" (probable human carcinogen).

RfDs and SFs are derived by the U.S. EPA for the most toxic chemicals generally associated with chemical releases to the environment for which adequate toxicological data are available. If both the carcinogenic and non-carcinogenic effects of a particular compound are significant, both values may be established. However, in most cases only one value is available.

### 4.1 Inhalation and oral RfDs and SFs -

SFs pertinent to the oral and inhalation exposure pathways will be obtained from U.S. EPA's IRIS database. The IRIS (Integrated Risk Information System) on-line database

was established by the U.S. EPA to provide risk assessors with peer reviewed toxicological data on chemicals commonly encountered at environmental sites of contamination. If data is not available from IRIS, it will be obtained from the Health Effects Assessment Summary Tables (HEAST), a compilation of toxicity values produced by the USEPA on a quarterly basis. The hierarchy presented in Appendix III of Virginia Risk guidance will be followed for using these sources.

### 4.2 Dermal RfDs and SFs -

Chemical specific oral-route absorption values ($ABS_{oral}$) are used to adjust the oral RfD or SF, which is computed from an administered dose, for use in the dermal exposure pathway. This correction is necessary due to the differences in absorption between the skin and the gastrointestinal tract. By correcting the administered-dose oral RfD or SF for the fraction expected to be absorbed in the gut, a dermal absorption factor can be used to estimate the correct dose received through the skin.

## 5. Evaluation of Risks

Using the toxicity criteria and identified exposure pathways discussed above, and the procedures described in the VDEQ guidance document (REAMS, November 1994), the risks presented by the COC will be estimated. The estimated risks will consider the effects from multiple constituents and all routes of exposure. The risk goals will be a total cumulative hazard index of 1.0 for multiple noncarcinogens and a total cumulative carcinogenic risk of 1E-04 for multiple carcinogens. However, the risk from each individual carcinogen shall not exceed 1E-06 (i.e., one case of cancer per 1,000,000 population).

### 5.1 Estimation of exposure concentration

For the contaminants detected at the site, an exposure point concentration (EPC) for each exposure pathway will be calculated for each contaminant by estimating the 95th upper confidence limit (UCL) on the arithmetic mean of the concentrations. If the calculated 95th UCL is greater than the maximum detected concentration, then the maximum detected concentration will be used as the EPC. The risks for contaminants will be calculated as per the equations and assumptions described in Table 1 through Table 4. If for a contaminant both carcinogenic and noncarcinogenic risk-based cleanup goal exists, the lower of the two will be used as a pathway specific to estimate the risk.

## 5.2. Risk Estimation

Health risk assessments are based on the relationship between risk, dose and toxicity:

$$Risk = Dose * Toxicity$$

Since dose is the product of the contaminant concentration multiplied by exposure (the intake), equation (1) becomes:

$$Risk = Intake\ rate * Contaminant\ conc. * Toxicity$$

(Please note that the term CDI in attached tables 1-4, includes intake rate and contaminant conc)

To estimate the intake, the exposure equations and assumptions discussed in Section 1, are used. The intake estimates for each route of exposure are then combined with the RfDs or SFs to determine the resulting risk.

**For Carcinogens Risk:**

$$Cancer\ Risk = (Intake_{oral} * Cont.conc. * SF_{oral})$$

$$+ (Intake_{inhal} * Cont.conc. * SF_{inhal}) + (Intake_{derm} * Cont.conc. * SF_{derm})$$

**For Noncarcinogens:**

$$Hazard\ Index = (Intake_{oral} * Cont.conc. * \frac{1}{RfD_{oral}}) + (Intake_{inhal} * Cont.conc. * \frac{1}{RfD_{inhal}})$$

$$+ (Intake_{derm} * Cont.conc. * \frac{1}{RfD_{derm}})$$

where, taking into account all COCs and relevant exposure pathways, the excess cancer risk is $10^{-6}$ or the hazard index is 1.0.

Using REAMS software a maximum acceptable contaminant concentrations will be calculated which meets the cumulative risk criteria. This process will be used in this risk assessment to derive the health-based cleanup criteria for the site. If the estimated risks satisfy the risk based performance standards, the soils/groundwater will be considered clean closed.

# Table 1
## Risk Assessment Algorithm for Carcinogenic Exposure

| Exposure Route | Chronic Daily Intake (CDI), mg/L-day | |
|---|---|---|
| | Residential Exposure | Occupational/Industrial Exposure |
| **Ground Water** | | |
| Ingestion | $\frac{CW \times IRW_{adj} \times EF}{AT_c}$ | $\frac{CW \times IRW_a \times EF_o \times ED_o}{BW_a \times AT_c}$ |

| Inhalation of emitting particles from soil | $\frac{CS \times 1/PEF \times IRA_c \times ET \times EF \times ED_c}{BW_c \times AT_n}$ | $\frac{CS \times 1/PEF \times IRA_a \times ET \times EF_o \times ED_o}{BW_a \times AT_n}$ |

**Note:** Occupational noncarcinogenic risk assessment is based on adult exposure

Table 3
Age Adjusted Factors

$$IRA_{adj} = \frac{ED_c \times IRA_c}{Bw_c} + \frac{(ED_{tot} - ED_c) \times IRA_a}{BW_a}$$

$$IRW_{adj} = \frac{ED_c \times IRW_c}{Bw_c} + \frac{(ED_{tot} - ED_c) \times IRW_a}{BW_a}$$

$$SAW_{adj} = \frac{ED_c \times SAW_c}{Bw_c} + \frac{(ED_{tot} - ED_c) \times SAW_a}{BW_a}$$

$$IRS_{adj} = \frac{ED_c \times IRS_c}{Bw_c} + \frac{(ED_{tot} - ED_c) \times IRS_a}{BW_a}$$

$$SAS_{adj} = \frac{ED_c \times Sa_c}{Bw_c} + \frac{(ED_{tot} - ED_c) \times SA_a}{BW_a}$$

---

Note regarding age adjusted factor:

Because contact rate with tap water, ambient air, and residential soil are different for children and adults, carcinogenic risks during the first 30 years of life were calculated using age adjusted factor. These factors approximate the integrated exposure from birth until age 30 by combining contact rates, body weights, and exposure durations for two age groups - small children and adults.

# Table 4
## Exposure Variables Included in Tables 1, 2, and 3

# GUIDELINES FOR DEVELOPING HEALTH-BASED CLEANUP GOALS USING RISK ASSESSMENT AT A HAZARDOUS WASTE SITE FACILITY FOR RESTRICTED INDUSTRIAL USE

THE DEPARTMENT OF ENVIRONMENTAL QUALITY
OFFICE OF WASTE RESOURCE MANAGEMENT

June 1, 1995

INTRODUCTION

This guidance document is intended for use by any facility conducting risk assessment pursuant to the risk based performance standards/closure requirements of ' 9.6 and '10.6.B., of VHWMR and evaluating the site for current and foreseeable industrial use. The information is intended solely for guidance. The document provides guidance on a) what approaches the Department considers acceptable for meeting the general requirements set forth in the closure performance section, b) situations where the industrial use may not apply and c) situations for which the Department will not accept the industrial use scenario.

The facilities using the guidance should be aware that there may be other alternatives such as evaluation for residential use (unrestricted use) for demonstrating the clean closure of the site. It is important that this material is used in conjunction with the Department risk assessment guidance titled "Guidance for Development of Health Based Cleanup Goals using Decision Tree/REAMS" November 1, 1994 developed by Old Dominion University, Norfolk, Virginia.

For the purpose of risk characterization it is necessary to determine the current and foreseeable uses of the site, and establish the acceptable cleanup levels. The Department prefers to clean close the site for residential use or unrestricted use. This applies both for the groundwater and soils. However, in the event the facility wishes to use the land (soils) for a restricted industrial use, the facility shall demonstrate so by provide the following additional information along with a residential risk assessment. The Department will use the residential risk assessment as a baseline to evaluate the proposed restricted site use.

A. Industrial Use

1. The Department recognizes a distinction between the current use of the site and foreseeable (hypothetical) which has not yet occurred and requires the facility to conduct the risk assessment for both the scenarios. For the purpose of risk characterization, the facility must identify current uses of the site and evaluate the activities to protect the present receptors. The facility shall also identify the future use of the site and evaluate the activities to protect future exposures for the designated future use. For the purpose of foreseeable industrial use of the site, the Department requires the facility to evaluate the impact to the groundwater (consistency with the current closure

performance standards '9.6.B and 10.6.B. of VHWMR). The residual contamination in-place shall not become a source of contamination to other media, such as leaching of wastes into the groundwater or surface water. For the purpose of risk assessment the facility must consider the groundwater as a potential drinking water source. However, on a site-specific basis the Department may allow use of institutional controls to minimize the leaching of wastes (residual contamination) to the groundwater.

2. In order for the Department to accept the current and foreseeable use of the site for industrial activity, the owner of the facility must present the signed acceptance letter provided in Appendix A which restricts land use for industrial only. The letter becomes part of the approved closure plan. The purpose of signing the letter is to notify the future owners of a property and local officials and the Department as to what uses and activities are consistent with a level of no significant risk at the site. This describes conditions under which site may pose a significant risk and establishes the necessity to evaluate the site conditions for future changes in site usage. The purpose of signing this letter does not permanently restrict changes in site use, however it insures that any proposed changes would require an evaluation of the residual contamination and the possible increase in exposure.

3. General Considerations

The facility must provide the following information which the Department will evaluate in making a determination to allow industrial site use:

a. A description of need and justification for the proposed use of the site. An explaination of the situation which prevents the facility from achieving clean closure for unrestricted use.

b. Duration of the proposed use of the site.

c. Cost and beneficial use of the proposed action in lieu of demonstration of a clean closure for

unrestricted use of the site.

d. Whether or not the site is zoned or has been otherwise officially designated for industrial use;

f. Whether or not the site is currently used for industrial purpose or has a history of use for industrial purposes;

g. Whether or not adjacent properties are currently used or designated for industrial use;

h. Whether or not the site is expected to be used for industrial purposes for the foreseeable future due to a) zoning, b) statutory or regulatory restrictions, c) adjacent land use, and/or d) other factors;

i. Other information beleived by the facility to pertinent;

j. Signed letter provided in the Appendix A.

k. Practical capability of the owner. The information shall include an indication of financial capability of the owner or operator to achieve a clean closure for unrestricted use of the site.

B. Based on the information received, the Director will consider the following factors:

1. Potential overall effect on public health, welfare, and safety of the proposed use of the site. Considerations will be given to the cost benefit analysis, distance to the existing nearest exposure point, potential adverse effects on groundwater quality, the current and future uses of the groundwater, and the potentical adverse effects on hydraulically connected surface water quality.

C. The following are some of the situations where the facility is not required to evaluate the industrial use scenario.

1. The on-site concentrations are below the background

concentrations.

2. The site is evaluated for residential and the concentrations are below the acceptable cleanup level for unrestricted use.

D. Following are some of the situation where the Department will not allow the evaluation of the site for Industrial use.

1. If the current use of site is not industrial and the facility assumes that the future use will be industrial. In such situations, prior to any approval of industrial use scenario, and location of the site with respect to the surrounding land use shall be evaluated.

2. For situation where the Department during an enforcement action has made a determination that the future use of site will not be industrial.

E. Risk Assessment

The facility shall consider the industrial use algorithm provided in the REAMS model. For more details refer to the Department document titled "Guidance for Development of Health Based Cleanup Goals using the Decision Tree/REAMS Program" dated November 1, 1994 by Old Dominion University, Norfolk, Virginia.

If you need any further information, please call Leslie Romanchik at (804) 698-4129 or Sanjay V. Thirunagari at (804) 698-4193.

Guidelines for conducting risk assessment/closure for industrial use

Attachment A

Guidelines for conducting risk assessment/closure for industrial use

NOTICE OF USE LIMITATION
' 9.6.B. & 10.6.B., VHWMR

Hazardous Waste Site Name:

I.D. No:

This Notice of Use Limitation ("Notice") is made as of the __ day of _____, 19__, by [Name and address of current property owner or owners], together with his/her/its/their successors and assigns, (collectively "Owner").

W I T N E S S E T H:

WHEREAS, _____ (name of Owner), of _____ County, Virginia, [is] [are] the owner(s) in fee simple of [that] [those] certain parcel(s) of [vacant] land located in _____ (Town/City), _____County, Virginia, with the buildings and improvements thereon, ("Property");

WHEREAS, said parcel(s) of land, which is more particularly bounded and described in Exhibit A, attached hereto and made a part hereof (" the Property") is subject to this Notice of Use Limitation. The Property is shown on a plan [recorded and/or registered herewith] [recorded and/or registered in _____ County Registry of Deeds/Land Registration Office in Plan Book _____, Plan _____, or as Land Court Plan No. _____.];

[WHEREAS, a portion of the Property is more specifically subject to this Notice of Use Limitation. This portion of the Property is more particularly bounded and described in Exhibit A-1, attached hereto and made a part hereof. This portion is shown on a plan [to be recorded herewith] [recorded in _____ County Registry of Deeds in Plan Book _____, Plan _____.];

WHEREAS, the Property [portion of the Property] comprises [all] [part of] a disposal site as the result of a release of hazardous waste. Exhibit A-1 is a sketch plan showing the relationship of the [Property] [portion of the Property] subject to this Notice of Use Limitation to the boundaries of said disposal site (to the extent such boundaries have been established). Exhibit A-1 is attached hereto and made a part hereof.]

Guidelines for conducting risk assessment/closure for industrial use

WHEREAS, one or more response actions have been selected for [the Disposal Site] [portion of the Disposal Site] in accordance with closure performance standards of '9.6.B., or 10.6.B., of Virginia Hazardous Waste Management Regulations. Said response actions are based upon (a) the restriction of human access to and contact with hazardous material in soil [and/or groundwater] and/or (b) the restriction of certain activities occurring in, on, through, over or under the [Property] [Portion of the Property].

NOW, THEREFORE, notice is hereby given that the use limitations set forth are as follows:

1. Permitted Activities and Uses Set Forth in the UL The use limitation provides that a condition of No Significant Risk to health, safety, public welfare or the environment (such condition being defined in the Closure Plan) exists for any foreseeable period of time so long as any of the following activities and uses occur on the [Property] [portion of the Property]:

1. ;
2. ; and
3. Such other uses which, in the Opinion of an owner or Registered Professional Engineer, shall present no greater risk of harm to health, safety, public welfare or the environment than the activities and uses set forth in this paragraph.

continued

2. Uses Inconsistent with the notification. Uses which are inconsistent with the notification, and which, if implemented at the [Property] [portion of the Property], may result in a significant risk of harm to health, safety, public welfare or the environment, are as follows:

1. ;
2. ; and
3. .

3. Obligations and Conditions Set Forth in the notification. If applicable, obligations and/or conditions to be undertaken and/or maintained at the [Property] [portion of the Property] to maintain a condition of No Significant Risk as set forth in the notification shall include the following:

1. ;
2. ; and
3. .

4. Proposed Changes in Uses. Any proposed changes in activities and uses at the [Property] [portion of the Property] which may result in higher levels of exposure to hazardous material than currently exist shall be evaluated by a Registered Professional Engineer or Department of Environmental Quality representative who shall render an opinion, in accordance with '9.6 and 10.6., of VHWMR, as to whether the proposed changes will present a significant risk of harm to health, safety, public welfare or the environment. Any and all requirements set forth in the notice to ensure a condition of No Significant Risk in the implementation of the proposed activity or use shall be satisfied before any such activity or use is commenced.

5. Violation of a Response Action Outcome. The activities, uses and/or exposures upon which this Notice is based shall not change at any time to cause a significant risk of harm to health, safety, public welfare, or the environment due to exposure to hazardous material without the prior evaluation of DEQ, and without additional response actions, if necessary, to achieve or maintain a condition of No Significant Risk.

If the activities, uses, and/or exposures upon which this Notice is based change without the prior evaluation and additional response actions determined to be necessary by DEQ in accordance with ''9.6 and 10.6., of the VHWMR the owner or operator of the [Property] [portion of the Property] subject to this Notice at the time that the activities, uses and/or exposures change, shall comply with the requirements set forth in ''9.6. and 10.6., of VHWMR.

6. Incorporation Into Deeds, Mortgages, Leases, and Instruments of Transfer. This Notice shall be incorporated either in full or by reference into all deeds, easements, mortgages, leases, licenses, occupancy agreements or any other instrument of transfer, whereby an interest in and/or a right to use the Property or a portion thereof is conveyed.

Owner hereby authorizes and consents to the filing and recordation and/or registration of this Notice to become effective when executed and sealed by the undersigned P.E, and recorded and/or registered with the appropriate Registry(ies) of Deeds and/or Land Registration Office(s).

WITNESS the execution hereof under seal this _____ day of _____, 19__.

**Re: Radford Army Ammunition Plant (RFAAP), Radford, VA**
**EPA ID No. VA1210020730**
**Field Investigation Report and Risk Assessment for Units 5 and 7[1]**
(Unit 5/S04; Unit 7/S04)

Dear Ms. Jake:

The Department of Environmental Quality, Office of Waste Permitting (the Department) has reviewed the *Field Investigation Report and Risk Assessment for Units 5 and 7* (*Report*) submitted with your correspondence of March 5, 2003. According to previous discussions and correspondence, RFAAP will attempt to remove the sources of contamination by achieving clean closure at the units. RFAAP had originally planned to revise the closure plans for HWMUs 5 and 7 based upon the results of the initial investigative sampling. Since, RFAAP believes the sampling results may already show that concentrations of contaminants are not a risk to human health or the environment, the *Report* provides a risk assessment instead of revised closure plans.

The May 27, 1988 approved closure plans for HWMUs 5 and 7 provided for closure only by landfilling (i.e., wastes in-place and capping). Therefore, if RFAAP wishes to continue pursuing clean closure of the capped units, revised closure plans that include procedures and standards for clean closure must be submitted. To assist with the revising the closure plans, an electronic copy of

[1] PCCP
Permit Event Code/NA

the Department's *Draft Guidance Manual for Closure Plans and Post-Closure Plans* (*Draft Guidance*), September 28, 2001 has been provided to Mr. J. Redder of your staff.

Concerning the *Field Investigation Report and Risk Assessment for Units 5 and 7*, the Department is providing the following comments:

1) The closure requirements for hazardous waste surface impoundments of 40 CFR 264.228(a)(1) requires the removal or decontamination of "contaminated containment system components (liners, etc.), contaminated subsoils, and structures and equipment contaminated with waste and leachate." Therefore, in order to demonstrate clean closure of these units, the soil and liner material immediately beneath the wastes must be sampled as well to determine if they meet clean closure standards.
2) EPA Region III Risk-Based Concentration (RBC) and Soil Screening Levels (SSLs) are not appropriate clean closure standards. Refer to Section 3.13 of the *Draft Guidance* for the requirements of all acceptable clean closure standards (i.e., analytical non-detection, background, and risk-based).
3) If RFAAP intends to demonstrate that clean closure may be achieved with wastes in-place, every sample of waste must not exceed the land disposal restrictions (LDRs) treatment standards specified in 40 CFR 286, Subpart D.

In addition to the above comments, the Department recommends that the revised closure plans include more than one option for meeting clean closure standards (e.g., no removal of wastes or soils, excavation and removal of contaminated materials, etc.) in order to minimize the need for future revisions. Please submit the revised closure plans within ninety (90) calendar days calendar of receipt of this letter.

The Department has also received the Professional Geologist's certification submitted with your correspondence of April 30, 2003. However, as indicated in comment 5 of the Department's October 18, 2002 letter, 40 CFR 264.115 requires that the certification be signed by an independent Professional Engineer registered in the Commonwealth of Virginia. Please provide the P.E. certification within thirty (30) calendar days of receipt of this letter.

If you have questions, please contact me at (804) 698-4131 or by e-mail at gweng@deq.state.va.us.

Sincerely,

Garwin W. Eng

**Closure Plan Amendments for Units 5 and 7 – Notice of Deficiencies**[1]
(Unit 5/S04; Unit 7/S04)

Dear Ms. Jake:

The Department of Environmental Quality, Office of Waste Permitting (the Department) has reviewed your February 20, 2004 request to amend the closure plan for Units 5 and 7. The Groundwater Monitoring portions of the proposed amendments is being reviewed by the Department's hydrogeology staff, and comments will be provided under separate cover.

Please provide responses to the enclosed comments within ninety (90) days of receipt of this letter. If you have questions, please contact me at (804) 698-4131 or by e-mail at gweng@deq.virginia.gov.

Sincerely,

[1] PCCP
Notice of Deficiency – Closure Plan/CL320

# NOTICE OF DEFICIENCIES
## Closure Plan Amendment, Hazardous Waste Management Unit 5
## Radford Army Ammunition Plant (RFAAP)

Comments are referenced by section, paragraph (counting from the beginning of the section), and sentence (counting from the beginning of the paragraph).

1. Although most of the comments below refer to a particular section, paragraph, or sentence, similar or related concepts are often repeated throughout the *Closure Plan Amendment, HWMU 5* (*Plan-HWMU 5*). Therefore, when making revisions as a result of a particular comment, please ensure that corresponding revisions are made in all applicable sections of the *Plan-HWMU 5*.

2. The *Plan-HWMU 5* indicates that RFAAP will attempt to achieve clean closure without removing any wastes or potentially contaminated equipment and subsoils. Several sections of the *Plan-HWMU 5* state that in order to leave the residual material in-place (i.e., meet clean closure standards), the residual material will need to meet only the land disposal restrictions (LDRs) treatment standards specified in 40 CFR 268. Please be advised that this is incorrect, and the Department apologizes for any confusion that the wording in its June 25, 2003 letter may have caused.

   In order to prevent any further confusion, the following clarification is provided. At closure, all contamination, i.e., wastes, equipment, structures, soils, and groundwater (for certain types of units), must be removed or decontaminated to clean closure standards (see Section 3.13 of the Department's *Draft Guidance Manual for Closure Plans and Post-Closure Plans*; September 28, 2001). In addition, all hazardous wastes must meet the 40 CFR 268 LDRs treatment standards prior to land disposal. Since the residual material is actually the hazardous waste from the surface impoundment, it must meet both the clean closure standards as well as the LDRs treatment standards in order to remain in-place.

3. 1.1, paragraph 3, 1st sentence – Pursuant to the March 12, 2004 telephone conference with Mr. J. J. Redder of your staff, no amendments to the Post-closure Care *Plan-HWMU 5* are being made at this time. Please delete all references to the Post-closure Care Plan throughout this document.

4. 3.1, paragraph 4 – This paragraph should refer to HWMU-5.

5. 4.2.1, paragraph 1, 6th sentence – The previous use of and the process code currently listed in EPA's RCRAInfo database for HWMU-5 is Surface Impoundment Storage (S04). If RFAAP wishes to modify the process code for this unit, a revised Part A Permit Application may be submitted.

6. 4.2.1, paragraph 2, 2nd sentence – This sentence should be revised to read "... similar waste streams were tested..."

7. 4.2.4, paragraph 2, 1st sentence – This sentence should refer to HWMU-5.

8. 4.2.4, paragraph 2, 6th sentence – This states that the residual material does not pose a threat to human health or the environment. Please remove this sentence as this conclusion has not been reviewed and approved by the Department.

9. 5.0 – This section provides procedures for collecting samples and evaluating the results to confirm clean closure. However, no procedures are provided in the event that wastes or potentially contaminated equipment, structures, and soils must be removed in order to achieve clean closure. As such, this *Plan-HWMU 5* appears to indicate that under no circumstances will any materials be removed. If this is the case, please clearly state this in the *Plan-HWMU 5*. If this is not the case, procedures for decontamination by removal should be provided.

10. 5.3.1 – The residual material shall include everything above the bottom liner (including any sand and rip-rap) and below any clean material placed on top of the residual material. The bottom six (6) inches of the clean material contacting the residual material shall be included with the residual material because of possible mixing with the residual material during its placement. Therefore, closure procedures addressing the residual material must include all materials above the bottom liner up to the first six inches of clean material placed above the residual material.

11. 5.3.1 – This section indicates that the samples taken during the 2002 Field Investigation results will be used to demonstrate that clean closure can be achieved with the residual materials remaining in-place. As such, please note that the 2002 Field Investigation must meet all of the requirements (e.g., constituent list, number of samples, sample locations, field and laboratory methodologies, QA/QC, etc.) specified in the final approved closure plan amendment. Therefore, the *Field Investigation Report and Risk Assessment for Units 5 and 7* submitted March 5, 2003 has not been reviewed as to its adequacy for the closure of HWMU-5.

12. 5.3.2, paragraph 1 – As stated Section 3.7.1 of the *Closure Guidance*, the list of hazardous constituents of concern (HCOCs) is developed as part of the closure plan, that is, prior to beginning closure procedures. For the purposes of closure under RCRA, the HCOC list must include the following:
    a. all hazardous waste constituents that were handled at the unit (this list may be found in the approved closure plan);
    b. all groundwater monitoring constituents that have been detected above background levels; and
    c. any other hazardous constituents detected in the course of other investigations at the unit.

    Please provide the HCOC list and an explanation as to why each constituent was included. Also, any other hazardous constituents (in addition to those constituents included above) detected during the course of closure activities shall be included in the list of HCOCs for the unit.

13. 8.2.3 – This section states that the levels of inorganics found during the development of the *Radford Army Ammunition Plant Facility-Wide Background Report* (December 2001) will be used as background. Section 3.11.3 of the *Closure Guidance* indicates that background soil and subsoil samples should be of the same geologic properties, type and texture and be from the same soil horizons, if possible, as the corresponding soil or subsoil samples from the unit. In addition, background samples must be collected in a manner identical to that of the closure samples and must comply with all Quality Assurance/Quality Control (QA/QC) procedures of the final approved closure plan. Not all of the *Facility-Wide Background* samples appear to meet these requirements. Please provide additional information concerning the *Facility-Wide Background* samples to determine which samples may meet the *Closure Guidance* requirements for background samples. Please note that if a large enough (minimum of eight) subset of the *Facility-Wide Background* samples does not meet the *Closure Guidance* requirements, additional background samples will need to be collected.

14. 6.1, paragraph 1 – Per Section 3.11.1 of the *Closure Guidance*, different sampling approaches are used to address differences in unit types, distributions of contamination, and assumptions concerning the unit. It appears that eight (8) sample locations shall be evenly spaced across the unit. Provide the rationale for this sampling approach. In addition, describe how decontamination by removal (if needed) will be conducted in light of this sampling approach (see Comment 9 above).

15. 6.1, paragraph 2 – Because the sample collection device will pass through the residual material then the bottom liner and subsoils, there is a potential for cross-contamination from the residual material to the subsoils. Therefore, the Department recommends collecting subsoil samples from the undisturbed center of the cores to minimize possible cross-contamination.

16. 6.1, paragraph 2, 2nd sentence – Section 4.2.1 states that the unit is lined with a 60-mil Hypalon liner. This liner must meets clean closure standards if RFAAP is to achieve clean closure without removal of wastes and potentially contaminated equipment, structures, and soils. However, the proposed sample collection method may not collect a sufficient amount of the liner material for analyses (i.e., at most, a 1.5 inch diameter circle if the sampler is able to collect any at all). Please describe how sufficient samples of the liner will be collected.

17. 6.4 – Section 3.11.5 of the *Closure Guidance* recommends additional rinses after sampling for metals and organic constituents. Please revise this section accordingly.

18. 6.7 – This section states that samples will be analyzed for Target Analyte List (TAL) and Target Compound List (TCL) constituents. However, the list of constituents provided in Table 2 does not include all TCL constituents. Please explain why certain TCL constituents were excluded.

19. 6.7, paragraph 2, last sentence – Specify what criteria against which the data will be validated (e.g., CLP Functional Guidelines, SW-846 QA/QC criteria, etc.).

20. 6.8.1 – In addition to indicating the total expected quantity of each type of QA/QC sample that will be collected, state the minimum collection frequency of each type of QA/QC sample (e.g., one trip blank/cooler/day of sampling).

21. 6.8.1, paragraph 3, 3rd and 5th sentences – Both of these appear to refer to constituents for which the equipment blank(s) will be analyzed. Please clarify these confusing sentences.

22. 6.8.1, paragraph 5, 1st sentence – Data shall be qualified appropriately if contamination is found in QA/QC blanks, however, such blank contamination may not be used to "invalidate" data.

23. 6.8.2, paragraph 4 – Matrix spike/matrix spike duplicates (MS/MSD) shall be prepared and analyzed at a frequency of one MS/MSD per sampling batch or 20 samples (whichever is more frequent) per matrix type.

24. 8.1, paragraph 4, 2nd sentence – Per Section 3.11.1 of the *Closure Guidance*, composite samples are not acceptable for demonstrating achievement of clean closure standards.

25. 8.2.1, last sentence – This appears to refer to HWMU 7 by mistake. Please clarify or correct.

26. 8.2.3.2 – This section states that if all inorganic results do not exceed the background concentrations, then "that sampling location will be deemed to be uncontaminated." It further states that if all sampling locations are uncontaminated, then "the soil will have met the clean closure decontamination standard." Please be advised that these statements are not correct. In order to meet the background clean closure standard, sampling results for **all** HCOCs (not just inorganics) must not exceed detection limits or background. Please revise accordingly.

27. 8.2.4 – Only those constituents that did not pass the non-detection and background clean closure standards (i.e., detects above background levels) need to be included in the risk-based evaluation.

28. 10.0, 2nd sentence – This states that the residual material left in-place is not a hazardous waste. Please remove this sentence as this conclusion has not been reviewed and approved by the Department.

29. 10.0 – Please revise the schedule pursuant to Comment 3 above.

30. 10.0 – Please provide additional details concerning closure activities. Enough detail should be provided to allow tracking of the progress of closure. In addition, contingent closure activities (such as those described in paragraph 4 of Section 13.0) must be included in the closure schedule.

31. 13.0, paragraph 3, 2nd and 3rd sentences – These are not correct. Please remove these sentences.

32. 13.0, paragraph 4 – Pursuant to 40 CFR 264.228(c)(1), a Contingent Closure Plan for closure with wastes/waste constituents in-place must be provided in the event that clean closure cannot be achieved.

33. Table 2 – This list does not contain a complete list of HCOCs (see Comment 12 above) for HWMU 5.

34. Table 2 – Section 8.2.2 of the *Plan-HWMU 5* states that, initially, RFAAP will attempt to demonstrate clean closure by analytical non-detection and comparison to background (for detected HCOCs). Section 3.9 of *Closure Guidance* recommends using the analytical methods with the lowest quantitation limits for each HCOC when demonstrating clean closure to these standards. Specifically:
    - SW-846 Methods 7000 Series typically achieve lower detection and quantitation limits than Method 6010 for inorganics;
    - SW-846 Method 8021B typically achieves lower detection and quantitation limits than Method 8260 for many chlorinated and aromatic volatiles; and
    - SW-846 Method 8330 typically achieves lower detection and quantitation limits than Method 8270 for 2,4- and 2,6-dinitrotoluene.

    Please review achievable detection and quantitation limits with your laboratory and revise Table 2 accordingly.

**NOTICE OF DEFICIENCIES**
**Closure Plan Amendment, Hazardous Waste Management Unit 7**
**Radford Army Ammunition Plant (RFAAP)**

Comments are referenced by section, paragraph (counting from the beginning of the section), and sentence (counting from the beginning of the paragraph).

1. Although most of the comments below refer to a particular section, paragraph, or sentence, similar or related concepts are often repeated throughout the Amended Closure Plan (Plan). Therefore, when making revisions as a result of a particular comment, please ensure that corresponding revisions are made in all applicable sections of the Plan.

2. Because of the similarity between the *Closure Plan Amendments* for HWMUs 5 and 7, the comments provided for the *Plan-HWMU 5* also apply to the *Plan-HWMU 7* with the exception of Comments 4, 6, 7, 10, 16, 25, 32, and 33. Although some of the paragraph and sentence numbers referenced for *Plan-HWMU 5* do not exactly match those for *Plan-HWMU 7*, the wording is close enough such that referring back to the text of *Plan-HWMU 5* should resolve any discrepancies. Additional comments specific to the *Plan-HWMU 7* are provided below.

3. 5.3.1 – Section 6.0 indicates that the unit is underlain by a clay liner and native soils. Because of possible mixing, the top six inches of clay or native soils directly beneath the residual material shall be included with the residual material. Similarly, the bottom six inches of clean material placed above the residual material shall be included with the residual material. Therefore, closure procedures addressing the residual material must include all materials from six inches beneath to six inches above the residual material.

4. 13.0, paragraph 4 – Since this unit does not meet the 40 CFR 264.221(a) liner requirements, a Contingent Closure Plan for closure with wastes/waste constituents in-place must be provided.

5. Table 2 – Please verify that all applicable HCOCs for HWMU 7 (see Comment 12 for the *Plan-HWMU 5*, above) are included in this list.

**RESPONSE TO COMMENTS**
**CLOSURE PLAN AMENDMENTS**
**HAZARDOUS WASTE MANAGEMENT UNITS 5 AND 7**
**RADFORD ARMY AMMUNITION PLANT**
**PERMIT NO. VA1210020730**

This document has been prepared to serve as a guide for the response to the Virginia Department of Environmental Quality (VDEQ) letter to the Radford Army Ammunition Plant (Radford AAP) dated June 7, 2004, regarding the Closure Plan Amendments for Units 5 and 7 – Notice of Deficiencies. In that letter (signed by Mr. Garwin Eng), 39 individual comments were presented; these comments are addressed in this Response to Comments. The comments have been reproduced in full within this guide to provide a convenient context for the responses. The following presents Radford AAP's response to each comment.

## Hazardous Waste Management Unit 5 (HWMU-5)

1. *Although most of the comments below refer to a particular section, paragraph, or sentence, similar or related concepts are often repeated throughout the Closure Plan Amendment, HWMU 5 (Plan-HWMU 5). Therefore, when making revisions as a result of a particular comment, please ensure that corresponding revisions are made in all applicable sections of the Plan-HWMU 5.*

**Response to Comment 1**

When a revision is made as the result of a particular comment, corresponding revisions will be made in all applicable sections of the Amended Closure Plan.

2. *The Plan-HWMU 5 indicates that the RFAAP will attempt to achieve clean closure without removing any wastes or potentially contaminated equipment and subsoils. Several sections of the Plan-HWMU 5 state that in order to leave the residual material in-place (i.e., meet clean closure standards), the residual material will need to meet only the land disposal restrictions (LDRs) treatment standards specified in 40 CFR 268. Please be advised that this is incorrect, and the Department apologizes for any confusion that the wording in its June 25, 2003 letter may have caused.*

*In order to prevent any further confusion, the following clarification is provided. At closure, all contamination, i.e., wastes, equipment, structures, soils, and groundwater (for certain types of units), must be removed or decontaminated to clean closure standards (see Section 3.13 of the Department's Draft Guidance Manual for Closure Plans and Post-Closure Plans; September 28, 2001). In addition, all hazardous wastes must meet the 40 CFR 268 LDRs treatment standards prior to land disposal. Since the residual material is actually hazardous waste from the surface impoundment, it must meet both the clean closure standards as well as the LDRs treatment standards in order to remain in-place.*

**Response to Comment 2**

Based on the June 22, 2004 teleconference between Radford AAP and the VDEQ, it is Radford AAP's understanding that the residual material remaining in-place in HWMU-5 must meet the clean closure standards as well as the 40 CFR 268.48 land disposal restrictions (LDRs) universal treatment standards for the Hazardous Constituents of Concern (HCOCs) specified in the Amended Closure Plan. In order to comply with the clean closure standards, individual samples of the residual material will be analyzed for the HCOCs. In order to comply with the LDRs universal treatment standards, a composite sample of the residual material will be analyzed for the HCOCs (please note: the LDRs universal treatment standards for inorganic constituents are based on TCLP results; therefore the inorganic HCOC analyses for the residual material composite sample will be conducted using TCLP). Based on the June 22, 2004 teleconference, it is Radford AAP's understanding that analysis of a composite sample of the residual material for the LDRs universal treatment standards is sufficient, as the LDRs are based on waste disposal criteria, and composite samples are acceptable for waste characterization purposes. In effect, if Radford AAP were to have placed the residual waste material that is present in HWMU-5 into HWMU-5 as a disposal action, they would have demonstrated compliance with the LDRs by conducting a composite sample on the containerized waste. Therefore Radford AAP feels that the composite sample of in-place residual material to demonstrate compliance with the LDRs is more representative and appropriate than discreet samples.

3. *1.1, paragraph 3, 1st sentence - Pursuant to the March 12, 2004 telephone conference with Mr. J. J. Redder of your staff, no amendments to the Post-Closure Care Plan-HWMU 5 are being made at this time. Please delete all references to the Post-Closure Care Plan throughout this document.*

**Response to Comment 3**

All references to amendment of the Post-Closure Care Plan will be removed from the Amended Closure Plan.

4. *3.1, paragraph 4 - This paragraph should refer to HWMU-5.*

**Response to Comment 4**

The reference will be changed to HWMU-5.

5. *4.2.1, paragraph 1, 6th sentence - The previous use of and the process code currently listed in EPA's RCRAInfo database for HWMU-5 is Surface Impoundment Storage (S04). If RFAAP wishes to modify the process code for this unit, a revised Part A Permit Application may be submitted.*

**Response to Comment 5**

In order to maintain consistency with the RCRAInfo database, the process code for HWMU-5 specified in Section 4.2.1, paragraph 1, 6th sentence will be changed to "S04."

6. *4.2.1, paragraph 2, 2nd sentence - This sentence should be revised to read "...similar streams were tested..."*

**Response to Comment 6**

The referenced sentence will be revised accordingly.

7. *4.2.4, paragraph 2, 1st sentence - This sentence should refer to HWMU-5.*

**Response to Comment 7**

The reference will be changed to HWMU-5.

8. *4.2.4, paragraph 2, 6th sentence - This states that the residual material does not pose a threat to human health or the environment. Please remove this sentence as this conclusion has not been reviewed and approved by the Department.*

**Response to Comment 8**

The referenced sentence will be removed.

9. *5.0 - This section provides procedures for collecting samples and evaluating the results to confirm clean closure. However, no procedures are provided in the event that wastes or potentially contaminated equipment, structures, and soils must be removed in order to achieve clean closure. As such, this Plan-HWMU 5 appears to indicate that under no circumstances will any materials be removed. If this is the case, please clearly state this in the Plan-HWMU 5. If this is not the case, procedures for decontamination by removal should be provided.*

**Response to Comment 9**

The Amended Closure Plan will be revised to include the following options for closure:

Option 1: Clean closure with the residual material remaining in-place can be successfully demonstrated, in accordance with the clean closure standards and the LDRs universal treatment standards.

Option 2: Clean closure cannot be achieved with the residual material remaining in-place. The Unit will remain closed with the residual material in-place in accordance with the VDEQ-approved May 1988 Closure Plan, and the Unit will remain in post-closure care in accordance with the Final Permit (October 4, 2002). Radford AAP will retain the option to attempt to demonstrate clean closure in the future by excavation and removal of the residual material.

Option 3: Clean closure cannot be achieved with the residual material remaining in-place. The residual material will be excavated and transported off-site for disposal.

Prior to excavation, soil samples will be collected to determine the volume of material to be excavated. Composite sample(s) of the excavated material will be submitted for waste characterization analyses to determine the proper disposal method (hazardous vs. non-hazardous). Following excavation, confirmation samples will be collected to ensure removal of all contaminated materials. The procedures and criteria that will be used to document clean closure by removal will be fully defined in Section 5.0 of the Amended Closure Plan.

The Amended Closure Plan also will include the statement that the closure plan may be amended in the future at the request of Radford AAP in accordance with 40 CFR 264.112.

**10.** *5.3.1 - The residual material shall include everything above the bottom liner (including any sand and rip-rap) and below any clean material placed on top of the residual material. The bottom six (6) inches of clean material contacting the residual material shall be included with the residual material because of possible mixing with the residual material during its placement. Therefore, closure procedures addressing the residual material must include all materials above the bottom liner up to the first six inches of clean material placed above the residual material.*

**Response to Comment 10**

Radford AAP concurs with this definition of the residual material. This definition of the residual material will be included in Section 5.3.1 of the Amended Closure Plan.

**11.** *5.3.1 - This section indicates that the samples taken during the 2002 Field Investigation results will be used to demonstrate that clean closure can be achieved with the residual materials remaining in-place. As such, please note that the 2002 Field Investigation must meet all of the requirements (e.g., constituent list, number of samples, sample locations, field and laboratory methodologies, QA/QC, etc.) specified in the final approved closure plan amendment. Therefore, the Field Investigation Report and Risk Assessment for Units 5 and 7 submitted March 5, 2003 has not been reviewed as to its adequacy for the closure of HWMU-5.*

**Response to Comment 11**

The 2002 Field Investigation serves as a previous study for the purpose of providing generator knowledge regarding the residual material contained in the Unit. The results of the 2002 Field Investigation will be used to assist with the development of the HCOC list for the Unit. Additionally, the samples collected in the 2002 Field Investigation may be used to support the Clean Closure Demonstration to the extent possible.

**12.** *5.3.2, paragraph 1 - As stated in Section 3.7.1 of the Closure Guidance, the list of hazardous constituents of concern (HCOCs) is developed as part of the closure plan, that is, prior to beginning closure procedures. For the purposes of closure under RCRA, the HCOC list must include the following:*

*a. all hazardous waste constituents that were handled at the unit (this list may be found in approved closure plan);*

*b. all groundwater monitoring constituents that have been detected above background levels; and*

*c. any other hazardous constituents detected in the course of other investigations at the unit.*

*Please provide the HCOC list and an explanation as to why each constituent was included. Also, any other hazardous constituents (in addition to those constituents included above) detected during the course of closure activities shall be included in the list of HCOCs for the unit.*

**Response to Comment 12**

The HCOC list for HWMU-5 will be developed based on the following:

a. The results of the analysis of influent water in 1981 (previously presented in the VDEQ-approved May 1988 Closure Plan);

b. The quarterly groundwater monitoring constituents for the Unit listed in Appendix E of Permit Attachment 2 of the Final Permit (October 4, 2002), as revised by subsequent detections of additional 40 CFR Part 264 Appendix IX constituents; and

c. Any hazardous constituents detected in soil samples collected from within and around the Unit during the 2002 Field Investigation.

In 1981, an analysis of influent water collected during low flow conditions indicated the presence of inorganic constituents at concentrations below levels defined as hazardous by the EP Toxicity test. Specifically, cadmium, chromium, and mercury were detected in the influent water sample at concentrations of 0.029 mg/l, 0.20 mg/l, and 0.020 mg/l, respectively. In addition, the influent water sample was analyzed for arsenic, barium, lead, selenium, and silver; concentrations of these constituents were not detected.

The quarterly groundwater monitoring list for HWMU-5, as presented in Appendix E of Permit Attachment 2 of the Final Permit (October 4, 2002), was developed in accordance with procedures specified by the VDEQ. As directed by the VDEQ during development of the January 2002 Permit Modification for the Draft Final Permit, Radford AAP carefully reviewed the groundwater monitoring data for HWMU-5 from First Quarter 1996 through Fourth Quarter 2001 in order to determine whether any constituents in the Unit's then-current groundwater monitoring list (as presented in the August 1999 GWQAR) were consistently <u>not</u> detected. Any constituents that had never been detected within the groundwater at the Unit were not included in the proposed Compliance Monitoring Constituent List presented in the January 2002 Permit Modification document. The VDEQ directed Radford AAP to follow this procedure in order to avoid the need to remove non-detected constituents later during the duration of the active permit. (Please note: in accordance with the May 19, 1999 agreement between the VDEQ and Radford AAP, pre-1996 groundwater analytical data were not to be used for regulatory decisions. Prior to 1996, the analytical data were generated from several different laboratories. In many cases, the analytical reports did not include detection limits. In several instances, different analytical methods were used during different quarters, resulting in noticeable variations in the reported

detection limits and practical quantitation limits. The analytical data collected during 1996 and subsequent sampling events proved to be more reliable. As a result, and as agreed with the VDEQ, any regulatory decisions with respect to historical analytical data would not be made using any data prior to 1996.) Based on this review, and as presented in Appendix E of Permit Attachment 2 of the Final Permit, the quarterly groundwater monitoring list for HWMU-5 consists of the following constituents:

| | | |
|---|---|---|
| Antimony, total | Nickel, total | 1,2-Dichloroethane |
| Arsenic, total | Selenium, total | Methylene chloride |
| Barium, total | Silver, total | Toluene |
| Beryllium, total | Thallium, total | Trichloroethene |
| Cadmium, total | Vanadium, total | Xylenes, total |
| Cobalt, total | Zinc, total | Bis (2-ethylhexyl) phthalate |
| Copper, total | Acetone | Diethyl phthalate |
| Lead, total | 2-Butanone | 2,4-Dinitrotoluene |
| Mercury, total | Chloroform | 2,6-Dinitrotoluene |

In addition, the following additional constituents have been detected in the groundwater at HWMU-5 during annual monitoring for the constituents listed in 40 CFR Part 264 Appendix IX: chromium, 2-nitroaniline, 4-nitroaniline, and nitrobenzene. As a result, these constituents have been added to the quarterly groundwater monitoring list for HWMU-5.

During the 2002 Field Investigation at HWMU-5, samples of the residual material and surrounding soils were analyzed for the USEPA Target Analyte List (TAL) inorganic compounds, and for the USEPA Target Compound List (TCL) organic compounds. The following hazardous constituents (as listed in 40 CFR Part 261 Appendix VIII) were detected in the samples:

| | | | |
|---|---|---|---|
| Arsenic | Beryllium | Lead | Nickel |
| Barium | Chromium | Mercury | 4,4-DDD |

The hazardous constituents detected in the samples of the residual material and surrounding soil, as well as the inorganic constituents detected in the 1981 influent water sample, are included in the quarterly groundwater monitoring list for HWMU-5 (with the exception of 4,4-DDD). Therefore, the HCOC list for HWMU-5 will be the same as the current quarterly groundwater monitoring list for the Unit, plus 4,4-DDD.

Interpretation of the closure guidance indicates that Radford AAP need only analyze for the HCOC list. In an effort to remain consistent with the detection requirements of the facility-wide federal RCRA Corrective Action Permit, Radford AAP proposes to sample for a list of constituents (the TAL/TCL list) that includes the HCOCs for this Unit. In doing so, Radford AAP is demonstrating their pro-active and conservative approach to environmental compliance. Radford AAP realizes that if any constituents detected using this expanded list of constituents are not represented on the proposed HCOC list (which contains all previously detected compounds), Radford AAP will be required to add those detected constituents to the HCOC list for the Unit. This "belt and suspenders" approach provides a level of protection that far exceeds the minimum requirements of the closure process.

**13.** *8.2.3 - This section states that the levels of inorganics found during the development of the Radford Army Ammunition Plant Facility-Wide Background Report (December 2001) will be used as background. Section 3.11.3 of the Closure Guidance indicates that background soils and subsoil samples should be of the same geologic properties, type and texture and be from the same soil horizons, if possible, as the corresponding soil or subsoil samples from the unit. In addition, background samples must be collected in a manner identical to that of the closure samples and must comply with all Quality Assurance/Quality Control (QA/QC) procedures of the final approved closure plan. Not all of the Facility-Wide Background samples appear to meet these requirements. Please provide additional information concerning the Facility-Wide Background samples to determine which samples may meet the Closure Guidance requirements for background samples. Please note that if a large enough (minimum of eight) subset of the Facility-Wide Background samples does not meet the Closure Guidance requirements, additional background samples will need to be collected.*

**Response to Comment 13**

Radford AAP has established the validity of the December 2001 Facility-Wide Background Report with the VDEQ and USEPA Region III, and has substantial documentation regarding VDEQ and USEPA Region III approval of the study and its use as a screening tool for soils at the facility. Specifically, Radford AAP has utilized the data from the Facility-Wide Background Report to the satisfaction of the VDEQ and USEPA Region III in the Site Screening Document for SWMU-6, in the Soil Screening Reports for SWMUs 8 and 36, and in the draft RCRA Facility Investigation Report for SWMU-58 (copies of the VDEQ and USEPA Region III approval letters for the above-referenced documents are included in Appendix A of this Response to Comments).

With respect to Section 3.11.3 of the Closure Guidance, which indicates that background soils and subsoil samples should be of the same geologic properties, type and texture and be from the same soil horizons, if possible, as the corresponding soil or subsoil samples from the unit, please note that the VDEQ provided the following comment regarding the background soil data presented in the draft Facility-Wide Background Report on September 10, 2001:

*"Given the conditions of mixed surface and subsurface soils at the potentially contaminated sites, it is recommended that the background data for both surface and subsurface soils be combined for each element to determine the 95% UTL to be used in conjunction with the USEPA Region III RBCs for human health risk screening, and with various ecological screening data for ecological screening purposes. This will not only simplify the screening process, but will add power to the statistical comparison and prevent the unnecessary, and costly, carrying forward of naturally occurring elements into the full-fledged risk assessment process."*

Therefore, it is Radford AAP's opinion that the soil samples analyzed in support of the Facility-Wide Background Study should be of sufficient quantity to meet the requirements of the Closure Guidance to provide background inorganic constituent concentrations for HWMU-5.

14. *6.1, paragraph 1 - Per Section 3.11.1 of the Closure Guidance, different sampling approaches are used to address differences in unit types, distributions or contamination, and assumptions concerning the unit. It appears that eight (8) samples locations shall be evenly spaced across the unit. Provide the rationale for this sampling approach. In addition, describe how decontamination by removal (if needed) will be conducted in light of this sampling approach (see Comment 8 above).*

**Response to Comment 14**

A stratified grid-based sampling approach is proposed to accurately characterize the horizontal and vertical extent of the residual material. Eight sample locations shall be evenly spaced across the Unit to provide a representative evaluation of the entire Unit.

15. *6.1, paragraph 2 - Because the sample collection device will pass through the residual material then the bottom liner and subsoils, there is a potential for cross-contamination from the residual material to the subsoils. Therefore, the Department recommends collecting subsoil samples from the undisturbed center of the cores to minimize possible cross-contamination.*

**Response to Comment 15**

This procedure will be specified in Section 6.1, paragraph 2.

16. *6.1, paragraph 2, 2nd sentence - Section 4.2.1 states that the unit is lined with a 60-mil Hypalon liner. This liner must meet clean closure standards if RFAAP is to achieve clean closure without removal of wastes and potentially contaminated equipment, structures, and soils. However, the proposed sample collection method may not collect a sufficient amount of the liner material for analyses (i.e., at most, a 1.5 inch diameter circle if the sample is able to collect any at all). Please describe how sufficient samples of the liner will be collected.*

**Response to Comment 16**

Recent investigations indicate that the 60-mil liner is not present beneath HWMU-5.

17. *6.4 - Section 3.11.5 of the Closure Guidance recommends additional rinses after sampling for metals and organic constituents. Please revise this section accordingly.*

**Response to Comment 17**

The Geoprobe sample collection system uses dedicated, disposable acetate liners for each sample collected. Therefore, decontamination using additional rinses between sample collection will not be required.

18. *6.7 - This section states that samples will be analyzed for Target Analyte List (TAL) and Target Compound List (TCL) constituents. However, the list of constituents provided in Table 2 does not include all TCL constituents. Please explain why certain TCL constituents were excluded.*

**Response to Comment 18**

The laboratory selected for the analyses (Lancaster Laboratories) uses statement of work OLM03.2 for the analysis of TCL organic constituents. This is the list that was presented in the Amended Closure Plan.

***19.*** *6.7, paragraph 2, last sentence - Specify what criteria against which the data will be validated (e.g., CLP Functional Guidelines, SW-846 QA-QC criteria, etc.).*

**Response to Comment 19**

Section 6.7, paragraph 2 will be revised to specify the following: "Data validation will be conducted using summary tables and raw data provided by the analyzing laboratory. Data validation will be conducted in general accordance with SW-846 Method requirements (Test Methods for Evaluating Solid Wastes - Physical and Chemical Methods, USEPA SW-846, 3rd edition - Final Update I, II/IIA and III) and CLP data validation guidelines (USEPA Contract Laboratory Program National Functional Guidelines for Organic Data Review, October 1999 and USEPA Contract Laboratory Program National Functional Guidelines for Inorganic Data Review, July 2002)."

***20.*** *6.8.1 - In addition to indicating the total expected quantity of each type of QA/QC sample that will be collected, state the minimum collection frequency of each type of QA/QC sample (e.g., one trip blank/cooler/day of sampling).*

**Response to Comment 20**

The following minimum collection frequency of each type of QA/QC sample will be specified in Section 6.8.1:

"A minimum of one trip blank per cooler per day of sampling will accompany the samples collected for TCL organic compounds analyses."

"A minimum of one equipment blank per day of sampling will be collected in the event that non-dedicated equipment is used during the sampling process."

"A minimum of one field duplicate sample per day of sampling will be collected at the Unit."

***21.*** *6.8.1, paragraph 3, 3rd and 5th sentences - Both of these appear to refer to constituents for which the equipment blank(s) will be analyzed. Please clarify these confusing sentences.*

**Response to Comment 21**

The 5th sentence of Section 6.8.1, paragraph 3 will be removed. The 3rd sentence of Section 6.8.1, paragraph 3 will be revised to read: "Any equipment blank(s) will be analyzed for the same constituents for which the soil samples and residual material samples are being analyzed."

22. *6.8.1, paragraph 5, 1st sentence - Data shall be qualified appropriately if contamination is found in QA/QC blanks, however, such blank contamination may not be used to "invalidate" data.*

**Response to Comment 22**

Section 6.8.1, paragraph 5 will be revised to read: "The occurrence of constituents in blank samples may serve to qualify the results presented by the laboratory. Additional blanks or duplicate samples may be prepared and analyzed to address specific, unanticipated conditions. Re-sampling and re-analysis may be required in certain cases depending on project objectives.

23. *6.8.2, paragraph 4 - Matrix spike/matrix spike duplicates (MS/MSD) shall be prepared and analyzed at a frequency of one MS/MSD per sampling batch or 20 samples (whichever is more frequent) per matrix type.*

**Response to Comment 23**

This statement will be added to the referenced section.

24. *8.1, paragraph 4, 2nd sentence - Per Section 3.11.1 of the Closure Guidance, composite samples are not acceptable for demonstrating achievement of clean closure standards.*

**Response to Comment 24**

Radford AAP concurs with this statement. Based on the June 22, 2004 teleconference between Radford AAP and the VDEQ, it is Radford AAP's understanding that in order to comply with the clean closure standards, individual samples of the residual material must be analyzed for the HCOCs. However, it is also Radford AAP's understanding that a composite sample is sufficient for demonstrating compliance with the LDRs universal treatment standards.

25. *8.2.1, last sentence - This appears to refer to HWMU 7 by mistake. Please clarify or correct.*

**Response to Comment 25**

The referenced sentence will be clarified.

26. *8.2.3.2 - This section states that if all inorganic results do not exceed the background concentrations, then "that sampling location will be deemed uncontaminated." It further states that if all sampling locations are uncontaminated then "the soil will have met the clean closure decontamination standard." Please be advised that these statements are not correct. In order to meet the background clean closure standard, sampling results of **all** HCOCs (not just inorganics) must not exceed detection limits or background. Please revise accordingly.*

**Response to Comment 26**

The referenced section will be revised to read as follows: "If the concentration of every inorganic HCOC in a soil sample is below the appropriate UTL, that sampling location will be deemed to be uncontaminated for inorganic constituents. Should all soil samples be uncontaminated for inorganic constituents in this manner, the soil will have met the clean closure decontamination standard for inorganic constituents."

27. *8.2.4 - Only those constituents that did not pass the non-detection and background clean closure standards (i.e., detects above background levels) need to be included in the risk-based evaluation.*

**Response to Comment 27**

Radford AAP concurs with this statement. This statement will be included in Section 8.2.4 of the Amended Closure Plan.

28. *10.0, 2nd sentence - This states that the residual material left in-place is not a hazardous waste. Please remove this sentence as this conclusion has not been reviewed and approved by the Department.*

**Response to Comment 28**

The referenced sentence will be revised to read as follows: "Based on generator knowledge and previous studies, Radford AAP has determined that the residual material contained in HWMU-5 is not a hazardous waste as defined in 40 CFR Part 261."

29. *10.0 - Please revise the schedule pursuant to Comment 3 above.*

**Response to Comment 29**

The schedule will be revised by removing references to the Post-Closure Care Plan.

It is Radford AAP's understanding that the VDEQ wants Radford AAP to submit a Closure Report and a Class II Permit Modification at the same time, and that the VDEQ will review both documents together. Assuming that approval for clean closure is obtained, Radford AAP will then submit a request to shorten the Post-Closure Care Period. If the request to shorten the Post-Closure Care Period is approved, the Final Permit will be modified accordingly.

30. *10.0 - Please provide additional details concerning closure activities. Enough detail should be provided to allow tracking of the progress of closure. In addition, contingent closure activities (such as those described in paragraph 4 of Section 13.0) must be included in the closure schedule.*

**Response to Comment 30**

The following closure schedule will be included in Section 10.0:

| CLOSURE ACTIVITY | TIMEFRAME FOR COMPLETION |
|---|---|
| Radford AAP:<br>Submittal of Amended Closure Plan | 30 days from VDEQ approval of Response to Comments |
| VDEQ:<br>Review and Approval of Amended Closure Plan | 90 days from submittal |
| Radford AAP:<br>Soil and Groundwater Sampling;<br>Submittal of Closure Report (with Class II Permit Modification if clean closure is demonstrated) | 90 days from VDEQ approval of Amended Closure Plan |
| VDEQ:<br>Review and Approval of Closure Report;<br>Review and Approval of Class II Permit Modification (if clean closure is certified) | 120 days from submittal |

In the event that clean closure is not achieved, the Unit will remain in post-closure care in accordance with the Final Permit (October 4, 2002). If Radford AAP chooses to demonstrate clean closure by removal, additional closure schedule information will be submitted.

31. *13.0, paragraph 3, 2nd and 3rd sentences - These are not correct. Please remove these sentences.*

**Response to Comment 31**

The referenced sentences will be removed.

32. *13.0, paragraph 4 - Pursuant to 40 CFR 264.225(c)(1), a Contingent Closure Plan for closure with wastes/waste constituents in-place must be provided in the event that clean closure cannot be achieved.*

**Response to Comment 32**

Section 13.0, paragraph 4 will be revised to read as follows: "In the unlikely event that HWMU-5 is unable to attain clean closure for soil, the Unit will remain closed with the residual material in-place. If this occurs, the VDEQ-approved May 1988 Closure Plan included in the Final Permit (October 4, 2002) will serve as the Contingent Closure Plan for the Unit in accordance with 40 CFR 264.225(c)(1), and the Unit will remain in post-closure care in accordance with the Final Permit."

33. *Table 2 - This list does not contain a complete list of HCOCs (see Comment 12 above) for HWMU 5.*

**Response to Comment 33**

In accordance with **Response to Comment 12**, Table 2 will be revised as follows:

**TABLE 2**

| HAZARDOUS WASTE MANAGEMENT UNIT 5<br>HAZARDOUS CONSTITUENTS OF CONCERN<br>RADFORD ARMY AMMUNITION PLANT, RADFORD, VIRGINIA | | | | |
|---|---|---|---|---|
| Analyte | SW-846 Method | Limit of Quantitation | Limit of Detection | Units |
| Antimony | 6010B | 6 | 0.2 | mg/kg |
| Arsenic | 6010B | 1 | 0.11 | mg/kg |
| Barium | 6010B | 20 | 0.073 | mg/kg |
| Beryllium | 6010B | 0.5 | 0.019 | mg/kg |
| Cadmium | 6010B | 0.5 | 0.022 | mg/kg |
| Chromium | 6010B | 1 | 0.13 | mg/kg |
| Cobalt | 6010B | 5 | 0.077 | mg/kg |
| Copper | 6010B | 2.5 | 0.38 | mg/kg |
| Lead | 6010B | 0.3 | 0.14 | mg/kg |
| Mercury | 7471A | 0.1 | 0.018 | mg/kg |
| Nickel | 6010B | 4 | 0.25 | mg/kg |
| Selenium | 6010B | 0.5 | 0.43 | mg/kg |
| Silver | 6010B | 1 | 0.077 | mg/kg |
| Thallium | 6010B | 1 | 0.42 | mg/kg |
| Vanadium | 6010B | 5 | 0.066 | mg/kg |
| Zinc | 6010B | 2 | 1.3 | mg/kg |
| Acetone | 8260B | 0.02 | 0.007 | mg/kg |
| 2-Butanone | 8260B | 0.01 | 0.004 | mg/kg |
| Chloroform | 8260B | 0.005 | 0.001 | mg/kg |
| 1,2-Dichloroethane | 8260B | 0.005 | 0.001 | mg/kg |
| Methylene chloride | 8260B | 0.005 | 0.002 | mg/kg |
| Toluene | 8260B | 0.005 | 0.001 | mg/kg |
| Trichloroethene | 8260B | 0.005 | 0.001 | mg/kg |
| Xylenes, total | 8260B | 0.005 | 0.001 | mg/kg |
| Bis (2-ethylhexyl) phthalate | 8270C | 0.4 | 0.08 | mg/kg |
| Diethyl phthalate | 8270C | 0.4 | 0.08 | mg/kg |
| 2,4-Dinitrotoluene | 8270C | 0.4 | 0.08 | mg/kg |
| 2,6-Dinitrotoluene | 8270C | 0.4 | 0.04 | mg/kg |
| 2-Nitroaniline | 8270C | 0.4 | 0.04 | mg/kg |
| 4-Nitroaniline | 8270C | 0.4 | 0.08 | mg/kg |
| Nitrobenzene | 8270C | 0.4 | 0.04 | mg/kg |
| 4,4-DDD | 8081A/8082 | 0.002 | 0.0004 | mg/kg |

Notes:
Actual sample quantitation and detection limits will be adjusted based on dry weight.
Limits provided above may change based on dry weight, matrix variability, instrumentation, and method detection limit studies.

**34.** *Table 2 - Section 8.2.2 of the Plan-HWMU 5 states that, initially, RFAAP will attempt to demonstrate clean closure by analytical non-detection and comparison to background (for detected HCOCs). Section 3.9 of Closure Guidance recommends using the analytical methods with the lowest quantitation limits for each HCOC when demonstrating clean closure at these standards. Specifically:*

- *SW-846 Methods 7000 Series typically achieve lower detection and quantitation limits than Method 6010 for inorganics;*
- *SW-846 Method 8021B typically achieves lower detection and quantitation limits that Method 8260 for many chlorinated and aromatic volatiles; and*
- *SW-846 Method 8330 typically achieves lower detection and quantitation limits than Method 8270 for 2,4- and 2,6-dinitrotoluene.*

*Please review the achievable detection and quantitation limits with your laboratory and revise table 2 accordingly.*

**Response to Comment 34**

Radford AAP realizes that the closure guidance document recommends the use of methods that achieve the lowest possible detection limits for clean closure documentation. While in theory the use of those methods may provide marginally lower detections than methods used in standard professional practice of analysis, they are inherently not definitive, by definition, and have significant limitations with respect to reliability, validity and reproducibility. Appendix III to 40 CFR Part 261 – *Chemical Analysis Test Methods* references the use of SW-846 in the selection of test methods. Chapter 2 of SW-846, Section 2.2.5 – *Detection and Monitoring* recommends the use of the *most practical* methods approved for detection. All of the analytical methods proposed by Radford AAP are considered the most practical and robust methods and are specifically approved for detection monitoring.

Additionally, many nationally accredited commercial laboratories do not routinely provide these methods for entire standard parameter lists. For example, Lancaster Laboratories only offers method 8021B for the suite of compounds that includes Benzene, Ethylbenzene, Toluene, and Xylenes (BTEX). Analysis of a full Volatile Organic Compound list for soil using method 8021B would constitute a research level effort, thereby more than tripling the cost. Additionally, many units at Radford AAP have been closed under the federal RCRA Corrective Action Permit for the entire facility using the methods proposed here. Using similar methods provides a consistent approach with respect to decision making at the facility and interpretation of the intent of RCRA. Accordingly, Radford AAP proposes to use the following methods:

- Analysis by SW-846 Method 6010B (ICP-trace) generally provides detection and quantitation limits comparable to SW-846 7000 series methods. In general, ICP-trace analysis is preferred since the method is subject to less interferences and potential false positives. Radford AAP requests the use of Method 6010B.

- Analysis by SW-846 Method 8021B typically achieves lower detection and quantitation limits for select chlorinated and aromatic volatiles. However, use of SW-846 Method 8260B is preferred due to the reliability associated with target analyte identification (less potential for false positives). In many cases, laboratory specific detection limits for

Method 8260B analytes may be comparable to Method 8021B. Radford AAP requests the use of Method 8260B.

- Analysis by SW-846 Method 8330 is subject to interferences and potential false positives. For this project, use of SW-846 Method 8270C is preferred due to the reliability associated with target analyte identification (less potential for false positives). As well, Lancaster Laboratories' specific detection and quantitation limits for Method 8270C analytes 2,4- and 2,6-dinitrotoluene are lower than Method 8330. Radford AAP requests the use of Method 8270C.

The above noted methods are reliable, cost-effective and can generate data to support clean closure demonstration at this facility. Therefore, RFAAP respectfully requests the use of SW-846 Methods 6010B, 8260B and 8270C for this project.

## Hazardous Waste Management Unit 7 (HWMU-7)

1. *Although most of the comments below refer to a particular section, paragraph, or sentence, similar or related concepts are often repeated throughout the Amended Closure Plan (Plan). Therefore, when making revisions as a result of a particular comment, please ensure that corresponding revisions are made in all applicable sections of the Plan.*

**Response to Comment 1**

When a revision is made as the result of a particular comment, corresponding revisions will be made in all applicable sections of the Amended Closure Plan.

2. *Because of the similarity between the Closure Plan Amendments for HWMUs 5 and 7, the comments provided for the Plan-HWMU 5 also apply to the Plan-HWMU 7 with the exception of comments 4, 6, 7, 10, 16, 25, 32, and 33. Although some of the paragraph and sentence numbers referenced for Plan-HWMU 5 do not exactly match those for Plan-HWMU7, the working is close enough such that referring back to the text of Plan-HWMU 5 should resolve any discrepancies.*

**Response to Comment 2**

The sections in the Amended Closure Plan for HWMU-7 that are similar to those in the Amended Closure Plan for HWMU-5 that require revision will be addressed accordingly.

3. *5.3.1 - Section 6.0 indicates that the unit is underlain by a clay liner and native soils. Because of possible mixing, the top six inches of clay or native soils directly beneath the residual material shall be included with the residual material. Similarly, the bottom six inches of clean material placed above the residual material shall be included with the residual material. Therefore, closure procedures addressing the residual material must include all materials from six inches beneath to six inches above the residual material.*

**Response to Comment 3**

Radford AAP concurs with this definition of the residual material. This definition of the residual material will be included in Section 5.3.1 of the Amended Closure Plan.

4. *13.0, paragraph 4 - Since this unit does not meet the 40 CFR 264.221(a) liner requirements, a Contingent Closure Plan for closure with wastes/waste constituents in-place must be provided.*

**Response to Comment 4**

Section 13.0, paragraph 4 will be revised to read as follows: "In the unlikely event that HWMU-5 is unable to attain clean closure for soil, the Unit will remain closed with the residual material in-place. If this occurs, the VDEQ-approved May 1988 Closure Plan included in the Final Permit (October 4, 2002) will serve as the Contingent Closure Plan for the Unit in accordance with 40 CFR 264.225(c)(1), and the Unit will remain in post-closure care in accordance with the Final Permit."

5. *Table 2 - Please verify that all applicable HCOCs for HWMU 7 (see Comment 12 for the Plan-HWMU 5, above) are included in this list.*

**Response to Comment 5**

The HCOC list for HWMU-7 will be developed based on the following:

a. The results of analyses of lagoon water and sediment in 1981 (previously presented in the VDEQ-approved May 1988 Closure Plan);

b. The quarterly groundwater monitoring constituents for the Unit listed in Appendix E of Permit Attachment 3 of the Final Permit (October 4, 2002), as revised by subsequent detections of additional 40 CFR Part 264 Appendix IX constituents; and

c. Any hazardous constituents detected in soil samples collected from within and around the Unit during the 2002 Field Investigation.

In 1981, analyses of lagoon water and sediment collected from HWMU-7 indicated the presence of inorganic constituents at concentrations below levels defined as hazardous by the EP Toxicity test. Specifically, cadmium was detected in the lagoon water sample at a concentration of 0.016 mg/l; no other inorganic constituents were detected in the lagoon water sample. Barium, cadmium, chromium, lead, and silver were detected in the sediment sample at concentrations of 0.33 mg/l, 0.027 mg/l, 0.73 mg/l, 0.58 mg/l, and 0.027 mg/l, respectively. In addition, the sediment sample was analyzed for arsenic, mercury, and selenium; concentrations of these constituents were not detected in the sediment sample.

The quarterly groundwater monitoring list for HWMU-7, as presented in Appendix E of Permit Attachment 3 of the Final Permit (October 4, 2002), was developed in accordance with procedures specified by the VDEQ. As directed by the VDEQ during development of

the January 2002 Permit Modification for the Draft Final Permit, Radford AAP carefully reviewed the groundwater monitoring data for HWMU-7 from First Quarter 1996 through Fourth Quarter 2001 in order to determine whether any constituents in the Unit's then-current groundwater monitoring list (as presented in the September 1999 Post-Closure Care Permit for HWMU-7) were consistently not detected. Any constituents that had never been detected within the groundwater at the Unit were not included in the proposed Compliance Monitoring Constituent List presented in the January 2002 Permit Modification document. The VDEQ directed Radford AAP to follow this procedure in order to avoid the need to remove non-detected constituents later during the duration of the active permit. (Please note: in accordance with the May 19, 1999 agreement between the VDEQ and Radford AAP, pre-1996 groundwater analytical data were not to be used for regulatory decisions. Prior to 1996, the analytical data were generated from several different laboratories. In many cases, the analytical reports did not include detection limits. In several instances, different analytical methods were used during different quarters, resulting in noticeable variations in the reported detection limits and practical quantitation limits. The analytical data collected during 1996 and subsequent sampling events proved to be more reliable. As a result (and as agreed with the VDEQ), any regulatory decisions with respect to historical analytical data would not be made using any data prior to 1996.) Based on this review, and as presented in Appendix E of Permit Attachment 3 of the Final Permit, the quarterly groundwater monitoring list for HWMU-7 consists of the following constituents:

| | | |
|---|---|---|
| Antimony, total | Mercury, total | 2,4-Dinitrophenol |
| Arsenic, total | Nickel, total | 2,4-Dinitrotoluene |
| Barium, total | Selenium, total | 2,6-Dinitrotoluene |
| Cadmium, total | Silver, total | 4-Nitrophenol |
| Chromium, total | Thallium, total | Cyanide, total |
| Cobalt, total | Bis (2-ethylhexyl) phthalate | |
| Lead, total | Butyl benzyl phthalate | |

In addition, copper has been detected in the groundwater at HWMU-7 during annual monitoring for the constituents listed in 40 CFR Part 264 Appendix IX. As a result, copper has been added to the quarterly groundwater monitoring list for HWMU-7.

During the 2002 Field Investigation at HWMU-7, samples of the residual material and surrounding soils were analyzed for the USEPA Target Analyte List (TAL) inorganic compounds, and for the USEPA Target Compound List (TCL) organic compounds. The following hazardous constituents (as listed in 40 CFR Part 261 Appendix VIII) were detected in the samples:

| | | | |
|---|---|---|---|
| Arsenic | Chromium | Cyanide | N-Nitrosodiphenylamine |
| Barium | Lead | 4,4-DDD | |
| Beryllium | Nickel | 4,4-DDE | |

As a result, Table 2 will be revised as follows:

## TABLE 2

| HAZARDOUS WASTE MANAGEMENT UNIT 7<br>HAZARDOUS CONSTITUENTS OF CONCERN<br>RADFORD ARMY AMMUNITION PLANT, RADFORD, VIRGINIA | | | | |
|---|---|---|---|---|
| Analyte | SW-846 Method | Limit of Quantitation | Limit of Detection | Units |
| Antimony | 6010B | 6 | 0.2 | mg/kg |
| Arsenic | 6010B | 1 | 0.11 | mg/kg |
| Barium | 6010B | 20 | 0.073 | mg/kg |
| Beryllium | 6010B | 0.5 | 0.019 | mg/kg |
| Cadmium | 6010B | 0.5 | 0.022 | mg/kg |
| Chromium | 6010B | 1 | 0.13 | mg/kg |
| Cobalt | 6010B | 5 | 0.077 | mg/kg |
| Copper | 6010B | 2.5 | 0.38 | mg/kg |
| Lead | 6010B | 0.3 | 0.14 | mg/kg |
| Mercury | 7471A | 0.1 | 0.018 | mg/kg |
| Nickel | 6010B | 4 | 0.25 | mg/kg |
| Selenium | 6010B | 0.5 | 0.43 | mg/kg |
| Silver | 6010B | 1 | 0.077 | mg/kg |
| Thallium | 6010B | 1 | 0.42 | mg/kg |
| Bis (2-ethylhexyl) phthalate | 8270C | 0.4 | 0.08 | mg/kg |
| Butyl benzyl phthalate | 8270C | 0.4 | 0.08 | mg/kg |
| 2,4-Dinitrophenol | 8270C | 2.4 | 0.8 | mg/kg |
| 2,4-Dinitrotoluene | 8270C | 0.4 | 0.08 | mg/kg |
| 2,6-Dinitrotoluene | 8270C | 0.4 | 0.04 | mg/kg |
| 4 Nitrophenol | 8270C | 1 | 0.2 | mg/kg |
| N-Nitrosodiphenylamine | 8270C | 0.4 | 0.04 | mg/kg |
| 4,4-DDD | 8081A/8082 | 0.002 | 0.0004 | mg/kg |
| 4,4-DDE | 8081A/8082 | 0.002 | 0.0004 | mg/kg |
| Cyanide | 9012A | 0.5 | 0.5 | mg/kg |

Notes:

Actual sample quantitation and detection limits will be adjusted based on dry weight.

Limits provided above may change based on dry weight, matrix variability, instrumentation, and method detection limit studies.

RE: SWMU 6 Sampling Results Report
Radford Army Ammunition Plant
Radford, Virginia, January 2001

Dear Mr. McKenna:

Thank you for the opportunity to review the above referenced document. There is only one minor comment at this time.

- Page ii, first full paragraph, second sentence – I believe that there is a typographical error and that the intent was to state that aluminum detections were above residential RBCs and below industrial RBCs.

As an additional note, I have forwarded the soil background study to our staff statistician for additional review. Please contact me at 804-698-4143 if you have any questions.

Very truly,

Sharon Wilcox

Re: Radford Army Ammunition Plant
SWMU 6
Draft *Site Screening Document* submittal and review

Dear Mr. McKenna and Ms. Jake:

The U.S. Environmental Protection Agency (EPA) has reviewed the Army's revised draft Site Screening *Sampling Results Report* for soil sampling at SWMU 6, located at the Radford Army Ammunition Plant (RFAAP). Based upon our review, the revised draft *Sampling Results Report* is approved. In accordance with Part II.(G)(2) of RFAAP's Corrective Action Permit, the schedule contained within Section 7, Figure 11 of the *Sampling Results Report* is now considered final and is henceforth incorporated into the Permit, via the Installation Action Plan.

RE: Work Plan Addendum No. 18, SWMU 41
Soil Screening Report SWMU 8
Soil Screening Report SWMU 36

Dear Mr. McKenna:

Thank you for providing the staff the opportunity to review and comment on the referenced documents. The staff has the following comments:

Work Plan Addendum No. 18, SWMU 41

Figure 1-16. The symbol for soil boring in the legend (closed black circle) does not correspond to the symbol used in the figure (open circle). Also, Table 1-9 indicates that soil samples SB 6, 7 and 8 will be taken outside Area B, while the figure clearly shows the samples to be within the inferred boundary line.

Figure 1-15. Table 1-9 indicates that soil samples SB 3, 4 and 5 will be taken outside Area A, while Figure 1-15 shows the samples within the inferred boundary line. Please explain.

Soil Screening Reports SWMUs 8 and 36

There are no additional comments on the Soil Screening Reports for SWMUs 8 and 36.

Please do not hesitate to contact Jennifer Jones, 804-698-4328, or myself if you have questions concerning these comments.

Sincerely,

Durwood Willis

Re: Radford Army Ammunition Plant
SWMUs 8 and 36
Draft *Soil Screening Report*
Review of the Army's 2/6/04 response to EPA's 12/11/03 comment letter

Dear Mr. McKenna and Ms. Jake:

The U.S. Environmental Protection Agency (EPA) has reviewed the Army's February 6, 2004 response to EPA's December 11, 2003 letter concerning the review of the Army's draft *Soil Screening Report* for SWMUs 8 and 36, located at the Radford Army Ammunition Plant (RFAAP). Outlined below, please find EPA's comments based upon that review:

***EPA General Comment 2***

2. As concluded in Section 5.0 of the Report, the soil screening at Solid Waste Management Units (SWMUs) 8 and 36 indicated the presence of "selected targeted constituents." However, it is concluded in this section that "point comparisons of the discrete data to Residential RBCs [risk-based concentrations], Industrial RBCs, and

RFAAP background did not indicate a potential to human health." There are potential flaws in this conclusion, among them:

- The screening process was not completed in accordance with the RFAAP *Site Screening Process* (SSP [October 26, 2001]). At this stage, the chemicals of potential concern (COPCs) should have been identified (COPC identification step in Section 6.1.1.1 of the SSP). Based on the data presented in the report, it appears manganese, lead, mercury, zinc, and antimony are the COPCs.

***RFAAP Response***

In order to achieve the project objectives of assessing for the presence or absence of hazardous constituents in soil and characterizing site materials for RCRA characteristics, particular elements enumerated in the RFAAP SSP were used to perform qualitative risk screening for the SWMUs 8 and 36 Soil Screening. There was no intent within the Report to identify COPCs for purposes of conducting an RFI risk assessment, thus the screening process for SWMUs 8 and 36 did not follow every element within the SSP developed at RFAAP for Site Screening Areas.

**EPA review**

Please note that the SSP, as envisioned, is not conducive towards the elimination of process steps within the SSP. It is not a "pick and choose" methodology. Either the SSP process is followed or it isn't. In the future, please follow the SSP process. The central questions that need to be answered BY THIS REPORT are: (a) which soil constituents failed the residential soil screening criteria and are above background values; (b) which soil constituents failed the industrial soil screening criteria and are above background values; (c) which soil constituents failed the BTAG soil screening criteria and are above background values; and (d) what soil constituents failed the SSL soil screening criteria and are above background values. The Report generally answers these questions, but not in a direct approach. Additionally, in the future, please differentiate between those soil constituents which exceed the residential RBC and background and those soil constituents which exceed the industrial RBC and background values. This is important in determining whether or not the site will need long-term monitoring, i.e. whether waste is left in-place. The conclusions section of the report should address this in future SSP documents.

***EPA General Comment 2 continued***

- No cumulative risk screening was conducted in accordance with the SSP. This evaluation includes uncertainty analysis of the cumulative risk screening. As the vertical and horizontal extent of contamination of all the chemicals detected in soil is not fully characterized, whether the data generated from this soil screening is sufficient to conduct a cumulative risk assessment will also need to be demonstrated.

***RFAAP Response***

The objectives of the Soil Screening did not include full characterization of the site for completion of a cumulative risk assessment. Characterization of the site, if necessary, will take place at some time after treatment activities cease at these locations.

**EPA review**

It is important to note that defining the full nature and extent of contamination is NOT part of the SSP, but is the function of the RFI. The uncertainty section of the SSP basically acknowledges this. The function of the SSP is to determine whether or not there has been a release at the site. To accomplish this, a proposed number of samples contained in an approved Work Plan is sufficient. Thus, the central questions that need to be answered revolve around (a) which soil constituents failed the residential soil screening criteria and are above background values; (b) which soil constituents failed the industrial soil screening criteria and are above background values; (c) which soil constituents failed the BTAG soil screening criteria and are above background values; and (d) what soil constituents failed the SSL soil screening criteria and are above background values. Defining nature and extent is left to the RFI phase, if needed.

***EPA General Comment 2 continued***

• Some potential exposure pathways were not evaluated. According to the conceptual site models (CSMs) presented in Figures 2-4 and 2-5, the potential impact from soil to groundwater and eventually surface water exists. However, the Report does not evaluate chemical migration of contaminants from soil to groundwater as required by the SSP. The SSP requires use of USEPA's *Soil Screening Guidance* (USEPA, 1996) as a source of information when conducting comparison to soil screening levels (SSLs). The Report did not compare soil concentrations to the USEPA Region 3 SSLs listed on the RBC Table. Based on the data provided in the Report, several metals (e.g., arsenic, chromium, manganese, vanadium, etc.) exceed their respective SSLs at dilution attenuation factor (DAF) 20.

***RFAAP Response***

The report will be revised to include a comparison of soil concentrations to the USEPA Region 3 soil to groundwater SSLs at DAF 20 listed on the most recent RBC Table.

**EPA review**

The Army's response is acceptable. However, in the future, please include the SSL screening in the text of the screening section of the report. Please note that the SSL screening was not discussed in Section 4 of the report.

***EPA comment 2 continued***

• In the Summary (Section 4.4) of the Report, only those metals with concentrations exceeding both the RBCs and the background concentrations are noted. Other metals that exceeded one or more screening criteria are dismissed

because their concentrations did not exceed the site background values. The risk conclusions, thus, consider only those metals noted in Section 4.4. At this stage, it appears inappropriate to eliminate metals from the risk assessment based solely on a comparison to background or ambient levels. In order to provide a more complete characterization of potential risks associated with exposures at the site, metals that exceed risk-based screening concentrations should not be excluded from quantitative consideration in the risk assessment. The contribution to the overall risk due to metals with high background concentrations should be presented in a risk characterization (EPA. 2002. *Role of Background in the CERCLA Cleanup Process.* Office of Solid Waste and Emergency Response. OSWER 9285.6-0P. April 26).

***RFAAP Response***

Per previous agreement with USEPA, investigations performed prior to WPA 016 would be allowed to screen out COPCs based on background comparison. Work at SWMUs 8 and 36 was performed under WPA 015. Also, please refer to the response to specific USEPA comment 18 below regarding the presentation of data for constituents exceeding relevant screening criteria but not their inorganic constituent background point estimates.

**EPA review**

The Army's response is acceptable.

This concludes EPA's review of the Army's February 6, 2004 response to EPA's December 11, 2003 letter concerning the review of the Army's draft *Soil Screening Report* for SWMUs 8 and 36, located at the RFAAP. All Army responses to EPA's December 11, 2003 letter were determined to be acceptable. The above comments reflect a need for refinement in the submittal of SSP documents in the future.

Based upon our review, the January, 2004 *Soil Screening Report* for SWMUs 8 and 36 is approved. In accordance with Part II.(G)(2) of RFAAP's Corrective Action Permit, the January, 2004 *Soil Screening Report* for SWMUs 8 and 36 is now considered final.

Based upon the above, please submit a draft *SWMU Decision Document* for SWMU 8 and 36, separately, to EPA for review. Please bear in mind the comments outlined above when preparing the text of the draft *SWMU Decision Documents.*

If you have any questions, please call me at 215-814-3357.

Sincerely,

Robert Thomson, PE

Re: Radford Army Ammunition Plant
SWMU 58
Rubble Pile
Document submittal and review

Dear Mr. McKenna and Ms. Jake:

The U.S. Environmental Protection Agency (EPA) has reviewed the U.S. Army's (Army's) March 2004 response to EPA's September 18, 2003 review comments pertaining to the draft *RCRA Facility Investigation Report* (RFI) for SWMU 58, located at the Radford Army Ammunition Plant (RFAAP). Based upon that review, EPA finds the Army's March 2004 response to be acceptable.

Given the above, the referenced draft *RCRA Facility Investigation Report* (RFI) is conditionally approved by EPA, provided that EPA's comments are satisfactorily addressed in the final RFI Report. Please forward two copies of the final SWMU 58 RFI Report to EPA for review and approval.

If you have any questions, please call me at 215-814-3357.

Sincerely,

Robert Thomson, PE
Federal Facilities Branch

Leslie A. Romanchik, Assistant Division Director
Hazardous Waste Permitting
Virginia Department of Environmental Quality
629 East Main Street
Richmond, Virginia 23219

Subject: Alternate Source Demonstration
Hazardous Waste Post-Closure Care Permit for HWMU 7
Radford Army Ammunition Plant, Radford, Virginia
EPA ID#: VA1210020730

Dear Ms. Romanchik:

During Third Quarter 2006, Alliant Techsystems Inc. completed the quarterly/Appendix IX groundwater monitoring at Hazardous Waste Management Units (HWMU) 5, 7, 10 and 16 located at the Radford Army Ammunition Plant (Radford AAP) in Radford, Virginia.

At HWMU 7, chloroform was detected during the Third Quarter 2006 groundwater monitoring event in monitoring wells 7W11B and 7W12B at concentrations of 0.7 µg/l and 1.1 ug/l, respectively. Chloroform was detected in confirmation samples collected on September 26, 2006, from 7W11B at a concentration below the quantitation limit and in 7W12B at a concentration of 1.4 ug/l.

Monitoring well 7W12B is the upgradient background well for the Unit; therefore, chloroform detected in the wells appears to be from a source upgradient of HWMU 7. Drinking water used at Radford AAP has been monitored for Disinfectant By-Products (DBPs), including chloroform, since 2004. Analytical results for chloroform in drinking water are summarized below.

| Drinking Water Sample Date | Chloroform Concentration (ug/l) |
|---|---|
| March 15, 2004 | <5.0 |
| May 18, 2004 | 60.0 |
| August 3, 2004 | 86.0 |
| October 5, 2004 | 120.0 |
| January 18, 2005 | 21.0 |
| April 26, 2005 | 40.2 |
| July 25, 2005 | 64.9 |
| December 13, 2005 | 13.4 |
| February 2, 2006 | 15.9 |
| April 4, 2006 | 25.9 |
| August 15, 2006 | 22.1 |

A number of drinking water supply lines are located upgradient of HWMU 7, and some of these lines have been in service since Radford AAP became operational in 1940. Therefore, it is likely that the chloroform concentrations detected in upgradient well 7W12B are the result of leaks in the facility drinking water supply lines. The supply lines located upgradient of HWMU 7 are highlighted on the attached site plan.

Radford AAP conducted subsurface evaluations to determine the nature and extent of the residual material contained in closed HWMU 7 on November 1, 2002 and on February 17, 2004. Chloroform was not detected in any of the soil samples collected within, under, and around HWMU 7 during those field investigations. Furthermore, historic

information regarding operations at HWMU 7 prior to closure indicates that the wastes processed through the Unit did not contain chloroform. Therefore, the chloroform concentrations detected in groundwater are not derived from the residual material contained in HWMU 7.

In accordance with Section V.J.2.e.(5) of the Post-Closure Care Permit, Radford AAP submits this letter as an alternate source demonstration (ASD) for chloroform at HWMU 7. As the source of chloroform impact in the wells is from the potable water lines upgradient of the Unit, chloroform will not be added to the groundwater monitoring list for HWMU 7.

If you have any questions or concerns, please contact Mr. William Glover at 540/639-7635 (William.Glover@ATK.com).

Sincerely,

Paige Holt, Environmental Manager
Alliant Techsystems Inc.

# Meeting Minutes

| | | | |
|---|---|---|---|
| **Project Name:** | Radford AAP HWMUs 5 and 7 Closure Plans | **Project Number:** | B03204-102 |
| | | **Date:** | January 18, 2007 |
| **Meeting Location:** | Radford AAP | **Time:** | 11:00 am |
| **Minutes by:** | L. Livingston | | |
| **In Attendance:** | VDEQ – Matt Stepien, Hassan Vakili, Erich Weissbart, Fuxing Zhou, Jim Cutler, Sonal Iyer<br>Army – Jim McKenna<br>ATK – Bill Glover, Jeremy Flint<br>DAA – Mike Lawless, Ross Miller, Lori Livingston | | |
| **cc:** | | | |

Alliant Techsystems Inc. (ATK) called a meeting with the Virginia Department of Environmental Quality (VDEQ) to discuss the Amended Closure Plans submitted for Hazardous Waste Management Units (HWMUs) 5 and 7 at the Radford Army Ammunition Plant (Radford AAP) in November 2006.

- Bill Glover of ATK explained that the amended plans were submitted to pick up where the project was left in 2004. Draft plans were sent to VDEQ to assist in review of the plans and to demonstrate how VDEQ's June 7, 2004 comments would be addressed.
- Matt Stepien has reviewed the plan for HWMU-5 based on Garwin Eng's comments dated June 2004 and ATK's response dated September 2004. Matt Stepien did not review the plan for HWMU-7 as he did not receive it. **Bill Glover forwarded a copy of the Amended Closure Plan for HWMU-7 to Matt Stepien in the afternoon of January 18, 2007.**
- Discussion regarding the HWMU-5 Amended Closure Plan was as follows. VDEQ comments and a summary of discussion are included. Radford AAP action items are included in bold.
  - Comment 2: Individual samples must meet clean closure performance standards. If clean closure performance standards are not met, a composite sample must be compared to Land Disposal Regulations (LDRs). Detailed discussion of LDRs as previously required by VDEQ confuses the process. **The closure plans will be revised to state that LDRs must be met only when clean closure performance standards cannot be achieved and removal is planned. Detailed discussion of LDRs will be removed.**
  - Comments 9 and 14: Additional discussion of decontamination standards for the HWMU-5 and for equipment used during removal should be incorporated to address potential excavation of the Unit. Standards are discussed in Section 3.13 of the VDEQ Closure Guidance. **Discussion of decontamination standards will be added.**
  - Comment 9: Sentence stating "Prior to excavation, soil samples will be collected to determine the volume of material to be excavated" should be removed. **This language will be removed.**
  - Comment 12: The Hazardous Constituents of Concern (HCOC) list should include all constituents that were handled in HWMU-5, that were detected in soil samples collected in 2002, that are included in the quarterly groundwater monitoring list, and that were listed in the 1988 Closure Plan. Constituents that are naturally occurring do not need to be included on the HCOC list. If a constituent is detected underneath the Unit and is not in the residual material, a

2206 South Main Street ◆ Blacksburg, VA ◆ 24060 ◆ (540) 552-0444 ◆ Fax: (540) 552-0291
Charlottesville ◆ Hampton Roads ◆ Richmond

demonstration can be prepared to indicate that its presence is due to an alternate source or laboratory contamination. Section 3.7.1 of the VDEQ Closure Guidance may be used as a reference. **The HCOC list will be reviewed, and language discussing the origin of the HCOC list will be included.**

- Comment 17: The report should include a provision to require decontamination of equipment if non-dedicated sampling equipment is used. **Language will be added to indicate that, if equipment is reused, the equipment will be decontaminated in accordance with the Closure Guidance.**
- Comment 26: Sentence stating "Should all soil samples be uncontaminated for inorganic constituents in this manner, the soil will have met the clean closure decontamination standard for inorganic constituents" should be removed. **This language will be removed.**
- Comments 29 and 30: The closure activity schedule needs to be more detailed. Section 3.20 of the VDEQ Closure Guidance can be used as a reference. **The schedule will be revised based on the guidance.** Also, there was discussion about which type of permit modification will be required for the Amended Closure Plans and closure. **VDEQ will review the permit modification requirements, and Matt Stepien will call or e-mail Bill Glover.**
- Groundwater Comments: VDEQ stated that all groundwater data collected from each Unit should be used to demonstrate clean closure rather than only the data from the quarter when soil samples were collected. If a groundwater constituent is detected at a concentration that is greater than the Groundwater Protection Standard (GPS), the concentration should be compared to background. The Units can receive clean closure for groundwater if all constituents are either below GPS or, if any constituents are above GPS, below background. **The groundwater sections will be revised to reflect these changes.** There have been no GPS exceedances at HWMU-7. **A revised Alternate Source Demonstration (ASD) will be prepared for trichloroethene (TCE) at HWMU-5.**

- Based on our discussion regarding comments at HWMU-5, VDEQ suggested that the Closure Plan for HWMU-7 be updated and revised in accordance with our discussion regarding comments for HWMU-5. **The plans will be revised accordingly. Bill Glover brought any significant differences in the plans for both units to Matt Stepien's attention when he forwarded the HWMU-7 plan to the VDEQ.**
- The meeting concluded at approximately noon.

Bill,

3-hard copies would work and 1-electronic.

I was reviewing the comments and I saw one that I overlooked that should not be a problem to address, I hope!

Comment #34, Table 2
The Detection Limit of the SW-846 method that RFAAP chooses to use should be below the Risk and/or Background #. If both methods provide a Detection Limit that is below the risk and/or background # than either one can be used. Example:
Background for constituent x: 5 ug/mg
Detection Limit using 8260B: 3 ug/mg
Detection Limit using 8021B: 1 ug/mg

In this case you can use either one 8260 or 8021.

I will have a definite answer for you early next week on the Class Determination. I am off tomorrow but will be in the office all of next week. Thanks for the conference call and information and let me know if you have any other questions.

Thanks,

Matthew M. Stepien

Good Afternoon Bill,

I completed my review of HWMU-7. All of the comments made on HWMU-5 during our 1-18-07 conference shall be addressed in HWMU-7 as well. In particular:

- References made to the LDRs throughout Closure Plan
- Section 5.0, option 3
- Section 5.3.2, HCOC list, also where did the interpretation of the closure guidance "belt and suspenders" approach disappear too? This paragraph was in the HWMU-5 report but not HWMU-7? That said lets just be sure to have a comprehensive HCOC list in both plans.
- Section 6.7, see my Jan. 18, 2007 email comment

These were the main areas of discussion but as stated above all comments made on HWMU-5 that apply to HWMU-7 shall be addressed.

Please submit the comments discussed during our 1-18-07 conference call and 1-18-07 email, with RFAAP's responses in letter format similar to the ***September 17, 2004 Response to Comments HWMUs 5 and 7 letter*** from RFFAP to the Department.

Any questions feel free to call or email me. Also, when you get a chance please call Erich Weissbart (804-698-4393) to discuss the HWMU-5 ASD for TCE.

Thanks and have a good day,

Re: **Alternate Source Demonstration (ASD) – Technical Review**
**Hazardous Waste Management Unit 7**
**Radford Army Ammunition Plant, Radford, VA**
**EPA ID No. VA1210020730**

Dear Ms. Holt:

The Department of Environmental Quality, Office of Hazardous Waste (the Department) has completed its review of the Alternate Source Demonstration (ASD) for the Radford Army Ammunition Plant (RFAAP) located in Radford, Virginia. The ASD was received via email by the Department on January 31, 2007.

The Department's groundwater staff has reviewed the ASD and concurs that the data and information collected indicates that the chloroform detected in groundwater was derived from other source(s), such as upgradient background, but not derived from the residual material contained in HWMU 7. A summary of this review is provided in Enclosure (1). RFAAP is advised to submit a final Closure Plan Amendment or replacement pages to the Closure Plan Amendment for HWMU 7, incorporating the above-mentioned ASD, as part of the Class 3 Permit Modification due on June 22, 2007.

If you have any questions regarding the information presented in this letter, please contact me at (804) 698-4026 or you may e-mail me at mmstepien@deq.virginia.gov.

Sincerely,

Matthew M. Stepien

**SUBJ:** **ALTERNATE SOURCE DEMONSTRATION OF CHLOROFORM**
HWMU 7
Radford Army Ammunition Plant, Radford, VA EPA ID# VA1210020730

---

I have reviewed the Alternate Source Demonstration (ASD) of chloroform for HWMU 7, dated January 9, 2007.

During the 2006 annual Appendix IX analysis (in 3rd quarter) chloroform (trichloromethane) was detected in the upgradient well 7W12B (1.1 µg/l) and a point of compliance (POC) well 7W11B (an estimated value of 0.7 µg/l). Resampling and confirmation results of chloroform were 1.4 µg/l in 7W12B and non-detected in 7W11B. The Permittee submitted an ASD of chloroform at HWMU-7. In order to justify the ASD from the Permittee I have also reviewed and verified the data and information available historically. The following are my comments.

1. The historical operation at Unit 7 did not involve any chloroform. Chloroform was not detected in any of the soil samples collected within, under, and around Unit 7 during the 2002 and 2004 field investigations.
2. The historical groundwater data available indicate that chloroform was detected in well 7W12B (Background/upgradient) during the 2000 annual Appendix IX analysis and in wells 7W12B and 7W11B during the 2006 annual Appendix IX analysis. No chloroform was detected in any other wells at any other monitoring events in Unit 7.
3. During the 2000 annual Appendix IX analysis the chloroform concentration in well 7W12B was 1.7 µg/l; chloroform was not detected in any downgradient

wells. During the 2006 annual Appendix IX analysis the Reporting Limit (RL) and the Detection Limit (DL) for chloroform were 1.0 and 0.3 μg/l, respectively. The concentration in 7W12B was 1.1 μg/l. The concentration in 7W11B was an estimated value (0.7 μg/l) which was between its RL and DL. The data indicate that the background value for chloroform was higher than its value in the POC well 7W11B.

4. Resampling and confirmation results of chloroform were 1.4 μg/l in 7W12B and non-detected in 7W11B during the 2006 annual Appendix IX analysis. In resampling and confirmation of chloroform the RL and the DL were 0.5 and 0.1 μg/l, respectively. That is, there was no chloroform detected at the downgradient wells. The data indicate that the background value for chloroform was higher than its value in the POC well 7W11B during the 2006 annual Appendix IX confirmation analysis, too.
5. The concentration of chloroform in the drinking water in the facility is very high (about 20 μg/l last year). 7W12B is located very close to some of drinking water pipelines.
6. MCL (EPA Maximum Concentration Level), ACL (VA DEQ Alternate Concentration Level), and RBC (EPA Region III Risk-Based Concentration) for chloroform are 80, 0.13, and 0.15 μg/l, respectively. During the 2000 annual Appendix IX analysis a concentration of 1.7 μg/l in the background well 7W12B was high than the ACL and RBC values for chloroform, but lower than its MCL. In the same way, during the 2006 annual Appendix IX analysis a concentration of 1.1 μg/l in the background well 7W12B, a concentration of 0.7 μg/l (estimated) in the POC well 7W11B, and a concentration of 1.4 μg/l in the background well 7W12B in resampling and confirmation analysis were higher than the ACL and RBC values for chloroform, but lower than its MCL.

7. No other related-chloro organic constituents [such as PCE, TCE, DCE (-ethene); PCA, TCA, DCA (ethane); and other dichloromethane/chloromethane] were detected in any well during any monitoring event.

Therefore, the data and information collected and available indicate that the chloroform detected in groundwater was derived from other source(s), such as upgradient background, but not derived from the residual material contained in HWMU 7. The ASD is acceptable.

Environmental Specialist II

**DATE:** September 14, 2007

**SUBJ:** Closure Plan Amendment for HWMU 7
Radford Army Ammunition Plant, Radford; EPA ID# VA1210020730

---

I have completed the review of the groundwater portions of the "Closure Plan Amendment for HWMU 7", dated June 2007.

The "Closure Plan Amendment" presents closure plans for both soil and groundwater, including general background, closure procedures and standards, sampling and analysis plan, and closure report requirements. The groundwater portions of the plan, including the references to the ASD for chloroform approved by the Department on June 14, 2007, are appropriate and should be approved.

As Radford AAP indicates in the cover letter of the August 9, 2007, Class 3 Permit Modification, the Department never forwarded any comments regarding the groundwater monitoring portions of the Amended Closure Plans to Radford AAP, even though the Department had indicated that the groundwater comments would be sent to Radford AAP under separate cover. There are a few issues pertaining to groundwater that Radford AAP should address in the closure report. These are outlined below.

**REPORTING REQUIREMENTS -- UPDATING GPSs and BACKGROUND VALUES** (Section 5.4.3)

A summary table for the groundwater monitoring data (concentrations) to date should be included in the closure report. Using the groundwater monitoring data collected to date, the Permittee should statistically recalculate the **background concentration values** and,

where applicable, update their **GPSs** for the constituents in the Compliance Monitoring List (Appendices E, F and G in Permit Attachment 3). An updated background concentration table should be submitted to replace Appendix E in Permit Attachment 3 with the closure report. In its review of the closure report, the Department will apply the GPSs for constituents monitored based on current MCLs, ACLs (if no MCL promulgated), and background concentrations pursuant to Permit Condition V.F.2.a ("Groundwater Protection Standard" for Unit 7).

**Copper** was added to the constituent list following Third Quarter 2003 and **zinc** was added to the constituent list following Second Quarter 2004. These two metals have no current background values. Using the groundwater monitoring data collected to date, the Permittee should statistically establish the background concentration values for copper and zinc. These values will be added to the background concentrations and GPS table (Appendices F and G in Permit Attachment 3). The Department will apply the GPSs for constituents monitored based on current MCLs, ACLs (if no MCL promulgated), and background concentrations pursuant to Permit Condition V.F.2.a ("Groundwater Protection Standard" for Unit 7).

To facilitate this process, an updated GPS table is attached. Please note that MCLs and ACLs have been updated since the Permit issuance: the current MCL for Arsenic is 10 µg/l and Cobalt and 4-Nitrophenol currently have no ACLs, resulting in the GPSs for Cobalt and 4-Nitrophenol based on background and PQL concentration, respectively. The Department will apply the GPSs for constituents monitored based on current MCLs, ACLs (if no MCL promulgated), and background concentrations pursuant to Permit Condition V.F.2.a ("Groundwater Protection Standard" for Unit 7).

Clean closure for groundwater at HWMU-7 will be demonstrated by comparing the groundwater sample analytical results collected to date to the updated Groundwater Protection Standards (GPSs) for the unit. HWMU-7 can receive clean closure for groundwater if all constituents are below their corresponding GPSs and clean closure for soils has been approved.

**PERMIT DATE** (Sections 2.2; 7.0 and 8.3)

The closure report should reflect the following: the original permit for unit 7 was issued on October 30, 1999,with an effective date of November 30, 1999. One consolidated Permit for HWMUs 5, 7, 10 and 16 was issued on October 4, 2002, and modified on June 14, 2007 (Class 1 modification to change monitoring frequency). The compliance period begins when the owner initiates a compliance monitoring program, which is the effective date of the original Permit. The current compliance period, therefore, continues until November 30, 2017, not October 30, 2017, if Radford AAP is not engaged in a corrective action program.

**CONTINUING GW MONITORING** (Sections 2.2, 5.3, 8.3 and 10.0)

The closure report should reflect the following: currently the groundwater at HWMU-7 is sampled and analyzed semiannually, not quarterly, in accordance with the requirements of the consolidated Final Hazardous Waste Post-Closure Care Permit for Hazardous Waste Management Units 5, 7, 10, and 16 modified June 14, 2007.

## APPENDIX G

## GROUNDWATER PROTECTION STANDARDS: UNIT 7

Unit: µg/l Unless Otherwise Noted

| Constituents | SW-846 Method | PQL (µg/l) | Back-ground (µg/l) | EPA MCL (µg/l) | VDEQ ACL (µg/l) | GPS (µg/l) |
|---|---|---|---|---|---|---|
| Antimony, total | 6010B, 6020 | 3 | 30 | 6 | | 30 |
| Arsenic, total | 6010B, 6020 | 10 | 2 | 10/~~50~~ | | 10/~~50~~ |
| Barium, total | 6010B, 6020 | 10 | 28.92 | 2,000 | | 2,000 |
| Cadmium, total | 6010B, 6020 | 1 | 0.4 | 5 | | 5 |
| Chromium, total | 6010B, 6020 | 5 | 34 | 100 | | 100 |
| Cobalt, total | 6010B, 6020 | 7 | 17 | | ~~313~~ | 17/~~313~~ |
| Copper, total | 6010 | 80 | ?? | 1300 | | ?? |
| Lead, total | 6010B, 6020 | 1 | 12.13 | 15* | | 15* |
| Mercury, total | 7470A, 7471A | 1 | 0.4 | 2 | | 2 |
| Nickel, total | 6010B, 6020 | 10 | 63 | | 313 | 313 |
| Selenium, total | 7740 | 10 | 58 | 50 | | 50 |
| Silver, total | 6010B, 6020 | 2 | 3.1 | | 78.25 | 78.25 |
| Thallium, total | 6010B, 6020 | 1 | 8 | 2 | | 2 |
| Zinc, total | 6010 | 20 | ?? | | 4695 | ?? |
| Bis (2-ethylhexyl) phthalate | 8270C | 10 | 9 | 6 | | 6 |
| Butyl benzyl phthalate | 8270C | 10 | 5 | | 3,130 | 3,130 |
| 2,4-Dinitrophenol | 8270C | 50 | 11 | | 31.3 | 31.3 |
| 2,4-Dinitrotoluene | 8270C | 10 | 0.2 | | 31.3 | 31.3 |
| 2,6-Dinitrotoluene | 8270C | 10 | 0.1 | | 15.65 | 15.65 |
| 4-Nitrophenol | 8270C | 50 | 9 | | ~~125.2~~ | 50/~~125.2~~ |
| Cyanide | 9010B, 9012A | 40 | 5 | 200 | | 200 |

Notes:

**EPA MCL:** Maximum Contaminant Level of USEPA National Primary Drinking Water Regulations (September 10th, 2007). Current MCL for Arsenic is 10 µg/l.

**Background:** Calculated using analytical data for upgradient well 7W12B (GWQAR, December 1998), except copper and zinc. Please calculate the background values for copper and zinc using analytical data for upgradient well 7W12B to-date.

**DEQ ACL:** VA DEQ Alternate Concentration Limit, April 2007. Cobalt and 4-Nitrophenol currently have no ACLs.

**GPS:** Pursuant to Permit Condition V.F.2.a ("Groundwater Protection Standard" for Unit 7) the GPSs for constituents monitored for HWMU-7 is based on background concentration from the upgradient well 7W12B and USEPA Maximum Contaminant Level (MCL) for drinking water or VDEQ-derived Alternate Concentration Level (ACL), if no MCL promulgated, whichever is higher.

Re: **Hazardous Waste Class 3 Permit Modification Request – Review Response**
**Post-Closure Care Permit – Hazardous Waste Management Units (HWMUs) 5, 7, 10, & 16; Open Burning Ground (OBG) Permit – HWMU 13**
**Radford Army Ammunition Plant, Radford, VA**
**EPA ID No. VA1210020730**

Dear Ms. Holt:

The Virginia Department of Environmental Quality, Office of Hazardous Waste (the Department) received the Class 3 permit modification request for the *Post-Closure Care Permit – Hazardous Waste Management Units (HWMUs) 5, 7, 10, & 16; and Open Burning Ground (OBG) Permit – HWMU 13,* associated with Radford Army Ammunition Plant (RFAAP) located in Radford, Virginia. RFAAP's Class 3 permit modification request was received by the Department on August 13, 2007. The Department has completed a review of the *Permit Modification Summary* and corresponding attachments included with the Class 3 permit modification request and has provided the following comments:

Item 1: The Department has reviewed the Closure Plan Amendment (CPA) for HWMU-7, revised June 2007, and concurs that the information presented in the CPA is technically adequate. Final approval of the CPA is contingent upon the Director's decision to grant or deny the Class 3 permit modification request after conclusion of the 45-day public comment period. Should the Director approve the Class 3 permit modification; at that time RFAAP will be advised to prepare and submit a Closure Report for HWMU-7. The Department's groundwater staff has provided comments included in Enclosure 1 to assist in the Closure Report preparation.

Item 2: The Department's groundwater staff has reviewed the Alternate Source Demonstration (ASD) for HWMU-5 and has provided a summary of that review in Enclosure 2. The Department has determined that the ASD does not provide sufficient information to demonstrate that the trichloroethene (TCE) present in the groundwater near HWMU-5 is from an alternate source. Therefore, upon receipt of this letter, RFAAP is advised to submit to the Director a permit modification to establish a corrective action program meeting **40 CFR Part 264.100** requirements within 180 days for HWMU-5.

Item 3: In the Permit Modification Summary, Item 3, RFAAP states, "RFAAP is requesting that DEQ review the data that RFAAP will submit to DEQ and incorporate the recommended reductions in monitoring constituents in the revised permit." RFAAP is advised to submit the referenced data to the Department for review.

Item 4: The Department's groundwater staff has reviewed the Constituent Background Values for the Compliance Groundwater Monitoring Program and Module V – Groundwater Compliance Monitoring Plan. Comments and revisions to Module V, Groundwater Compliance Monitoring, are provided in Enclosure 3.

Item 5: The Department's groundwater staff has reviewed the Source Area Evaluation Sampling and Analysis Plan (SAP) in support of the Open Burning Ground Corrective Action Plan and has provided a summary of that review in Enclosure 4. The Department has provided the following comments in addition to the summary in Enclosure 4.

Section 2.3, Soil Sample Selection Criteria, page 5: The following soil sample selection criteria should be utilized for both VOC and perchlorate analysis. At each boring location a 6" soil sample shall be collected at the interface of the fill material soils and underlying native soil (base of former burn pit), as well as a 6" sample of the native soil just above the water table. If there are no obvious differences between the burn pits fill material and the native soil, and the base of the former burn pit cannot be determined, then the first 6" soil sample will be collected at the first confining layer of soils or clay. If contamination is evident from a single boring, based on PID readings as well as visual and olfactory observations, then additional soil samples will be taken every 6' in the soil boring. If no obvious signs of contamination are observed in a boring, then only the two above-mentioned soil samples shall be taken.

Section 3.6, Disposition of Investigation Derived Waste, page 10: Disposition of Investigation Derived Waste should be in accordance with the Department's Guidance on the Handling of Investigation Derived Waste (IDW). Please include a reference to this guidance in Section 3.6. For your convenience the above-referenced guidance has been included in Enclosure 5.

Item 6: RFAAP has sufficiently established that no constituents were detected at concentrations above the Soil Monitoring Program (SMP) Action Limits (ALs). Based on this information, the Department concurs with RFAAP to decrease the soil sampling frequency from semiannually to annually.

The Department does not concur with RFAAP to cease random sampling at the northern and southern OBG boundaries (NB-1, NB-2, SB-1, and SB-2), at the berm located on the southeast side of the site (Berm-1), and in the center of the sediment pond (Pond-1). Although no ALs were exceeded, some constituents were detected well above their reporting limit (RL) at these locations. In particular, lead exhibited concentrations to warrant continual monitoring in these locations. RFAAP is advised to continue sampling these locations annually.

RFAAP requested eight Constituents of Potential Concern (COPC) to be removed from the monitoring events that were not detected above ALs in any of the 2005 through 2007 soil monitoring events. These eight constituents include antimony, benzoic acid, dibenzofuran, di-n-octyl phthalate, nickel, nitroglycerin, pyrene, and zinc. The Department concurs with removing seven of the eight constituents from the sampling events with the one exception being nitroglycerin. Although nitroglycerin did not exceed its AL, the concentrations exhibited warrant its inclusion on the COPC list.

Should the Director approve the Class 3 permit modification; at that time RFAAP will be advised to implement the above-mentioned changes and to submit a revised SMP to be incorporated into the Open Burning Grounds Permit.

Item 7: At their earliest convenience, the facility is advised to contact the Department in order to schedule a meeting between John Lowe of CH2MHill (representing RFAAP) and Sanjay Thirunagari, the Department's Office of Waste Technical Support Manager.

Please review and address each comment within forty-five (45) days of your receipt of this letter. If you have any questions regarding the information presented in this letter, please contact me at (804) 698-4026 or you may e-mail me at mmstepien@deq.virginia.gov.

Sincerely,

Matthew M. Stepien

## Comments on HWMU-7 Closure Report Preparation

VIRGINIA DEPARTMENT OF ENVIRONMENTAL QUALITY
WASTE DIVISION
OFFICE OF HAZARDOUS WASTE

Memorandum

**TO:** Matthew Stepien
Environmental Engineer Sr.

**THROUGH:** Jutta Schneider
Hazardous Waste/Groundwater Manager

**FROM:** Fuxing Zhou
Environmental Specialist II

**DATE:** September 14, 2007

**SUBJ:** Closure Plan Amendment for HWMU 7
Radford Army Ammunition Plant, Radford; EPA ID# VA1210020730

---

I have completed the review of the groundwater portions of the "Closure Plan Amendment for HWMU 7", dated June 2007.

The "Closure Plan Amendment" presents closure plans for both soil and groundwater, including general background, closure procedures and standards, sampling and analysis plan, and closure report requirements. The groundwater portions of the plan, including the references to the ASD for chloroform approved by the Department on June 14, 2007, are appropriate and should be approved.

As Radford AAP indicates in the cover letter of the August 9, 2007, Class 3 Permit Modification, the Department never forwarded any comments regarding the groundwater monitoring portions of the Amended Closure Plans to Radford AAP, even though the Department had indicated that the groundwater comments would be sent to Radford AAP under separate cover. There are a few issues pertaining to groundwater that Radford AAP should address in the closure report. These are outlined below.

**REPORTING REQUIREMENTS -- UPDATING GPSs and BACKGROUND VALUES** (Section 5.4.3)

A summary table for the groundwater monitoring data (concentrations) to date should be included in the closure report. Using the groundwater monitoring data collected to date, the Permittee should statistically recalculate the **background concentration values** and,

where applicable, update their **GPSs** for the constituents in the Compliance Monitoring List (Appendices E, F and G in Permit Attachment 3). An updated background concentration table should be submitted to replace Appendix E in Permit Attachment 3 with the closure report. In its review of the closure report, the Department will apply the GPSs for constituents monitored based on current MCLs, ACLs (if no MCL promulgated), and background concentrations pursuant to Permit Condition V.F.2.a ("Groundwater Protection Standard" for Unit 7).

**Copper** was added to the constituent list following Third Quarter 2003 and **zinc** was added to the constituent list following Second Quarter 2004. These two metals have no current background values. Using the groundwater monitoring data collected to date, the Permittee should statistically establish the background concentration values for copper and zinc. These values will be added to the background concentrations and GPS table (Appendices F and G in Permit Attachment 3). The Department will apply the GPSs for constituents monitored based on current MCLs, ACLs (if no MCL promulgated), and background concentrations pursuant to Permit Condition V.F.2.a ("Groundwater Protection Standard" for Unit 7).

To facilitate this process, an updated GPS table is attached. Please note that MCLs and ACLs have been updated since the Permit issuance: the current MCL for Arsenic is 10 µg/l and Cobalt and 4-Nitrophenol currently have no ACLs, resulting in the GPSs for Cobalt and 4-Nitrophenol based on background and PQL concentration, respectively. The Department will apply the GPSs for constituents monitored based on current MCLs, ACLs (if no MCL promulgated), and background concentrations pursuant to Permit Condition V.F.2.a ("Groundwater Protection Standard" for Unit 7).

Clean closure for groundwater at HWMU-7 will be demonstrated by comparing the groundwater sample analytical results collected to date to the updated Groundwater Protection Standards (GPSs) for the unit. HWMU-7 can receive clean closure for groundwater if all constituents are below their corresponding GPSs and clean closure for soils has been approved.

**PERMIT DATE** (Sections 2.2; 7.0 and 8.3)

The closure report should reflect the following: the original permit for unit 7 was issued on October 30, 1999,with an effective date of November 30, 1999. One consolidated Permit for HWMUs 5, 7, 10 and 16 was issued on October 4, 2002, and modified on June 14, 2007 (Class 1 modification to change monitoring frequency). The compliance period begins when the owner initiates a compliance monitoring program, which is the effective date of the original Permit. The current compliance period, therefore, continues until November 30, 2017, not October 30, 2017, if Radford AAP is not engaged in a corrective action program.

**CONTINUING GW MONITORING** (Sections 2.2, 5.3, 8.3 and 10.0)

The closure report should reflect the following: currently the groundwater at HWMU-7 is sampled and analyzed semiannually, not quarterly, in accordance with the requirements of the consolidated Final Hazardous Waste Post-Closure Care Permit for Hazardous Waste Management Units 5, 7, 10, and 16 modified June 14, 2007.

## APPENDIX G

Notes:

**EPA MCL:** Maximum Contaminant Level of USEPA National Primary Drinking Water Regulations (September 10th , 2007). Current MCL for Arsenic is 10 µg/l.

**Background:** Calculated using analytical data for upgradient well 7W12B (GWQAR, December 1998), except copper and zinc. Please calculate the background values for copper and zinc using analytical data for upgradient well 7W12B to-date.

**DEQ ACL:** VA DEQ Alternate Concentration Limit, April 2007. Cobalt and ~~4-~~ Nitrophenol currently have no ACLs.

**GPS:** Pursuant to Permit Condition V.F.2.a ("Groundwater Protection Standard" for Unit 7) the GPSs for constituents monitored for HWMU-7 is based on background concentration from the upgradient well 7W12B and USEPA Maximum Contaminant Level (MCL) for drinking water or VDEQ-derived Alternate Concentration Level (ACL), if no MCL promulgated, whichever is higher.

MEETING SUMMARY
Meeting concerning Radford Army Ammunition Plant (RFAAP)
Class 3 Permit Modification
January 23, 2008 10:00

**Item 1. Clean Closure to Risk-based Standards and elimination of post-closure care for Hazardous Waste Management Unit 7**

DEQ indicated that the closure plan is not approved until the public comment period is complete but that the closure report could be submitted when complete. RFAAP indicated that the closure report will likely be submitted in early March.

**Item 2. Clean Closure to Risk-based Standards and elimination of post-closure care for Hazardous Waste Management Unit 5**

**SUMMARY:** RFAAP December 14 response indicated that a process to further characterize the area via a RCRA Facility Investigation/Corrective Measure Study (RFI/CMS) is under way. Rather than characterize this effort as a corrective action program, RFAAP would prefer to conduct the proposed actions as an investigation to confirm an alternate source. A large amount of discussion occurred attempting to determine how to best fit this into the frame work the regulations allow. The initial conclusion was to amend the existing modification to apply for a corrective action module that would specify the proposed contamination assessment plan (alternate source demonstration), and a proposed corrective action plan if the ASD was not approved by DEQ. It was determined that if the ASD was not approved then change from compliance monitoring with ASD to corrective action could not occur with out a permit application with public comment period. Therefore, it was agreed that the permit modification request for clean closure of HWMU 5 with an ASD for TCE would continue. The permit will include a negotiated compliance schedule with milestone dates. A comment indicating that DEQ may extend these dates upon request of the permittee will be included to allow a small schedule slip without noncompliance or permit modification. If the ASD assessment is completed but does not support an ASD then a permit modification with associated fee to enter corrective action would be required. The modification and corrective action plan would be due in less than 180 days, likely 60 or 90 days since additional time has been allotted to establish an ASD.

**Item 3. Request for Reduced Groundwater Constituent Monitoring for Units 5, 7, 10, and 16, currently in Post Closure Care.**

**SUMMARY:** DEQ indicated that the December 14 submission was reviewed and could be accepted as proposed.

**Item 4. Addition of Module V: Groundwater Compliance Monitoring Program to the Permit for the Treatment of Hazardous Waste by Open Burning**

*1. In reference to the statistical evaluation of background, the memo references arsenic changing from 5 µ/L to 3 µ/L, but it appears that Module V Attachment V.C-2 changed antimony by mistake. Also, since the QL for arsenic by Method 6010B is 5 µ/L, ATK requests the background value be reverted to the QL.*

**SUMMARY: DEQ agreed that setting the background at the QL of 5 µ/L was acceptable.**

*2. Section V.D Groundwater Protection Standards (GPS) references a Permit Attachment V.E that was not included in the enclosure. The memo references a change in the perchlorate GPS from 24.5 µ/L to 26 µ/L based on the EPA Region III Risk-Based Concentration (RBC) as the only change from the original proposal. ATK agrees with this change.*

**SUMMARY: DEQ provided a copy of the GPS Table previously sent by e-mail in December. The table showed the changes to the Arsenic and Barium background values and the perchlorate ACL. DEQ agreed to update the Arsenic background value to 5. It was also noted that the perchlorate value in the ACL column (26) did not match the perchlorate value in the GPS column (24.5); DEQ agreed to update the GPS column to 26.**

*3. The text of Section V.D appears to establish the priority of setting the GPS to include the Region 3 RBC in front of the DEQ ACL. The initially submitted proposed GPS list prioritized the DEQ ACL over the RBC. Therefore, some revisions to the GPS table may be possible.*

**SUMMARY: DEQ indicated that the only reason that Region 3 RBCs were mentioned was because Perchlorate did not have an MCL, or ACL. Rather than set the GPS at the background value, the EPA Region 3 RBC was used as the GPS.**

*4. The text of Section V.D.1 establishes that DEQ may modify the permit based on changes to MCLs or RBCs. However, a Class 3 permit modification is required to update a GPS based on DEQ ACLs to a "less stringent" GPS. ATK requests that this language be clarified to establish that the permitee is not required to submit a permit modification (Class 1 or Class 3) when a DEQ ACL changes, although the DEQ may pursue one. DEQ appears to be updating ACLs two to four times per year. An alternate compliance strategy would be to waive the permit*

*modification fee since the effort required to update the permit GPS is not consistent with the fee schedule for a class 3 permit modification.*

**SUMMARY: RFAAP wanted to be assured that this language did not require the permittee to submit a permit modification when DEQ revises an ACL. DEQ agreed that a permit amendment was not required from the permittee, but indicated that DEQ may review the ACL changes about annually and decide if the changes were significant enough to warrant DEQ pursuing a permit amendment.**

*5. The Module V submitted with the permit modification made it clear that any or all analytical results could be verified by resampling within thirty (30) days of receipt of the laboratory data. The revised Module V clearly allows resampling for the Appendix IX monitoring event newly detected constituents, but is not clear concerning resampling for the standard semiannual monitoring. RFAAP would like to insert language that allows verification sampling for all results. Perhaps V.H.3 would be an appropriate location.*

**SUMMARY: DEQ indicated that regulations clearly allow verification sampling for Appendix IX newly detected compounds but do not specify verification events for other sampling. The procedures in V.I.3 Alternate Source Demonstration allow the permittee to demonstrate a GPS exceedence is "due to error in sampling, analysis, or statistical evaluation or due to natural variation." A resampling event can support such a demonstration.**

*6. Section V.H.4 <u>Determination of Additional Constituents Present</u> requires a comparison to background for newly detected compounds. It may be more appropriate to refer the permitee to section V.H.5 to develop background and section V.H.7 to add the constituent to the monitoring list in Attachment V.B as a class 1 permit modification.*

**SUMMARY: DEQ indicated they would review this comment and make appropriate changes.**

**<u>Item 5. Addition of Module VII: Regulated Corrective Action to the Permit for the Treatment of Hazardous Waste by Open Burning</u>**

**SUMMARY: There was a significant amount of discussion on the pros and cons of the source identification approach versus unit characterization approach. RFAAP indicated that the regulatory driver was the perchlorate detections above the proposed GPS. However, historical carbon tetrachloride (CT) detections above the proposed GPS and trichloroethylene (TCE) detections at about half of the proposed GPS lead to the inclusion of CT and TCE and associated daughter compounds. Since DEQ had increased the scope of the characterization, RFAAP proposed focusing the investigation on the western area near MW3, MW4, and MW5, and delete analysis for TCE. DEQ indicated that there was a lot of space between the existing monitoring wells and that the characterization could be focused on the western area but the eastern end could not be omitted. DEQ was also firm on the fact that all selected sampling locations (soil and groundwater) should be analyzed for perchlorate and CT/daughters. In addition, DEQ declined the suggestion that the borings placed along the southern border be restricted to just a groundwater sample. Therefore, at a minimum all borings will be sampled at the visual interface of fill materials and native soils, and in the six inches just above the water table. If there is no visual interface a sample will be collected at the first confining layer of soils or clay. If contamination is evident (based on PID readings, olfactory observations, visual characterization, etc.) a sample shall be taken at the area of obvious contamination and at least every 6 feet thereafter. If no obvious contamination is evident only the minimum of two (2) samples is required. A groundwater sample will be collected from each boring using a temporary well casing and screen. Each boring will be abandoned soon after collection of the groundwater sample.**

**Once the sampling method and analyses were determined the boring locations were discussed. A color 11" by 17" figure was distributed that showed the original plan's proposed 14 boring locations and the DEQ's proposed ten (10) additional locations and two (2) moved locations. A thorough discussion of each proposed location was conducted and a consensus was reached on the location of 21 borings. A map showing the selected locations is attached. It was agreed not to collect the two background locations DEQ recommended since it was agreed that what is being found is coming from the unit. In addition it was agreed that the two locations DEQ recommended outside the fence would be relocated inside the fence as close to the toe of the berm that the Stormwater drainage structure (subsurface textile wrapped stone) would allow.**

**After the locations were selected the contents of the permit section were discussed. The corrective action plan needs to describe what we plan to do. It should include the source identification process, the evaluation to be conducted to specify removal, and the actions to be conducted for groundwater (likely monitored natural attenuation). DEQ recommended that a contingency plan be included incase source removal of monitored natural attenuation are not successful. RFAAP asked if there were some examples of the Module VII that could be provided to be used as templates. DEQ indicated that they would send some. (received 1-24-08)**

**Item 6. Modification to Module II Attachment IIC: Soil Monitoring Program of the Permit for the Treatment of Hazardous Waste by Open Burning**

RFAAP requested, in December 14 response, a reduction in the parameters to be analyzed at the non-pad soil sampling locations, since elimination was not accepted.

**SUMMARY: DEQ indicated that their review is not complete, but would continue reviewing with an anticipated completion date of about 2-3 weeks.**

**Item 7. Modification to Module III B.3 Risk-based limits of the Permit for the Treatment of Hazardous Waste by Open Burning**

RFAAP and DEQ conducted a teleconference on December 18, 2007. Has DEQ completed the review of the proposal or need additional information?

**SUMMARY: DEQ indicated that the risk assessor needed to finish discussing the issues with a couple more experts.**

**Schedule**

Due to the complexity of Item 2, Item 5, and potentially Item 7, RFAAP would like to broach the possibility of doing two (2) public notices for this single permit action. This would allow the "simple" items to proceed, while to complex items are processed.

**SUMMARY: DEQ indicated that the modification should proceed as one action. Both parties desire that the permit modification be complete prior to September 30. Final documents need to be ready before the end of July, sooner if possible. The critical path time elements are establishing the schedule for the contamination assessment of TCE in the vicinity of HWMU 5 and finalization of the corrective action plan for the open burning ground.**

Hey Jeremy,

I reviewed the CD you provided me and still need the following.

- These are the maps I needed for Module V:

  Figure V.A.1 OBG/HWMU-13 Geological Cross Section Location Map

  Figure V.A.2 OBG/HWMU-13 Geological Cross Section Figures

  Figure V.A.3 OBG/HWMU-13 Groundwater Monitoring (wells) System Map

  Figure V.A.4 OBG/HWMU-13 Groundwater Elevation Contour Maps (4th and 2nd Quarters 2006) I have these

- You haven't provided me with anything for Module III. Am I to assume you want me to make the updates to the Table and text?

- Also I didn't notice the items below addressed in the Closure Plan for HWMU-7. The Closure Plan you provided was never updated appropriately and should also be updated with any new gw and/or soil analytical data collected from over the years.

Let me know if we need to further discuss. Thanks,

**Matthew M. Stepien**

**Sent:** Tuesday, March 02, 2010 4:28 PM
**To:** 'Flint, Jeremy'
**Subject:** RAAP HWMU - 5 Closure Plan

Hey Jeremy,

I did notice some things that need revised in the Closure Plan (not sure if I am looking at most current version June 2007).

**#1) Page 14 – These are being updated with permit mod**

The analytical data collected during 1996 and subsequent sampling events proved to be more reliable. As a result (and as agreed with the VDEQ), any regulatory decisions with respect to historical analytical data would not be made using any data prior to 1996.) Based on this review, and as presented in Appendix E of Permit Attachment 3 of the Final Permit, **the quarterly groundwater monitoring list for HWMU-7** consists of the following constituents:

Antimony, total Mercury, total 2,4-Dinitrophenol

Arsenic, total Nickel, total 2,4-Dinitrotoluene

Barium, total Selenium, total 2,6-Dinitrotoluene

Cadmium, total Silver, total 4-Nitrophenol

Chromium, total Thallium, total Cyanide, total

Cobalt, total Bis (2-ethylhexyl) phthalate

Lead, total Butyl benzyl phthalate

**#2) Page 35 – Schedule for Closure is incorrect. As part of Class 3 mod we are public noticing the Closure Plan. If it is approved then we will review report and approve closure (see January 2008 meeting summary)**

## 10.0 SCHEDULE FOR CLOSURE

HWMU-7 received certification for closure with waste in place in 1990 and is currently in the Compliance Period, which extends until October 30, 2017. The sampling activities outlined in this *Amended Closure Plan* constitute additional closure activities in support of clean closure of HWMU-7. Based on generator knowledge and previous studies, Radford AAP has determined that residual material contained in HWMU-7 is not a hazardous waste as defined in 40 CFR Part 261. Radford AAP completed the additional sampling activities in accordance with the *Amended Closure Plan* and VDEQ correspondence dated June 25, 2003, in February/March 2004.

It is Radford AAP's understanding that the VDEQ wants Radford AAP to submit a Closure Report and Class III Permit Modification at the same time and that the VDEQ will review both documents together. A Closure Report will be submitted within 90 days of approval of the *Amended Closure Plan.* A Class III Permit Modification will be submitted with the Closure Report if clean closure is demonstrated.

In the event that clean closure is not achieved, HWMU-7 will remain in post-closure care in accordance with the Final Permit (October 4, 2002). If Radford AAP chooses to demonstrate clean closure by removal at a future date, additional closure schedule information will be submitted.

Let me know how you are coming along, things are pretty much ready for Hassan's review on our end.

Thanks,

**Matthew M. Stepien**

# APPENDIX E

## GROUNDWATER COMPLIANCE MONITORING (QUARTERLY) CONSTITUENT AND REQUIRED ANALYTICAL METHOD LIST

| Analyte | METHOD | PQL (ug/l) | MDL (ug/l) |
|---|---|---|---|
| Arsenic, total | 6020 | 10 | 2 |
| Barium, total | 6020 | 10 | 1 |
| Cadmium, total | 6020 | 1 | 0.2 |
| Chromium, total | 6020 | 5 | 1 |
| Cobalt, total | 6020 | 5 | 1 |
| Copper | | 5 | 1 |
| Lead, total | 6020 | 1 | 0.2 |
| Nickel, total | 6020 | 10 | 2 |
| Selenium, total | 6020 | 10 | 3 |
| Silver, total | 6020 | 2 | 0.2 |
| Thallium, total | 6020 | 1 | 0.2 |
| Bis(2-ethylhexyl)phthalate | 8270 | 10 | 0.54 |
| 2,4-Dinitrotoluene | 8270 | 10 | 0.5 |
| 2,6-Dinitrotoluene | 8270 | 10 | 0.46 |
| Cyanide, total | 9010 | 20 | 4 |

Notes:

ug/l = micrograms per liter
PQL = Practical Quantitation Limit
MDL = Method Detection Limit

All methods are as described in EPA's SW-846, Test Methods in support of the RCRA program, December 3, 2008. Web site: http://www.epa.gov/epawaste/hazard/testmethods/index.htm. Single samples are required for each parameter and constituent during each sampling event. Alternate SW-846 Methods may be approved by the Department if the request is in writing and submitted at least 30 days prior to the sample collection event. Proposed alternate methods shall achieve the same practical quantitation limit/estimated quantitation limit (or lower) as the specified method.

**Re: Radford Army Ammunition Plant, Radford, VA**
**EPA ID No.VA1210020730, Approval of Class 3 Permit Modifications**
**Hazardous Waste Management Open Burning Ground (OB) Operating Permit and Post Closure-Care Permit (PCCP)**

Dear Ms. Holt:

Enclosed are the Final Class 3 Modifications to the Open Burning Grounds (OBG) treatment and Post Closure-Care Permits, respectively, for hazardous waste management at the Radford Army Ammunition Plant (RAAP), Radford, Virginia, facility. The Final Class 3 Modifications to the Permits have been approved and will become effective on October 27, 2011.

This final permit decision is in accordance with the Virginia Hazardous Waste Management Regulations (VHWMR), 9 VAC 20-60, 9 VAC-20-60-124, which incorporates 40 CFR Part 124 by reference, and in accordance with 40 CFR § 124.13, Obligation to Raise Issues and Provide Information During the Public Comment Period, which specifies:

> *All persons, including applicants, who believe any condition of a draft permit is inappropriate or that the Director's tentative decision to deny an application, terminate a permit, or prepare a draft permit is inappropriate, must raise all reasonably ascertainable issues and submit all reasonably available arguments and factual grounds supporting their position, including all supporting material, by the close of public comment period (including any public hearing) under §124.10). Any supporting materials which are submitted shall be included in full and may not be incorporated by reference, unless they are already part of the administrative record in the same proceeding, or consists of commonwealth or federal statutes and regulations, documents of general applicability or other generally available reference materials. Commenters*

> *shall make all supporting materials not already included in the administrative record available to the commonwealth as directed by the director.*

The public notice of the 60 day comment period for the draft Class 3 modifications to the two permits was published in the Roanoke Times on August 16, 2007, by the facility. The facility held a public meeting to address the modifications on September 17, 2007. The DEQ published a Public Notice of a 45-day comment period addressing the Class 3 Modifications to the Permits in the Roanoke Times on May 29, 2011. The corresponding radio announcement was broadcast on May 29, 2011, on Radio Station 710 am, WFNR in Blacksburg, Virginia. A public meeting to disseminate information and exchange ideas relevant to the Class 3 permit modifications was held on June 28, 2011. A public hearing to accept oral comments regarding the Class 3 modifications was also held on June 28, 2011. The Draft Permits were assembled after finding the Part B Permit Application, submitted August 9, 2007 with subsequent additions dated October 15 and 17, 2010, complete and technically accurate.

The hazardous waste Permit fee of $45,160 was received by the DEQ on March 15, 2007 and was deposited with the DEQ's Department of Finance account on March 16, 2007.

The DEQ received no comments expressing the opinion that the permit should be denied. Therefore, in accordance with 40 CFR § 124.15, the Director of the DEQ has made a final permit decision to issue the permit modification, for the open burning ground treatment permit and the post closure-care permit. The final permit modification documents are enclosed.

This final permit decision is based upon the supporting rationale provided in the enclosed "Comment Response Summary," dated September 27, 2011, for the Radford Army Ammunition Plant, Radford, Virginia facility which is in accordance with 40 CFR § 124.17. The "Comment Response Summary" specifies which provisions of the draft permit modifications, if any, have been changed in the final permit decision, and the reasons for the change. In addition, this document describes and responds to all significant comments on the draft permit modifications or the permit application in support of the Class 3 modifications that were raised during the public comment period.

In addition, please note that this final permit decision shall become effective 30 days after the service of notice of this decision unless a review or an appeal is requested on the permit under the VHWMR, 9 VAC 20-60-124. Appeals under the VHWMR do not incorporate the appeals process under 40 CFR § 124.19. Appeals under the VHWMR will be in accordance with the Administrative Process Act, Chapter 40, § 2.2-4000 et seq., of Title 2.2 of the Code of Virginia. All federal regulatory references to the appeals process or the EPA Environmental Appeals Board, such as in 40 CFR § 124.5, shall be construed to mean the administrative processes and appeals processes as specified by Virginia's Administrative Process Act.

As provided by Rule 2A:2 of the Supreme Court of Virginia, you have 30 days from the date of service of this decision to initiate a legal appeal by filing a notice of appeal with:

David K. Paylor, Director
Department of Environmental Quality
629 East Main Street
PO Box 1105
Richmond VA 23218

In the event that this decision is served to you by mail, the date of service will be calculated as three days after the postmark date. Please refer to Part 2A of the Rules of the Supreme Court of Virginia, which describes the required content of the Notice of Appeal, including specifications of the Circuit Court to which the appeal is taken, and additional requirements concerning appeals from decisions of administrative agencies.

If you should have any further questions regarding this matter please contact Russell McAvoy, Jr., Environmental Engineer Senior, of my staff by phone at (804) 698-4194 or by e-mail at russell.mcavoy@deq.virginia.gov.

Sincerely,

Leslie A. Romanchik

## HAZARDOUS WASTE MANAGEMENT POST-CLOSURE CARE PERMIT

PERMITTEES: **Radford Army Ammunition Plant**
Alliant Ammunition and Powder Company, L.L.C.
Route 114, P.O. Box 1
Radford Army Ammunition Plant
Radford, VA 24141-0100

US Army Radford Army Ammunition Plant
Route 114, P.O. Box 2
Radford Army Ammunition Plant
Radford, VA 24141

EPA I.D.#: **VA1210020730**

Pursuant to Chapter 14, Section 10.1-1426, Code of Virginia (1950), as amended and regulations promulgated thereunder by the Department of Environmental Quality (hereinafter referred to as the Department), a Post-closure Permit is issued to the United States Army and Alliant Techsystems Inc. (hereinafter referred to as the Permit and the Permittees), for the post-closure care of four closed hazardous waste management units (HWMU) of one hazardous waste disposal facility: Unit 5, Unit 7, Unit 10, and Unit 16. The facility is located in Montgomery and Pulaski Counties at Route 114, PO. Box 1, Radford, Virginia, 24141-0100.

HWMU-5 is a former lined surface impoundment (Neutralization Pond) located at latitude 37°11'12" North and longitude 80°32'15" West. HWMU-7 is a former closed surface impoundment (Unlined Holding and Neutralization Basin) located at 37°11'12" N longitude and 80°33'15" W latitude. HWMU-10 is a Closed Equalization Basin for the Biological Treatment System located at latitude 37°11'31" North and longitude 80°31'51" West. HWMU-16 is a closed hazardous waste landfill located at latitude 37°11'49" North and longitude 80°31'26" West.

These four HWMUs, 5, 7, 10, and 16, at the above facility are currently limited to the following activities: maintenance and monitoring of three closed hazardous waste surface impoundments (5, 7 and 10) and one hazardous waste landfill (16).

The Permittees shall comply with all terms and conditions set forth in this Permit including all attachments. If the Permit and the attachments conflict, the wording of the Permit shall prevail. The Permittees shall also comply with all applicable regulations contained in the Virginia Hazardous Waste Management Regulations (VHWMR) as codified in Title 9 of the Virginia Administrative Code, Agency 20, Chapter 60 (9 VAC 20-60) and in 40 CFR 124, 260, 261, 262, 264, 265, 268, and 270 as adopted by reference in these regulations (for convenience, wherever regulations adopted by reference are cited in this Permit and the attachments, citations will be only those from 40 CFR). The Commonwealth of Virginia has received authorization for these programs under Section 3006(b) of the *Resource Conservation and Recovery Act* (RCRA), 42 U.S.C. § 6926(b), to administer and enforce in lieu of the federal hazardous waste management program under RCRA. Applicable regulations are those which are in effect on the date of final administrative action on this Permit (9 VAC 20-60; *Virginia Hazardous Waste Management Regulations*, Amendment 15A, effective March 13, 2002) as well as any self implementing statutory provisions and related regulations which are automatically applicable to the Permittees' hazardous waste management activities, notwithstanding the conditions of this Permit.

This Permit is based on the administrative record and the assumption that the information submitted by the Permittees and contained in the administrative record is complete and accurate. The Permittees' failure in the application or during the Permit issuance process to fully disclose all relevant facts, or the Permittees' misrepresentation of any relevant facts at any time, shall be grounds for the termination or modification of this Permit pursuant to 40 CFR 124.5, 270.41, and 270.43 and shall also be grounds for initiation of an enforcement action. The Permittees' shall inform the Department of any deviations from permit conditions or changes from information provided in the application. In particular, the Permittees' shall inform the Department of any proposed changes that might affect the ability of the Permittees to comply with applicable regulations and/or permit conditions, or which alter any of the conditions of the Permit in any way.

This Permit is effective as of **November 4, 2002** and shall remain in effect until **November 4, 2012** unless revoked and reissued in accordance with 40 CFR 124.5 and 270.41, terminated in accordance with 40 CFR 270.43, or continued in accordance with VHWMR 9 VAC 20-60-270.B.5.

## SW-846 INORGANIC DATA REVIEW SUMMARY

Draper Aden Associates (DAA) performed a limited review of the analytical results for the October 31-November 1, 2002 soil sampling event at hazardous waste management units 5 and 7, Radford Army Ammunition Plant (RAAP)/Alliant Ammunition and Powder Company, Montgomery County, Virginia. Soil samples were collected from locations 5GP-1 (1-2'), 5GP-1 (9-10'), 5GP-3 (9-10'), 5GP-6 (10-11'), 5GP-8 (7-8'), 5GP-8 (11-12'), 5 GP-12 (3-4'), 5GP-16 (3-4'), 7GP-1 (1-3'), 7GP-2 (8-12'), 7GP-2 (13.5-14.5'), 7GP-3 (10-11'), 7GP-4 (3-4'), 7GP-5 (6-11'), 7GP-8 (5-8') and 7 GP-16 (3-4').

DAA performed a limited review of the analytical results for twenty-two metal target analytes analyzed per SW-846 Method 6010B, one metal target analyte analyzed per SW-846 7471A and one metal target analyte analyzed per SW-846 9012A. Inductively coupled plasma (ICP), cold vapor atomic absorption (CVAA) and colorimetric were the techniques on which the individual analytical methods for each of the inorganics were based.

Soil samples were collected and submitted to the laboratory for analysis of the following metals: ICP Method 6010B (aluminum, antimony, arsenic, barium, beryllium, cadmium, calcium, chromium, cobalt, copper, iron, lead, magnesium, manganese, nickel, potassium, selenium, silver, sodium, thallium, vanadium and zinc), Method 7471A (mercury) and Method 9012A (total cyanide).

Severn Trent Laboratories (STL) of North Canton, Ohio performed the inorganic analyses. On behalf of RAAP, STL submitted results to Draper Aden Associates in a final certificate of analysis which included sample analytical results as well as relevant documentation to verify and validate the results.

The evaluation of STL's compliance with inorganic analytical methods and validation of results presented here are based upon a limited review of QA/QC information including chain of custody, case narrative, holding time, preservation procedures, standards, spike analysis on sample matrix (S), blank samples analyses (method, calibration and other blanks), and duplicate analyses (SD) results. Review was limited to summary sheets provided by the laboratory, unless a notable discrepancy in the data package required review of the raw data. Additionally, sample results were recalculated and verified for arsenic and cyanide, sample 7GP-3(10-11'). A summary of data review results and any observed deviations is provided below.

STL received the samples on ice and in good condition. All technical holding time criteria were met.

***Method 6010B***

The original certificate of analysis appeared complete in its presentation and the data were of acceptable quality. The data set exhibited the laboratory's ability to achieve the reported limit of quantitation (LOQ) for each target parameter, as outlined by the method detection limit study.

All instrument calibration and calibration verification criteria were met. Blank samples, calibration standards, pre-digestion spikes and duplicates were analyzed as required. All laboratory control samples, pre-digestion spikes and duplicates were recovered within control limits, except where noted below. Duplicate sample results exhibited acceptable precision, where applicable. All LOQ standards exhibited acceptable recovery. Deviations from specific quality control criteria that were identified and noted during the data review process are summarized below.

The associated blanks were not interference free, however, data qualification was necessary for only antimony. Antimony was reported in all samples less than the LOQ, however, all antimony results were attributed to laboratory contamination.

Antimony, chromium, vanadium, recovered low in the matrix spike sample and all results for these target parameters were qualified as estimated and should be considered biased low.

The laboratory presented all results in mg/kg and on a dry weight basis. Except where noted above, all sample results remain as reported by the laboratory. All results unaffected by the data validation process and/or detected less than their corresponding LOQs were validated and reported as "U." Refer to the attached table titled "Data Validation Report" for a summary of results which required data validation.

***Methods 7471A (CVAA/ 9012A(Colorimetric)***

The original certificate of analysis appeared complete in its presentation and the data were of acceptable quality. The data set exhibited the laboratory's ability to achieve the reported limit of quantitation for mercury and cyanide, as outlined by the method detection limit study.

All instrument calibration and calibration verification criteria were met. Blank samples, LCS samples, pre-digestion spikes and spike duplicates were analyzed as required. All blank criteria were met, except where noted below. Laboratory duplicate sample results exhibited acceptable precision, where applicable. All laboratory control samples, pre-digestion spikes and duplicates were recovered within control limits. Deviations from specific quality control criteria that were identified and noted during the data review process are summarized below.

The associated blanks were not interference free, however, data qualification was necessary for only cyanide. Cyanide was reported less than the LOQ in 5 GP-1(9-10') and 5-GP-6(10-11') and results were attributed to laboratory contamination. Cyanide reported above the LOQ in 7GP-3(10-11') was not influence by the observed laboratory blank contamination and no data qualification was required.

The laboratory presented all results in mg/kg and on a dry weight basis. Except where noted above, all sample results remain as reported by the laboratory. All results unaffected by the data validation process and/or detected less than their corresponding LOQs were validated and reported as "U." Refer to the attached table titled "Data Validation Report" for a summary of results which required data validation.

## INORGANIC DATA EVALUATION FOR ICP SW-846 METHOD 6010B-SOILS

**Sample ID:** 5GP-1 (1-2'), 5GP-1 (9-10'), 5GP-3 (9-10'), 5GP-6 (10-11'), 5GP-8 (7-8'), 5GP-8 (11-12'), 5 GP-12 (3-4'), 5GP-16 (3-4'), 7GP-1 (1-3'), 7GP-2 (8-12'), 7GP-2 (13.5-14.5'), 7GP-3 (10-11'), 7GP-4 (3-4'), 7GP-5 (6-11'), 7GP-8 (5-8'), 7 GP-16 (3-4')

**QC Samples:** Lab blanks, Pre-digestion spikes, Duplicates, ICS, LCS, etc.
- Matrix spike/duplicate-7GP5(6-11')

**Laboratory:** STL, North Canton, OH; SDG A2K040189

Does Laboratory analyte list correspond to analyte list requested by DAA? _X_ yes ___ no

"☑" denotes items reviewed. See Data Validation Summary for additional comments.

### A. QC DOCUMENTATION CRITERIA

☑ Specific LODs for all target analytes
☑ Specific LOQs for all target analytes

### B. TECHNICAL HOLDING TIMES AND PRESERVATION REQUIREMENTS:

☑ 6 month holding time

### C. INSTRUMENT CALIBRATION CRITERIA:

☑ 1 calibration blank and at least 1 standard

### D. INITIAL AND CONTINUING CALIBRATION VERIFICATION CRITERIA:

☑ 10 sample frequency
☑ Use of calibration blank and check standard
☑ %R within 90-110% range

**E. BLANK SAMPLES ANALYSES CRITERIA:**

- ☑ Method/Other Lab Blanks (check only if analyzed)
- ☑ Interference free
- ☑ CCB 10 sample frequency

**F. INTERFERENCE CHECK SAMPLES (ICS) CRITERIA:**

- ☑ ICS (80-120%)

**G. DUPLICATE ANALYSES CRITERIA:**

- ☑ One spike/sample duplicate per batch of samples
- ☑ %RPD ± 20% for spike/ sample values greater than 5 X LOQ
- ☑ {spike/sample ± LOQ} when spike/sample values are less than 5 X LOQ

**H. SPIKED SAMPLES ANALYSES /LCS CRITERIA:**

- ☑ %R within 75-125% range/ 80-120%

**I. SAMPLE RESULTS CRITERIA:**

- ☑ Samples fall within ICP linear concentration ranges

**Revisions:** No revisions were required. Prep method 3050B

DAA conducted a limited data validation of the above noted data set using the data package provided by the analyzing laboratory. Data evaluation was conducted using SW-846 (Test Methods for Evaluating Solid Waste-Physical/Chemical Methods, USEPA, SW-846, 3rd Edition-Final Update I, II/IIA and III) method requirements and CLP data validation guidelines (USEPA Contract Laboratory Program National Functional Guidelines for Inorganic Data Review, February 1994). Validation of this data set is limited to review of items detailed in this data review report.

## INORGANIC DATA EVALUATION FOR MERCURY- BY COLD VAPOR AA METHOD 7471A

**Sample ID:** 5GP-1 (1-2'), 5GP-1 (9-10'), 5GP-3 (9-10'), 5GP-6 (10-11'), 5GP-8 (7-8'), 5GP-8 (11-12'), 5 GP-12 (3-4'), 5GP-16 (3-4'), 7GP-1 (1-3'), 7GP-2 (8-12'), 7GP-2 (13.5-14.5'), 7GP-3 (10-11'), 7GP-4 (3-4'), 7GP-5 (6-11'), 7GP-8 (5-8'), 7 GP-16 (3-4')

**QC Samples:** Lab blanks, Pre-digestion spikes, Duplicates, LCS, Matrix spike/duplicate-7GP5(6-11')

**Laboratory:** STL, North Canton, OH; SDG A2K040189

Does Laboratory analyte list correspond to analyte list requested by DAA? √yes ___no

"☑" denotes items reviewed. See Data Validation Summary for additional comments.

### A. QC DOCUMENTATION CRITERIA

☑ Specific LODs for all target analytes
☑ Specific LOQs for all target analytes

### B. METHOD INFORMATION DOCUMENTATION

☑ All target parameters analyzed by requested methods?

### C. TECHNICAL HOLDING TIMES AND PRESERVATION REQUIREMENTS:

☑ 28 Day holding time
☑ Cool 4°C

### D. INSTRUMENT CALIBRATION CRITERIA:

☑ 1 calibration blank and 5 standards
☑ Instrument calibrated for every analytical sequence for every method

**E. INITIAL AND CONTINUING CALIBRATION VERIFICATION CRITERIA:**

- ☑ 10 sample frequency for CCV
- ☑ %R within 90-110% range

**F. BLANK SAMPLES ANALYSES CRITERIA:**

- NA Trip Blank (check only if analyzed)
- NA Equipment Blank (check only if analyzed)
- ☑ Method/other laboratory blanks (check only if analyzed)
- ☑ Interference free
- ☑ CCB 10 sample frequency

**G. DUPLICATE ANALYSES CRITERIA:**

- ☑ One spike/sample duplicate per batch of samples
- ☑ %RPD ± 20% for spike/sample values greater than 5 X LOQ
- ☑ {spike/sample ± LOQ} when spike/sample values are less than 5 X LOQ

**H. SPIKED SAMPLES ANALYSES/LCS CRITERIA:**

- ☑ Pre-digestion matrix spikes for all analytes
- ☑ %R within 75-125% range/80-120%

**I. SAMPLE RESULTS CRITERIA:**

- ☑ Samples fall within calibration concentration range

**J. Revisions:** No revisions were required.

DAA conducted a limited data validation of the above noted data set using the data package provided by the analyzing laboratory. Data evaluation was conducted using SW-846 (Test Methods for Evaluating Solid Waste-Physical/Chemical Methods, USEPA, SW-846, 3rd Edition-Final Update I, II/IIA and III) method requirements and CLP data validation guidelines (USEPA Contract Laboratory Program National Functional Guidelines for Inorganic Data Review, February 1994). Validation of this data set is limited to review of items detailed in this data review report.

### A. QC DOCUMENTATION CRITERIA

☑ Specific LODs for all target analytes
☑ Specific LOQs for all target analytes

### B. TECHNICAL HOLDING TIMES AND PRESERVATION REQUIREMENTS CRITERIA:

☑ 14 days holding time
☑ Cool 4° C

### C. INSTRUMENT CALIBRATION CRITERIA:

☑ 6 levels plus blank

### D. INITIAL AND CONTINUING CALIBRATION VALIDATION CRITERIA:

☑ 20 sample frequency
☑ Use of check standard with every batch of samples
☑ %R within 85-115% range (± 15%)

### E. BLANK SAMPLES ANALYSES CRITERIA:

☑ Interference free

☑ Verification Blank analysis every 20 samples

**F. DUPLICATE SAMPLE ANALYSES CRITERIA:**

☑ One duplicate for every 20 samples
☑ %RPD ± 20% for sample values greater than 5 times LOQ
☑ (Sample ± LOQ) when values are less than 5 times LOQ

**G. SPIKED SAMPLE ANALYSES CRITERIA:**

☑ One spike for every 20 samples
☑ Spikes fall within 85-115% range

**H. LCS CRITERIA:**

☑ 80-120%

**I. SAMPLE RESULTS CRITERIA:**

☑ Samples fall within calibration concentration range

DAA conducted a limited data validation of the above noted data set using the data package provided by the analyzing laboratory. Data evaluation was conducted using SW-846 (Test Methods for Evaluating Solid Waste-Physical/Chemical Methods, USEPA, SW-846, 3rd Edition-Final Update I, II/IIA, and III) method requirements and CLP data validation guidelines (USEPA Contract Laboratory Program National Functional Guidelines for Inorganic Data Review, February 1994). Validation of this data set is limited to review of items detailed in this data review report.

**SW-846 METHODS 8081A**
**VOLATILE DATA REVIEW SUMMARY**

Draper Aden Associates (DAA) performed a limited review of the analytical results for the October 31-November 1, 2002 soil sampling event at hazardous waste management units 5 and 7, Radford Army Ammunition Plant (RAAP)/Alliant Techsystems. Soils samples were collected from sixteen sample locations (see page 3 for specific sample identifications). All soil samples were analyzed for twenty-eight (28) pesticides and polychlorinated biphenyls (PCBs) per USEPA Methods 8081A.

Lancaster Laboratories (Lancaster) of Lancaster, Pennsylvania performed the analyses. On behalf of RAAP, Lancaster submitted results to DAA in a final certificate of analysis, which included sample analytical results as well as relevant documentation to validate and verify the results.

The evaluation of laboratories' compliance with Method 8081A and validation of the results was based on a limited review of the following items: quality control (QC) deliverables package, QC history documentation, case narrative, technical holding time and preservation requirements, extraction procedures, instrument calibrations, blank analysis, surrogate spike recoveries, retention time, matrix spike (MS/MSD) analyses, laboratory control samples (LCS), and internal standards requirements, where applicable. A review of all transcriptions from instrument data to sample summary sheets was performed. Specific representative calculations were performed. The following information is intended to summarize data review results and any observed significant deviations from method and/or contractual requirements.

The laboratory received the samples on ice and in good condition with custody seals intact. All technical holding time criteria were met. All sample extraction and analysis holding time criteria were met. All preservation criteria were met.

***Method 8081A***

The original certificate of analysis for Method 8081A was complete in its presentation and the data were of acceptable quality. The data set exhibited the laboratory's ability to achieve the reported limit of quantitation (LOQ) for each target parameter, as outlined by the method detection limit study.

All QC history documentation and QC check sample criteria were met. All initial calibration, calibration verification, breakdown check, blank, surrogate, retention time, MS/MSD and LCS criteria were met.

Sample results were reviewed for transcription errors from the instrument data to the laboratory report and no errors were noted. Deviations from specific quality assurance and quality control criteria that were identified during the review process are summarized below.

Sample analysis by Method 8081A included PCBs. However, since the LCS and MS/MSD samples were not spiked with PCBs, all PCB results were qualified as estimated due to limited availability of quality control data.

All sample results were reported on a dry-weight basis. All samples were florisil cleaned. To obtain a final result within the instrument calibration range, sample dilutions were required, where appropriate.

Target parameters reported above the LOQ remain as reported by the laboratory. All sample results unaffected by the data validation process and/or detected less than their corresponding LOQs were validated and reported as "U" (i.e., not detected above the LOQ). Refer to the attached table titled "Data Validation Report" for a summary of results which required data validation.

**SW-846 METHOD 8081A (ORGANOCHLORINE PESTICIDES/PCBs)**
**GC DATA VALIDATION FOR SOILS**

**Sample ID:** 5GP-1(1-2'), 5GP-1(9-10'), 5GP-6(10-11'), 5GP-3(9-10'), 5GP-8(7-8'), 5GP-8(11-12'), 5GP-16(3-4'), 5GP-12(3-4'), 7GP-1(1-3'), 7GP-2(8-12'), 7GP-2(13.5-14.5'), 7GP-3(10-11'), 7GP-8(5-8'), 7GP-5(6-11'), 7GP-16(3-4'), 7GP-4(3-4')

**QC Samples:** 7GP-5(6-11') Matrix spike/Matrix spike duplicate, Extraction Blank, LCS

**Laboratory:** Lancaster Laboratories, Lancaster, PA, SDG RAR01-01

***Comments: Method 8081A involves the extraction of samples usingSW-846 Method 3550B-ultrasonic extraction. Target parameters are separated and quantified by GC using electron capture detection (ECD). All samples were florisil cleaned.***

## A. QC DELIVERABLES PACKAGE:

| | | |
|---|---|---|
| 1. | Was case narrative present and signed by a laboratory representative? | ☑ YES ☐ NO |
| 2. | Was the Chain of Custody present and signed by a laboratory representative? | ☑ YES ☐ NO |
| 3. | Were sample results included for all sample locations? | ☑ YES ☐ NO |
| 4. | Did the laboratory parameter list correspond to project specific parameter list? | ☑ YES ☐ NO |
| 5. | Were the LOQs reported on sample summary sheets supported by the MDL study? | ☑ YES ☐ NO |
| 6. | Did the electronic deliverable list the correct LOQs? | ☑ YES ☐ NO |

**Comments:** All QC deliverables requirements were met.

## B. INSTRUMENT QC HISTORY DOCUMENTATION CRITERIA:

| | | |
|---|---|---|
| 1. | Was the specific extraction method specified? | ☑ YES ☐ NO |
| 2. | Was documentation of DDT/Endrin breakdown study provided? | ☑ YES ☐ NO |
| 3. | Were instrument specific LODs for the target parameters provided? | ☑ YES ☐ NO |
| 4. | Were instrument specific LOQs for the target parameters provided? | ☑ YES ☐ NO |
| 5. | Were instrument specific working ranges for target parameters specified? | ☑ YES ☐ NO |
| 6. | Were sample analysis log sheets provided? | ☑ YES ☐ NO |

7. Were chromatograms and integration reports provided? ☑ YES ☐ NO

**Comments:** All instrument QC history criteria were met.

## C. CHECK SAMPLE CRITERIA:
***(Initial Demonstration of Capability)***

1. Was the check sample data obtained from the instrument that was used for analysis? ☑YES ☐ NO
2. Did the check sample contain all required target parameters? ☑ YES ☐ NO
3. Were the check samples analyzed in quadruplicate? ☑ YES ☐ NO
4. Were the average recoveries of the target parameters in the check samples reported? ☑ YES ☐ NO
5. Were the standard deviations for the recoveries of target parameters quadruplicated and reported? ☑ YES ☐ NO

**Comments:** All check sample criteria were met.

## D. TECHNICAL HOLDING TIME AND PRESERVATION CRITERIA:

1. Was the 7-day sample collection to extraction holding time met? ☑ YES ☐ NO
2. Was the 40-day extraction to analysis holding time met? ☑ YES ☐ NO
3. Were the samples received at 4°C (± 2°C)? ☑ YES ☐ NO

**Comments:** All preservation criteria were met. All sample extraction and analysis holding time criteria were met.

## E. INITIAL GC CALIBRATION CRITERIA:

1. Were all target parameters included in the ICAL? ☑ YES ☐ NO
2. Was a minimum five-point calibration analyzed prior to analysis? ☑YES ☐ NO
3. Calibration type used by laboratory: *External.*
4. Was the % Relative Standard Deviation (%RSD) for all target parameter CFs <20% over the established working range? ☑ YES ☐ NO
5. State the Quantitation Method used by the laboratory: *Calibration Factor.*
6. List target parameters with a % RSD >20% over the established working range: *None.*
   Note: Up to 2 target parameters may exceed the 20% criteria, but must be <30%.

7. Was the lowest concentration calibration standard at or below the LOQ, MCL, regulatory compliance or action limit? ☑ YES ☐ NO
8. Were calibration standards dropped to meet calibration criteria? ☑NA ☐YES ☐ NO

**Comments:** All initial calibration criteria were met. The lowest calibration standard for 4,4-DDD was manually calculated to verify the calibration standard concentration was less than the LOQ.

## F. DDT / ENDRIN BREAKDOWN CHECK CRITERIA:

1. Was a 4,4'-DDT and Endrin standard analyzed every 12-hours? ☑ YES ☐ NO
2. For every 12-hours, was 4,4'-DDE, 4,4'-DDD, Endrin Ketone or Endrin Aldehyde present which indicated breakdown? ☑ YES ☐ NO
3. Was the calculated % breakdown less than 15%? ☐ NA ☑ YES ☐ NO
   If no, corrective action must be taken before proceeding with analysis.

**Comments:** All DDT/Endrin breakdown criteria were met.

## G. CALIBRATION VERIFICATION CRITERIA:

1. Was a calibration verification (CV) standard performed once every 12-hours? ☑ YES ☐ NO
2. Did target parameter responses have a % Difference (%D) within ± 15%? (For chlordane and toxaphene, qualify only 3 peaks). ☑ YES ☐ NO
   If no, was a new calibration curve prepared? *No.*
3. Was a mid-concentration standard analyzed after each group of 20 samples (10 recommended) and at the end of the analytical sequence? ☑YES ☐ NO
4. Were all target parameters and surrogates included in the CV? ☑ YES ☐ NO

**Comments:** All calibration verification criteria were met.

## H. BLANK CRITERIA:

1. Was a blank analyzed prior to the batch samples? ☑ YES ☐ NO
2. Was a blank analyzed after 20 batch samples? ☐ NA ☑ YES ☐ NO
3. Was an extraction blank analyzed with the batch samples? ☑ YES ☐ NO

4 Was a trip blank analyzed per analytical batch? ☑ YES ☐ NO

5. List target parameters identified in the blanks: *None.*

**Comments:** All blank criteria were met.

## I. SURROGATE CRITERIA:

1. Were all samples, standards, blanks, and checks spiked with at least 2 surrogate parameters for dual column analysis? ☑ YES ☐ NO
2. List surrogate used and laboratory's surrogate % recovery range criteria:
   tetrachloro-xylene (TCMX): 40%-130%
   decachlorobiphenyl (DCBP): 40%-130%
   4-chloro-3-nitrobenzotrifluoride (CNBT): 40%-130%
3. List samples whose surrogate % recoveries were not within the laboratory range: *None*

**Comments:** All surrogate recovery criteria were met.

## J. RETENTION TIME CRITERIA:

1. Were the daily Retention Time (RT) windows reported? ☑ YES ☐ NO

**Comments:** All retention time criteria were met.

## K. MATRIX SPIKE/ MATRIX SPIKE DUPLICATE CRITERIA:

1. Was a MS/MSD analyzed per sample batch or every 20 samples, whichever may occur first? ☑ YES ☐ NO
2. Did the MS/MSD contain required target parameters? See comment section
3. Was the MS/MSD analyzed on the specific project matrix? ☑ YES ☐ NO
4. List laboratory's matrix spike % recovery range criteria: *40%-130%, select analytes*
5. List matrix spike target parameters not within the recovery range criteria: None
6. Was a LCS analyzed to address failed matrix spike criteria? ☑ NA ☐ YES ☐ NO
7. Did the LCS for the failed matrix spike

parameter(s) fall within the recovery range criteria and was the problem identified as matrix interference? ☑ NA ☐ YES ☐ NO

8. Were any parameters flagged as estimated concentrations? ☐ YES ☑ NO
9. List parameters flagged as estimated concentrations:

**Comments:** The QC samples were not spiked with PCBs. All PCB results were qualified as estimated due to insufficient quality control data. All other matrix spike criteria were met.

## L. LABORATORY CONTROL SAMPLE (LCS) CRITERIA:

1. Was a LCS included in the sample analysis? ☑ YES ☐ NO
2. Did the LCS contain all required target parameters?*select analytes* ☑ YES ☐ NO
3. List the LCS parameters and the laboratory's recovery range criteria. *See certificate of analysis.*
4. List the LCS parameters not within the recovery range criteria. *None.*

**Comments:** The LCS was not spiked with PCBs. All PCB results were qualified as estimated due to insufficient quality control data. All other LCS data were met.

## M. TARGET PARAMETER IDENTIFICATION:

1. Were the reported parameters within the retention time windows? ☑ NA ☐ YES ☐ NO
2. Were retention time shifts observed when compared with the last calibration verification? ☐ YES ☑ NO
3. Were all reported parameters confirmed? ☑ YES ☐ NO
4. Did the initial analysis of any sample have a concentration of a target parameter which exceeded the instrument calibration range? ☑ NA ☐ YES ☐ NO
5. Were sample dilutions required? ☑ YES ☐ NO
6. Were all parameter concentrations that were recorded on the sample quantitation reports accurately transferred to the sample summary sheets? ☑ YES ☐ NO

**Comments:** All target parameter identification criteria were met. The 4,4"-DDD sample result for 7GP-2(8-12") was manually verified and no calculation discrepancy was observed. All results above the LOQ were verified against the instrument data, primary

and confirmation data. For results above the LOQ, the disparity between the results from both columns was acceptable (<40RPD).

## N. DAA CORRECTIVE ACTION TAKEN AND GENERAL COMMENTS:

**Comments:** No corrective action was taken.

## LIMITATIONS AND REFERENCES:

Draper Aden Associates conducted a limited data validation for the above noted data set using summary tables and raw data provided by the analyzing laboratory. Data evaluation was conducted in general accordance with SW-846 Method requirements (Test Methods for Evaluating Solid Wastes - Physical and Chemical Methods, USEPA SW-846, 3rd edition - Final Update I, II/IIA and III) and CLP data validation guidelines (USEPA Contract Laboratory Program National Functional Guidelines for Organic Data Review, October 1999). Validation of this data set is limited to the items detailed in this report.

## METHODS 8260B AND 8270C ORGANIC DATA REVIEW SUMMARY

Draper Aden Associates (DAA) performed a limited review of the analytical results for the October 31-November 1, 2002 soil sampling event at hazardous waste management units 5 and 7, Radford Army Ammunition Plant (RAAP)/Alliant Techsystems, Montgomery County, Virginia. Soil samples were collected from locations 5GP-1 (1-2'), 5GP-1 (9-10'), 5GP-3 (9-10'), 5GP-6 (10-11'), 5GP-8 (7-8'), 5GP-8 (11-12'), 5 GP-12 (3-4'), 5GP-16 (3-4'), 7GP-1 (1-3'), 7GP-2 (8-12'), 7GP-2 (13.5-14.5'), 7GP-3 (10-11'), 7GP-4 (3-4'), 7GP-5 (6-11'), 7GP-8 (5-8'), and 7 GP-16 (3-4'). Soil samples were analyzed for the 33 (thirty-three) volatile parameters by Method 8260B and 64 (sixty-four) semivolatile parameters according to Method 8270C.

Lancaster Laboratories (Lancaster) of Lancaster, Pennsylvania performed the GC/MS analysis. Lancaster Laboratories submitted results to DAA in a final certificate of analysis, which included sample analytical results as well as relevant documentation to validate and verify the results.

The evaluation of Lancaster's compliance with Methods 8260B and 8270C and validation of the results was based on a limited review of the following items: QC deliverables package, QC history documentation, case narrative, technical holding time and preservation requirements, instrument performance (tune) check, instrument calibrations, blank analysis, surrogate spike recoveries, matrix spike and matrix spike duplicate (MS/MSD) analyses, laboratory control sample (LCS) data, and internal standard requirements. A review of all transcriptions from instrument data to sample summary sheets was performed. Specific representative calculations were not performed. The following information is intended to summarize data review results and any observed significant deviations from method and/or contractual requirements.

### *Method 8260B*

The revised certificate of analysis for Method 8260B appeared complete in its presentation and the data were of acceptable quality. The data set demonstrated the laboratory's ability to achieve the reported LOQ, as outlined by the initial calibration data and the method detection limit study data. The first calibration level was less than the reported LOQ in all cases.

All sample holding time criteria, QC history documentation, instrument performance check (tuning) criteria, initial calibration, blank, and internal standard requirements were met. All sample results were reviewed for transcription errors from the instrument data to the laboratory report and no errors were noted. Deviations from specific quality assurance/quality control (QA/QC) criteria that were identified during the data review process are discussed below.

Samples collected from HWMU 5 on October 31, 2002 were shipped on ice and under chain of custody for overnight delivery to the laboratory. Although samples were packed in ice

for shipment, the Lancaster Laboratories Sample Administration Receipt Documentation Log noted that only bagged ice was present the morning of November 1, 2002. As well, the cooler temperature bottle/blank was recorded as 7°C, which is 1 degree higher than method guidelines of 4°C (± 2°C). Sample results for HWMU-5 may be biased slightly low due to elevated sample storage temperature.

All calibration verification criteria were met except acetone, 2-butanone, 2-hexanone and 1,1,2,2-tetrachloroethane (associated with HWMU-5) and 1,1-dichloroethane (associated with HWMU-7) exceeded validation guidelines for percent drift / difference. Results for these parameter, where appropriate, were qualified as estimated

All surrogate criteria were met except for one slightly low surrogate recovery in sample 5GP-1 (1-2'). Insufficient sample was available for reanalysis. However, the matrix spike analysis for this sample had compliant surrogate recoveries. As per validation guidelines all results were qualified as estimated for this sample.

A MS, LCS and LCS duplicate were performed. Due to limited sample volume a MSD was not performed. All quality control samples were spiked with all parameters of interest. All recoveries and %RPD results, where applicable, were acceptable for all target parameters.

All target parameter identification and quantitation requirements were met. No target parameters were reported above the LOQ in any sample.

All results were reported on a dry weight basis. All sample results unaffected by the data validation process and less than their corresponding LOQs were validated and reported as "U." Refer to the attached table titled "Data Validation Report" for a summary of results which required data validation.

***Method 8270C***

The original certificate of analysis for Method 8270C was complete and the data were of acceptable quality. The data set demonstrated the laboratory's ability to achieve the reported LOQ, as outlined by the initial calibration data as well as the method detection limit study data.

QC history documentation were provided. Sample preservation, instrument performance check (tuning), initial calibration, calibration verification, blank, surrogate, MS/MSD, LCS and internal standard requirements were met. All sample results were reviewed for transcription errors from the instrument data to the laboratory report and no errors were noted. No deviations from specific QA/QC criteria were identified during the data review process.

## SW-846 METHOD 8260B (GC/MS) VOLATILE ORGANIC DATA VALIDATION

*HWMU-5*

**Sample ID:** 5GP-1 (1-2'), 5GP-1 (9-10'), 5GP-3 (9-10'), 5GP-6 (10-11'), 5GP-8 (7-8'), 5GP-8 (11-12'), 5 GP-12 (3-4'), 5GP-16 (3-4')

*HWMU-7*

**Sample ID:** 7GP-1 (1-3'), 7GP-2 (8-12'), 7GP-2 (13.5-14.5'), 7GP-3 (10-11'), 7GP-4 (3-4'), 7GP-5 (6-11'), 7GP-8 (5-8'), 7 GP-16 (3-4')

**QC Samples:** 5GP-1 (1-2')MS, LCS, LCS DUP, Method Blank
7GP-5 (6-11')MS, 7GP-5 (6-11')MSD, LCS, Method Blank

**Laboratory:** Lancaster Laboratories, Lancaster PA; SDG RAR01-01

***Comment:*** *Method 8260B uses a purge and trap system to remove volatile organic target analytes from a 5 gram soil sample (SW-846 5035). Parameters are separated and quantified using a capillary column GC/MS.*

### A. QC DELIVERABLES PACKAGE:

1. Was the case narrative present and signed by a laboratory representative? ☑ YES ☐ NO
2. Was the Chain of Custody present and signed by a laboratory representative? ☑ YES ☐ NO
3. Were the sample results included for all sample locations? ☑ YES ☐ NO
4. Did the laboratory parameter list correspond to the project specific parameter list? ☑ YES ☐ NO
5. Did the laboratory parameter list include methylene chloride and vinyl chloride for confirmational analysis? ☑ NA ☐ YES ☐ NO
6. Were all parameter LOQs reported on sample summary sheets in agreement with the instrument specific MDL study? ☑ NA ☐ YES ☐ NO

**Comments:** All QC deliverables package requirements were met. The MDL study does not list the LOQ. However, all LOQs are supported by an acceptable MDL study. A 1 ppb standard was also analyzed and reported to support limit of detection (LOD) values.

## B. QC HISTORY DOCUMENTATION CRITERIA:

1. Was an instrument specific MDL study provided, which included LOD and LOQ values for all target parameters? ☑ YES ☐ NO
2. Was the instrument specific working range for each target parameter specified? ☑ YES ☐ NO
3. Was initial demonstration of capability data provided for each target parameter? ☑ YES ☐ NO

**Comments:** QC history documentation criteria were met. MDL study is laboratory specific.

## C. TECHNICAL HOLDING TIME AND PRESERVATION CRITERIA:

1. Was the 14-day sample collection to analysis holding time met? ☑ YES ☐ NO
2. Were the samples received at 4°C (± 2°C)? ☐ YES ☑ NO
3. Was the pH of each sample adjusted to < 2 with HCl? ☑ NA ☐ YES ☐ NO

**Comments:** All sample holding time criteria were met.

Samples collected from HWMU 5 on October 31, 2002 were shipped on ice and under chain of custody for overnight delivery to the laboratory. Although samples were packed in ice for shipment, the Lancaster Laboratories Sample Administration Receipt Documentation Log noted that only bagged ice was present the morning of November 1, 2002. As well, the cooler temperature bottle/blank was recorded as 7°C, which is 1 degree higher than method guidelines of 4°C (± 2°C). Sample results for HWMU-5 may be biased slightly low due to elevated sample storage temperature. All other sample preservation criteria were met.

## D. GC/MS INSTRUMENT PERFORMANCE (TUNING) CHECK CRITERIA:

1. Was analysis of the instrument performance check solution performed at the beginning of each 12-hour period during which standards or samples were analyzed? ☑ YES ☐ NO
2. Was there documentation of the injection of 5-50 ng bromofluorobenzene (BFB)? ☑ YES ☐ NO
3. Were all ion abundance criteria met? ☑ YES ☐ NO
4. Were calibration, blank, and sample analyses performed within 12 hours of tuning? ☑ YES ☐ NO

**Comments:** All instrument performance check criteria were met.

## E. INITIAL GC/MS CALIBRATION CRITERIA:

***SW-846 Criteria:***

1. Was the internal standard (IS) which was selected for target parameter RF calculation the IS which had the closest retention time? ☑ YES ☐ NO
2. Were all target parameters included in the ICAL? ☑ YES ☐ NO
3. Did all ICALs consist of a minimum of 5 calibration levels? ☑ YES ☐ NO
4. Was the lowest concentration calibration standard at or below the associated MCL, regulatory compliance, or action limit? ☑ NA ☐ YES ☐ NO
4. Was the calibration curve developed using the same purge volume used for sample analysis? ☑ YES ☐ NO
6. Were 8260B SPCC criteria met? ☑ YES ☐ NO
   - chloromethane (0.100)
   - 1,1-dichloroethane (0.100)
   - bromoform (0.100)
   - 1,1,2,2-tetrachloroethane (0.300)
   - chlorobenzene (0.300)

7. Were 8260B CCC criteria met? (%RSD ≤ 30%) ☑ YES ☐ NO
   - 1,1-dichloroethene
   - chloroform
   - 1,2-dichloropropane
   - toluene
   - ethylbenzene
   - vinyl chloride

8. Was each target parameter %RSD ≤ 15%? ☐ YES ☑ NO

9. Was the correlation coefficient >0.99 for target parameters with ≥15 % RSD? ☐ NA ☑ YES ☐ NO

***Method Validation Performance Criteria:***

1. Did target parameters and surrogates have % RSDs ≤ 15% and >0.99 correlation coefficient? ☐NA ☑ YES ☐ NO

   (Evaluate RRFs < 0.05 for potential problems.)

**Comments:** All initial calibration criteria were met.

## F. CALIBRATION VERIFICATION CRITERIA:

***SW-846 Criteria:***

1. Was a calibration verification analyzed at the beginning of each 12-hour period following the analysis of the instrument performance check and prior to analysis of the method blank and samples? The calibration verification may be part of the ICAL or analyzed independently during another 12-hour analysis period. ☑ YES ☐ NO

2. Were 8260B SPCC criteria met? ☑ YES ☐ NO
   - chloromethane (0.100)
   - 1,1-dichloroethane (0.100)
   - bromoform (0.100)
   - 1,1,2,2-tetrachloroethane (0.300)
   - chlorobenzene (0.300)

3. Were 8260B CCC criteria met?
   (%Drift or % Difference (%D) within ± 20%) ☑ YES ☐ NO
   - 1,1-dichloroethene
   - chloroform
   - 1,2-dichloropropane
   - toluene
   - ethylbenzene
   - vinyl chloride

***Method Validation Performance Criteria:***

1. Did all target parameters and system monitoring parameters (surrogates) have the % D within ± 25.0%? ☐ YES ☑ NO
   (Evaluate RRFs < 0.05 for potential problems.)

   If "NO", list parameters that exceed these criteria:

*HWMU-5*

*acetone %D = 26%*
*2- butanone %D = 41%*
*2-hexanone %D = 35%*
*1,1,2,2-tetrachloroethane %D = 28%*

*HWMU-7*

*1,1-dichloroethane %D = 26%*

***DAA Contractual Requirements:***

1. Did all target parameters and system monitoring parameters (surrogates) have % Ds within ± 25.0%? *not applicable for this project*

2. Three parameters may fail to meet maximum % D as long as the % D is within ± 40.0%
   Did the calibration verification meet this criteria? *not applicable for this project*

**Comments:** All calibration verification criteria were met except acetone, 2-butanone, 2-hexanone and 1,1,2,2-tetrachloroethane (associated with HWMU-5) and 1,1-dichloroethane (associated with HWMU-7) exceeded validation guidelines for percent drift / difference. Results for these parameter, where appropriate, were qualified as estimated.

## G. BLANK CRITERIA:

1. Was a method blank analyzed after the calibration standards, prior to sample analysis, and once for every 12-hour period beginning with the injection of BFB? ☑ YES ☐ NO
2. Was a trip blank analyzed with this sample batch? ☐ YES ☑ NO
3. Were the trip blanks and method blanks interference free? ☑ YES ☐ NO
4. List target parameters detected in the blanks: *none*
5. Was the level of blank contamination less than 5% of the MCL associated with the analyte? ☑ NA ☐ YES ☐ NO
6. Did any samples contain high concentrations of VOCs in excess of the linear range of the calibration curve? ☐ YES ☑ NO
7. Were one or more blanks analyzed following the high concentration sample to prevent cross contamination? ☑ NA ☐ YES ☐ NO

**Comments:** All blank criteria were met.

## H. SURROGATE CRITERIA:

***SW-846 Criteria:***

1. Were the following surrogates used? ☑ YES ☐ NO
   - dibromofluoromethane ( 80%-120%)
   - 4-bromofluorobenzene (74%-121%)
   - toluene-$d_8$ (81%-117%)

- 1,2-dichloroethane-$d_4$ (80%-120%)

2. Were recoveries within the specified ranges? ☐ YES ☑ NO
   If "NO", corrective action is required. Flagging of the data as estimated is not acceptable until corrective action has been attempted.

3. Were samples with surrogates outside the QC window reanalyzed as required? *See comment*

**Comments:** All surrogate criteria were met except for one slightly low surrogate recovery in sample 5GP-1 (1-2'). Insufficient sample was available for reanalysis. However, the matrix spike for this sample had compliant surrogate recoveries. As per validation guidelines, all results were qualified as estimated for this sample. All other surrogate criteria were met.

## I. MATRIX SPIKE, MATRIX SPIKE DUPLICATE CRITERIA:

(MS/MSD Requirements - CLP Guidelines)

| *Parameter* | *% R Water* | *RPD Water* |
|---|---|---|
| 1,1-dichloroethene | 61-145 | 14 |
| trichloroethene | 71-120 | 14 |
| benzene | 76-127 | 11 |
| toluene | 76-125 | 13 |
| chlorobenzene | 75-130 | 13 |

1. Was a matrix spike and matrix spike duplicate (MS/MSD) analyzed per sample batch or every 20 samples, whichever may occur first? *See comment*
2. Did the MS/MSD contain additional target parameters? *See comment*
3. Was the MS/MSD analyzed on the specific project matrix? *See comment*
4. List matrix spike target parameters not within laboratory recovery ranges: *none*
5. Was a LCS analyzed to address failed matrix spike criteria? *See comment*
6. Did the LCS for the failed matrix spike parameter(s) fall within the acceptable recovery ranges and was the problem identified as matrix interference? *NA.*
7. Were any parameters flagged as estimated concentrations? ☐ NA ☐ YES ☑ NO
8. List parameters flagged as estimated concentrations: *none*

**Comments:**
HWMU-5: Due to limited sample volume, a MSD was not performed. A MS, LCS and LCS Duplicate were performed. These QC samples were spiked with all parameters of interest. All recoveries and %RPD results, where applicable, were acceptable for all target parameters.
HWMU-7: All MS/MSD criteria were met. QC was performed on 7 GP-5(6-11').

## J. LABORATORY CONTROL SAMPLE (LCS) CRITERIA:

1. Was a LCS included in the sample analysis? ☑ YES ☐ NO
2. Did the LCS contain all required target parameters? ☑ YES ☐ NO
3. List the LCS parameters and the laboratory's acceptable recovery range. *See page 37-38 and 137-138 of the volatile certificate of analysis.*
4. List the LCS parameters that exceeded the acceptable recovery range. *None.*

**Comments:** All LCS criteria were met.

## K. INTERNAL STANDARDS CRITERIA:

1. Were the following internal standards used? ☑ YES ☐ NO
   - fluorobenzene
   - chlorobenzene-$d_5$
   - 1,4-dichlorobenzene-$d_4$
2. Were internal standard areas within - 50% to + 100% of the last calibration verification? ☑ YES ☐ NO
3. Were internal standard retention times within ± 30 seconds of the last calibration verification? ☑ YES ☐ NO
4. Were samples failing items 2. and/or 3. above reanalyzed as required by the method? ☑ NA ☐ YES ☐ NO

**Comments:** All internal standard criteria were met.

## L. TARGET PARAMETER IDENTIFICATION:

1. Were the RRTs of the reported parameters within ± 0.06 RRT units of the standard RRT? ☐ NA ☑ YES ☐ NO
2. Check the sample spectra against the laboratory standard spectra to see that the following criteria were met:

- Did characteristic ions maximize in the same scan or within one scan of each other? ☐ NA ☑ YES ☐ NO
- Were all characteristic ions present in the standard spectra present in the sample spectra for parameters detected above the LOQ? ☑ NA ☐ YES ☐ NO
- Were the relative intensities of the ions between the standard and sample spectra within ± 30 %? ☐ NA ☑ YES ☐ NO

3. Were all reported parameters confirmed? ☐ NA ☑ YES ☐ NO

**Comments:**
HWMU-5: All target parameter identification criteria were met. Acetone was reported below the LOQ in several samples. No target parameters were reported above the LOQ in any sample.
HWMU-7: All target parameter identification criteria were met. 1,1-Dichloroethene was reported below the LOQ in 7GP-16(3-4'). No target parameters were reported above the LOQ in any sample.

## M. TARGET PARAMETER QUANTITATION:

- If the %RSD of a parameter was 15% or less, then the average relative response factor should have been used for quantitation.

- If the %RSD of a parameter was greater than 15%, then the quantitation should be based on a calibration curve using the first or higher order regression fit of the five calibration points (6 calibration points for 2nd order).

1. List the detected parameters whose %RSD was >15%: *none*
   a. Was the subsequent quantitation based on a linear regression fit? ☑ NA ☐ YES ☐ NO
   b. Was the curve forced through the origin? ☑ NA ☐ YES ☐ NO
2. Did the initial analysis of any sample have a target parameter concentration that exceeded the initial calibration range? ☐ NA ☐ YES ☑ NO
   -If so, was the sample reanalyzed at a higher dilution? ☑ NA ☐ YES ☐ NO

3. Were the parameter concentrations that were recorded on the raw sample quantitation reports accurately transferred to the sample summary sheets? ☑ YES ☐ NO

**Comments:** All target parameter quantitation criteria were met.

## N. LIBRARY SEARCHES:

**Comments:** Library searches were not requested with this data set.

## O. DAA CORRECTIVE ACTION TAKEN AND GENERAL COMMENTS:

**Comments:** DAA requested, and Lancaster Laboratories provided, method detection limit study and initial demonstration of proficiency documentation.

Sample results for HWMU-5 were originally reported on an "as received" basis without dry weight factors. Lancaster Laboratories provided revised sample results including the dry weight factors.

## SW-846 METHOD 8270C (GC/MS) SEMIVOLATILE ORGANIC DATA VALIDATION

| | | | | |
|---|---|---|---|---|
| **Sample ID:** | 5GP-1 (1-2'), | 5GP-1 (9-10'), | 5GP-3 (9-10'), | 5GP-6 (10-11'), |
| | 5GP-8 (7-8'), | 5GP-8 (11-12'), | 5 GP-12 (3-4'), | 5GP-16 (3-4') |
| | 7GP-1 (1-3'), | 7GP-2 (8-12'), | 7GP-2 (13.5-14.5'), | 7GP-3 (10-11'), |
| | 7GP-4 (3-4'), | 7GP-5 (6-11'), | 7GP-8 (5-8'), | 7 GP-16 (3-4') |

**QC Samples:** 7GP-5 (6-11') MS/MSD, LCS, Extraction Blank

**Laboratory:** Lancaster Laboratories, Lancaster PA, SDG RAR01-01

***Comment: Semivolatile (a.k.a, base/neutral and acid extractables) analysis involves sample preparation using SW-846 Method 3550B-ultrasonic extraction. The semivolatile extracts are concentrated through evaporation. Target analytes are separated and quantified using capillary column GC/MS.***

### A. QC DELIVERABLES PACKAGE:

1. Was the case narrative present and signed by a laboratory representative? ☑ YES ☐ NO
2. Was the Chain of Custody present and signed by a laboratory representative? ☑ YES ☐ NO
3. Were the sample results included for all sample locations? ☑ YES ☐ NO
4. Did the laboratory parameter list correspond to the project specific parameter list? ☑ YES ☐ NO
5. Were all parameter LOQs reported on sample summary sheets in agreement with the instrument specific MDL study? ☑NA☐ YES ☐NO

**Comments:** All QC deliverables package criteria were met. All LOQs were supported by an acceptable MDL study. Additionally, Lancaster Laboratories provided a calibration standard at 1 ppm to verify instrument sensitivity at the LOD level.

### B. QC HISTORY DOCUMENTATION CRITERIA:

1. Were the instrument specific LODs for target parameters provided? ☑ YES ☐ NO
2. Were the instrument specific LOQs for target parameters provided? ☑ YES ☐ NO
3. Was the instrument specific calibration range for each target parameter specified? ☑ YES ☐ NO
4. Was initial demonstration of capability data provided for all

target parameters? ☑ YES ☐ NO

**Comments:** All QC history documentation criteria were met.

## C. TECHNICAL HOLDING TIME AND PRESERVATION CRITERIA:

1. Was the 7-day sample collection to extraction holding time met? ☑ YES ☐ NO
2. Was the 40-day extraction to analysis holding time met? ☑ YES ☐ NO
3. Were the samples received at 4°C (± 2°C)? ☑ YES ☐ NO

**Comments:** The sample collection to extraction and extraction to analysis holding times were met. All preservation criteria were met.

## D. GC/MS INSTRUMENT PERFORMANCE CHECK CRITERIA:
***(Tuning, Injection Port And Column Performance)***

1. Was analysis of the instrument performance check solution performed at the beginning of each 12-hour period of standard and/or sample analysis? ☑ YES ☐ NO
2. Was there documentation of the injection of 50 ng of DFTPP? ☑ YES ☐ NO
3. Were all ion abundance criteria met? ☑ YES ☐ NO
4. Was the injection port inertness verified by analysis of 4,4'-DDT? ☑ YES ☐ NO
   - If no, does associated data require qualification? ☑ NA ☐ YES ☐ NO
   - Was the injection port inertness check acceptable? ☐ NA ☑ YES ☐ NO

5. Was column performance checked through the analysis of peak tailing of pentachlorophenol and benzidine? ☑ YES ☐ NO
   - If no, does associated data require qualification? ☑ NA ☐ YES ☐ NO
   - Was column performance check acceptable? ☐ NA ☑ YES ☐ NO

**Comments:** All GC/MS instrument performance check criteria were met.

## E. INITIAL GC/MS CALIBRATION CRITERIA:

***SW-846 Criteria:***

1. Were the initial calibrations (ICAL) and any directly associated

blanks and samples analyzed within 12-hours of the associated instrument performance (tune) check? ☑ YES ☐ NO

2. Were quantitation ions, used and listed on data, randomly checked against primary quantitation ions as required by Method 8270C and the RFP? ☑ YES ☐ NO
3. Were all target parameters included in the ICAL? ☑ YES ☐ NO
4. Did the ICAL consist of a minimum of 5 calibration levels? ☑ YES ☐ NO
5. Was the lowest concentration calibration standard at or below the associated MCL, regulatory compliance, or action limit? ☑ YES ☐ NO
6. Were calibration levels removed from the curve that would negatively impact the data integrity? ☐ YES ☑ NO
7. Were 8270C SPCC criteria met?
   (Relative Response Factor-average(RRF) ≥ 0.050) ☐ NA ☑ YES ☐ NO
   - N-nitroso-di-n-propylamine
   - Hexachlorocyclopentadiene
   - 2,4-Dinitrophenol
   - 4-nitrophenol
   -
8. Were 8270C B/N Fraction parameter criteria met?
   ( % Relative Standard Deviation (%RSD) ≤ 30%) ☐ NA ☑ YES ☐ NO
   - acenaphthene
   - 1,4-dichlorobenzene
   - hexachlorobutadiene
   - N-nitrosodiphenylamine
   - Di-n-octyl phthalate
   - fluoranthene
   - benzo(a)pyrene
9. Were 8270C Acid Fraction parameter criteria met?
   ( % Relative Standard Deviation (%RSD) ≤ 30%) ☐ NA ☑ YES ☐ NO
   - 4-chloro-3-methylphenol
   - 2,4-dichlorophenol
   - 2-nitrophenol
   - phenol
   - pentachlorophenol
   - 2,4,6-trichlorophenol
10. Was each target parameter %RSD ≤ 15%?
    (with the exception of SPCC/CCC compounds) ☐ NA ☑ YES ☐ NO
11. Was the correlation coefficient or coefficient of determination >0.99 for target parameters with ≥ 15 % RSD
    (with the exception of SPCC/CCC compounds)? ☑ NA ☐ YES ☐ NO

***Method Validation Performance Criteria:***

1. Did target parameters and surrogates (with the exception of SPCC/ CCC compounds)that have % RSDs ≥ 15% have >0.99 correlation coefficient or coefficient of determination? ☐ NA ☑ YES ☐ NO
(Evaluate RRFs < 0.05 for potential problems.)

**Comments:** All initial calibration criteria were met.
ICAL performed on October 15, 2002 - Instrument ID HP06754.

## F. CALIBRATION VERIFICATION CRITERIA:

***SW-846 Criteria:***

1. Was a calibration verification analyzed at the beginning of each 12-hour period following the analysis of the instrument performance check and prior to analysis of the method blank and samples? The calibration verification may be part of the ICAL or run independently on another 12-hour analysis period. ☑ YES ☐ NO
2. Were 8270C SPCC criteria met?
(Relative Response Factor (RRF) ≥ 0.050) ☑ YES ☐ NO
3. Were all 13 8270C CCC criteria met?
(%D within ± 20%) ☑ YES ☐ NO

***Method Validation Performance Criteria:***

1. Did all target parameters and system monitoring parameters (surrogates) have % Ds within ± 25.0%? ☑ YES ☐ NO
(Evaluate RRFs < 0.05 for potential problems.)
If "NO", list parameters that exceed this criterion:

***DAA Contractual Requirements:***

1. Did all target parameters and system monitoring parameters (surrogates) have % Ds within ± 25.0%? *not applicable for this project*

2. Five parameters, in each standard mix, may fail to meet maximum % D as long the % D is within ± 40.0%
Did calibration verification meet this criteria? *not applicable for this project*
If "NO", explain.

**Comments**: All calibration verification criteria were met.

## G. BLANK CRITERIA:

1. Was a method/extraction blank analyzed on each GC/MS system used for sample analysis? ☑ YES ☐ NO
2. Was a trip blank analyzed with this sample batch? ☐ YES ☑ NO
3. Were the blank samples interference free? ☑ YES ☐ NO
4. Was the level of blank contamination less than 5% of the MCL? ☑ NA ☐ YES ☐ NO
5. List target parameters detected in the blanks:
   *none*

**Comments:** All blank criteria were met.

## H. SURROGATE CRITERIA:

1. Were the following surrogates used? ☑ YES ☐ NO
   - phenol - $d_6$ (24%-113%)
   - 2-fluorophenol (25%-121%)
   - 2,4,6-tribromophenol (19%-122%)
   - nitrobenzene – $d_8$ (23%-120%)
   - 2-fluorobiphenyl (25%-121%)
   - p-terphenyl - $d_{14}$ (18%-137%)
2. Were recoveries within the specified ranges? ☑ YES ☐ NO
3. Were any two base/neutral or acid surrogates out of specification or did any one base/neutral or acid extractable surrogate have a recovery of less than 10%? ☐YES ☑ NO
   If yes, was a reextraction and reanalysis performed to confirm that the non-compliance was due to sample matrix effects rather than laboratory deficiencies? ☑ NA ☐ YES ☐ NO

**Comments:** All surrogate requirements were met. (Lancaster Laboratories used laboratory derived surrogate limits as suggested by SW-846.)

## I. MATRIX SPIKE/ MATRIX SPIKE DUPLICATE CRITERIA:

(MS/MSD Requirements - CLP Guidelines)

| Parameter | % R Water | % RPD Water |
|---|---|---|
| Phenol | 12-110 | 42 |
| 2-Chlorophenol | 27-123 | 40 |
| N-Nitroso-di-n-propylamine | 41-116 | 38 |
| 4-Chloro-3-methylphenol | 23-97 | 42 |
| Acenaphthene | 46-118 | 31 |
| 4-Nitrophenol | 10-80 | 50 |
| 2,4-Dinitrotoluene | 24-96 | 38 |
| Pyrene | 26-127 | 31 |

1. Was a matrix spike and matrix spike duplicate (MS/MSD) analyzed per sample batch or every 20 samples, whichever may occur first? ☑ YES ☐ NO
2. Did the MS/MSD spike contain additional target parameters? ☐ YES ☑ NO
3. Was the MS/MSD analyzed on the specific project matrix? ☑ YES ☐ NO
4. List MS/MSD target parameters not within acceptable laboratory recovery ranges: *none*
5. Was a LCS analyzed to address failed matrix spike criteria? ☑ NA ☐ YES ☐ NO
6. Did the LCS for the failed matrix spike parameter(s) fall within the acceptable recovery ranges and was the problem identified as matrix interference? ☑ NA ☐ YES ☐ NO
7. Were any parameters flagged as estimated concentrations? ☐ YES ☑ NO
8. List parameters flagged as estimated concentrations: *none*

**Comments:** MS/MSD analyses were performed on sample 7GP-5(6-11') and all method requirements were met.

## J. LABORATORY CONTROL SAMPLE (LCS) CRITERIA:

1. Was a LCS included in the sample analysis? ☑ YES ☐ NO
2. Did the LCS contain all required target parameters? ☑ YES ☐ NO
3. List the LCS target parameters and laboratory recovery range. *See page 402-403 of the semivolatile certificate of analysis.*
4. List the LCS parameters which exceeded the acceptable recovery range: *none*

**Comments:** All LCS criteria were met.

## K. INTERNAL STANDARDS CRITERIA:

1. Were the following internal standards used? ☑ YES ☐ NO
   - 1,4-Dichlorobenzene-$d_4$
   - Naphthalene-$d_8$
   - Acenapththene-$d_{10}$
   - Phenanthrene-$d_{10}$
   - Chrysene-$d_{12}$
   - Perylene-$d_{12}$

2. Were internal standard areas within ± 50% of last calibration verification? ☑ YES ☐ NO
3. Were internal standard retention times within ± 30 seconds of last calibration verification? ☑ YES ☐ NO

**Comments:** All internal standard criteria were met.

## L. TARGET PARAMETER IDENTIFICATION:

1. Were the RRTs of the reported parameters within ± 0.06 RRT units of the standard RRT? ☐ NA ☑YES ☐ NO

2. Check the sample spectra against the laboratory standard spectra to see that the following criteria were met:
   - Did characteristic ions maximize in the same scan or within one scan of each other? ☐ NA ☑YES ☐ NO
   - Were all characteristic ions present in the standard spectra present in the sample spectra for parameters detected above the LOQ? ☐ NA ☑YES ☐ NO
   - Were the relative intensities of the ions between the standard and sample spectra within ± 30 %? ☐ NA ☑YES ☐ NO
3. Were all reported parameters confirmed? ☐NA ☑YES ☐ NO

**Comments:** All target parameter identification requirements were met.

## M. TARGET PARAMETER QUANTITATION:

- If the %RSD of a parameter was 15% or less, then the average relative response factor should have been used for quantitation.
- If the %RSD of a parameter was greater than 15%, then the quantitation

should be based on a calibration curve using the first or higher order regression fit of the five calibration points (6 calibration points for 2nd order).

1. List the parameters detected above the LOQ whose %RSD was >15%: *none*
   a. Was the subsequent quantitation based on a linear regression fit? ☑ NA ☐ YES ☐ NO
   b. Was the curve forced through the origin? ☑ NA ☐ YES ☐ NO

2. Did the initial analysis of any sample have a concentration of a target parameter that exceeded the initial calibration range? ☐ YES ☑ NO
   -If so, was the sample reanalyzed at a higher dilution? ☑ NA ☐ YES ☐ NO
3. Were the parameter concentrations that were recorded on the raw sample quantitation reports accurately transferred to the sample summary sheets? ☑ YES ☐ NO

**Comments:** Target parameter quantitation criteria were met.

## N. LIBRARY SEARCHES:

**Comments:** Library searches were not requested with this data set.

## O. DAA CORRECTIVE ACTION TAKEN AND GENERAL COMMENTS:

**Comments:** No corrective action was required.

**LIMITATIONS AND REFERENCES:**

Draper Aden Associates conducted data validation of the above noted data set using summary tables and raw data provided by the analyzing laboratory. Data validation was conducted in general accordance with SW-846 Method requirements (Test Methods for Evaluating Solid Wastes - Physical and Chemical Methods, USEPA SW-846, 3rd edition - Final Update I, II/IIA and III) and CLP data validation guidelines (USEPA Contract Laboratory Program National Functional Guidelines for Organic Data Review, October, 1999). Validation of this data set is limited to the items detailed in this report.

**Data Validation Qualifier Definitions:**

**U-** Denotes the analyte was analyzed for, but was not detected above the laboratory limit of quantitation (LOQ).

**J-** Denotes an estimated value. See sample specific note presented on data validation report table for further explanation.

**UJ-** The LOQ should be considered estimated. See sample specific note presented on data validation report table for further explanation.

**R-** Denotes sample result was rejected. See sample specific note presented on data validation report table for further explanation.

NOTE: The table summaries all detected results and results which required qualification based on data validation. All Results reported on a dryweight basis.
See laboratory report for definition of laboratory result qualifiers, if needed.

| 06301 | Xylene (Total) | 1330-20-7 | N.D. | 1. | ug/kg | 0.88 |

A site-specific MSD sample was not submitted for the project. A LCS/LCSD was performed to demonstrate precision and accuracy at a batch level.

Poor surrogate recovery was observed for 1,2-dichloroethane-d4 in the GC/MS volatile fraction. The percent recovery was 79%. The sample was reanalyzed as a matrix spike, and 1,2-dichloroethane-d4 was 86% recovery which was within the QC limits. Another vial of the sample was not available for further analysis.

Paired with 5GP-1 (1-2') for % MOS result. See SW3933074

# Quality Control Summary

Client Name: Draper Aden Associates, Inc. Group Number: 829270
Reported: 11/25/02 at 02:38 PM

## Surrogate Quality Control

| | | | | |
|---|---|---|---|---|
| MSD | 64 | 111 | | |
| Limits: | 22-96 | 36-147 | | |

Analysis Name: TCL by 8260 (soil)
Batch number: K023091AA

| | Dibromofluoromethane | 1,2-Dichloroethane-d4 | Toluene-d8 | 4-Bromofluorobenzene |
|---|---|---|---|---|
| 3933061 | 97 | 80 | 107 | 99 |
| 3933062 | 96 | 81 | 106 | 103 |
| 3933063 | 97 | 81 | 104 | 100 |
| 3933064 | 92 | 83 | 106 | 92 |
| 3933065 | 98 | 82 | 103 | 99 |
| 3933066 | 97 | 81 | 103 | 99 |
| 3933067 | 99 | 85 | 112 | 111 |
| 3933068 | 96 | 86 | 113 | 103 |
| 3933069 | 96 | 83 | 111 | 89 |
| 3933070 | 96 | 82 | 109 | 97 |
| Blank | 94 | 88 | 101 | 102 |
| LCS | 100 | 97 | 105 | 107 |
| MS | 99 | 85 | 112 | 111 |
| MSD | 96 | 86 | 113 | 103 |
| Limits: | 80-120 | 80-120 | 81-117 | 74-121 |

Analysis Name: TCLP by 8260
Batch number: N023141AB

| | Dibromofluoromethane | 1,2-Dichloroethane-d4 | Toluene-d8 | 4-Bromofluorobenzene |
|---|---|---|---|---|
| 3933073 | 98 | 100 | 95 | 90 |
| 3933084 | 98 | 99 | 94 | 89 |
| Blank | 98 | 98 | 96 | 93 |
| LCS | 95 | 99 | 103 | 106 |
| MS | 94 | 98 | 100 | 104 |
| MSD | 95 | 98 | 101 | 105 |
| Limits: | 86-118 | 80-120 | 88-110 | 86-115 |

*- Outside of specification
(1) The result for one or both determinations was less than five times the LOQ.
(2) The background result was more than four times the spike added.

HWMU-5 Composite Soil Sample
HWMU-5 & HWMU-7 Investigation

Draper Aden Associates, Inc.
2206 South Main Street
Blacksburg VA 24060

MWMU5 SDG#: RAR01-20

| CAT No. | Analysis Name | CAS Number | Dry Result | Dry Method Detection Limit | Units | Dilution Factor |
|---|---|---|---|---|---|---|
| 00111 | Moisture | n.a. | 15.3 | 0.50 | % | 1 |
| | "Moisture" represents the loss in weight of the sample after oven drying at 103 - 105 degrees Celsius. The moisture result reported above is on an as-received basis. | | | | | |
| 00394 | pH | n.a. | 7.38 | 0.010 | | 1 |
| | The pH was performed on a 1:1 slurry (25 gms. of sample and 25 ml. of deionized water) after being tumbled for 30 min. | | | | | |
| 00496 | Corrosivity | n.a. | See Below | | See Below | 1 |
| | Corrosivity:<br>The pH of a 1:1 slurry (with deionized water) was 7.38 indicating that the waste is not corrosive.<br>A waste is corrosive if it exhibits a pH equal to or less than 2 or equal to or greater than 12.5. | | | | | |
| 00542 | Ignitability | n.a. | See Below | | See Below | 1 |
| | The sample did not spontaneously ignite when exposed to air or water.<br>The sample did not ignite by friction.<br>The sample vapors did not ignite when exposed to a flame using a closed cup apparatus. | | | | | |
| 01121 | Reactivity | n.a. | See Below | | See Below | 1 |
| | Reactivity:<br>The sample was extracted by the interim method described in SW 846, Chapter 7.3. This solution was analyzed for cyanide and sulfide. This waste is not considered reactive and hazardous because it does not generate a quantity of hydrogen cyanide exceeding 250 mg/kg or hydrogen sulfide exceeding 500 mg/kg. These interim threshold limits were established by the Solid Waste Branch of EPA, July, 1992. These results do not reflect total cyanide or total sulfide. | | | | | |
| 01122 | Sulfide (Reactivity) | n.a. | N.D. | 27. | mg/kg | 1 |
| 01123 | Cyanide (Reactivity) | n.a. | N.D. | 98. | mg/kg | 1 |

Blacksburg VA 24060

UNIT7 SDG#: RAR01-09

| CAT No. | Analysis Name | CAS Number | Dry Result | Dry Method Detection Limit | Units | Dilution Factor |
|---|---|---|---|---|---|---|
| 00111 | Moisture | n.a. | 15.5 | 0.50 | % | 1 |
| | "Moisture" represents the loss in weight of the sample after oven drying at 103 - 105 degrees Celsius. The moisture result reported above is on an as-received basis. | | | | | |
| 00394 | pH | n.a. | 7.15 | 0.010 | | 1 |
| | The pH was performed on a 1:1 slurry (25 gms. of sample and 25 ml. of deionized water) after being tumbled for 30 min. | | | | | |
| 00496 | Corrosivity | n.a. | See Below | | See Below | 1 |
| | Corrosivity:<br>The pH of a 1:1 slurry (with deionized water) was 7.15 indicating that the waste is not corrosive.<br>A waste is corrosive if it exhibits a pH equal to or less than 2 or equal to or greater than 12.5. | | | | | |
| 00542 | Ignitability | n.a. | See Below | | See Below | 1 |
| | The sample did not spontaneously ignite when exposed to air or water.<br>The sample did not ignite by friction.<br>The sample vapors did not ignite when exposed to a flame using a closed cup apparatus. | | | | | |
| 01121 | Reactivity | n.a. | See Below | | See Below | 1 |
| | Reactivity:<br>The sample was extracted by the interim method described in SW 846, Chapter 7.3. This solution was analyzed for cyanide and sulfide. This waste is not considered reactive and hazardous because it does not generate a quantity of hydrogen cyanide exceeding 250 mg/kg or hydrogen sulfide exceeding 500 mg/kg. These interim threshold limits were established by the Solid Waste Branch of EPA, July, 1992. These results do not reflect total cyanide or total sulfide. | | | | | |
| 01122 | Sulfide (Reactivity) | n.a. | N.D. | 27. | mg/kg | 1 |
| 01123 | Cyanide (Reactivity) | n.a. | N.D. | 100. | mg/kg | 1 |

EPA, 1999= EPA Region III Risk-Based Concentration Table: Technical Background Information

(1) Air concentrations may be estimated by applying the particulate emission factor (PEF) or volatilization factor (VF) to soil concentrations as described in Soil Screening Guidance: Technical Background Document. U. S. EPA, Office of Solid Waste and Emergency Response. May 1996. (EPA/540/R-95/128) and Soil Screening Guidance: User's Guide. U.S.EPA, Office of Solid Waste and Emergency Response. April 1996. (EPA/540/R-96/018).

(2) Indoor air concentrations for volatiles may be estimated with the Johnson and Etinger Model.

EPA, 1989= Risk Assessment Guidance for Superfund: Volume I -- Human Health Evaluation Manual (Part A). Office of Emergency and Remedial Response. EPA/540/1-89/002.
EPA, 1991= Human Health Evaluation Manual, Supplemental Guidance: Standard Default Exposure Factors. Office of Solid Waste and Emergency Response. OSWER Directive 9285.6-03
EPA, 1999= EPA Region III Risk-Based Concentration Table: Technical Background Information

(1) Air concentrations may be estimated by applying the particulate emission factor (PEF) or volatilization factor (VF) to soil concentrations as described in Soil Screening Guidance: Technical Background Document. U. S. EPA, Office of Solid Waste and Emergency Response. May 1996. (EPA/540/R-95/128) and Soil Screening Guidance: User's Guide. U.S.EPA, Office of Solid Waste and Emergency Response. April 1996. (EPA/540/R-96/018).
(2) Indoor air concentrations for volatiles may be estimated with the Johnson and Etinger Model.

**Definitions:**

***The following definitions apply to results reported for Appendix IX monitoring events.***
***All Appendix IX monitoring results for compliance wells are reported to the detection limit.***

**QL** Denotes permit required quantitation limit.
**U** denotes not detected at or above the detection limit.
**UA** denotes not detected at or above the adjusted detection limit.
**J** Denotes result is estimated. When used with "U" (i.e., "UJ"), denotes analyte not detected at or above the detection limit and detection limit and QL are estimated. When used with "UA" (i.e., "UAJ"), denotes analyte not detected at or above adjusted detection limit and adjusted detection limit and QL are estimated.
**UN** Denotes analyte concentration is less than the quantitation limit and/or five times the blank concentration. Not reliably detected due to blank contamination. This qualifier used only for Appendix IX monitoring event when compliance well results are reported to at or above the project detection limit.
**R** Denotes result rejected.
**Q** Denotes data validation qualifier.
**Background** Denotes background concentrations listed in the pending Class 3 Permit Modification for the Post-Closure Care Permit for HWMUs 5, 7, 10 and 16.
**CAS#** Denotes Chemical Abstract Services registration number.
**GPS** Denotes groundwater protection standard.

***The following definitions apply to results reported for non-Appendix IX monitoring events.***
***All non-Appendix IX monitoring results for compliance wells are reported to at or above the quantitation limit.***

**QL** Denotes permit required quantitation limit.
**U** Denotes analyte not detected at or above QL.
**UA** Denotes analyte not detected at or above adjusted sample QL.
**J** Denotes result is estimated. When used with "U" (i.e., "**UJ**"), denotes analyte not detected at or above QL and QL is estimated. When used with "UA" (i.e., "**UAJ**"), denotes analyte not detected at or above adjusted QL and adjusted QL is estimated.
**R** Denotes result rejected.
**Q** Denotes data validation qualifier.
**Background** Denotes background concentrations listed in the pending Class 3 Permit Modification for the Post-Closure Care Permit for HWMUs 5, 7, 10 and 16.
**CAS#** Denotes Chemical Abstract Services registration number.
**GPS** Denotes groundwater protection standard.

DRAPER ADEN ASSOCIATES (DAA) PREPARED THIS DOCUMENT (WHICH MAY INCLUDE DRAWINGS, SPECIFICATIONS, REPORTS, STUDIES AND ATTACHMENTS) IN ACCORDANCE WITH THE AGREEMENT BETWEEN DAA AND ALLIANT TECHSYSTEMS INC.

THE STANDARD OF CARE FOR ALL PROFESSIONAL ENGINEERING, ENVIRONMENTAL AND SURVEYING AND RELATED SERVICES PERFORMED OR FURNISHED BY DAA UNDER THIS AGREEMENT ARE THE CARE AND SKILL ORDINARILY USED BY MEMBERS OF THESE PROFESSIONS PRACTICING UNDER SIMILAR CIRCUMSTANCES AT THE SAME TIME AND IN THE SAME LOCALITY. DAA MAKES NO WARRANTIES, EXPRESS OR IMPLIED, UNDER THIS AGREEMENT IN CONNECTION WITH DAA'S SERVICES.

CONCLUSIONS PRESENTED ARE BASED UPON A REVIEW OF AVAILABLE INFORMATION, THE RESULTS OF OUR FIELD STUDIES, AND/OR PROFESSIONAL JUDGMENT. TO THE BEST OF OUR KNOWLEDGE, INFORMATION PROVIDED BY OTHERS IS TRUE AND ACCURATE, UNLESS OTHERWISE NOTED.

DAA'S LIABILITY, HEREUNDER, SHALL BE LIMITED TO AMOUNTS DUE DAA FOR SERVICES ACTUALLY RENDERED, OR REIMBURSABLE EXPENSES ACTUALLY INCURRED.

ANY REUSE OR MODIFICATION OF ANY OF THE AFOREMENTIONED DOCUMENTS (WHETHER HARD COPIES OR ELECTRONIC TRANSMITTALS) PREPARED BY DAA WITHOUT WRITTEN VERIFICATION OR ADAPTATION BY DAA WILL BE AT THE SOLE RISK OF THE INDIVIDUAL OR ENTITY UTILIZING SAID DOCUMENTS AND SUCH USE IS WITHOUT THE AUTHORIZATION OF DAA. DAA SHALL HAVE NO LEGAL LIABILITY RESULTING FROM ANY AND ALL CLAIMS, DAMAGES, LOSSES, AND EXPENSES, INCLUDING ATTORNEY'S FEES ARISING OUT OF THE UNAUTHORIZED REUSE OR MODIFICATION OF THESE DOCUMENTS. CLIENT SHALL INDEMNIFY DAA FROM ANY CLAIMS ARISING OUT OF UNAUTHORIZED USE OR MODIFICATION OF THE DOCUMENTS WHETHER HARD COPY OR ELECTRONIC.

CONCLUSIONS PRESENTED BY DAA DO NOT REFLECT VARIATIONS IN SUBSURFACE GROUNDWATER QUALITY THAT MIGHT EXIST BETWEEN OR BEYOND SAMPLING POINTS OR BETWEEN SPECIFIC SAMPLE COLLECTIONS EVENTS. DAA SHALL INCUR NO LIABILITY RESULTING FROM INFORMATION SUPPLIED BY OTHERS.

## RADFORD ARMY AMMUNITION PLANT – HWMU-7
### CALCULATION OF CONSTITUENT BACKGROUND VALUES

Draper Aden Associates recalculated background values for the plume monitoring well constituents of the groundwater monitoring program for Hazardous Waste Management Unit No. 7 (HWMU-7) located at the Radford Army Ammunition Plant (Radford AAP) in Radford, Virginia. Background values were calculated for all plume monitoring well constituents.

The background values for HWMU-7 plume monitoring well constituents were calculated using the analytical data for upgradient well 7W12B using data from Second Quarter 2003 through Second Quarter 2007 (available most recent data with one exception-cyanide includes 4th Quarter 2007 data). Inter-well upper prediction limits (UPL) were calculated on the background data for the target parameters in accordance with the facility permit and VHWMR (40 CFR 264.97(h)). Where applicable, the background value calculations were based on site-wide 95% confidence, 95% coverage upper prediction intervals. The calculated background values for all target constituents are listed on **Table 1**.

### Background Data and Background Value Calculations

The constituents listed below were 100% non-detected (<LOQ) in the background well. The background values for these constituents were established as equal to their quantitation limits (QL).

| Background Value = Quantitation Limit (QL) | | | | |
|---|---|---|---|---|
| **Constituent** | **Sample Size** | **% Non-Detects** | **QL (µg/l)** | **Background Value (µg/l)** |
| Antimony | 17 | 100 | 1 | 1 |
| Arsenic | 17 | 100 | 10 | 10 |
| Cadmium | 17 | 100 | 1 | 1 |
| Cobalt | 17 | 100 | 5 | 5 |
| Copper | 16 | 100 | 5 | 5 |
| Lead | 17 | 100 | 1 | 1 |
| Mercury | 17 | 100 | 2 | 2 |
| Nickel | 17 | 100 | 10 | 10 |
| Selenium | 17 | 100 | 10 | 10 |
| Silver | 17 | 100 | 2 | 2 |
| Thallium | 17 | 100 | 1 | 1 |
| Cyanide | 18 | 100 | 20 | 20 |
| Bis(2-ethylhexyl)phthalate | 17 | 100 | 6 | 6 |
| Butyl benzyl phthalate | 17 | 100 | 10 | 10 |
| 2,4-Dinitrophenol | 17 | 100 | 10 | 10 |
| 2,4-Dinitrotoluene | 17 | 100 | 10 | 10 |
| 2,6-Dinitrotoluene | 17 | 100 | 10 | 10 |
| p-Nitrophenol | 17 | 100 | 10 | 10 |

Non-parametric prediction intervals were computed for the constituents for which the data from upgradient well 7W-12B satisfied one of the following two criteria, per VDEQ regulations and guidance as well as USEPA guidance:

- Percentage of non-detects was greater than or equal to 50 and less than 100; or
- Percentage of non-detects was less than 50, but data was not normally distributed in original or log-transformed mode.

Only one result for zinc was reported above its LOQ. The reported result (10.9 µg/l) is the NUPL for zinc. The non-parametric prediction limit computation for chromium is presented in **Appendix A**.

| **Background Value = UPL of Non-parametric Prediction Interval (NUPL)** | | | | | |
|---|---|---|---|---|---|
| **Parameter** | **Sample Size** | **% Non-Detects** | **QL (µg/l)** | **NUPL (µg/l)** | **Background Value (µg/l)** |
| Chromium | 17 | 12 | 5 | 9.9 | 9.9 |
| Zinc | 14 | 93 | 10 | 10.9 | 10.9 |

The following constituent (barium) exhibited normally distributed background data with less than 0% non-detects. One sided parametric prediction interval was computed on the background data for barium. The background value for barium was set as equal to its UPL. The background concentration calculations were based on a site wide 95% confidence, 95% coverage upper prediction intervals. The background and relevant statistical data for barium is summarized below. The prediction interval computation is presented in **Appendix A**.

| **Background Value = UPL of one-sided Prediction Interval** | | | | | |

| 2007-Qtr2 | | | 8/17/1999 |

**Notes:**

1) Background data was computed for all target constituents using the 2Q 2003 - 2Q 2007 data for background well 7W12B. Background data was 100% <LOQ for all target parameters except barium, chromium and zinc. Zinc had only one reported result > LOQ.

Statistical computations using GRITS/STAT V5.0 performed only for barium and chromium, as applicable.

## EXECUTIVE SUMMARY

In correspondence dated September 27, 2011, the Virginia Department of Environmental Quality (VDEQ) approved the Class 3 permit modification for the Post Closure Care Permit (Permit) for Hazardous Waste Management Units (HWMUs) 5, 7, 10, and 16 located at the Radford Army Ammunition Plant (Radford AAP) in Radford, Virginia. The Class 3 permit modification request included a closure plan amendment for HWMU-7 to allow Radford AAP to pursue clean closure for soil and groundwater at the Unit. The approved Class 3 permit modification reduced the GPS for total cobalt at HWMU-7 from the previous VDEQ-calculated ACL of 156.65 µg/L to the site-specific background concentration of 5 µg/L due to the reduction of the VDEQ-calculated ACL to 4.695 µg/l. Total cobalt has been detected consistently at concentrations greater than the recently revised GPS of 5 µg/l in plume monitoring well 7W13 and sporadically at concentrations greater than the revised GPS in point of compliance well 7WCA.

During teleconferences on November 9, 2011 and November 17, 2011, the VDEQ recommended Radford AAP submit an alternate source demonstration (ASD) for total cobalt concentrations detected in groundwater at HWMU-7. The results of this ASD support the conclusion that the total cobalt concentrations observed in wells 7WCA and 7W13 are derived from ambient, naturally-occurring and naturally variable sources based on the following:

- Statistical trend analysis results show there are no increasing trends of total cobalt concentrations in groundwater in point of compliance well 7WCA and in plume well 7W13 and that the total cobalt concentrations in both wells are stable.
- Cobalt is widely observed at significant concentrations in non-waste derived materials used for construction, operation and closure of the Unit.
- Based on the results of the 2001 Facility-Wide Background Study, cobalt occurs naturally within the native soils at Radford AAP at concentrations that are more than three orders of magnitude greater than the highest concentration (on a relative weight percent basis) detected in groundwater at HWMU-7.
- Cobalt is typically found as a trace element within the type of bedrock (dolomite) within which monitoring wells 7WCA and 7W13 are screened.
- Groundwater analytical data from upgradient wells serving multiple additional waste management units at Radford AAP confirm that cobalt occurs naturally within the alluvium and carbonate bedrock aquifers at naturally variable concentrations throughout the Facility.

Based on the information presented above, it is reasonable to conclude that the total cobalt concentrations observed in groundwater monitoring wells 7WCA and 7W13 are derived from ambient, naturally-occurring and naturally variable trace elements in the aquifer solid matrix, and not from a temporally-varying source such as a release from the closed HWMU-7. Further, it is noted that detections of total cobalt concentrations greater than the Unit's revised GPS of 5 µg/l are not the result of changes in groundwater quality, but due instead to the reduction of the risk-based ACL for cobalt from 156.65 µg/l to 4.695 µg/l. No other constituents have been detected in groundwater at HWMU-7 at concentrations greater than their respective GPS. Therefore, it is our professional opinion that HWMU-7 meets the requirements for clean closure for groundwater.

## 1.0 INTRODUCTION

This report presents the results of an alternate source demonstration (ASD) for total cobalt concentrations detected in groundwater at Hazardous Waste Management Unit 7 (HWMU-7) located at the Radford Army Ammunition Plant (Radford AAP) in Radford, Virginia. Draper Radford AAP prepared this ASD as recommended by the Virginia Department of Environmental Quality (VDEQ) during teleconferences on November 9, 2011 and on November 17, 2011.

In August 2007, Radford AAP submitted a request for a Class 3 permit modification for the Post Closure Care Permit (Permit) for Hazardous Waste Management Units 5, 7, 10, and 16. The Class 3 permit modification request included a closure plan amendment for HWMU-7 to allow Radford AAP to pursue clean closure for soil and groundwater at the Unit. The VDEQ approved the Class 3 permit modification in correspondence dated September 27, 2011. The approved Class 3 permit modification reduced the GPS for total cobalt at HWMU-7 from the previous VDEQ-calculated Alternate Concentration Limit (ACL) of 156.65 µg/L to the site-specific background concentration of 5 µg/L; this revision occurred due to the reduction of the VDEQ-calculated ACL for total cobalt from 156.65 µg/l to 4.695 µg/l. Total cobalt was never detected at concentrations greater than the previous GPS of 156.65 µg/l in any of the monitoring wells at HWMU-7. However, total cobalt has been detected consistently at concentrations greater than the revised GPS of 5 µg/l in plume monitoring well 7W13 and sporadically at concentrations greater than the revised GPS in point of compliance well 7WCA, thus complicating the pending demonstration for clean closure for groundwater at the Unit.

In correspondence dated October 4, 2011, Radford AAP provided the VDEQ with a summary of groundwater, soil, and sediment data collected at the Facility supporting the conclusion that the total cobalt concentrations observed in wells 7W13 and 7WCA at HMWU-7 are the result of natural variation within the carbonate bedrock aquifer and are not indicative of a release from the Unit. On November 9, 2011, Radford AAP held a teleconference with VDEQ to discuss the October 4, 2011 submittal as well as additional data that may be needed to support clean closure of the Unit. During the November 9, 2011 teleconference and a subsequent teleconference on November 17, 2011, the VDEQ indicated that an ASD would be the most appropriate mechanism by which to evaluate the total cobalt concentrations detected in groundwater at HWMU-7. As indicated by the VDEQ during the November 2011 teleconferences, Radford AAP will be able to pursue clean closure for groundwater at HWMU-7 should the ASD adequately demonstrate that the detected total cobalt concentrations are the result of natural variation within the aquifer.

# 2.0 FACILITY DESCRIPTION

## 2.1 Facility Location

Radford AAP is located in the mountains of southwestern Virginia within Pulaski and Montgomery Counties. The installation consists of two noncontiguous areas - the Radford Unit (or Main Section) and the New River Ammunition Storage Area Unit. The Main Section is located approximately 4 miles northeast of the city of Radford, approximately 10 miles west of Blacksburg, and 47 miles southwest of Roanoke, Virginia. The New River Unit is located approximately 6 miles west of the Main Section, near the town of Dublin, Virginia. All uses of the terms "Radford AAP" or "the Facility" in this document refer to the Main Section only.

Radford AAP is situated in one of a series of narrow valleys typical of the Valley and Ridge physiographic province of the Appalachian Highland Region of North America. Radford AAP is divided by the New River into two areas (**Figure 1**). The southern area, which comprises approximately two-thirds of Radford AAP, is called the "Main Plant Area." The remaining northern one-third section is called the "Horseshoe Area," and is located within the meander of the New River. As shown in **Figure 1**, forty three (43) Solid Waste Management Units (SWMUs) and eight (8) HWMUs are located in both the Main Plant Area and the Horseshoe Area; HWMU-7 is located in the Main Plant Area.

## 2.2 Hydrogeologic Framework

### 2.2.1 Geologic Setting

The general geology at Radford AAP consists of limestone/dolomite bedrock covered by weathered residual deposits and/or alluvial deposits. The alluvial deposits consist of typical fluvial deposits of interbedded clay, silt, and sand/gravel deposits with cobble lenses. The thickness of the alluvial deposits ranges from a few feet to approximately 50 feet, with an average thickness of 20 feet. The residual deposits consist of clay, silt, and clasts resulting from the physical and chemical weathering of the parent bedrock. The residual deposits typically underlie the alluvium, except in locations where the residuum has been eroded to bedrock and replaced by alluvium. The thickness of the residual deposits ranges from a few feet to approximately 40 feet. Underlying the alluvium and residuum throughout most of Radford AAP is a series of dolomite, limestone, and shale strata known as the Cambrian-aged Elbrook Formation. The Elbrook formation is the major outcropping formation as well as the predominant karstic formation below the Facility. Sinkholes, solution channels, pinnacled surfaces, and springs are common to the Elbrook Formation.

*Fracture Trace Analysis*

A total of 66 fracture traces were identified within and around Radford AAP in a photogeologic study conducted by the USEPA's Environmental Photographic interpretation center (EPIC) in 1992. Fracture traces are linear features identified in aerial photographs that represent the surface expression of primary joint sets, major fractures, and/or zones of fracturing in the subsurface. These features may be expressed as soil-tonal variations and vegetational and topographical alignments, and are significant in consideration of groundwater flow at Radford

AAP. The fractures and joint sets can act as discrete conduits for groundwater flow, increasing flow rates, and in some cases, redirecting flow away from the expected flow direction. In karst terrains, such features are environmentally significant because solutionization and resulting conduits develop along bedding plans as well as fractures and joints.

The primary traces identified at Radford AAP in the 1992 USEPA EPIC study are illustrated on the **Figure 2**. The bedding plane structures, seen as ledges in the New River channel, are also illustrated on **Figure 2**.

*Sinkhole Delineation*

The locations of sinkholes at Radford AAP were also mapped during the 1992 USEPA EPIC study (**Figure 2**). In the vicinity of Radford AAP, the strike of bedding in the Elbrook Formation is roughly west/northeast, with dips to the south/southeast. As shown on the Fracture Trace Map, the orientation of bedding can be seen in the nearly east-west alignment of sinkholes at Radford AAP and surrounding areas. Most of the sinkholes in the area are oval shaped and elongated with respect to the strike of bedding planes. In some instances, the sinkholes appear to align with respect to the fracture traces. The sinkholes most likely represent bedrock units with a greater carbonate content and lower shale content within the underlying Elbrook formation (USEPA, 1992).

*Dye Trace Study*

In September 1993 through December 1993, Engineering-Science, Inc. of Fairfax, Virginia (ESI) conducted a dye-trace test to identify hydrologic connections between areas of groundwater recharge (upland sinkholes) in the south-central portion of Main Plant and their respective discharge areas around the Facility. The south-central portion of the Main Plant area is characterized by sinkholes and a deep water table. The karst development within the underlying folded limestone and dolomite of the Elbrook Formation likely has a significant influence on groundwater flow through the bedrock in this area. The flow route as determined by the dye trace study and suggested by the fractures traces and regional groundwater flow is illustrated in **Figure 2**.

### 2.2.2 Occurrence of Groundwater

The general hydrogeological setting at Radford AAP is characterized by porous alluvial sediments overlying weathered and unweathered dolomite and limestone. In areas where the porous alluvial sediments are the uppermost water-bearing zone, groundwater flow is generally from topographically high areas to topographically low areas. In some areas of Radford AAP, the uppermost water-bearing zone is within the limestone and dolomite bedrock. The karst features within the bedrock aquifer can provide conduits for rapid transport of groundwater to the New River, which is the discharge area for regional groundwater flow.

Seasonal variations in precipitation can affect the direction of groundwater flow within the bedrock aquifer at Radford AAP. During wet seasons (high flow conditions), groundwater flow may occur in higher elevation conduits that are not normally saturated during dry seasons (low

flow conditions). As a result, flow may short-circuit the predominant flow paths and be redirected, discharging in unexpected areas.

In addition to seasonal variations, groundwater levels within the bedrock aquifer may fluctuate dramatically during heavy precipitation events. Groundwater levels in the karst bedrock aquifer generally respond to heavy precipitation within approximately 14 hours, and may rise several feet in a short time (Engineering-Science, 1994). This condition exists throughout Radford AAP, especially in areas where surface water infiltrates through these conduits, stormwater infiltrating in the uplands of the Facility may discharge to the New River in a matter of a few days following a storm event. The turbulent flow created by these conditions aerates the infiltrating water. The increased $O_2$ content can significantly affect the chemistry of the groundwater, increasing the concentration of many commonly occurring inorganic analytes. It is this direct connection between surface water and groundwater and the rapid movement of groundwater through the aquifer that is vital to interpreting the migration of both naturally occurring and released constituents in the groundwater at Radford AAP.

## 3.0 HAZARDOUS WASTE MANAGEMENT UNIT 7

### 3.1 Unit Description and History

HWMU-7 is a former unlined holding and neutralization basin located on the floodplain of the New River. A Site Plan for HWMU-7 is illustrated in **Figure 3**. Intermittent drainages are located to the north and south of the Unit, and the New River is located approximately 225 feet to the west of the Unit.

HWMU-7 was put into operation in 1972. When HWMU-7 was in operation, the impoundment measured approximately 90 feet wide by 160 feet long by 12 feet deep (side slope at 2:1). The resulting maximum capacity of the Unit was 566,131 gallons (75,685 cubic feet or 2,803 cubic yards). During operation, influent into HWMU-7 included spills, runoff, and wash down waters from the Acid Tank Farms in the Oleum Plant Area; waste sulfuric acid and caustics from oleum production; and waste caustic mixed with acidic water for neutralization. The wastes were characteristically hazardous as corrosive (EPA I.D. No. S04). The acidic waste waters were both nitric ($NO_3$) and sulfuric ($SO_4$) in origin with a pH ranging from 1.5 to 1.6 and a dominant constituent of mixed acids. The waste caustics were also corrosive in characteristic (pH >12.5), resulting in a similar EPA designation of D002. The dominant constituent of the caustic wastes was sodium hydroxide. The relative abundance of both waste streams was less than 1 percent.

Radford AAP ceased operation of HWMU-7 in 1986 and closed the Unit in 1989 in accordance with the VDEQ-approved Closure Plan dated May 1988. At the time of closure, HWMU-7 was drained of all waters, the residual material was treated in-place with flyash and cement kiln dust to achieve a target pH range of 6.3 and 10.5, and the basin was filled with the residual material and stone and capped. No waste has been processed through HWMU-7 since it was closed.

The closed HWMU-7 consists of a mound measuring approximately 90 feet wide by 160 feet long by 7 feet high, with a bottom elevation of approximately 1,711.1 feet above msl and a top elevation of approximately 1,718.3 feet above msl. The closed HWMU-7 is capped with a composite liner, which is underlain by the neutralized residual material. The residual material in turn is underlain by a clay liner ranging in thickness from 1.75 feet to 3 feet throughout most of the Unit. At the northern end of the Unit, the neutralized residual material is underlain by native soils.

Certifications of closure for HWMU-7 were submitted to the VDEQ in letters dated October 26, 1989 and January 4, 1990. Following closure, Radford AAP monitored HWMU-7 in accordance with the post-closure care and groundwater monitoring procedures specified in the May 1988 Closure Plan. HWMU-7 was classified as an interim status Unit until the VDEQ issued the ***Post-Closure Permit for Hazardous Waste Management Unit 7*** (effective date October 30, 1999); the VDEQ subsequently revised the October 1999 ***Post-Closure Permit***, and issued the ***Final Hazardous Waste Post-Closure Permit for HWMUs 5, 7, 10, and 16*** (October 4, 2002). Since 1999, Radford AAP has monitored HWMU-7 in accordance with the post-closure care and groundwater monitoring procedures specified in the ***Post-Closure Permits***, as appropriate.

## 3.2 Unit Hydrogeology

The compliance groundwater monitoring well network is illustrated in **Figure 3**. The compliance groundwater monitoring network consists of one upgradient well (7W12B), three point of compliance (POC) wells (7WCA, 7MW6, and 7W11B), four plume monitoring wells (7W9C, 7W10B, 7W10C, and 7W13), and three observation wells used only for the measurement of static water levels (7MW5, 7W9B, and 7W11). The monitoring wells are screened entirely within alluvium, weathered carbonate bedrock residuum, or carbonate bedrock or across the interfaces between two of the listed strata. Copies of the monitoring well boring logs and construction diagrams are included in **Appendix A**.

Groundwater elevation (potentiometric surface) and flow direction at HWMU-7 during the Second Quarter 2011 semiannual groundwater monitoring event are illustrated in **Figure 3**. Groundwater at the Unit is encountered at an average depth of 22 feet below ground level (bgl) with the water table generally located within the weathered bedrock residuum. Groundwater fluctuation in this zone typically does not exceed 1 to 2 feet annually over most of the site. Groundwater movement beneath the Unit is generally to the west towards the New River and to the northeast and southwest toward the unnamed intermittent drainages that flow into the New River north and south of the site.

Geologic cross sections for HWMU-7 are presented in **Appendix A**. Like most of Radford AAP, HWMU-7 is underlain by carbonate bedrock of the Elbrook Formation. Bedrock is generally encountered at a depth ranging from 29 to over 65 feet below the unit, with alluvial sediments and weathered bedrock residuum overlying the bedrock. The bedrock surface is characterized by depressions and pinnacles resulting from differential physical and chemical weathering influenced primarily by the depositional and mineralogical variations within the carbonate unit (shaley vs. crystalline carbonate). The shaley units of the Elbrook Formation tend to be more resistant, resulting in pinnacles or bedrock highs. As shown on the Geologic Cross Sections (**Appendix A**), the bedrock beneath the Unit appears to slope downward to the southwest, northwest, and northwest toward the intermittent drainages and the New River. HWMU-7 rests upon lower level terrace and flood plain deposits consisting of mixed silts, sands, gravels, and cobbles. The area around HWMU-7 is characterized by the development of sinkholes without any apparent alignment or preferred orientation. Bedrock bedding plane ledges identified during the fracture trace analysis that are located immediately upstream of HWMU-7 exhibit a west-northwest to east-southeast trend. It is probable that there are well developed karst conduits along these bedrock bedding planes which convey aerated surface water to the subsurface fairly rapidly during precipitation events.

## 3.3 Total Cobalt Concentrations in Groundwater

### 3.3.1 Groundwater Analytical Data – 2002-2011

Total cobalt concentrations detected in groundwater samples collected from the compliance groundwater monitoring network at HWMU-7 from Fourth Quarter 2002 through Fourth Quarter 2011 are summarized in **Table 1** (the initial GPS for total cobalt at HWMU-7 was established in the *Final Hazardous Waste Post-Closure Permit for HWMUs 5, 7, 10, and 16* dated October 4, 2002 [Fourth Quarter 2002]). As shown in **Table 1**, total cobalt has been detected sporadically

in POC well 7WCA at concentrations greater than revised GPS of 5 µg/l, but it has not been detected in upgradient well 7W12B or in POC wells 7MW6 and 7W11B at a concentration greater than 5 µg/l. With respect to the plume wells total cobalt has been detected consistently in well 7W13 at concentrations ranging from 5.3 µg/l to 16.4 µg/l, but it has not been detected in the other plume wells (**Table 1**).

### 3.3.2 Compliance Monitoring Well Network Sediment Sampling

In a meeting between Radford AAP and VDEQ on May 4, 2011, the VDEQ directed Radford AAP to collect sediment samples from each well in the monitoring network, to redevelop well 7W13 to reduce turbidity in order to evaluate the influence of sediment on total cobalt concentrations in groundwater, and to collect two (2) independent samples from well 7W13 to evaluate total cobalt concentrations following well redevelopment. As directed by VDEQ during the May 4, 2011 meeting, Radford AAP collected sediment samples from each well in the monitoring network on June 23, 2011. Copies of the field notes describing each sediment sample are included in **Appendix B**. The laboratory analytical results for the June 2011 sediment samples are summarized in **Table 2**. As shown in **Table 2**, the sediment sample collected from plume monitoring well 7W13 exhibited a total cobalt concentration of 10,700 µg/kg, which is approximately 1,137 times greater than the Second Quarter 2011 total cobalt concentration of 9.41 µg/l detected in well 7W13. The sediment sample collected from point of compliance well 7WCA exhibited the highest concentration of total cobalt (226,000 µg/kg). Copies of the field notes describing each sediment sample along with the laboratory certificates of analysis and data validation report,are included in **Appendix B**.

### 3.3.3 Plume Monitoring Well 7W13 Redevelopment and Sampling

On June 29-30, 2011, Radford AAP re-developed plume monitoring well 7W13 in an effort to reduce turbidity and collected a groundwater samples for laboratory analysis in order to evaluate the influence of sediment on total cobalt concentrations in groundwater in the well. Following redevelopment, the June 30, 2011 groundwater sample collected from well 7W13 exhibited a turbidity reading of 11.6 NTU and a total cobalt concentration of 12.4 µg/l, which was comparable with the Second Quarter 2011 concentration of 9.41 µg/l. On July 27, 2011, Radford AAP collected an additional groundwater sample from well 7W13 to evaluate the effectiveness of redevelopment of the well; the July 27, 2011 groundwater sample was analyzed for total and dissolved cobalt. The July 27, 2011 groundwater sample from well 7W13 exhibited a turbidity reading of 8.8 NTU, a total cobalt concentration of 14.5 µg/l, and a dissolved cobalt concentration of 13.7 µg/l (again, comparable to the Second Quarter 2011 total cobalt concentration of 9.41 µg/l). Based on these results, it appears that the redevelopment efforts did not significantly affect the total cobalt concentration in well 7W13. Copies of the field notes for the June 2011 and July 2011 well redevelopment and sampling events along with the laboratory certificates of analysis and data validation reports are included in **Appendix B**.

## 4.0 ALTERNATE SOURCE DEMONSTRATION FOR TOTAL COBALT

As indicated by the VDEQ during the November 2011 teleconferences, Radford AAP will pursue clean closure for groundwater at HWMU-7 should the ASD adequately demonstrate that the total cobalt concentrations detected in POC well 7WCA and in plume monitoring well 7W13 are the result of natural variation within the carbonate bedrock aquifer. The information provided in the following sections supports the reasonable conclusion that the total cobalt concentrations observed in wells 7WCA and 7W13 are derived from ambient, naturally-occurring and naturally variable sources including the aquifer media, and not a temporally-varying source such as a release from the closed Unit.

### 4.1 Trend Analysis of Total Cobalt Concentrations in Groundwater

As shown in **Table 1**, total cobalt has been detected sporadically in POC well 7WCA and consistently in plume well 7W13 at concentrations greater than revised GPS of 5 µg/l. A concentration versus time graph of the total cobalt concentrations detected from Fourth Quarter 2002 through Fourth Quarter 2011 is included as **Figure 4**. Visual observation of **Figure 4** indicates that the total cobalt concentrations detected in POC well 7WCA appear to be stable, and that the total cobalt concentrations detected in plume monitoring well 7W13 appear to have no notable, systematic trend.

Statistical trend analyses were also completed on the total cobalt concentrations in wells 7WCA and 7W13 using the data from the last 5 years (consistent with VDEQ's general statistical trend analysis guidelines for such circumstances). Since total cobalt has not been detected above its quantitation limit over the last five years in the other monitoring wells, no trend analyses were required in those cases. The trend analysis results show there are no increasing trends and that the total cobalt concentrations in both POC well 7WCA and plume well 7W13 are stable (**Appendix C**).

### 4.2 Review of HWMU-7 Monitoring Well Boring Logs

A review of the boring logs for the groundwater monitoring well network at HWMU-7 (**Table 3**) indicates that upgradient well 7W12B and POC well 7W11B are screened within alluvium (silt, sand, and gravel) and dolomite, while POC well 7WCA and plume monitoring well 7W13 are screened entirely within dolomite. Diagenesis of parent carbonate-rich sediments to form dolomites incorporates trace-element rich fluids in the rock-forming process. Therefore, dolomite bedrock is typically enriched in a variety of trace elements including arsenic, barium, cadmium, chromium, cobalt, copper, lead, nickel, uranium, vanadium, and zinc. Copies of the monitoring well boring logs and construction diagrams are included in **Appendix A**.

### 4.3 HWMU-7 Residual Material and Soil Concentrations

In November 2002, Radford AAP conducted a subsurface investigation at HWMU-7 to evaluate the nature and extent of the residual material contained in the closed Unit. In February 2004, Radford AAP conducted an additional subsurface investigation at HWMU-7 as directed by the VDEQ to evaluate the soil and liner material beneath the residual material. The Soil Sample Location Plan for HWMU-7 is included as **Figure 5**. The analytical results from both

investigations are summarized in **Table 4**. Cobalt was detected in only one sample of the residual material, at a concentration of 12.5 mg/kg. Cobalt was also detected in the soil cap for the Unit at a concentration of 11.5 mg/kg, within the bottom clay liner at concentrations ranging from 8.2 mg/kg to 23.6 mg/kg, and within the native soil underlying the Unit at concentrations ranging from 6.6 mg/kg to 10.4 mg/kg. These results indicate that cobalt is widely observed at significant concentrations in non-waste native materials underlying the closed Unit, or in materials used for construction, operation and closure of the Unit that were not affected by waste, further demonstrating a naturally-occurring source of cobalt to the local groundwater.

## 4.4 Facility-Wide Background Soil Concentrations

In August and September 2001, the IT Corporation conducted a Facility-Wide Background Study at the Main Manufacturing Area and the New River Unit of Radford AAP in accordance with a USEPA Region III-approved Work Plan; the primary objective of the study was to collect soil samples representative of background conditions to establish a baseline for inorganic constituents of concern at Radford AAP. Radford AAP has established the validity of the Facility-Wide Background Report with the VDEQ and USEPA Region III, and has substantial documentation regarding VDEQ and USEPA Region III approval of the study and its use as a screening tool for soils at the Facility.

The Facility-wide background values for the inorganic constituents of concern as calculated from background soil samples collected from the Main Manufacturing Area at Radford AAP (in which HWMU-7 is located) are summarized in **Table 5**. As shown in **Table 5**, the calculated Facility-wide background concentration for cobalt in soil within the Main Manufacturing Area is 72.3 mg/kg (72,300 µg/kg), or 4,400 times greater than the highest total cobalt concentration detected in groundwater at HWMU-7 (16.4 µg/l in well 7W13, **Table 1**). The calculated Facility-wide background concentration for cobalt in soil within the Main Manufacturing Area is also three times greater than the highest concentration detected in soil samples collected from the clay liner beneath HWMU-7 (**Table 4**). These results further support the conclusion that cobalt observed in the local groundwater is derived from naturally-occurring sources.

## 4.5 Total Cobalt in Groundwater at Additional Radford AAP Units

During the November 9, 2011 teleconference, the VDEQ recommended Radford AAP evaluate existing groundwater data from other Units at the Facility for the presence and concentration of total cobalt. Radford AAP evaluated groundwater data for the following solid waste management units (SWMUs), HWMUs, and areas of concern, which are listed in order of proximity to HWMU-7 (**Figure 1**):

- SWMU-37;
- SWMU-38 and AOC-Q;
- Oleum Plant;
- SWMUs 17, 40, 76, and Former Lead Furnace Area (FLFA);
- HWMU-5;
- HWMU-10; and
- HWMU-16.

Of the Units listed above, SWMUs 37, 38, and AOC-Q are located immediately northeast of HWMU-7 (**Figure 1**). The Oleum Plant is located approximately 750 feet east (topographically upgradient) from HWMU-7. SWMUs 17, 40, 76, and the FLFA are located approximately 3700 feet southeast (topographically upgradient) from HWMU-7. HWMU-5 is located approximately 3900 feet east-southeast from HWMU-7, HWMU-10 is located approximately 5000 feet northeast from HWMU-7, and HWMU-16 is located approximately 7500 feet northeast and across the New River from HWMU-7.

Total cobalt results for groundwater samples collected from only the upgradient (background) wells serving the Units listed above were evaluated in an effort to assess naturally-occurring total cobalt concentrations in the aquifer unaffected by the presence of the Units. The total cobalt concentrations observed in the upgradient wells at these Units are summarized in **Table 6**. Additionally, the lithologies in which the upgradient wells are screened (based on a review of the boring logs/construction diagrams) are also summarized in **Table 6**.

As shown in **Table 6**, a review of groundwater data for HWMU-7 from 1996 to 2011 indicates that total cobalt has been detected in upgradient well 7W12 at concentrations from less than the QL of 5 µg/L up to 17 ug/L. At SWMU-37, total cobalt was detected at a concentration of 12 µg/l in upgradient well 37MW2 during RCRA Facility Investigation activities conducted at the Unit in 2008 (**Table 6**). According to the monitoring well installation details for SWMU-37, upgradient well 37MW2 is screened in unconsolidated alluvial sediments and carbonate bedrock similar to HWMU-7 upgradient well 7W12B. Additionally, total cobalt was detected at a concentration of 26.9 µg/L in upgradient well 17MW02 during investigation activities conducted at SWMUs 17, 40, 76, and the FLFA in 2007 (**Table 6**). According to the monitoring well installation details for SWMU-17, upgradient well 17MW02 is screened in carbonate bedrock. A dye trace study conducted by ESI in 1993 indicates that groundwater in the vicinity of SWMUs 17, 40, 76, and the FLFA flows northeast via karst conduits to discharge into the New River. Low level total cobalt concentrations also have been detected in the upgradient wells serving SWMU-38, AOC-Q, the Oleum Plant, HWMU-5, HWMU-10, and HWMU-16 during previous investigations (**Table 6**). The groundwater data from the upgadient wells serving these multiple waste management units indicate that cobalt occurs naturally within the alluvium and carbonate bedrock aquifers at naturally variable concentrations throughout the Facility.

## 5.0 CONCLUSIONS AND RECOMMENDATIONS

The recently approved Class 3 permit modification reduced the GPS for total cobalt at HWMU-7 from the previous VDEQ-calculated ACL of 156.65 µg/L to the site-specific background concentration of 5 µg/L due to the reduction of the VDEQ-calculated ACL to 4.695 µg/l. Total cobalt has been detected consistently at concentrations greater than the recently revised GPS of 5 µg/l in plume monitoring well 7W13 and sporadically at concentrations greater than the revised GPS in point of compliance well 7WCA.

Statistical trend analysis results show there are no increasing trends of total cobalt concentrations in groundwater in POC well 7WCA and in plume well 7W13 and that the total cobalt concentrations in both wells are stable. Cobalt is widely observed at significant concentrations in non-waste derived materials used for construction, operation and closure of the Unit. Furthermore, based on the results of the 2001 Facility-Wide Background Study, cobalt occurs naturally within the native soils at Radford AAP at concentrations that are more than three orders of magnitude greater than the highest concentration (on a relative weight percent basis) detected in groundwater at HWMU-7. Additionally, cobalt is typically found as a trace element within the type of bedrock (dolomite) within which monitoring wells 7WCA and 7W13 are screened. Groundwater analytical data from upgradient wells serving multiple additional waste management units at Radford AAP confirm that cobalt occurs naturally within the alluvium and carbonate bedrock aquifers at naturally variable concentrations throughout the Facility.

Based on the information presented above, it is reasonable to conclude that the total cobalt concentrations observed in groundwater monitoring wells 7WCA and 7W13 are derived from ambient, naturally-occurring and naturally variable trace elements in the aquifer solid matrix, and not from a temporally-varying source such as a release from the closed HWMU-7. Further, it is noted that detections of total cobalt concentrations greater than the Unit's revised GPS of 5 µg/l are not the result of changes in groundwater quality, but due instead to the reduction of the risk-based ACL for cobalt from 156.65 µg/l to 4.695 µg/l. No other constituents have been detected in groundwater at HWMU-7 at concentrations greater than their respective GPS. Therefore, it is our professional opinion that HWMU-7 meets the requirements for clean closure for groundwater.

**NOTES:**
QL: Permit-specified Quantitation Limit.
GPS: Permit-specified Groundwater Protection Standard. The initial GPS for total cobalt at HWMU-7 was established in the Final Hazardous Waste Post-Closure Care Permit dated October 4, 2002 (Fourth Quarter 2002).
U: Not detected above the QL.
**BOLD** and yellow highlight denotes detected at or above QL.

**TABLE 2**
**HWMU-7, Radford AAP**
**Comparison of Total Cobalt Concentrations**
**Groundwater vs. Sediment Samples**

| Well ID | Total Cobalt Concentrations | |
|---|---|---|
| | Groundwater 2nd Qtr 2011 (ug/l) | Sediment June 23, 2011 (ug/kg) |
| 7W12B | U | 4,420 |
| 7MW6 | U | 9,010 |
| 7WCA | U | 226,000 |
| 7W11B | U | 11,000 |
| 7W9C | U | 4,410 |
| 7W10B | U | 48,400 |
| 7W10C | U | 5,860 |
| 7W13 | 9.41 | 10,700 |

**NOTES:**
U: Not detected above the QL of 5 ug/l.

Project Number: **B02271-01**

| | |
|---|---|
| Client: | Drilling Company: **Vironex** |
| Project: **HWMUs 5 & 7 Subsurface Investigation** | Driller: **Corey Gamwell** |
| Location: **Radford, Virginia** | Boring Method: **Geoprobe** |
| North: East: | Logged by: **R. Miller** |
| Total Depth **16.0'** Elev GS: | Reference: **Ground Surface** Completion Date: **February 18, 2004** |

| Samp ID | Blow Counts | N Value | Depth Scale | DESCRIPTION (USC) | Stratum Elev | PID (ppm) | WELL LOG | H2O | REMARKS |
|---|---|---|---|---|---|---|---|---|---|
| S-1 | | | | Fill. Brown fine silty sand, moist. | | | | | Boring backfilled with bentonite. |
| | | | | CL. Yellow-brown fine to coarse sandy clay, damp. | | | | | |
| | | | | SP. Light gray fine to coarse sand, wet. | | | | | Perched water. |
| S-2 | | | | SM. Yellow-brown fine silty sand with trace gravel, green compacted residual material, dry. | | | | | Residual material. |
| | | | 5 | | | | | | |
| S-3 | | | | CL. Red-brown micaceous fine sandy clay, dry. | | | | | |
| | | | 10 | | | | | | |
| S-4 | | | | | | | | | Clay liner. Sample 7-GP-24 (14) submitted for analysis by TAL/TCL. |
| | | | 15 | SM. Dark gray fine sand and silt with trace round gravel, dry. | | | | | |
| | | | | Boring terminated at 16 feet. | | | | | |
| | | | 20 | | | | | | |

# APPENDIX C

## MANN-KENDALL TREND TESTS – WELLS 7WCA AND 7W13

**Mann-Kendall Trend Test**
**Radford AAP HWMU-7**
**Dec-11**

Analyte: Cobalt
Well: 7WCA
Time Period: Semiannual data for the last 5 years (Second Qtr 2007 through Fourth Qtr 2011)
Time Period 1 corresponds to Second Qtr 2007 data and Time Period 10 corresponds to Fourth Qtr 2011 data

**Mann-Kendall Triangular Table**

| **Time** | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 | 9 | 10 | **Number of +signs (shown as 1)** | **Number of -signs (shown as -1)** |
|---|---|---|---|---|---|---|---|---|---|---|---|---|
| **Data** | 5 | 5 | 5.8 | 5.5 | 5.7 | 5 | 5 | 5 | 5 | 5 | | |
| 5 | | 0 | 1 | 1 | 1 | 0 | 0 | 0 | 0 | 0 | 3 | 0 |
| 5 | | | 1 | 1 | 1 | 0 | 0 | 0 | 0 | 0 | 3 | 0 |
| 5.8 | | | | -1 | -1 | -1 | -1 | -1 | -1 | -1 | 0 | 7 |
| 5.5 | | | | | 1 | -1 | -1 | -1 | -1 | -1 | 1 | 5 |
| 5.7 | | | | | | -1 | -1 | -1 | -1 | -1 | 0 | 5 |
| 5 | | | | | | | 0 | 0 | 0 | 0 | 0 | 0 |
| 5 | | | | | | | | 0 | 0 | 0 | 0 | 0 |
| 5 | | | | | | | | | 0 | 0 | 0 | 0 |
| 5 | | | | | | | | | | 0 | 0 | 0 |
| | | | | | | | | | **Total Number of Signs** | | 7 | 17 |

From the Table Above, S = -10
From Table A-12a of Appendix A (Reference Document), critical value for sample size of 10 for $\alpha = 0.05$ is 21
The calculated S value is not greater than the critical value.
From Table A-12b of Appendix A for n=10, S=-10, p=0.216
Since S<0, but p=0.216 ≥ 0.05, the null hypothesis is not rejected.
Therefore there is not enough evidence to conclude that there is a decreasing trend in the data. Also, there is no evidence of an increasing trend.
**Trend Analysis shows evidence that the data are stable.**
The QL of 5 was substituted for data reported less than QL

| | | | | | | | | | **Total Number of Signs** | | 32 | 13 |

From the Table Above, S = 19
From Table A-12a of Appendix A (Reference Document), critical value for sample size of 10 for $\alpha = 0.05$ is 21
The calculated S value is not greater than the critical value.
From Table A-12b of Appendix A for n=10, S=19, p=0.054
Since S>0, but p=0.054 ≥ 0.05, the null hypothesis is not rejected.
Therefore there is not enough evidence to conclude that there is a decreasing trend in the data. Also, there is no evidence of an increasing trend.
**Trend Analysis shows evidence that the data are stable.**

**Notes:**

CAS = Chemical Abstracts Service
µg/L = Microgram Per Liter
TAL = Target Analyte List
TCL = Target Compound List
VOC = Volatile Organic Compound
MDL = Method Detection Limit
RL = Reporting Limit
LQ = Laboratory Qualifier
VQ = Validation Qualifier
r = Reason Code
NT = Not Tested

mg/L = Milligram Per Liter
mV = millivolt
SU = Standard Units
mS = milliSiemen
°C = degrees Celcius
ntu = Nephelometric Turbidity
RBC = USEPA Region III Risk-Based Concentration (RBC) values from the October 11, 2007, RBC Table and October 11, 2007, Alternate RBC Table
C = Carcinogenic per EPA RBC Table (October 2007)
N = Noncarcinogenic per EPA RBC Table (October 2007)
MCL = Maximum Contaminant Level

* Re-sampled 6/24/08 for Pesticides only

[1] = Chromium VI RBC used for screening
[2] = USEPA Action Level used for screening
[3] = Chlordane RBC used for screening
[4] = alpha-BHC RBC used for screening
[5] = Endosulfan RBC used for screening

=Exceeds MCL

=Exceeds Adjusted T-RBC

Data Qualifiers:
B = Not detected substantially above the level reported in laboratory or field blanks.
J = Analyte present. Reported value may not be accurate or precise.
,J = The analyte was positively identified; the associated numerical value is the approximate concentration of the analyte in the sample.
U = Not detected. The associated number indicates the approximate sample concentration necessary to be detected.
UJ = Not detected, quantitation limit may be inaccurate or imprecise.
c = Calibration failure; poor or unstable response
m = MS/MSD recovery failure.
p = Preparation blank contamination
x = Trip blank contamination
z = Method blank and/or storage blank contamination

**Notes:**

CAS = Chemical Abstracts Service
mg/L = Milligram Per Liter
µg/L = Microgram Per Liter
TAL = Target Analyte List
TCL = Target Compound List
SVOC = Semi-volatile Organic Compound
MDL = Method Detection Limit
RL = Reporting Limit
LQ = Laboratory Qualifier
VQ = Validation Qualifier
r = Reason Code
NT = Not Tested

mV = millivolt
SU = Standard Units
mS = milliSiemen
°C = degrees Celcius
NTU = Nephelometric Turbidity
RBC = USEPA Region III Risk-Based Concentration (RBC) values from the October 11, 2007, RBC Table and October 11, 2007, Alternate RBC Table
C = Carcinogenic per EPA RBC Table (October 2007)
N = Noncarcinogenic per EPA RBC Table (October 2007)
MCL = Maximum Contaminant Level

[1] = Chromium VI RBC used for screening
[2] = USEPA Action Level used for screening
[3] = Endosulfan RBC used for screening

* Re-sampled on 6/24/08 for Manganese only

=Exceeds MCL

=Exceeds Adjusted T-RBC

Data Qualifiers:
B = Not detected substantially above the level reported in laboratory or field blanks.
J = Analyte present. Reported value may not be accurate or precise.
U = Not detected. The associated number indicates the approximate sample concentration necessary to be detected.
f = Field duplicate imprecision
m = MS/MSD recovery failure.
p = Preparation blank contamination
x = Field and/or equipment blank contamination
y = Trip blank contamination
z = Method blank and/or storage blank contamination

| | | | | | | | | | | |

Key:
< = Not detected (lab reporting limit shown).
/D = Field duplicate sample.
J = Estimated value
ug/L = micrograms per liter
mg/L = milligrams per liter
For blank cells the samples were not analyzed
Shaded/bolded cells indicate concentration or reporting limit greater than residential RBC.

Note:
Perchlorate –O(18) is a perchlorate isotope using oxygen with a molecular weight of 18 instead of 16. It is a marker added to the sample during analysis. The laboratory is required to report it since it determines matrix effects and data quality issues. Perchlorate –O(18) is shown in the laboratory reports in Appendix E; however, it is not reported in the final data table.

# RADFORD ARMY AMMUNITION PLANT, VIRGINIA

# Former Lead Furnace Area
# RCRA Facility Investigation/
# Corrective Measures Study Report

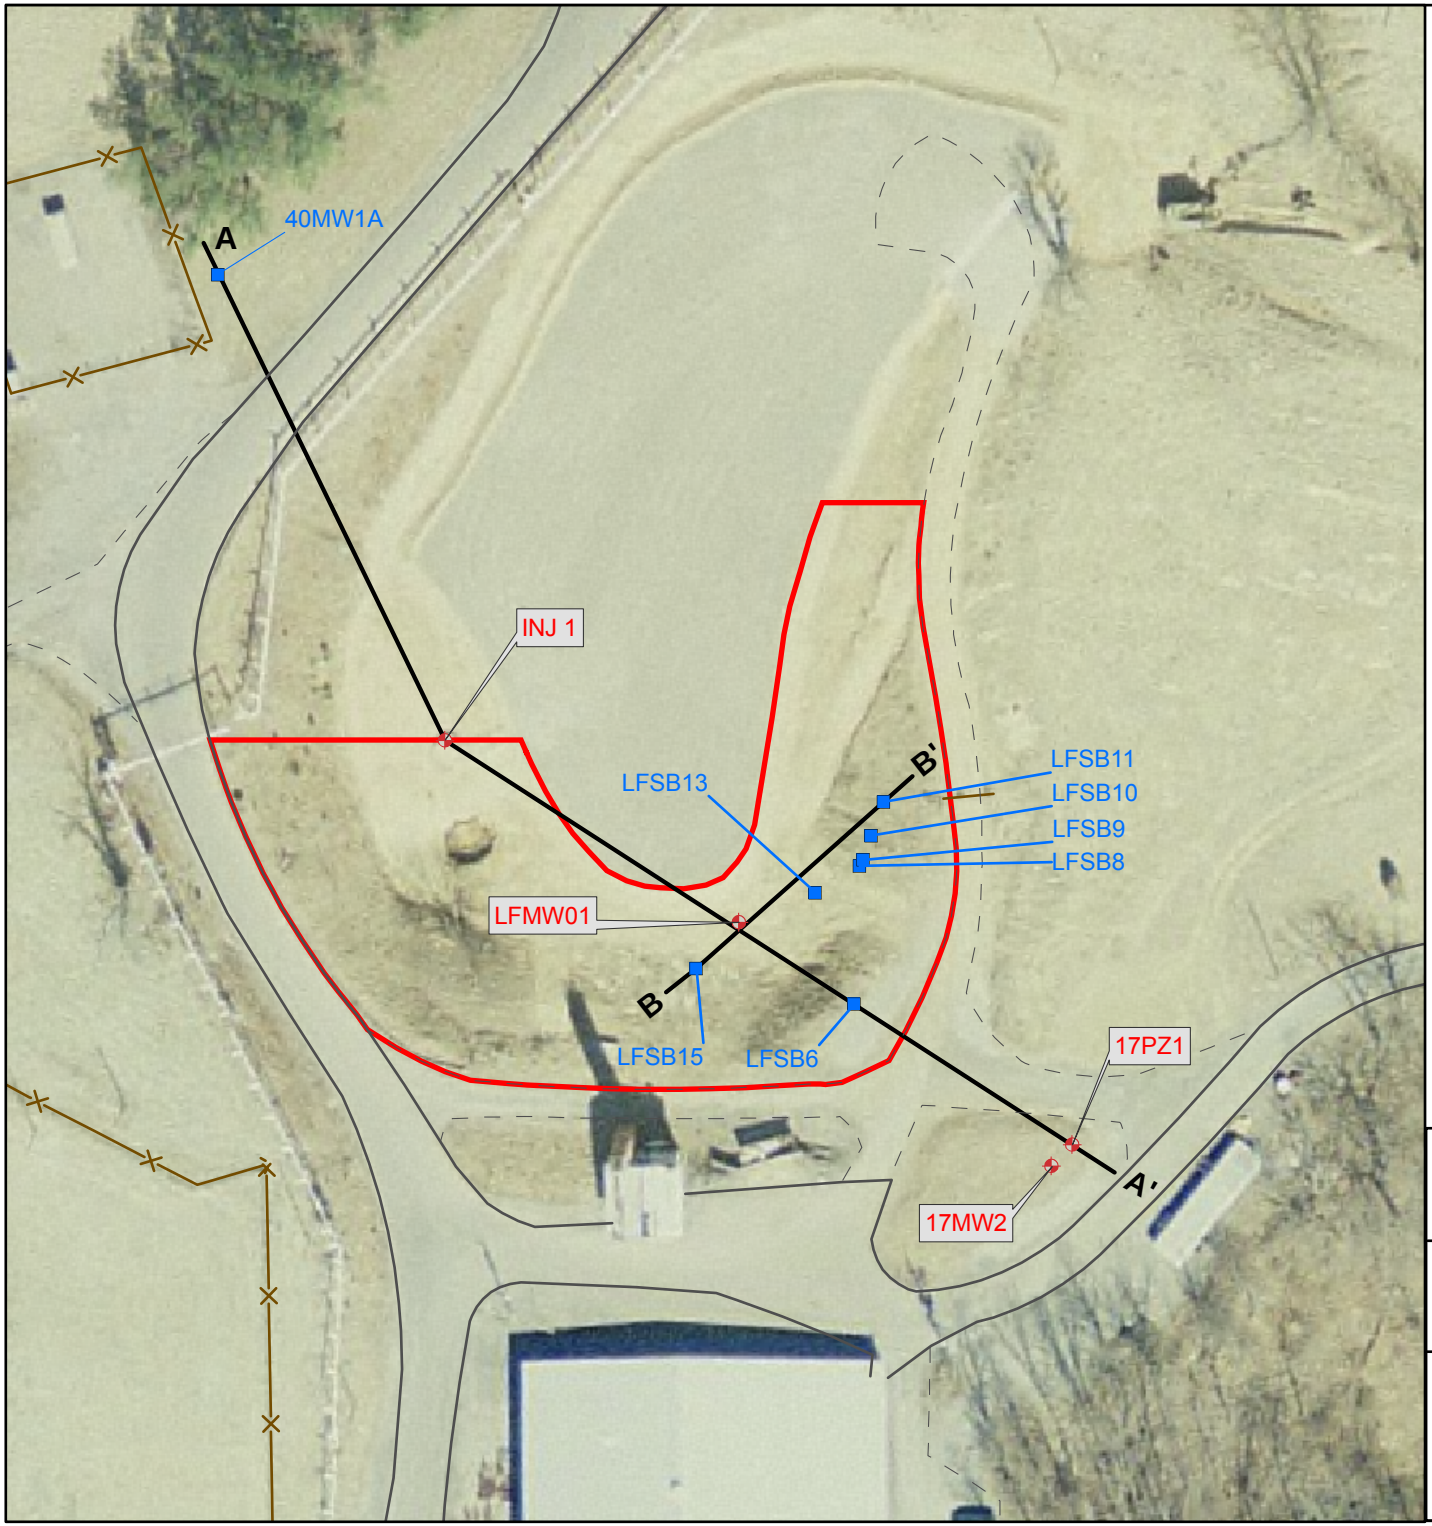
**Prepared for:**

USACE Baltimore District
10 S. Howard St.
Baltimore, MD 21201

**Prepared by:**

Shaw Environmental, Inc.
2113 Emmorton Park Rd.
Edgewood, MD 21040

**Final Document** **November 2008**



## LEGEND

- Soil Sample Location
- Monitoring Well
- Dirt Road
- Paved Road
- Fence Line
- Geologic Cross Section Line
- Former Lead Furnace Area Boundary

Notes:
1) Aerial photo, dated 2005, was obtained from Montgomery County, VA Planning & GIS Services.

N

Scale:

0 37.5 75 150 Feet

U.S. Army Corps of Engineers

Shaw® Shaw Environmental, Inc.

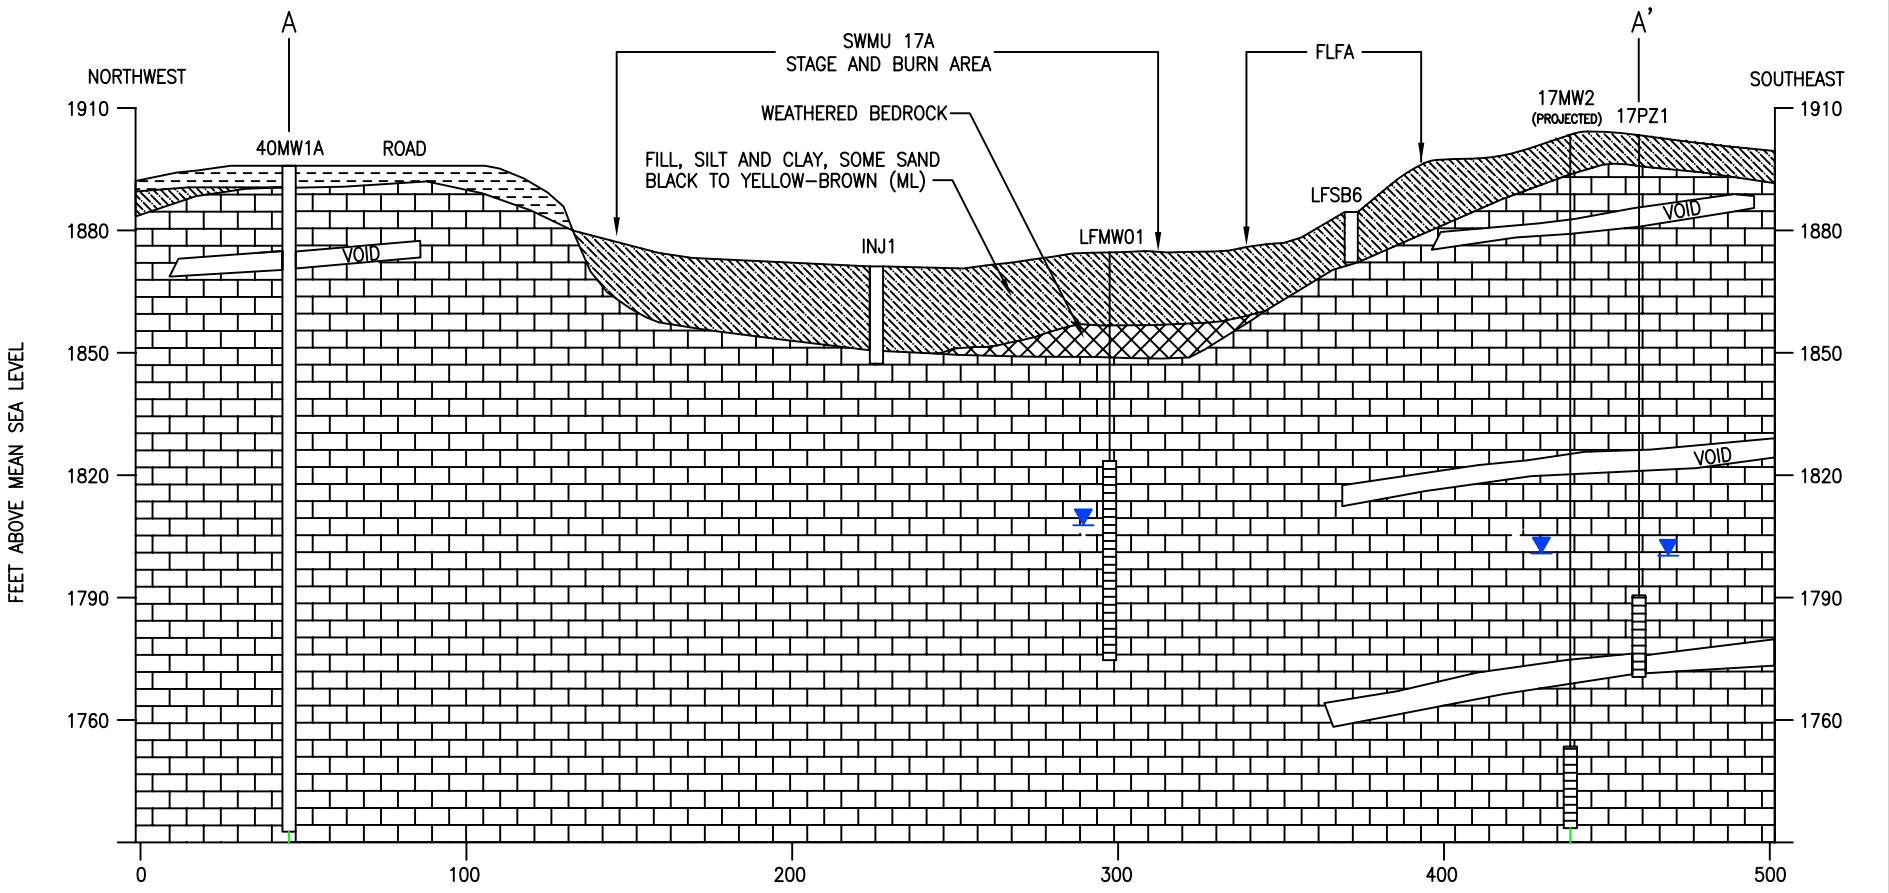
Radford Army Ammunition Plant,
Radford, VA

GIS File: RFAAP_Fig2-3_FLFA_XSect.mxdjoy.pasquarelli (1/29/2008 11:28:55 AM)



HORIZ. SCALE: 0 50 100

VERT. SCALE: 0 15 30 45 60 75

LEGEND

- CLAY AND SILT, LITTLE SAND, RED-BROWN (CL)
- SILT AND CLAY (ML/CL)
- WEATHERED BEDROCK
- LIMESTONE, GRAY-BROWN, ARGILLACEOUS (LMSN)
- STATIC GROUNDWATER LEVEL

NOTES

1) WATER LEVELS MEASURED DECEMBER 2007 (17MW2 AND 17PZ1) AND AUGUST 2007 (LFMW01)
2) SOME DATA POINTS ARE PROJECTED ONTO PROFILE.
3) 40MW1A AND 17PZ1 LITHOLOGY FROM DAMES AND MOORE.
4) 40MW1A IS A BORING.
5) INJECTION WELL IS AN OPEN HOLE AT THE BEDROCK INTERFACE.

## LEGEND

- Monitoring Well Location
- Dirt Road
- Paved Road
- Fence Line
- Former Lead Furnace Area Boundary
- Other Site Boundary

Notes:
1) Aerial photo, dated 2005, was obtained from Montgomery County, VA Planning & GIS Services.
2) All water levels measured in December 2007, except LFMW01, which was measured in August 2007.
3) Water levels are expressed in feet above mean sea level.
4) Groundwater flow direction is based on the 1994 dye trace study results (Engineering Science, 1994).

N

Scale:

0 70 140 280 Feet

# Table 4-7
# Legend

| | | |
|---|---|---|
| 12 | J | Shading and black font indicate an MCL exceedance. |
| 12 | J | Bold outline indicates a tw-RBC exceedance. |
| *12* | *12* | Shading in the MDL/MRL columns indicates the MDL exceeds a criterion. |

tw-RBCs for non-Carcinogenic compounds have been recalculated to an HI of 0.1.
The pyrene tw-RBCs were used for acenaphthylene, benzo(g,h,i)perylene and phenanthrene.
Secondary MCLs were used for aluminum, iron, manganese, silver, and zinc.
MCL Action Levels were used for copper and lead.
MCL = Maximum Contaminant Level (USEPA, 2006).
tw-RBC = Tap Water Risk-Based Concentration (USEPA, October 2007).
tw-RBC value in table is for the more conservative chromium VI.
tw-RBC value for chromium III is 5,500, which was not exceeded.
ng/L = nanograms per liter (parts per trillion).
µg/L = micrograms per liter (parts per billion).
NA = not applicable.
NT = analyte not tested.

**LQ = Lab Data Qualifiers**

B = (organics) Blank contamination. Value detected in sample and associated blank.
A (Dioxins) = B = (metals) Value <MRL and >MDL and is considered estimated.
E (metals) = Reported value is estimated because of the presence of interferences.
EMPC (Dioxins) = The ion-abundance ratio between the two characteristic PCDD/PCDF ions was outside accepted ranges. The detected PCDD/PCDF was reported as an estimated maximum possible concentration (EMPC).
J = (organics) Value <MRL and >MDL and is considered estimated.
U = Analyte not-detected at the method reporting limit.
X = (dioxins) Ion abundance ratio outside acceptable range. Value reported is EMPC.

**VQ = Validation Data Qualifiers:**

B = blank contamination. Value detected in sample and associated blank.
J = estimated concentration
K = estimated concentration bias high
L = estimated concentration bias low
N = presumptive evidence for tentatively identified compounds using a library search
U = analyte not detected
UJ = estimated concentration non-detect
UL = estimated concentration non-detect bias low

flow line vectors over the Potentiometric Surface Map, measuring their lengths, calculating the head differential over the distances measured, and dividing the head differential by the length of the flow line vectors. The three calculated gradients were then averaged to a single value. Using this method, the average groundwater hydraulic gradient across the site based on First Quarter 1999 groundwater elevations was calculated to be 0.017 ft/ft. Historical slug test data for the site yielded an average hydraulic conductivity of $5.25 \times 10^{-5}$ ft/second. This value is consistent with literature values for karst carbonate rock and for clayey, silty sand and gravel alluvium and residuum (Domenico and Schwartz, 1990).

The estimated groundwater velocity across the site was calculated to be approximately 0.193 ft/day or 70.4 ft/year, based on the following:

- an average hydraulic conductivity of $5.25 \times 10^{-5}$ ft/second;
- an average hydraulic gradient of 0.017 ft/ft; and
- an assumed effective porosity of 0.40, based on a representative range of porosities for karst carbonate rock, weathered residuum, and clayey, silty sand and gravel alluvium (Domenico and Schwartz, 1990).

The actual groundwater flow velocities in the carbonate bedrock may vary as much as one to two orders of magnitude from the velocity presented above, depending on water level conditions and the distribution of karst conduits.

## 3.3 HWMU-5 GROUNDWATER MONITORING ANALYTE LIST

The groundwater monitoring analyte list for HWMU-5 is presented in **Table 1 (Appendix B)**. The list represents the subset of the constituents listed in Appendix VIII of 40 CFR Part 261 that previously have been detected in the groundwater and/or that are reasonably expected to be in or derived from waste contained in HWMU-5. As discussed in Section 3.5.2 below, 11 inorganic constituents, three volatile organic constituents, and two explosive/ propellant constituents have been detected in the groundwater monitoring network for HWMU-5 at statistically significant concentrations above the Unit's calculated background concentrations.

The concentration limits established for the hazardous constituents also are listed in **Table 1**. The concentration limits represent either background concentrations calculated for the constituents in this GWQAR, Maximum Concentrations of Constituents for Ground-water Protection listed in Table 1 of 40 CFR 264.94, USEPA Drinking Water Standard Maximum Contaminant Levels (MCLs), or alternate concentration limits (ACLs) established by the VDEQ (July 1998).

As Alliant discussed with the VDEQ in the past, the reliability of previous laboratory analytical data - particularly dissolved metals data - appeared to be questionable in some cases. In an April 9, 1996 letter to C. Jake (Alliant), the VDEQ agreed that only total metals concentrations in groundwater would be measured, as described in a USEPA Region III guidance on groundwater sampling in karst terrain. Therefore, all references to metals concentrations in this GWQAR refer to <u>total</u> metals concentrations.

## 3.4 HWMU-5 GROUNDWATER BACKGROUND CONCENTRATIONS

Background concentrations were calculated for each constituent in the groundwater monitoring program using the analytical data from First Quarter 1996 through First Quarter 1999 for upgradient well 5W8B. The background concentration calculations were based on site wide 95% confidence, 95% coverage upper prediction intervals. The calculated background

concentrations are listed in **Table 2 (Appendix B)**. The background concentrations were used to construct the outermost closing contours on the Isoconcentration Maps **(Appendix A)**.

## 3.5 HWMU-5 STATISTICAL ANALYSIS

Statistical evaluations for HWMU-5 are performed annually and submitted to the VDEQ in accordance with the annual reporting requirements specified in 40 CFR 265.94. As part of this GWQAR, statistical evaluations were performed on First Quarter 1999 analytical data in accordance with the procedures and guidance provided in the following documents:

- Title 40 of the Code of Federal Regulations, 40 CFR 264.97 and 264.98;
- VDEQ Guidance for statistical analysis titled "Data Analysis Plan," undated;
- Interim Final Guidance for Statistical Analysis of Groundwater Monitoring Data at RCRA Facilities, USEPA, April 1989;
- Addendum to Interim Final Guidance for Statistical Analysis of Groundwater Monitoring Data at RCRA Facilities, USEPA, July 1992; and
- Statistical Methods for Groundwater Monitoring, Gibbons, R.D., 1994.

Statistical threshold values were computed for the 40 constituents for which HWMU-5 is currently monitored based on the concentrations of those constituents in upgradient (background) well 5W8B. All data starting with First Quarter 1996 to First Quarter 1999 were used for this purpose. The 1996 through 1999 monitoring data have been submitted previously to the VDEQ by Alliant in quarterly monitoring reports; therefore, the data are not listed in this GWQAR. Statistical comparisons were performed for the First Quarter 1999 data set. Comparison statistical analyses were performed for all constituents which were detected in any downgradient well during that event.

### 3.5.1 Background Data and Statistical Comparisons

Statistical analyses were performed using the analytical results from upgradient well 5W8B as background data. Based on the percentage of non-detects and the distribution of the background data, methods of statistical comparisons varied. Background average, standard deviation and other descriptive statistical data were computed for all constituents and are presented in **Appendix C**.

The constituents listed below were 100% non-detected in the background data. The background threshold levels (BTLs) for these constituents were established as equal to their detection limits (DL). Detections of these constituents in the downgradient wells during First Quarter 1999 were compared to these BTLs.

| Background Threshold Level (BTL) = Detection Limit (DL) | | | | |
|---|---|---|---|---|
| Parameter | Sample Size | % Non-Detects | DL (µg/l) | BTL (µg/l) |
| Antimony | 13 | 100 | 3 | 3 |
| Arsenic | 13 | 100 | 1 | 1 |
| Selenium | 13 | 100 | 1 | 1 |
| Benzene | 13 | 100 | 0.1 | 0.1 |
| Chloromethane | 13 | 100 | 0.3 | 0.3 |
| 1,2-Dichloroethane | 13 | 100 | 0.1 | 0.1 |
| Tetrachloroethene | 13 | 100 | 0.1 | 0.1 |
| Toluene | 13 | 100 | 0.1 | 0.1 |
| trans-1,2-Dichloroethene | 13 | 100 | 0.1 | 0.1 |

| Background Threshold Level (BTL) = Detection Limit (DL) | | | | |
|---|---|---|---|---|
| Parameter | Sample Size | % Non-Detects | DL (µg/l) | BTL (µg/l) |
| 1,1,2-Trichloroethane | 13 | 100 | 0.5 | 0.5 |
| Trichlorofluoromethene | 13 | 100 | 0.5 | 0.5 |
| Vinyl chloride | 13 | 100 | 0.1 | 0.1 |
| Xylenes (total) | 13 | 100 | 0.1 | 0.1 |
| Bis (2-ethylhexyl) phthalate | 13 | 100 | 10 | 10 |
| Di-n-butyl phthalate | 9 | 100 | 5 | 5 |
| Diethyl phthalate | 13 | 100 | 5 | 5 |
| Diphenylamine | 13 | 100 | 10 | 10 |
| 2,6-Dinitrotoluene | 13 | 100 | 0.08 | 0.08 |

Non-parametric prediction intervals were computed for all of the constituents for which the data from background well 5W8B satisfied one of the following two criteria, per VDEQ regulations and guidance as well as USEPA guidance:

- Percentage of non-detects was greater than or equal to 50 and less than 100; or
- Percentage of non-detects was less than 50, but data was not normally distributed in original or log-transformed mode.

The background threshold levels for these constituents were set as equal to their upper prediction limits (UPLs). The background and relevant statistical data for these constituents are summarized below. The confidence level and false positive rate were calculated based on the number of background data points available and number of future comparisons. For all constituents, the confidence level was determined to be equal to 0.920, and the false positive rate was equal to 0.080. Since the upper control limit of a non-parametric interval cannot be adjusted for multiple comparisons and inadequate number of background data, the number of resampling events required was adjusted to account for the high error rates inherent in those situations. The number of confirmation resamples required for all constituents is 2. The background and relevant statistical data for these constituents are summarized below. Associated statistical computations are presented in **Appendix C**.

| BTL = Upper Prediction Limit of Non-parametric Prediction Interval w/false positive rate=0.067 | | | | |
|---|---|---|---|---|
| Parameter | Sample Size | % Non-Detects | DL (µg/l) | BTL (µg/l) |
| Beryllium | 13 | 54 | 0.2 | 0.7 |
| Cobalt | 13 | 46 | 1 | 7 |
| Copper | 13 | 54 | 1 | 18 |
| Lead | 13 | 69 | 1 | 10 |
| Mercury | 13 | 85 | 0.2 | 0.9 |
| Nickel | 13 | 69 | 15 | 106 |
| Silver | 13 | 85 | 0.2 | 2.3 |
| Thallium | 13 | 85 | 1 | 2 |
| Vanadium | 13 | 62 | 4 | 17 |
| Zinc | 13 | 38 | 5 | 75 |
| Acetone | 13 | 92 | 10.0 | 89 |
| Chloroform | 13 | 77 | 0.3 | 0.5 |
| Methylene chloride | 13 | 92 | 0.7 | 0.7 |
| Methylethyl ketone | 13 | 92 | 1.1 | 21.3 |
| Trichloroethene | 13 | 85 | 0.1 | 0.8 |
| 2,4-Dinitrotoluene | 13 | 92 | 0.08 | 0.18 |
| Total Organic Carbon | 13 | 69 | 1,000 | 253,000 |
| Total Organic Halides | 13 | 46 | 5 | 13.4 |

The following constituents exhibited normally distributed background data with less than 25% non-detects. One sided parametric prediction intervals were computed on the background data for all of these constituents. The UPLs for these constituents were set as their respective BTLs, with one exception. For pH, a two-sided parametric prediction interval was computed; therefore, the BTL for pH consisted of a range between the lower prediction limit (LPL) and the upper prediction limit. The background concentration calculations were based on a site wide 95% confidence, 95% coverage upper prediction intervals. When adjusted for multiple comparisons of the background data, the minimum required false positive rate was below 1% (0.01). A 99% confidence level (0.01 false positive rate) was used for all individual comparisons, which with the most conservative assumptions provided a site-wide false positive rate of >0.05 for all constituents. The background and relevant statistical data for these constituents are summarized below. The prediction interval computations for these constituents are presented in **Appendix C**.

| **BTL = UPL of one-sided Prediction Interval (exception pH) w/site-wide false positive rate>0.05 (individual comparisons false positive rate=0.01) BTL for pH = LPL – UPL of two-sided Prediction Interval** | | | | |
|---|---|---|---|---|
| **Parameter** | **Sample Size** | **% Non-Detects** | **DL (µg/l)** | **BTL (µg/l)** |
| Barium | 13 | 0 | 2 | 172.87 |

| pH | 8 | 0 | 0.1 pH units | 2.79 - 7.47 pH units |

### 3.5.2 Results of Statistical Comparisons

The following table lists the constituents which were detected during the First Quarter 1999 event at concentrations exceeding their respective background threshold levels (BTLs), and the downgradient wells in which they were detected.

| Parameter | Monitoring Well(s) |
|---|---|
| Arsenic | S5W5 |
| Beryllium | 5W7B, 5WC21, S5W5 |
| Cadmium | 5WC21 |
| Cobalt | 5W5B, 5W7B, 5WC21, 5WC22, S5W7, 5W11A |
| Copper | 5W7B, 5WC21 |
| Lead | 5W7B, S5W5 |
| Nickel | 5WC21 |
| Selenium | 5W5B |
| Silver | 5W5B |
| Vanadium | 5W5B, 5W7B, S5W5 |
| Zinc | 5W7B, 5WC21, 5W11A |
| Chloroform | 5WC21 |
| Trichloroethene | 5W5B, 5WC21, 5WC22, 5WC23, 5W10A |
| Xylenes (total) | 5W5B |
| 2,4-Dinitrotoluene | 5W5B, 5W7B, 5WC21, 5WC22, 5WC23 |
| 2,6-Dinitrotoluene | 5W5B, 5W7B, 5WC21, 5WC22, 5WC23, 5W9A |
| Specific Conductivity | 5W5B, 5W7B, 5WC21, 5WC22, 5WC23, S5W7, 5W9A, 5W11A |
| pH | 5WC23, 5W10A, 5W11A |

**Definitions:**

**QL:** Denotes laboratory quantitation limit.
**Permit QL:** Denotes permit quantitation limit.
**U:** Denotes not detected at or above the permit detection limit or QL.
**UA:** Denotes not detected at or above the adjusted detection limit or adjusted QL.
**J:** Denotes result is estimated. When used with "U" (i.e., "UJ"), denotes analyte not detected at or above the detection limit or QL and detection limit and QL are estimated. When used with "UA" (i.e., "UAJ"), denotes analyte not detected at or above adjusted detection limit and adjusted detection limit and QL are estimated.
**UN:** Denotes analyte concentration is less than the QL and/or five times the blank concentration. Not reliably detected due to blank contamination.
**Q:** Denotes data validation qualifier.

**CAS#:** Denotes Chemical Abstract Services registration number.
**GPS:** Denotes Groundwater Protection Standards listed in Appendix K of Module VI-Groundwater Corrective Action & Monitoring Program for Unit 5 (approved by the VDEQ in the Final Class 3 Hazardous Waste Permit Modification dated November 5, 2009) which was incorporated into the Final Hazardous Waste Post-Closure Care Permit for Hazardous Waste Units 5, 7, 10, and 16 (October 4, 2002).

## *Target Analyte Monitoring Results - HWMU-10 Point of Compliance Wells*

## *Radford Army Ammunition Plant, Radford, Virginia*

***Upgradient well = 10D4*** ***All Results in ug/L.***

| *Analyte/Quarter* | *10D4 Q* | *10D3 Q* | *10D3D Q* | *10DDH2R Q* | *10MW1 Q* | *QL* | *GPS* | *Method* |
|---|---|---|---|---|---|---|---|---|

**Definitions:**

**QL** Denotes permit required quantitation limit.
**U** Denotes analyte not detected at or above QL.
**UA** Denotes analyte not detected at or above adjusted sample QL.
**J** Denotes associated result is estimated. When used with "U" (i.e., "**UJ**"), denotes analyte not detected at or above QL and QL is estimated. When used with "UA" (i.e., "**UAJ**"), denotes analyte not detected at or above adjusted QL and adjusted QL is estimated.
**UN** Denotes analyte concentration is less than the quantiation limit and five times the blank concentration. Not reliably detected due to blank contamination. This qualifier used only for Appendix IX monitoring event when results are reported to at or above the detection limit.
**R** Denotes result rejected.
**Q** Denotes data validation qualifier.
**CAS#** Denotes Chemical Abstract Services registration number.
**GPS** Denotes Groundwater Protection Standards listed in Appendix G to Attachment 4 in the Final Hazardous Waste Post-Closure Care Permit for Hazardous Waste Units 5, 7, 10, and 16 (October 4, 2002). For cobalt, vanadium, acetone and 2-propanol, these analytes are not listed in Appendix VIII to 40 CFR Part 261; therefore, GPSs will not be established for these constituents.
**NS** denotes not sampled.
**NA** denotes not analyzed.
**"–"** denotes not detected (pre-2nd Quarter 2003) or not available / not sampled (beginning 2nd Quarter 2003).

**Appendix IX Monitoring Events:**
***First Quarter 2003,***
***Second Quarter: 2004, 2005, 2007, 2008, 2009, 2010, 2011***
***Third Quarter 2006***

For Appendix IX monitoring, compliance well results reported/evaluated to detection limit. See data validation Qualifier definitions noted below.

***The following definitions apply to results reported for Appendix IX monitoring events.***
***All Appendix IX monitoring results for compliance wells are reported to the detection limit.***

**QL** Denotes permit required quantitation limit.
**U** denotes not detected at or above the detection limit or QL.
**UA** denotes not detected at or above the adjusted detection limit or adjusted QL.
**J** Denotes result is estimated. When used with "U" (i.e., "UJ"), denotes analyte not detected at or above the detection limit or QL and detection limit and QL are estimated. When used with "UA" (i.e., "UAJ"), denotes analyte not detected at or above adjusted detection limit or adjusted QL and adjusted detection limit and adjusted QL are estimated.
**UN** Denotes analyte concentration is less than the quantitation limit and/or five times the blank concentration. Not reliably detected due to blank contamination. This qualifier used only for Appendix IX monitoring event when compliance well results are reported to at or above the project detection limit.

Verification events: 12/12/03, 06/17/04, 7/25/2005.
6/17/04. Verification event. Acetone: 10D3D was not detected during verification event. Verification event result reported.
7/25/05. Verification event. All wells: ethyl acetate. 10D3D: alpha-BHC, acetone and 2-propanol. All verification results: Not detected except for acetone and 2-propanol. Verification results presented in table.
7/17/2008. Verification event. 10MW1. Technical chlordane, diethyl phthalate. Verification results reported-all not detected.
6/11/2009 – Verification event, 10DDH2R, Diethyl ether, Verification results reported in table-all not detected.

- It was not understood why the majority of fluorescein detections were considered false positive detections. The basis of this observation is unclear considering a lack of background and laboratory confirmation results.

- It was not apparent why certain samples were selected for laboratory confirmation and others were not. There was no apparent consistency in the selection of samples for laboratory confirmation.

- Samples were submitted for confirmation laboratory analyses three months or more following the collection of the samples in the field. No information was provided regarding the custody and/or storage of the samples. The samples were submitted to the analytical laboratory with incomplete chain-of-custody (COC), and the COC documentation was not completed by the laboratory.

In summary, the data from the study do not provide the basis for meaningful interpretation. Any attempt to formulate conclusions from the data as presented regarding the presence of preferred or predominant groundwater flow patterns is not warranted or recommended.

## 3.3 HWMU-16 GROUNDWATER MONITORING ANALYTE LIST

The groundwater monitoring analyte list for HWMU-16 is presented in **Table 1 (Appendix B)**. The list represents the subset of the constituents listed in Appendix III of 40 CFR Part 261 that previously have been detected in the groundwater and/or that are reasonably expected to be in or derived from waste contained in HWMU-16. As discussed in Section 3.5.2 below, 12 inorganic constituents and two explosive/propellant constituents have been detected in the groundwater monitoring network for HWMU-16 at statistically significant concentrations above the Unit's calculated background concentrations. The inorganic constituents may be derived from the aquifer formation materials; however, the two explosive/propellant constituents (2,4-Dinitrotoluene and 2,6-Dinitrotoluene) are byproducts of wastes derived from explosives. Therefore, the two explosive/propellant constituents detected could only be from HWMU-16.

The concentration limits established for the hazardous constituents also are listed in **Table 1**. The concentration limits represent either background concentrations calculated for the constituents in this GWQAR, Maximum Concentrations of Constituents for Ground-water Protection listed in Table 1 of 40 CFR 264.94, USEPA Drinking Water Standard Maximum Contaminant Levels (MCLs), or alternate concentration limits (ACLs) established by the VDEQ (July 1998). Certain organic constituents on the list do not have USEPA MCLs or VDEQ ACLs; they also do not have calculated background concentrations because they have not been detected in the Unit's upgradient well. Therefore, the concentration limits for these constituents are equal to their respective method detection limits.

As Alliant discussed with the VDEQ in the past, the reliability of previous laboratory analytical data - particularly dissolved metals data - appeared to be questionable in some cases. In an April 9, 1996 letter to C. Jake (Alliant), the VDEQ agreed that only total metals concentrations in groundwater would be measured, as described in a USEPA Region III guidance on groundwater sampling in karst terrain. Therefore, all references to metals concentrations in this GWQAR refer to <u>total</u> metals concentrations.

## 3.4 HWMU-16 GROUNDWATER BACKGROUND CONCENTRATIONS

Background concentrations were calculated for each constituent in the groundwater monitoring program using the analytical data from 1996 through 1998 for upgradient well 16C1.

The background concentration calculations were based on site wide 95% confidence, 95% coverage upper prediction intervals. The calculated background concentrations are listed in **Table 2 (Appendix B)**. The background concentrations were used to construct the outermost closing contours on the Isoconcentration Maps **(Appendix A)**.

## 3.5 HWMU-16 STATISTICAL ANALYSIS

Statistical evaluations for HWMU-16 are performed annually and submitted to the VDEQ in accordance with the annual reporting requirements specified in 40 CFR 265.94. As part of this GWQAR, statistical evaluations were performed on Fourth Quarter 1998 analytical data in accordance with the procedures and guidance provided in the following documents:

- Title 40 of the Code of Federal Regulations, 40 CFR 264.97 and 264.98;
- VDEQ Guidance for statistical analysis titled "Data Analysis Plan," undated;
- Interim Final Guidance for Statistical Analysis of Groundwater Monitoring Data at RCRA Facilities, USEPA, April 1989;
- Addendum to Interim Final Guidance for Statistical Analysis of Groundwater Monitoring Data at RCRA Facilities, USEPA, July 1992; and
- Statistical Methods for Groundwater Monitoring, Gibbons, R.D., 1994.

Statistical threshold values were computed for the 54 constituents for which HWMU-16 is currently monitored based on the concentrations of those constituents in upgradient (background) well 16C1. All data starting with First Quarter 1996 to Fourth Quarter 1998 were used for this purpose. The 1996 through 1998 monitoring data have been submitted previously to the VDEQ by Alliant in quarterly monitoring reports; therefore, the data are not listed in this GWQAR. Statistical comparisons were performed for the Fourth Quarter 1998 data set. Comparison statistical analyses were performed for all constituents which were detected in any downgradient well during that event.

### 3.5.1 Background Data and Statistical Comparisons

Statistical analyses were performed using the analytical results from upgradient well 16C1 data as background data. Based on the percentage of non-detects and the distribution of the background data, methods of statistical comparisons varied. Background average, standard deviation and other descriptive statistical data were computed for all constituents and are presented in **Appendix C**.

The constituents listed below were 100% non-detected in the background data. The background threshold levels (BTLs) for these constituents were established as equal to their detection limits (DL). Detections of these constituents in the downgradient wells during Fourth Quarter 1998 were compared to these BTLs.

| Background Threshold Level (BTL) = Detection Limit (DL) | | | | |
|---|---|---|---|---|
| Parameter | Sample Size | % Non-Detects | DL (µg/l) | BTL (µg/l) |
| Antimony | 12 | 100 | 3 | 3 |
| Arsenic | 12 | 100 | 1 | 1 |

Non-parametric prediction intervals were computed for all of the constituents for which the data from background well 16C1 satisfied one of the following two criteria, per VDEQ regulations and guidance as well as USEPA guidance:

- Percentage of non-detects was greater than or equal to 50 and less than 100; or
- Percentage of non-detects was less than 50, but data was not normally distributed in original or log-transformed mode.

The background threshold levels for these constituents were set as equal to their upper prediction limits (UPLs). The background and relevant statistical data for these constituents are summarized below. The confidence level and false positive rate were calculated based on the number of background data points available and number of future comparisons. For all constituents, the confidence level was determined to be equal to 0.933, and the false positive rate was equal to 0.067. Since the upper control limit of a non-parametric interval cannot be adjusted for multiple comparisons and inadequate number of background data, the number of resampling events required was adjusted to account for the high error rates inherent in those situations. The number of confirmation resamples required for all constituents is 2. The background and relevant statistical data for these constituents are summarized below. Associated statistical computations are presented in **Appendix C**.

| BTL = Upper Prediction Limit of Non-parametric Prediction Interval w/false positive rate=0.067 | | | | |
|---|---|---|---|---|
| Parameter | Sample Size | % Non-Detects | DL (µg/l) | BTL (µg/l) |
| Beryllium | 12 | 75 | 0.2 | 0.7 |
| Cadmium | 12 | 75 | 0.1 | 0.2 |
| Cobalt | 12 | 75 | 1 | 5 |
| Copper | 12 | 50 | 1 | 13 |
| 1,1-Dichloroethane | 12 | 0 | 0.2 | 9.5 |
| 2,4-Dinitrotoluene | 12 | 92 | 0.08 | 0.10 |

| BTL = Upper Prediction Limit of Non-parametric Prediction Interval w/false positive rate=0.067 | | | | |
|---|---|---|---|---|
| Parameter | Sample Size | % Non-Detects | DL (µg/l) | BTL (µg/l) |
| 2,6-Dinitrotoluene | 12 | 75 | 0.08 | 0.11 |
| Lead | 12 | 42 | 1 | 10 |
| Nickel | 12 | 92 | 15 | 16 |
| Silver | 12 | 75 | 0.2 | 0.5 |
| Thallium | 12 | 67 | 1 | 6 |

| 1,1,1-Trichloroethane | 12 | 17 | 0.3 | 9.2 |
| Vanadium | 12 | 83 | 4 | 151 |
| Vinyl Chloride | 12 | 92 | 0.1 | 0.1 |
| Xylene (total) | 12 | 92 | 0.1 | 0.2 |
| Zinc | 12 | 50 | 5 | 51 |

Chromium exhibited normally distributed data (excluding non-detects) with between 25% and 50% non-detects in the background well. The mean and standard deviation of the background data for chromium were adjusted using Cohen's Maximum Likelihood Estimator Method (1959, 1961). A one-sided parametric prediction interval was then computed for chromium based on the adjusted mean and standard deviation. The Upper Prediction Limit was set as the BTL for chromium. The background and relevant statistical data for chromium are summarized below. Cohen's adjustment computations and prediction interval computations are presented in **Appendix C**.

| BTL = Upper Prediction Limit of Prediction Interval w/false positive rate=0.05<br>Original Mean = 3.54, Original SD = 1.933<br>Adjusted Mean = 3.642. Adjusted SD = 1.95 | | | | |
|---|---|---|---|---|
| Parameter | Sample Size | % Non-Detects | DL (µg/l) | BTL (µg/l) |
| Chromium | 12 | 25 | 1 | 6.2 |

The following constituents exhibited normally distributed background data with less than 25% non-detects. One sided parametric prediction intervals were computed on the background data for all of these constituents. The UPLs for these constituents were set as their respective BTLs, with one exception. For pH, a two-sided parametric prediction interval was computed; therefore, the BTL for pH consisted of a range between the lower prediction limit (LPL) and the upper prediction limit. The background concentration calculations were based on a site wide 95% confidence, 95% coverage upper prediction intervals. When adjusted for multiple comparisons of the background data, the minimum required false positive rate was below 1% (0.01). A 99% confidence level (0.01 false positive rate) was used for all individual comparisons, which with the most conservative assumptions provided a site-wide false positive rate of >0.05 for all constituents. The background and relevant statistical data for these constituents are summarized below. The prediction interval computations for these constituents are presented in **Appendix C**.

| BTL = UPL of one-sided Prediction Interval (exception pH) w/site-wide false positive rate>0.05<br>(individual comparisons false positive rate=0.01)<br>BTL for pH = LPL – UPL of two-sided Prediction Interval | | | | |
|---|---|---|---|---|

### 3.5.2 Results of Statistical Comparisons

The following table lists the constituents which were detected during the Fourth Quarter 1998 event at concentrations exceeding their respective background threshold levels (BTLs), and the downgradient wells in which they were detected.

| Parameter | Monitoring Well(s) |
|---|---|
| Arsenic | 16-5, 16WC2B |
| Barium | 16-2, 16-3, 16-5, 16WC1A, 16WC1B, 16WC2B, 16SPRING |
| Beryllium | 16WC1B, 16WC2B |
| Cadmium | 16WC1B |
| Chromium | 16-3, 16-5, 16WC1B, 16WC2B |
| Cobalt | 16-5, 16WC1B, 16WC2B |
| Copper | 16-5, 16WC1B, 16WC2B |
| Lead | 16WC1B |
| Mercury | 16WC1B |
| Nickel | 16-5, 16WC1A, 16WC2B |
| Selenium | 16-5, 16WC1B, 16WC2B |
| Zinc | 16WC1B |
| 2,4-Dinitrotoluene | 16-3, 16-5, 16WC1B, 16WC2B, 16SPRING |
| 2,6-Dinitrotoluene | 16WC1A, 16WC1B |

Any HWMU-16 target constituents not listed above were not detected in the downgradient monitoring wells at concentrations exceeding their respective BTLs.

## 3.6 HWMU-16 PLUME DELINEATIONS

In accordance with VDEQ instructions presented during the May 19, 1999 meeting between Alliant and the VDEQ, Isoconcentration Maps were produced to depict constituent plumes in the groundwater beneath the site (**Appendix A**). In order to evaluate the shape and position of constituent plumes over time, historical Isoconcentration Maps were developed using the historical maximum concentrations for the constituents monitored at the site for the time periods of 1992 through 1995 and 1996 through 1998. The historical maximum concentrations for these time periods are listed in **Tables 3** and **4**, respectively (**Appendix B**).

Groundwater analytical data collected prior to 1992 were not included in the evaluation of historical maximum concentrations. The data collected prior to 1992 are considered unreliable due to "order-of-magnitude" variations in parameter concentrations from quarter to quarter, as well as a general lack of laboratory QA/QC. Additionally, the groundwater monitoring analyte lists prior to 1992 did not include many of the parameters on the current groundwater monitoring analyte list for HWMU-16.

**TABLE 2**

## *Target Analyte Monitoring Results - HWMU-16 Point of Compliance Wells*
## *Radford Army Ammunition Plant, Radford, Virginia*

*Upgradient well = 16C1* *All Results in ug/L.*

| *Analtye/Quarter* | *16C1* | *16MW8* | *16MW9* | *16WC1A* | *16WC1B* | *QL* | *GPS* | *Method* |
|---|---|---|---|---|---|---|---|---|
| Second Quarter 2011 | U | U | 2.77 J | 9.24 | U | 5 | 313 | 6020A |
| Fourth Quarter 2011 | U | U | U | U | 6.09 | 5 | 313 | 6020A |

**Definitions:**

***The following definitions apply to results reported for Appendix IX monitoring events. All Appendix IX monitoring results for compliance wells are reported to the detection limit.***

*Appendix IX Monitoring Events: 3Q2003, 2Q-2004, 2Q-2005, 3Q2006, 2Q2007, 2Q2008, 2Q2009, 2Q 2010, 2Q 2011*

**QL** Denotes permit required quantitation limit.
**U** denotes not detected at or above the detection limit.
**UA** denotes not detected at or above the adjusted detection limit.
**J** Denotes result is estimated. When used with "U" (i.e., "UJ"), denotes analyte not detected at or above the detection limit and detection limit and QL are estimated. When used with "UA" (i.e., "UAJ"), denotes analyte not detected at or above adjusted detection limit and adjusted detection limit and QL are estimated.
**UN** Denotes analyte concentration is less than the quantitation limit and/or five times the blank concentration. Not reliably detected due to blank contamination. This qualifier used only for Appendix IX monitoring event when compliance well results are reported to at or above the project detection limit.
**R** Denotes result rejected.
**Q** Denotes data validation qualifier. **X** Denotes mass spectral confirmation not obtained-result suspect.
Background Denotes background concentrations listed in Appendix F to Attachment 5 in the Final Hazardous Waste Post-Closure Care Permit for Hazardous Waste Units 5, 7, 10, and 16 (October 4, 2002), where applicable.
**CAS#** Denotes Chemical Abstract Services registration number.
**GPS** Denotes Groundwater Protection Standards listed in Appendix G to Attachment 5 in the Final Hazardous Waste Post-Closure Care Permit for Hazardous Waste Units 5, 7, 10, and 16 (October 4, 2002).
**NS** denotes not sampled. **NA** denotes not analyzed.
"–" denotes not detected (pre-2nd Quarter 2003) or not available / not sampled (beginning 2nd Quarter 2003).

***The following definitions apply to results reported for non-Appendix IX monitoring events. All non-Appendix IX monitoring results for compliance wells are reported at or above the quantitation limit.***

**QL** Denotes permit required quantitation limit.
**U** Denotes analyte not detected at or above QL.
**UA** Denotes analyte not detected at or above adjusted sample QL.
**J** Denotes result is estimated. When used with "U" (i.e., "**UJ**"), denotes analyte not detected at or above QL and QL is estimated. When used with "UA" (i.e., "**UAJ**"), denotes analyte not detected at or above adjusted QL and adjusted QL is estimated.
**R** Denotes result rejected.
**Q** Denotes data validation qualifier.
**Background** Denotes background concentrations listed in Appendix F to Attachment 5 in the Final Hazardous Waste Post-Closure Care Permit for Hazardous Waste Units 5, 7, 10, and 16 (October 4, 2002), where applicable.
**CAS#** Denotes Chemical Abstract Services registration number.
**GPS** Denotes Groundwater Protection Standards listed in Appendix G to Attachment 5 in the Final Hazardous Waste Post-Closure Care Permit for Hazardous Waste Units 5, 7, 10, and 16 (October 4, 2002).

**NOTE:**

Fourth Quarter 2008:
Due to laboratory error all HWMU 16 samples were analyzed using Method 8260B 5 ml purge instead of a 25 ml purge which resulted in a higher QL. For these samples, all results were evaluated to the detection limit, which is comparable to the permit QL. Results below the laboratory QL but at or above the permit QL are reported and qualified as estimated.
Second Quarter 2009:
Verification event 6/11/2009 - 16MW8 for acetone. Verification result reported as not detected.
4/ 2010 event -Per DEQ, tin analyzed by Method 6010B instead of Method 6020. Verification event: 16MW9 1,1-dichloroethene and benzene. 16WC1B 4,4-DDD. Verification result reported as not detected.

*See last page of this report for definitions.*

April 1995 letter from the DEQ to J. Redder, Hercules, Inc. (now Alliant TechSystems, Inc.). The lists incorporate requirements outlined in the Virginia Hazardous Waste Management Regulations (VR 672-10-1) Sections 9.5.C and 9.5.D. These include the Indicator Parameters, Ground Water Quality Parameters, EPA Interim Primary Drinking Water Standards, Known Hazardous Waste Constituents, and Detected VHWMR Appendix 10.6 Constituents. A demonstration was made to the DEQ that several hazardous waste constituents had not been detected for six consecutive quarters. As a result, these constituents have not been analyzed for on a regular basis. These are highlighted in the **Table 3-1.**

Additional parameters have not been detected in any of the wells. During the meeting between Alliant and DEQ on 21 May 1996, DEQ suggested that the recommendations to temporarily cease sampling additional constituents that had not been detected in six or more consecutive sampling events made in the GWQAP addendum submitted 3 November 1995 would better be addressed in the post closure permitting process. Therefore, those additional constituents will not be addressed in this report.

## 3.4 *UNIT 7 GROUND WATER BACKGROUND VALUES*

As requested in the DEQ's 23 July letter, background values were calculated for each parameter .

As discussed with DEQ, Alliant believes the analytical data to be questionable in some cases. DEQ has agreed in a 9 April 1996 letter to C. Jake (Alliant) that only total metals will be measured, as described in an EPA Region III guidance on ground water sampling in karst terrain. Another case of questionable data involves an increase in Total Organic Carbon (TOC) concentrations by a factor of 10. As such, the TOC concentrations from 1995 through 1997 were used to calculate the background values. **Table 3-2** presents the *Historical Maximum Values,* which were used to develop the isocontour maps.

As requested in the DEQ's 23 July 1998 letter, using the data from well 7W12B, background values were calculated for each parameter in the ground water monitoring program. However, as a result of the 21 May 1996 meeting and subsequent telephone conversations, these background values are being submitted in accordance with the regulations and shown on the isocontour maps but were not utilized for purposes of this report.

Additionally, calculations of background values based on the 95% confidence, 95% coverage upper tolerance limit require that data distributions be normal or lognormal. Some of the data do not fulfill this requirement

## 3.5 *UNIT 7 STATISTICAL ANALYSIS*

Statistical evaluations for Unit 7 are performed annually and submitted as part of the Annual Reporting requirements found in the VHWMR Section 9.5. As a result of the 21 May 1996 meeting between Alliant and DEQ, Alliant has established background ground water concentrations for the upgradient well, 7W12B utilizing the Virginia DEQ "*Guidance on Statistical Methods for Ground Water Data Analysis at a Solid Waste or Hazardous Waste Site, Version 2.0, 1995*". In response to Mr. Glenn von Gonten's letter dated 23 July, 1998, Alliant has revised the background concentrations to include sample data collected in 1997. These values can be found in **Table 3-3.** Methods used for background concentration computation and statsistical analysis are described below.

The following parameters were 100% Non-Detected in 20 or more sampling events. The downgradient well data points were compared to the laboratory PQLs in a nonparametric statistical manner or to the applicable MCL or VGWPS (if one exists). Background values were then estimated by using the laboratory PQL for that constituent.

| *Parameter* | *PQL (ppb)* | *Sample Size* | *% Non-Detect* | *MCL or VGWPS (ppb)* |
|---|---|---|---|---|
| **2,4-DNT** | 0.2 | 22 | 100 | None |
| **2,6-DNT** | 0.1 | 22 | 100 | None |
| **2,4 Dinitrophenol** | 11 | 11 | 100 | None |
| **Benzyl Alcohol** | 8 | 8 | 100 | None |
| **Cyanide** | 20 | 20 | 100 | 5 |
| **Bis(2- ethyl hexyl) phthalate** | 9 | 9 | 100 | None |
| **2 – Nitrophenol** | 9 | 9 | 100 | None |
| **4 – Nitrophenol** | 9 | 9 | 100 | None |
| **Acetone** | 100 | 14 | 100 | None |
| **Antimony** | 30 | 14 | 100 | None |
| **Vanadium** | 40 | 20 | 100 | None |

The following parameter has log-normally distributed data with between 15 and 50 percent Non-Detect values. As such, Cohen's Method was used as an adjustment for the mean and standard deviation, as recommended in the DEQ guidance. Results of the background analysis are summarized in **Table 3-4**

| *Parameter* | *Sample Size* | *% Non-Detect* |
|---|---|---|
| **Lead** | 23 | 34 |

The following parameters have data with greater than 50% Non-Detects, a minimum sample size of twenty (20). The data were non-normally distributed as indicated using a data distribution statistical method. According to Mr. Glenn von Gonten, DEQ in a 30 July 1996 telephone conversation, the maximum value detected will be used for plume delineation purposes for those constituents with greater than 50% non-detected values. An isocontour map for Total Organic Halides could not

be created because only one sampling point maximum concentration exceeded the background value.

| *Parameter* | *Sample Size* | *% Non-Detect* |
|---|---|---|
| **Arsenic** | 23 | 91.3 |
| **Cadmium** | 23 | 60.9 |
| **Chromium** | 23 | 56.5 |
| **Cobalt** | 20 | 65.5 |
| **Mercury** | 23 | 82.6 |
| **Nickel** | 20 | 85 |
| **Selenium** | 23 | 82.6 |
| **Thallium** | 20 | 70 |
| **Total Organic Halides** | 48 | 62.5 |

The following parameters do not have greater than four (4) sampling events and therefore could not be included in this (plume) evaluation:

- 2,4-D
- Gross Beta
- Radium
- Sulfate

The following parameters have between 15 and 50 percent Non-Detect values, and do not have normal or log-normal data distributions. Thus, Cohen's Method could not be used. Per the DEQ's 23 July letter, background concentrations were computed by calculating an upper tolerance limit based on 95% coverage, at a 95% confidence level. It should be noted that upper tolerance limits are not typically used unless the data are normally or log-normally distributed. Background concentration analysis data is summarized in **Table 3-4.**

| *Parameter* | *Sample Size* | *% Non-Detects* |
|---|---|---|
| **Total Organic Carbon** | 36 | 27.2% |
| **Silver** | 23 | 47.8% |

The remaining parameters have less than 15% Non-Detect values and no data manipulation was required. Computation data for barium, copper, specific conductivity, and zinc are summarized in Table 3-4

| *Parameter* | *Sample Size* | *% Non-Detect* |
|---|---|---|
| **Copper** | 20 | 0 |
| **PH** | 92 | 0 |
| **Barium** | 23 | 13 |
| **Specific Conductivity** | 92 | 0 |
| **Zinc** | 20 | 0 |

Well Number W-10B

Client Corps of Engineers, RAAP, Radford, VA — Project No. 00-0008-01
Well Location Northwest of HWM 7 Lagoon
Driller/Company M. Dean, Cunningham Core Drilling and Grouting Corp, Salem, VA
Drilling Method Fishtail/Core — Hole Diameter 4.5" — Date(s) Drilled 8/16-17/83
Sample Type Split Spoon — Sample Interval 5' — No. Samples Retained 7
Surface Elevation 1704.65' — Casing Top Elevation 1705.63'* — Total Well Depth 30'
Casing Material and Size 2" ID Sch. 80 PVC — Cased Interval(s) 0-20'
Grouting Type Portland Cement with Sand — Grouted Interval 0-12'
Screening Material and Size 2" ID 0.01 Slotted PVC — Screened Interval(s) 20-30'
Packing Material and Size Fine to Coarse Silica Sand — Packed Interval 13-30'
Depth to Static Water 15-52' (T.O.C.) — Date 8/19/83 — Approx Well Yield < 1 gpm
Development Method Air — Development Time 4 hours
Logged by: D. J. Varner

Comments
1) Drilling Water obtained from RAAP hydrants
2) Replaces well W-10
3) Bentonite pellet seal in the 12-13' annular interval
4) Depth to water table measured from the top of the steel casing
5) Core size: HW

*Top of steel casing

# SDG NARRATIVE
# SDG # 1107163
## Client: DRAPER
## Project: RAAP UNIT 7/2011 POST DEV. 2nd EVENT/B03204-304B

The indicated Sample Delivery Group (SDG) consisting of two (2) dissolved water samples was received into the laboratory information management system (LIMS) on July 28, 2011 intact and in good condition with the Chain of Custody (COC) Records in order, unless otherwise noted in any attachments or Quality Assurance Notices. The cooler temperature indicator bottle was not found with the samples and the samples temperature was 26.7 degrees Celsius. Temperature was recorded by IR temperature gun.

The samples were prepared and analyzed in accordance with SW846 and 6020A methodology for the requested dissolved metals arsenic and cobalt. All non-detects are reported to the reporting limit (RL) with a "U" flag qualifier.

### EQUATIONS FOR LIQUID SAMPLE CALCULATIONS:

Equation for obtaining metals sample results in µg/L as presented on Analysis Data Sheet data sheets from ICP/MS instrument acquired results in µg/L (ppb).

$$\frac{C \times F}{I}$$

Where

C = concentration (µg/L)

F = final volume in liters after sample preparation

I = initial volume in liters

Example: Cobalt for sample 7DUP

$$\frac{13.92093\ \mu g/L\ (C) \times 0.10\ L\ (F)}{0.10\ L\ (I)} = 13.921\ \mu g/L \text{ reported as } 13.9\ \mu g/L$$

### INSTRUMENTAL QUALITY CONTROL:

All calibration verification solutions (LLICV, LLCCV, ICV & CCV), blanks (ICB, & CCB), and interference check samples (ICSA & ICSAB) associated with this data were confirmed to be within SW-846 methodology.

AMENDED DATA

## SAMPLE PREPARATION QUALITY CONTROL:

The sample preparation procedure verifications (LCSW, LCSWD, & PBW) were found to be within acceptable ranges and the field samples were prepared and analyzed within the contract specified holding times.

## MATRIX RELATED QUALITY CONTROL:

No matrix spikes were requested for this sample.

A five-fold serial dilution of sample, CCN = SDI1107163-01 (7DUPL) was performed in accordance with SW-846 requirements for ICP/MS analysis.

The adjusted sample concentrations were inside control limits.

The ICP/MS sample post digestion spike, CCN =1072905-PS2 (7DUPA) was performed and passed criteria except arsenic.

I certify that the tests used in this report meet all requirements of the NELAC standards unless otherwise stated in the SDG narrative or QA notice.

I certify that this data package is in compliance with the terms and conditions of the contract, both technically and for completeness, for other than the conditions detailed above. Release of the data contained in this hardcopy data package and in the computer-readable data submitted on CD has been authorized by the Laboratory Manager or his/her designee, as verified by the following signature.

AMENDED DATA

6/23/11 RAAP F.B.#10
B03204-304B
CJB/KFC

General Notes:
- Weather - 70's, rainy then clearing - 80's
- PPE: Nitrile Gloves, Eye Protection,
- All equipment decon'ed between wells
- Purge water disposed of at on-site bio plant location
- Samples stored in coolers

| Soil Sediment Sampling well | COLLECTION TIME |
|---|---|
| 7W13 | 0900 |
| 7W12B | 1000 |
| 7W9C | 1100 |
| 7W10B | 1200 |
| 7W10C | 1300 |
| 7MW6 | 1400 |
| 7W11B | 1500 |
| 7WCA | 1600 |

7W13 - Container ~2/3 RDS full. Sediment looks like cement mix. Color is a light/dark grey - Darker than 7W9C & 7W10C; however lighter than 7WCA. Consistency is a thick sediment.

7W12B - Filled container ~2/3 RDS full. Color is a light brown and the consistency of sand

7W9C - Filled container ~2/3 RDS full. Sample is a light grey in color and is consistency of sediment. There are also black specks amoungst the sample.

6/23/11 RAAP FB# 10
B03204-304R
CJB/KFC

7W10B - Filled container ~ 1/8th full. Sample is a light brown color with black specks

7W10C - Filled container ~ 1/2 full. Sample is a light grey/brownish in color. Very fine grained.

7MW6 - Filled container ~ 1/8th full. Sample is a light grey in color. Looks similar to sample from 7W10B.

7W11B - Filled container ~ 1/3rd full. Sample is reddish-brown in color and the consistency is sediment. Plant matter is amoungst the sample.

7WCA - Collected sample in two jars and each is ~ 1/4th full. Very fine, dark grey sediment.

Used bailers to collect each sample. Poured contents of bailer into one or more plastic bags then decanted water as the sample settled. Poured/scraped resulting sediment into 4 oz CG jar.
Needed to use surge block on final well; 7WCA - to agitate screen and flush in sediment

6/29/11 RMAP 803204-324B KFC/JF FB#10

General Notes: Well development
- Weather: 70's sunny & clear
- PPE: Nitrile Gloves, eye protection, hard hats, steel toed boots
- Equip: Development Pump, Myron L Ultrameter, Hach Turbidity Meter
- Calibrations:
  pH: 4.00 = 4.00 7.00 = 7.00 10.00 = 10.00
  Conductivity: Reads 1413 µs in a 1413 µs standard.
- All equipment decon'ed between wells
- Purge & decon water disposed of at the Plant Bio-station
- See entry on 6/28/11 for general development notes.

MW13
TD: 38.00 Begin Purge (0930)
DTW: 19.68 Initial Purge (Cloudy)

Returned development pump to well and filled up water before beginning pump.

| (1000) Time | Temp (C°) | Cnd (µs) | pH | NTU Turb. | Purge Vol (gal) | Desc |

| (1120) | 16.9 | 1353 | 6.71 | >1000 | ~25 gal. | cloudy |

Well appeared to have cleaned up during this development. Less milky towards end of cycle. Surged pump by hand throughout. Will allow well to settle and collect samples tomorrow.

Subject:

Report of Data - Project: RAAP UNIT 7/2011 POST DEV. 2nd EVEN WorkOrder: 1107162

Attn.: JANET FRAZIER

Enclosed are the results of analytical work performed in accordance with the referenced account number. This report covers sample(s) appearing on the listing.

Thank you for selecting CompuChem for your sample analysis. If you should have questions or require additional analytical services, please contact your representative at 1-800-833-5097

Sincerely,

Joan Purdie

# Analysis Data Package

## EPA SW-846

The sample data package shall include data for all analyses of all samples in one Sample Delivery Group (SDG), including field and analytical samples, reanalyses, blanks, spikes, duplicates, and laboratory control samples. The sample data package consists of the following:

## A. Cover Documentation

## B. Sample Data

Client: **DRAPER** SDG#: **1107162**

Project: **RAAP UNIT 7/2011 POST DEV. 2nd EVENT/B03204-304B**

CompuChem
A Division Of
Liberty Analytical Corp.

# A. Cover Documentation

1. Cover Page

2. SDG Narrative

3. Chain-Of-Custody Records

# 1. Cover Page

## Inorganic Analyses Data Package

The Cover Page includes laboratory information, SDG numbers, project name and the Client Identification in alphanumeric order showing the Client Identification cross-referenced with Lab ID numbers.

# ANALYSES DATA PACKAGE COVER PAGE

**Client:** DRAPER

**Project:** RAAP UNIT 7/2011 POST DEV. 2nd EVENT/B03204-304B

**Laboratory:** COMPUCHEM

**SDG:** 1107162

| Client Sample Id: | Lab Sample Id: |
|---|---|
| 7DUP | 1107162-01 |
| 7W13 | 1107162-02 |

I certify that this data package is in compliance with the terms and conditions of the contract, both technically and for completeness, for other than the conditions detailed above. Release of the data contained in this hardcopy data package and in the Electronic Data Deliverable has been authorized by the Laboratory Manager or the Manager's designee, as verified by the following signature.

Signature: _____ for

Name: Susan Bess

Date: 08-08-11

Title: Senior Chemist

# 2. SDG Narrative

The SDG Narrative contains laboratory information, SDG number, and detailed documentation of any QC, sample, shipment, and/or analytical problems encountered in processing the samples. This will include any technical and administrative problems encountered and the resolution or corrective actions taken. The SDG Narrative will also document the alternative means of determining the cooler temperature when a cooler's temperature indicator bottle is absent. The SDG Narrative also provides equations or curves and utilizes raw data from the SDG being reported to demonstrate how sample results are obtained from raw instrument output. Finally, the SDG Narrative will identify and explain any differences between results being provided in the data package and those provided previously as Preliminary Results.

# SDG NARRATIVE
# SDG # 1107162
## Client: DRAPER
## Project: RAAP UNIT 7/2011 POST DEV. 2nd EVENT/B03204-304B

The indicated Sample Delivery Group (SDG) consisting of two (2) water samples was received into the laboratory information management system (LIMS) on July 28, 2011 intact and in good condition with the Chain of Custody (COC) Records in order, unless otherwise noted in any attachments or Quality Assurance Notices. The cooler temperature indicator bottle was not found with the samples and the samples temperature was 26.7 degrees Celsius. Temperature was recorded by IR temperature gun.

The samples were prepared and analyzed in accordance with SW846 and 6020A methodology for the requested metals arsenic and cobalt.

### EQUATIONS FOR LIQUID SAMPLE CALCULATIONS:

Equation for obtaining metals sample results in µg/L as presented on Analysis Data Sheet data sheets from ICP/MS instrument acquired results in µg/L (ppb).

$$\frac{C \times F}{I}$$

Where

C = concentration (µg/L)

F = final volume in liters after sample preparation

I = initial volume in liters

Example: Cobalt for sample 7DUP

$$\frac{14.08144\ \mu g/L\ (C) \times 0.10\ L\ (F)}{0.10\ L\ (I)} = 14.08\ \mu g/L \text{ reported as } 14.1\ \mu g/L$$

### INSTRUMENTAL QUALITY CONTROL:

All calibration verification solutions (LLICV, LLCCV, ICV & CCV), blanks (ICB, & CCB), and interference check samples (ICSA & ICSAB) associated with this data were confirmed to be within SW-846 methodology.

## SAMPLE PREPARATION QUALITY CONTROL:

The sample preparation procedure verifications (LCSW, LCSWD, & PBW) were found to be within acceptable ranges and the field samples were prepared and analyzed within the contract specified holding times.

## MATRIX RELATED QUALITY CONTROL:

No matrix spikes were requested for this sample.

A five-fold serial dilution of sample, CCN = SDI1107162-01 (7DUPL) was performed in accordance with SW-846 requirements for ICP/MS analysis.

The adjusted sample concentrations were outside control limits.

The ICP/MS sample post digestion spike, CCN =1072905-PS1 (7DUPA) was performed and passed criteria.

I certify that the tests used in this report meet all requirements of the NELAC standards unless otherwise stated in the SDG narrative or QA notice.

I certify that this data package is in compliance with the terms and conditions of the contract, both technically and for completeness, for other than the conditions detailed above. Release of the data contained in this hardcopy data package and in the computer-readable data submitted on CD has been authorized by the Laboratory Manager or his/her designee, as verified by the following signature.

# INORGANIC DATA REPORTING QUALIFIERS

On the Form I, under the column labeled "Q" for qualifier, each result is flagged with the specific data reporting qualifiers listed below, as appropriate. The qualifiers used are:

U : This flag indicates the compound was analyzed for, not detected and is reported as less than the Method Detection Limit (MDL) (or as defined by the client). The Reporting Limit (RL), or Limit of Quantitation (LOQ), and the MDL will be adjusted to reflect any dilution or concentration of the sample and, for soils, the percent moisture.

J : This flag indicates the reported result is an estimated value. The flag is used when an analyte is detected and the result is less than the adjusted RL/LOQ but equal to or greater than the MDL.

Q : This flag denotes that one or more quality control criteria have failed (e.g., LCS recovery, Continuing Calibration Verification, CCV, and interference check standards for ICP-AES/ICP-MS) and reanalyses can't be performed. The Q flag is applied to all specific analyte(s) in all samples associated with the failed quality control criteria.

B : This flag is used when the analyte is found in the associated method or calibration blank as well as in the sample. It indicates probable blank contamination and warns the data user to take appropriate action. The combination of flags BU or UB is not an allowable policy. Blank contaminants are flagged B only when they are detected in the sample.

D: This flag is applied to an analyte when the reported result is based on a dilution.

X/Y/Z : Other specific flags may be required to properly define the results. If used, the flags will be fully described in the SDG Narrative. The laboratory-defined flags are limited to X, Y, and Z.

**The extensions: D, S, SD, L, and A are added to the end of the Client ID and represent the following:**

**D – Matrix Duplicate**
**S – Matrix Spike**
**SD – Matrix Spike Duplicate**
**L – Serial Dilution**
**A – Post Digestion Spike**

# 3. Raw Data

For each reported value, the laboratory shall include in the data package all raw data used to obtain that value. This applies to all required QA/QC measurements, instrument standardization, as well as all sample analysis results. This does not apply to the quarterly verification of method and instrument parameters submitted as a part of each data package.

The order of the raw data in the data package shall be: ICP-AES, ICP-MS, mercury, and cyanide (if a target analyte).

Raw data shall be labeled with Client Identification numbers and appropriate codes in order to identify:

- calibration standards, including source and preparation date
- initial and continuing calibration blanks and preparation blanks
- initial and continuing calibration verification standards, interference check samples, serial dilution samples, LRS check standard, Laboratory Control Sample, and post digestion spike
- diluted and undiluted sample and all weights, dilutions, and volumes used to obtain the reported values
- duplicates
- spikes (indicating standard solutions used, final spike concentrations, and volumes involved).
- instrument used, any instrument adjustments, data corrections or other apparent anomalies on the measurement record, including all data voided or data not used and a brief written explanation
- time and date of each analysis (instrument run logs can be submitted if they contain this information)

**Daily Instrument Profile**

Detector Cross Cal: 061310
Analog Voltage: -1600
Pulse Voltage: 1000
Nebulizer Pressure: 0.89

**Maintenance:** NONE

Printed: 8/1/2011 8:05:58 PM

**Method(s)** (circle one): **ILM05.4** **SW-846** **6020** **Other** 6020A

**Operator(s):** JCF

**Date/Time** 080111/1656 to 080111/1950

**Tune Date/Time** 080111/1523

The presence of the Chemist's/Analyst's employee ID number, or signature, on this run log attests that strict compliance with the method's SOP has occurred. Any SOP deviations require documentation by the responsible chemist/analyst together with the chemist's/analyst's initials and the initials of the lab supervisor and a QA department representative, signifying approval of the deviation.

The presence of the Chemist's/Analyst's employee ID number, or signature, on this run log attests that strict compliance with the method's SOP has occurred. Any SOP deviations require documentation by the responsible chemist/analyst together with the chemist's/analyst's initials and the initials of the lab supervisor and a QA department representative, signifying approval of the deviation.

# EPA 6020 & EPA 6020A - Summary Report

## Sample ID: LLCCV

Sample Date/Time: Monday, August 01, 2011 17:23:15
Sample Type: Sample
Sample Description:
Number of Replicates: 3
Batch ID:
Method File: C:\Elandata1\Method\6020\6020AAAMETHOD.mth
Dataset File: C:\Elandata1\Dataset\default\LLCCV.1470

# 4. Digestion and Distillation Logs

The following logs shall be submitted, as appropriate, for each preparation procedure: digestion logs for ICP-AES, ICP-MS, mercury preparations, and cyanide. The logs shall include: (1) date; (2) sample weights and volumes, with initial sample weight/volume and final volume clearly indicated; (3) sufficient information to unequivocally identify which QC samples (i.e., LCS, PB) correspond to each batch digested; (4) comments describing any significant sample changes or reactions which occur during preparation shall be entered in the log and noted in the SDG Narrative; (5) indication of pH less than 2 or greater than 12, as applicable; (6) identification of the sample preparer(s) [signature (s)].

***Shading has been applied to unused portions of this worksheet as a substitute for 'Z-out'.***

"The presence of the Chemist's/analyst's employee ID number, or signature, on this log attests that strict compliance with the method's SOP has occurred. Any SOP deviations requires documentation by the chemist/analyst together with the chemist's/analyst's initials and the initials of the lab supervisor and a QA department representative, signifying approval of the deviation."

**Sample Verification Signature:** JM
This signature corroborates that the sample identification numbers appearing on the digestion cups are the same as those appearing on the field sample containers.

# Analysis Data Package

## EPA SW-846

The sample data package shall include data for all analyses of all samples in one Sample Delivery Group (SDG), including field and analytical samples, reanalyses, blanks, spikes, duplicates, and laboratory control samples. The sample data package consists of the following:

## A. Cover Documentation

## B. Sample Data

Client: **DRAPER** SDG#: **1107163**

Project: **RAAP UNIT 7/2011 POST DEV. 2nd EVENT/B03204-304B**

# 2. SDG Narrative

The SDG Narrative contains laboratory information, SDG number, and detailed documentation of any QC, sample, shipment, and/or analytical problems encountered in processing the samples. This will include any technical and administrative problems encountered and the resolution or corrective actions taken. The SDG Narrative will also document the alternative means of determining the cooler temperature when a cooler's temperature indicator bottle is absent. The SDG Narrative also provides equations or curves and utilizes raw data from the SDG being reported to demonstrate how sample results are obtained from raw instrument output. Finally, the SDG Narrative will identify and explain any differences between results being provided in the data package and those provided previously as Preliminary Results.

# SDG NARRATIVE
# SDG # 1107163
## Client: DRAPER
## Project: RAAP UNIT 7/2011 POST DEV. 2nd EVENT/B03204-304B

The indicated Sample Delivery Group (SDG) consisting of two (2) dissolved water samples was received into the laboratory information management system (LIMS) on July 28, 2011 intact and in good condition with the Chain of Custody (COC) Records in order, unless otherwise noted in any attachments or Quality Assurance Notices. The cooler temperature indicator bottle was not found with the samples and the samples temperature was 26.7 degrees Celsius. Temperature was recorded by IR temperature gun.

The samples were prepared and analyzed in accordance with SW846 and 6020A methodology for the requested dissolved metals arsenic and cobalt.

### EQUATIONS FOR LIQUID SAMPLE CALCULATIONS:

Equation for obtaining metals sample results in µg/L as presented on Analysis Data Sheet data sheets from ICP/MS instrument acquired results in µg/L (ppb).

$$\frac{C \times F}{I}$$

Where

C = concentration (µg/L)

F = final volume in liters after sample preparation

I = initial volume in liters

Example: Cobalt for sample 7DUP

$$\frac{13.92093\ \mu g/L\ (C) \times 0.10\ L\ (F)}{0.10\ L\ (I)} = 13.921\ \mu g/L \text{ reported as } 13.9\ \mu g/L$$

### INSTRUMENTAL QUALITY CONTROL:

All calibration verification solutions (LLICV, LLCCV, ICV & CCV), blanks (ICB, & CCB), and interference check samples (ICSA & ICSAB) associated with this data were confirmed to be within SW-846 methodology.

## SAMPLE PREPARATION QUALITY CONTROL:

The sample preparation procedure verifications (LCSW, LCSWD, & PBW) were found to be within acceptable ranges and the field samples were prepared and analyzed within the contract specified holding times.

## MATRIX RELATED QUALITY CONTROL:

No matrix spikes were requested for this sample.

A five-fold serial dilution of sample, CCN = SDI1107163-01 (7DUPL) was performed in accordance with SW-846 requirements for ICP/MS analysis.

The adjusted sample concentrations were inside control limits.

The ICP/MS sample post digestion spike, CCN =1072905-PS2 (7DUPA) was performed and passed criteria.

I certify that the tests used in this report meet all requirements of the NELAC standards unless otherwise stated in the SDG narrative or QA notice.

I certify that this data package is in compliance with the terms and conditions of the contract, both technically and for completeness, for other than the conditions detailed above. Release of the data contained in this hardcopy data package and in the computer-readable data submitted on CD has been authorized by the Laboratory Manager or his/her designee, as verified by the following signature.

Susan W. Bass

# INORGANIC DATA REPORTING QUALIFIERS

On the Form I, under the column labeled "Q" for qualifier, each result is flagged with the specific data reporting qualifiers listed below, as appropriate. The qualifiers used are:

U : This flag indicates the compound was analyzed for, not detected and is reported as less than the Method Detection Limit (MDL) (or as defined by the client). The Reporting Limit (RL), or Limit of Quantitation (LOQ), and the MDL will be adjusted to reflect any dilution or concentration of the sample and, for soils, the percent moisture.

J : This flag indicates the reported result is an estimated value. The flag is used when an analyte is detected and the result is less than the adjusted RL/LOQ but equal to or greater than the MDL.

Q : This flag denotes that one or more quality control criteria have failed (e.g., LCS recovery, Continuing Calibration Verification, CCV, and interference check standards for ICP-AES/ICP-MS) and reanalyses can't be performed. The Q flag is applied to all specific analyte(s) in all samples associated with the failed quality control criteria.

B : This flag is used when the analyte is found in the associated method or calibration blank as well as in the sample. It indicates probable blank contamination and warns the data user to take appropriate action. The combination of flags BU or UB is not an allowable policy. Blank contaminants are flagged B only when they are detected in the sample.

D: This flag is applied to an analyte when the reported result is based on a dilution.

X/Y/Z : Other specific flags may be required to properly define the results. If used, the flags will be fully described in the SDG Narrative. The laboratory-defined flags are limited to X, Y, and Z.

**The extensions: D, S, SD, L, and A are added to the end of the Client ID and represent the following:**

**D – Matrix Duplicate**
**S – Matrix Spike**
**SD – Matrix Spike Duplicate**
**L – Serial Dilution**
**A – Post Digestion Spike**

# 3. Raw Data

For each reported value, the laboratory shall include in the data package all raw data used to obtain that value. This applies to all required QA/QC measurements, instrument standardization, as well as all sample analysis results. This does not apply to the quarterly verification of method and instrument parameters submitted as a part of each data package.

The order of the raw data in the data package shall be: ICP-AES, ICP-MS, mercury, and cyanide (if a target analyte).

Raw data shall be labeled with Client Identification numbers and appropriate codes in order to identify:

- calibration standards, including source and preparation date
- initial and continuing calibration blanks and preparation blanks
- initial and continuing calibration verification standards, interference check samples, serial dilution samples, LRS check standard, Laboratory Control Sample, and post digestion spike
- diluted and undiluted sample and all weights, dilutions, and volumes used to obtain the reported values
- duplicates
- spikes (indicating standard solutions used, final spike concentrations, and volumes involved).
- instrument used, any instrument adjustments, data corrections or other apparent anomalies on the measurement record, including all data voided or data not used and a brief written explanation
- time and date of each analysis (instrument run logs can be submitted if they contain this information)

**Daily Instrument Profile**

Detector Cross Cal: 061310
Analog Voltage: -1600
Pulse Voltage: 1000
Nebulizer Pressure: 0.97

**Maintenance:** NONE

The presence of the Chemist's/Analyst's employee ID number, or signature, on this run log attests that strict compliance with the method's SOP has occurred. Any SOP deviations require documentation by the responsible chemist/analyst together with the chemist's/analyst's initials and the initials of the lab supervisor and a QA department representative, signifying approval of the deviation.

The presence of the Chemist's/Analyst's employee ID number, or signature, on this run log attests that strict compliance with the method's SOP has occurred. Any SOP deviations require documentation by the responsible chemist/analyst together with the chemist's/analyst's initials and the initials of the lab supervisor and a QA department representative, signifying approval of the deviation.

# 4. Digestion and Distillation Logs

The following logs shall be submitted, as appropriate, for each preparation procedure: digestion logs for ICP-AES, ICP-MS, mercury preparations, and cyanide. The logs shall include: (1) date; (2) sample weights and volumes, with initial sample weight/volume and final volume clearly indicated; (3) sufficient information to unequivocally identify which QC samples (i.e., LCS, PB) correspond to each batch digested; (4) comments describing any significant sample changes or reactions which occur during preparation shall be entered in the log and noted in the SDG Narrative; (5) indication of pH less than 2 or greater than 12, as applicable; (6) identification of the sample preparer(s) [signature (s)].

# METALS/MERCURY PREPARATION LOG

# Data Validation Report

## INORGANIC DATA REVIEW SUMMARY

Draper Aden Associates performed a manual comprehensive review of the inorganic analytical results for the July 27, 2011 groundwater monitoring event at RFAAP HWMU7. Draper Aden Associates, of Blacksburg, Virginia, collected a groundwater sample and blind field duplicate from monitoring well 7W13. Monitoring well re-development was performed prior to June 30, 2011 sample collection. This event represents the second of two monitoring events to be conducted subsequent to the well re-development. These samples were analyzed for total and dissolved arsenic and cobalt by SW-846 Method 6020A - inductively coupled plasma-mass spectrometry (ICP-MS). The following information and attached table summarize the inorganic data validation results.

Draper Aden Associates sent the samples to CompuChem (CompuChem), a Division of Liberty Analytical, of Cary, North Carolina, for the inorganic analyses. On behalf of RFAAP, CompuChem submitted results to Draper Aden Associates in a final certificate of analysis which included sample analytical results as well as relevant documentation to verify and validate the results.

The evaluation of CompuChem's compliance with the method and validation of results presented here are based upon a limited review of QA/QC information including holding times, preservation procedures, instrument tuning, calibration and calibration verification data, QL standards, blank samples (method, calibration, and other blanks), interference check sample, pre-digestion matrix spike and matrix spike duplicate (MS/MSD), laboratory control sample (LCS), internal standard, and serial dilution results, where applicable. A review of transcriptions from instrument data to sample summary sheets was performed. Calculation checks were performed on a minimum ten percent of the data set. The following information is intended to summarize data review results and any observed significant deviations from method and/or contractual requirements.

CompuChem received the samples in good condition, with custody seals intact. Each sample aliquot requiring dissolved analysis was field filtered using a 0.45 micron filter and the filtrate was preserved in the field. Applicable holding time and preservation criteria were met. The chain of custody was appropriately signed and data by field and laboratory personnel.

### *Method 6020A (ICP-MS)*

The revised certificate of analysis for Method 6020A was complete in its presentation and the data were of acceptable quality. The data set exhibited the laboratory's ability to achieve the reported QL for arsenic and cobalt, as outlined by the precision and accuracy data. QLs were equal to or less than the permit QL.

QC documentation criteria were met. Instrument tuning, calibration and calibration verification criteria were met. QL standards, blank samples, interference check sample (ICSAB),

pre-digestion MS/MSD, LCS, internal standard and serial dilution results recovered within control limits, except where noted below. No deviations from specific control limits and QA/QC controls were identified during the data review process.

The laboratory report was revised to correctly report results to at or above the permit QL for arsenic (10 µg/l) and cobalt (4 µg/l).

Arsenic and cobalt detections reported at or above the permit QL and/or results that required a data validation qualifier due to quality control deviations noted above are summarized below.

No results were rejected based on the data validation criteria.

***Summary of Detections:***

| ANALYTE | METHOD | SAMPLE ID | LAB RESULT | VALIDATED RESULT | QL | UNITS | DATA VALIDATION NOTES |
|---|---|---|---|---|---|---|---|
| Arsenic, Total | 6020A | 7W13 | U | U | 10 | µg/l | Result < Permit QL. |
| Cobalt, Total | 6020A | 7W13 | 14.5 | 14.5 | 4 | µg/l | No action taken. |
| Arsenic, Dissolved | 6020A | 7W13 | U | U | 10 | µg/l | Result < Permit QL. |
| Cobalt, Dissolved | 6020A | 7W13 | 13.7 | 13.7 | 4 | µg/l | No action taken. |
| Arsenic, Total | 6020A | 7DUP | U | U | 10 | µg/l | Result < Permit QL. |
| Cobalt, Total | 6020A | 7DUP | 14.1 | 14.1 | 4 | µg/l | No action taken. RPD <10. |
| Arsenic, Dissolved | 6020A | 7DUP | U | U | 10 | µg/l | Result < Permit QL. |
| Cobalt, Dissolved | 6020A | 7DUP | 13.9 | 13.9 | 4 | µg/l | No action taken. RPD <10. |

**Data Validation Qualifiers:**
**QL** Denotes permit quantitation limit.
**U** Denotes analyte not detected at or above QL.
**J** Denotes analyte reported above QL and associated result is estimated.
**UJ** Denotes analyte not detected at or above the QL and associated QL is estimated.
**UA** Denotes analyte detected above QL, but attributed to laboratory contamination. Sample QL adjusted to sample concentration. Final result not detected at or above adjusted sample QL.

## INORGANIC DATA EVALUATION FOR ICP-MS SW-846 METHOD 6020A

**Sample ID:** 7W13
**QC Samples:** Lab blanks, LCS/LCSD, serial dilution (7W13-T&D), Field duplicate of 7W13: (7DUP)
**Laboratory:** CompuChem, Cary, NC; SDG: 1107162 (T), 1107163 (D)

Does Laboratory analyte list correspond to analyte list requested? _X_ yes ___ no
Corresponds to As and Co, total and dissolved, Preparation method: 3005A

"☑" denotes items reviewed. NR Denotes not reviewed.
See Data Validation Summary for additional comments.

### A. DOCUMENTION COMPLETENESS CRITERIA:

*Data Quality Objective: Representativeness*

- ☑ Chain of custody – Custody transfers must be signed and dated
- ☑ Chain of custody properly and completely filled out including sampler signatures, date and time of sampling, sample ID, analysis requested

### B. DETECTION LIMIT AND QUANTITATION LIMIT CRITERIA:

*Data Quality Objective: Analytical Sensitivity*

- ☑ Specific detection limit reported
- ☑ Specific quantitation limit reported
- ☑ Standard analyzed at the QL (LLQC), digested, 70-130% recovery, analyzed after MDL determination and as needed
- ☑ Method detection limit (MDL) less than QL
- ☑ Performance evaluation sample analyzed within 12 months

### C. INITIAL DEMONSTRATION OF CAPABILITY (IDOC) CRITERIA:

*Data Quality Objective: Laboratory Method Sensitivity*

- ☑ Analyst IDOC for J. Feldhaus submitted previously

### D. SAMPLE AND STANDARD PREPARATION CRITERIA:

*Data Quality Objective: Accuracy and Representativeness*

- ☑ Digestion prior to analysis
- ☑ Digestion method: 3005A
- ☑ Samples and standards matrix matched

### E. TECHNICAL HOLDING TIME / PRESERVATION REQUIREMENTS:

*Data Quality Objective: Representativeness*

- ☑ 6 month holding time, pH<2 with Nitric Acid ($HNO_3$)

### F. INSTRUMENT TUNE CRITERIA:

*Data Quality Objective: Verify Operating Conditions*

- ☑ Prior to calibration
- ☑ Relative Standard Deviation (RSD) </=5%

☑ Resolution < 0.9 amu full width at 10% peak height (or lower)
☑ Mass calibration </=0.1 amu difference from true value

## G. INITIAL CALIBRATION CRITERIA:

*Data Quality Objective: Laboratory Accuracy*

☑ 1 calibration blank and 3 standards,
☑ Linear curve fit with correlation coefficient $r \geq 0.998$
☑ Daily calibration following tuning and prior to sample analysis

## H. INITIAL CALIBRATION VERIFICATION (ICV) CRITERIA:

*Data Quality Objective: Laboratory Accuracy*

☑ Daily following initial calibration, independent/second source used for ICV
☑ ICV concentration near mid-point of calibration curve, 90-110% recovery
☑ Low level ICV (LLICV) – prior to analysis, at QL concentration, 70-130% recovery

## I. INITIAL CALIBRATION BLANK CRITERIA:

*Data Quality Objective: Laboratory Analytical Sensitivity/Instrument Drift/Contamination Evaluation*

☑ Daily following ICV
☑ Interference free

## J. CONTINUING CALIBRATION VERIFICATION (CCV) CRITERIA:

*Data Quality Objective: Laboratory Analytical Accuracy*

☑ CCV, prior to analysis, after every 10 samples, at end of analysis
☑ CCV recovery within 90-110%, mid-point of curve concentration
☑ Low level CCV (LLCCV), concentration at QL, prior to analysis, after every 10 samples, end of analysis (70-130% R)

## K. CONTINUING CALIBRATION BLANK CRITERIA:

*Data Quality Objective: Laboratory Analytical Sensitivity/Instrument Drift/Contamination Evaluation*

☑ Immediately after the CCV, 10 sample frequency
☑ Interference free

## L. BLANK CRITERIA:

*Data Quality Objective: Sensitivity/Instrument Drift/Contamination Evaluation*

N/A Trip Blank (check only if analyzed)
☑ Method/Other Lab Blanks (check only if analyzed), one per digestion batch
☑ Interference free

## M. INTERFERENCE CHECK SAMPLE (ICS) CRITERIA:

*Data Quality Objective: Analytical Accuracy/Verification of Isobaric Interference Corrections*

☑ At beginning of analytical run
☑ Recovery: 80-120% (ICSAB)

## N. MATRIX SPIKE DUPLICATE (MSD) CRITERIA:

*Data Quality Objective: Method Precision in Sample Matrix*

☑ All analytes, one MSD or sample duplicate per batch of 20 samples
☑ Spiked prior to sample preparation
☑ RPD ≤ 20 between MS and MSD results or sample and duplicate results
☑ MSD analyte recovery 75-125%

## O. MATRIX SPIKE (MS) CRITERIA:

*Data Quality Objective: Method Accuracy in Sample Matrix*

- ☑ All analytes, one MS per digestion batch of 20 samples
- ☑ Spiked prior to sample preparation
- ☑ Recovery: 75-125%
- ☑ Post digestion spike if MS/MSD recoveries fail
- ☑ Recovery of post digestion spike analytes within 80-120%

## P. LABORATORY CONTROL SAMPLE (LCS) CRITERIA:

*Data Quality Objective: Laboratory Method Accuracy, Laboratory Performance*

- ☑ LCS for all target analytes, one LCS per 20 sample batch
- ☑ LCS concentration at approximately mid-point of analytical curve
- ☑ Recovery within 80-120% for all analytes

## Q. INTERNAL STANDARDS (IS) CRITERIA:

*Data Quality Objective: Analytical Accuracy in Sample Matrix*

- ☑ IS (Li6, **Sc45**, In115, Tb159, Bi209) intensities, IS added to each sample and QC sample
- ☑ % Relative intensity (RI) within 70-125%

## R. SERIAL DILUTION (DILUTION TEST) TEST CRITERIA:

*Data Quality Objective: Accuracy in Sample Matrix*

- ☑ <10% Difference (applicable when sample concentration >10X QL)

## S. SAMPLE QUANTITATION AND GENERAL REPORTING CRITERIA:

*Data Quality Objective: n/a*

- ☑ Sample results reported within instrument linear dynamic range
- ☑ Sample results reported to the detection limit
- ☑ Sample/blind field duplicate results <10 RPD

---

Draper Aden Associates conducted a limited data validation of the above noted data set using the data package provided by the analyzing laboratory. Data evaluation was conducted using SW-846 (Test Methods for Evaluating Solid Waste-Physical/Chemical Methods, USEPA, SW-846, 3rd Edition-Final Update I, II/IIA and III) method requirements and CLP data validation guidelines (USEPA Contract Laboratory Program National Functional Guidelines for Inorganic Data Review, October 2004 USEPA Contract Laboratory Program National Functional Guidelines for Inorganic Superfund Data Review, January 2010). Validation of this data set is limited to review of items detailed in this data review report.

**LIMITATIONS:**

Draper Aden Associates prepared this document (which may include drawings, specifications, reports, studies and attachments) in accordance with the agreement between Draper Aden Associates and the client.

The standard of care for all professional engineering, environmental and surveying and related services performed or furnished by Draper Aden Associates under this Agreement are the care and skill ordinarily used by members of these professions practicing under similar circumstances at the same time and in the same locality. Draper Aden Associates makes no warranties, express or implied, under this Agreement in connection with Draper Aden Associates' services.

Conclusions presented are based upon a review of available information, the results of our field studies, and/or professional judgment. To the best of our knowledge, information provided by others is true and accurate, unless otherwise noted. Draper Aden Associates' liability, hereunder, shall be limited to amounts due Draper Aden Associates for services actually rendered, or reimbursable expenses actually incurred. Any reuse or modification of any of the aforementioned documents (whether hard copies or electronic transmittals) prepared by Draper Aden Associates without written verification or adaptation by Draper Aden Associates will be at the sole risk of the individual or entity utilizing said documents and such use is without the authorization of Draper Aden Associates. Draper Aden Associates shall have no legal liability resulting from any and all claims, damages, losses, and expenses, including attorney's fees arising out of the unauthorized reuse or modification of these documents. Client shall indemnify Draper Aden Associates from any claims arising out of unauthorized use or modification of the documents whether hard copy or electronic.

# SDG NARRATIVE
# SDG # 1107162
## Client: DRAPER
## Project: RAAP UNIT 7/2011 POST DEV. 2nd EVENT/B03204-304B

The indicated Sample Delivery Group (SDG) consisting of two (2) water samples was received into the laboratory information management system (LIMS) on July 28, 2011 intact and in good condition with the Chain of Custody (COC) Records in order, unless otherwise noted in any attachments or Quality Assurance Notices. The cooler temperature indicator bottle was not found with the samples and the samples temperature was 26.7 degrees Celsius. Temperature was recorded by IR temperature gun.

The samples were prepared and analyzed in accordance with SW846 and 6020A methodology for the requested total metals arsenic and cobalt. All non-detects are reported to the reporting limit (RL) with a "U" flag qualifier.

### EQUATIONS FOR LIQUID SAMPLE CALCULATIONS:

Equation for obtaining metals sample results in µg/L as presented on Analysis Data Sheet data sheets from ICP/MS instrument acquired results in µg/L (ppb).

$$\frac{C \times F}{I}$$

Where

C = concentration (µg/L)

F = final volume in liters after sample preparation

I = initial volume in liters

Example: Cobalt for sample 7DUP

$$\frac{14.08144\ \mu g/L\ (C) \times 0.10\ L\ (F)}{0.10\ L\ (I)} = 14.08\ \mu g/L \text{ reported as } 14.1\ \mu g/L$$

### INSTRUMENTAL QUALITY CONTROL:

All calibration verification solutions (LLICV, LLCCV, ICV & CCV), blanks (ICB, & CCB), and interference check samples (ICSA & ICSAB) associated with this data were confirmed to be within SW-846 methodology.

AMENDED DATA

## SAMPLE PREPARATION QUALITY CONTROL:

The sample preparation procedure verifications (LCSW, LCSWD, & PBW) were found to be within acceptable ranges and the field samples were prepared and analyzed within the contract specified holding times.

## MATRIX RELATED QUALITY CONTROL:

No matrix spikes were requested for this sample.

A five-fold serial dilution of sample, CCN = SDI1107162-01 (7DUPL) was performed in accordance with SW-846 requirements for ICP/MS analysis.

The adjusted sample concentrations were inside control limits.

The ICP/MS sample post digestion spike, CCN =1072905-PSI (7DUPA) was performed and passed criteria except arsenic.

I certify that the tests used in this report meet all requirements of the NELAC standards unless otherwise stated in the SDG narrative or QA notice.

I certify that this data package is in compliance with the terms and conditions of the contract, both technically and for completeness, for other than the conditions detailed above. Release of the data contained in this hardcopy data package and in the computer-readable data submitted on CD has been authorized by the Laboratory Manager or his/her designee, as verified by the following signature.

CompuChem, a Division of Liberty Analytical Corporation

# Analysis Data Package

## EPA SW-846

The sample data package shall include data for all analyses of all samples in one Sample Delivery Group (SDG), including field and analytical samples, reanalyses, blanks, spikes, duplicates, and laboratory control samples. The sample data package consists of the following:

## A. Cover Documentation

## B. Sample Data

Client: **DRAPER** SDG#: **1107004**

Project: **RAAP 2nd QTR.2011 UNIT 7/RE-DEVELOPMENT EVENT**

Environmental Testing Laboratories

CompuChem

A Division Of

Liberty Analytical Corp.

# A. Cover Documentation

1. Cover Page

2. SDG Narrative

3. Chain-Of-Custody Records

# 1. Cover Page

## Inorganic Analyses Data Package

The Cover Page includes laboratory information, SDG numbers, project name and the Client Identification in alphanumeric order showing the Client Identification cross-referenced with Lab ID numbers.

# ANALYSES DATA PACKAGE COVER PAGE

**Client:** DRAPER

**Project:** RAAP 2nd QTR.2011 UNIT 7/RE-DEVELOPMENT EVENT

**Laboratory:** COMPUCHEM

**SDG:** 1107004

| Client Sample Id: | Lab Sample Id: |
|---|---|
| 7W13 | 1107004-01 |
| 7DUP | 1107004-02 |

I certify that this data package is in compliance with the terms and conditions of the contract, both technically and for completeness, for other than the conditions detailed above. Release of the data contained in this hardcopy data package and in the Electronic Data Deliverable has been authorized by the Laboratory Manager or the Manager's designee, as verified by the following signature.

Signature: _____ for

Name: Susan Boss

Date: 07-13-11

Title: Senior Chemist

# 2. SDG Narrative

The SDG Narrative contains laboratory information, SDG number, and detailed documentation of any QC, sample, shipment, and/or analytical problems encountered in processing the samples. This will include any technical and administrative problems encountered and the resolution or corrective actions taken. The SDG Narrative will also document the alternative means of determining the cooler temperature when a cooler's temperature indicator bottle is absent. The SDG Narrative also provides equations or curves and utilizes raw data from the SDG being reported to demonstrate how sample results are obtained from raw instrument output. Finally, the SDG Narrative will identify and explain any differences between results being provided in the data package and those provided previously as Preliminary Results.

# SDG NARRATIVE
# SDG # 1107004
## Client: DRAPER
## Project: RAAP 2nd QTR.2011 UNIT 7/RE-DEVELOPMENT EVENT

The indicated Sample Delivery Group (SDG) consisting of two (2) water samples was received into the laboratory information management system (LIMS) on July 1, 2011 intact and in good condition with the Chain of Custody (COC) Records in order, unless otherwise noted in any attachments or Quality Assurance Notices. The cooler temperature indicator bottle was found with the samples and the samples temperature was 1.6 degrees Celsius. Temperature was recorded by IR temperature gun.

The samples were prepared and analyzed in accordance with SW846 and 6020A methodology for the requested metals arsenic and cobalt.

### EQUATIONS FOR LIQUID SAMPLE CALCULATIONS:

Equation for obtaining metals sample results in µg/L as presented on Analysis Data Sheet data sheets from ICP/MS instrument acquired results in µg/L (ppb).

$$\frac{C \times F}{I}$$

Where

C = concentration (µg/L)

F = final volume in liters after sample preparation

I = initial volume in liters

Example: Cobalt for sample 7W13

$$\frac{12.40392\ \mu g/L\ (C) \times 0.10\ L\ (F)}{0.10\ L\ (I)} = 12.404\ \mu g/L \text{ reported as } 12.4\ \mu g/L$$

### INSTRUMENTAL QUALITY CONTROL:

All calibration verification solutions (LLICV, LLCCV, ICV & CCV), blanks (ICB, & CCB), and interference check samples (ICSA & ICSAB) associated with this data were confirmed to be within SW-846 methodology.

## SAMPLE PREPARATION QUALITY CONTROL:

The sample preparation procedure verifications (LCSW, LCSWD, & PBW) were found to be within acceptable ranges and the field samples were prepared and analyzed within the contract specified holding times.

## MATRIX RELATED QUALITY CONTROL:

No matrix spikes were requested for this sample.

A five-fold serial dilution of sample, CCN = SDI1107005-01 (7W13L) was performed in accordance with SW-846 requirements for ICP/MS analysis.

The adjusted sample concentrations were outside control limits.

The ICP/MS sample post digestion spike, CCN =1070509-PS1 (7W13A) was performed and passed criteria.

I certify that the tests used in this report meet all requirements of the NELAC standards unless otherwise stated in the SDG narrative or QA notice.

I certify that this data package is in compliance with the terms and conditions of the contract, both technically and for completeness, for other than the conditions detailed above. Release of the data contained in this hardcopy data package and in the computer-readable data submitted on CD has been authorized by the Laboratory Manager or his/her designee, as verified by the following signature.

# INORGANIC DATA REPORTING QUALIFIERS

On the Form I, under the column labeled "Q" for qualifier, each result is flagged with the specific data reporting qualifiers listed below, as appropriate. The qualifiers used are:

U : This flag indicates the compound was analyzed for, not detected and is reported as less than the Method Detection Limit (MDL) (or as defined by the client). The Reporting Limit (RL), or Limit of Quantitation (LOQ), and the MDL will be adjusted to reflect any dilution or concentration of the sample and, for soils, the percent moisture.

J : This flag indicates the reported result is an estimated value. The flag is used when an analyte is detected and the result is less than the adjusted RL/LOQ but equal to or greater than the MDL.

Q : This flag denotes that one or more quality control criteria have failed (e.g., LCS recovery, Continuing Calibration Verification, CCV, and interference check standards for ICP-AES/ICP-MS) and reanalyses can't be performed. The Q flag is applied to all specific analyte(s) in all samples associated with the failed quality control criteria.

B : This flag is used when the analyte is found in the associated method or calibration blank as well as in the sample. It indicates probable blank contamination and warns the data user to take appropriate action. The combination of flags BU or UB is not an allowable policy. Blank contaminants are flagged B only when they are detected in the sample.

D: This flag is applied to an analyte when the reported result is based on a dilution.

X/Y/Z : Other specific flags may be required to properly define the results. If used, the flags will be fully described in the SDG Narrative. The laboratory-defined flags are limited to X, Y, and Z.

**The extensions: D, S, SD, L, and A are added to the end of the Client ID and represent the following:**

**D – Matrix Duplicate**
**S – Matrix Spike**
**SD – Matrix Spike Duplicate**
**L – Serial Dilution**
**A – Post Digestion Spike**

# 3. Raw Data

For each reported value, the laboratory shall include in the data package all raw data used to obtain that value. This applies to all required QA/QC measurements, instrument standardization, as well as all sample analysis results. This does not apply to the quarterly verification of method and instrument parameters submitted as a part of each data package.

The order of the raw data in the data package shall be: ICP-AES, ICP-MS, mercury, and cyanide (if a target analyte).

Raw data shall be labeled with Client Identification numbers and appropriate codes in order to identify:

- calibration standards, including source and preparation date
- initial and continuing calibration blanks and preparation blanks
- initial and continuing calibration verification standards, interference check samples, serial dilution samples, LRS check standard, Laboratory Control Sample, and post digestion spike
- diluted and undiluted sample and all weights, dilutions, and volumes used to obtain the reported values
- duplicates
- spikes (indicating standard solutions used, final spike concentrations, and volumes involved).
- instrument used, any instrument adjustments, data corrections or other apparent anomalies on the measurement record, including all data voided or data not used and a brief written explanation
- time and date of each analysis (instrument run logs can be submitted if they contain this information)

The presence of the Chemist's/Analyst's employee ID number, or signature, on this run log attests that strict compliance with the method's SOP has occurred. Any SOP deviations require documentation by the responsible chemist/analyst together with the chemist's/analyst's initials and the initials of the lab supervisor and a QA department representative, signifying approval of the deviation.

## QC Out of Limits

| Measurement Type | Analyte | Mass | Out of Limits Message |
|---|---|---|---|

# 4. Digestion and Distillation Logs

The following logs shall be submitted, as appropriate, for each preparation procedure: digestion logs for ICP-AES, ICP-MS, mercury preparations, and cyanide. The logs shall include: (1) date; (2) sample weights and volumes, with initial sample weight/volume and final volume clearly indicated; (3) sufficient information to unequivocally identify which QC samples (i.e., LCS, PB) correspond to each batch digested; (4) comments describing any significant sample changes or reactions which occur during preparation shall be entered in the log and noted in the SDG Narrative; (5) indication of pH less than 2 or greater than 12, as applicable; (6) identification of the sample preparer(s) [signature (s)].

# METALS/MERCURY PREPARATION LOG

# Data Validation Report

## INORGANIC DATA REVIEW SUMMARY

Draper Aden Associates performed a manual comprehensive review of the inorganic analytical results for the June 30, 2011 groundwater monitoring event at RFAAP HWMU7. Draper Aden Associates, of Blacksburg, Virginia, collected a groundwater sample and blind field duplicate from monitoring well 7W13. Monitoring well re-development was performed prior to sample collection. This event represents the first of two monitoring events to be conducted subsequent to the well re-development. These samples were analyzed for total arsenic and cobalt by SW-846 Method 6020A - inductively coupled plasma-mass spectrometry (ICP-MS). The following information and attached table summarize the inorganic data validation results.

Draper Aden Associates sent samples to CompuChem (CompuChem), a Division of Liberty Analytical, of Cary, North Carolina, for the inorganic analyses. On behalf of RFAAP, CompuChem submitted results to Draper Aden Associates in a final certificate of analysis which included sample analytical results as well as relevant documentation to verify and validate the results.

The evaluation of CompuChem's compliance with the method and validation of results presented here are based upon a limited review of QA/QC information including holding times, preservation procedures, instrument tuning, calibration and calibration verification data, QL standards, blank samples (method, calibration, and other blanks), interference check sample, pre-digestion matrix spike and matrix spike duplicate (MS/MSD), laboratory control sample (LCS), internal standard, and serial dilution results, where applicable. A review of transcriptions from instrument data to sample summary sheets was performed. Calculation checks were performed on a minimum ten percent of the data set. The following information is intended to summarize data review results and any observed significant deviations from method and/or contractual requirements.

CompuChem received the samples on ice and in good condition, with custody seals intact. Applicable holding time and preservation criteria were met. The chain of custody was appropriately signed and data by field and laboratory personnel.

### *Method 6020A (ICP-MS)*

The revised certificate of analysis for Method 6020A was complete in its presentation and the data were of acceptable quality. The data set exhibited the laboratory's ability to achieve the reported QL for arsenic and cobalt, as outlined by the precision and accuracy data. QLs were equal to or less than the permit QL.

QC documentation criteria were met. Instrument tuning, calibration and calibration verification criteria were met. QL standards, blank samples, interference check sample (ICSAB), pre-digestion MS/MSD, LCS, internal standard and serial dilution results recovered within

control limits, except where noted below. No deviations from specific control limits and QA/QC controls were identified during the data review process.

The laboratory report was revised to correctly report results to at or above the permit QL for arsenic (10 µg/l) and cobalt (4 µg/l).

Arsenic and cobalt detections reported at or above the permit QL and/or results that required a data validation qualifier due to quality control deviations noted above are summarized on the attached table.

No results were rejected based on the data validation criteria.

*Summary of Detections:*

| ANALYTE | METHOD | SAMPLE ID | LAB RESULT | VALIDATED RESULT | QL | UNITS | DATA VALIDATION NOTES |
|---|---|---|---|---|---|---|---|
| Arsenic, Total | 6020A | 7W13 | U | U | 10 | µg/l | Result < Permit QL.. |
| Cobalt, Total | 6020A | 7W13 | 12.4 | 12.4 | 4 | µg/l | No action taken. |
| Arsenic, Total | 6020A | 7DUP | U | U | 10 | µg/l | Result < Permit QL. |
| Cobalt, Total | 6020A | 7DUP | 12.9 | 12.9 | 4 | µg/l | No action taken. RPD <10. |

**Data Validation Qualifiers:**
**QL** Denotes project quantitation limit.
**U** Denotes analyte not detected at or above QL.
**J** Denotes analyte reported above QL and associated result is estimated.
**UJ** Denotes analyte not detected at or above the QL and associated QL is estimated.
**UA** Denotes analyte detected above QL, but attributed to laboratory contamination. Sample QL adjusted to sample concentration. Final result not detected at or above adjusted sample QL.

## INORGANIC DATA EVALUATION FOR ICP-MS SW-846 METHOD 6020A

**Sample ID:** 7W13
**QC Samples:** Lab blanks, LCS/LCSD, serial dilution (7W13), Field duplicate (7DUP)
**Laboratory:** CompuChem, Cary, NC; SDG: 1107004

Does Laboratory analyte list correspond to analyte list requested? _X_ yes ___ no
Corresponds to As and Co, total, Preparation method: 3005A

"☑" denotes items reviewed. NR Denotes not reviewed.
See Data Validation Summary for additional comments.

### A. DOCUMENTION COMPLETENESS CRITERIA:

*Data Quality Objective: Representativeness*

- ☑ Chain of custody – Custody transfers must be signed and dated
- ☑ Chain of custody properly and completely filled out including sampler signatures, date and time of sampling, sample ID, analysis requested

### B. DETECTION LIMIT AND QUANTITATION LIMIT CRITERIA:

*Data Quality Objective: Analytical Sensitivity*

- ☑ Specific detection limit reported
- ☑ Specific quantitation limit reported
- ☑ Standard analyzed at the QL (LLQC), digested, 70-130% recovery, analyzed after MDL determination and as needed
- ☑ Method detection limit (MDL) less than QL
- ☑ Performance evaluation sample analyzed within 12 months

### C. INITIAL DEMONSTRATION OF CAPABILITY (IDOC) CRITERIA:

*Data Quality Objective: Laboratory Method Sensitivity*

- ☑ Analyst IDOC for J. Feldhaus submitted previously

### D. SAMPLE AND STANDARD PREPARATION CRITERIA:

*Data Quality Objective: Accuracy and Representativeness*

- ☑ Digestion prior to analysis
- ☑ Digestion method: 3005A
- ☑ Samples and standards matrix matched

### E. TECHNICAL HOLDING TIME / PRESERVATION REQUIREMENTS:

*Data Quality Objective: Representativeness*

- ☑ 6 month holding time, pH<2 with Nitric Acid ($HNO_3$)

### F. INSTRUMENT TUNE CRITERIA:

*Data Quality Objective: Verify Operating Conditions*

- ☑ Prior to calibration
- ☑ Relative Standard Deviation (RSD) </=5%
- ☑ Resolution < 0.9 amu full width at 10% peak height (or lower)

☑ Mass calibration </=0.1 amu difference from true value

## G. INITIAL CALIBRATION CRITERIA:

*Data Quality Objective: Laboratory Accuracy*

☑ 1 calibration blank and 3 standards,
☑ Linear curve fit with correlation coefficient $r \geq 0.998$
☑ Daily calibration following tuning and prior to sample analysis

## H. INITIAL CALIBRATION VERIFICATION (ICV) CRITERIA:

*Data Quality Objective: Laboratory Accuracy*

☑ Daily following initial calibration, independent/second source used for ICV
☑ ICV concentration near mid-point of calibration curve, 90-110% recovery
☑ Low level ICV (LLICV) – prior to analysis, at QL concentration, 70-130% recovery

## I. INITIAL CALIBRATION BLANK CRITERIA:

*Data Quality Objective: Laboratory Analytical Sensitivity/Instrument Drift/Contamination Evaluation*

☑ Daily following ICV
☑ Interference free

## J. CONTINUING CALIBRATION VERIFICATION (CCV) CRITERIA:

*Data Quality Objective: Laboratory Analytical Accuracy*

☑ CCV, prior to analysis, after every 10 samples, at end of analysis
☑ CCV recovery within 90-110%, mid-point of curve concentration
☑ Low level CCV (LLCCV), concentration at QL, prior to analysis, after every 10 samples, end of analysis (70-130% R)

## K. CONTINUING CALIBRATION BLANK CRITERIA:

*Data Quality Objective: Laboratory Analytical Sensitivity/Instrument Drift/Contamination Evaluation*

☑ Immediately after the CCV, 10 sample frequency
☑ Interference free

## L. BLANK CRITERIA:

*Data Quality Objective: Sensitivity/Instrument Drift/Contamination Evaluation*

N/A Trip Blank (check only if analyzed)
☑ Method/Other Lab Blanks (check only if analyzed), one per digestion batch
☑ Interference free

## M. INTERFERENCE CHECK SAMPLE (ICS) CRITERIA:

*Data Quality Objective: Analytical Accuracy/Verification of Isobaric Interference Corrections*

☑ At beginning of analytical run
☑ Recovery: 80-120% (ICSAB)

## N. MATRIX SPIKE DUPLICATE (MSD) CRITERIA:

*Data Quality Objective: Method Precision in Sample Matrix*

☑ All analytes, one MSD or sample duplicate per batch of 20 samples
☑ Spiked prior to sample preparation
☑ RPD $\leq 20$ between MS and MSD results or sample and duplicate results
☑ MSD analyte recovery 75-125%

## O. MATRIX SPIKE (MS) CRITERIA:

*Data Quality Objective: Method Accuracy in Sample Matrix*

- ☑ All analytes, one MS per digestion batch of 20 samples
- ☑ Spiked prior to sample preparation
- ☑ Recovery: 75-125%
- ☑ Post digestion spike if MS/MSD recoveries fail
- ☑ Recovery of post digestion spike analytes within 80-120%

## P. LABORATORY CONTROL SAMPLE (LCS) CRITERIA:

*Data Quality Objective: Laboratory Method Accuracy, Laboratory Performance*

- ☑ LCS for all target analytes, one LCS per 20 sample batch
- ☑ LCS concentration at approximately mid-point of analytical curve
- ☑ Recovery within 80-120% for all analytes

## Q. INTERNAL STANDARDS (IS) CRITERIA:

*Data Quality Objective: Analytical Accuracy in Sample Matrix*

- ☑ IS (Li6, Sc45, In115, Tb159, Bi209) intensities, IS added to each sample and QC sample
- ☑ % Relative intensity (RI) within 70-125%

## R. SERIAL DILUTION (DILUTION TEST) TEST CRITERIA:

*Data Quality Objective: Accuracy in Sample Matrix*

- ☑ <10% Difference (applicable when sample concentration >10X QL)

## S. SAMPLE QUANTITATION AND GENERAL REPORTING CRITERIA:

*Data Quality Objective: n/a*

- ☑ Sample results reported within instrument linear dynamic range
- ☑ Sample results reported to the detection limit
- ☑ Sample results/blind field duplicate RPD<10.

---

Draper Aden Associates conducted a limited data validation of the above noted data set using the data package provided by the analyzing laboratory. Data evaluation was conducted using SW-846 (Test Methods for Evaluating Solid Waste-Physical/Chemical Methods, USEPA, SW-846, 3rd Edition-Final Update I, II/IIA and III) method requirements and CLP data validation guidelines (USEPA Contract Laboratory Program National Functional Guidelines for Inorganic Data Review, October 2004 USEPA Contract Laboratory Program National Functional Guidelines for Inorganic Superfund Data Review, January 2010). Validation of this data set is limited to review of items detailed in this data review report.

**LIMITATIONS:**

Draper Aden Associates prepared this document (which may include drawings, specifications, reports, studies and attachments) in accordance with the agreement between Draper Aden Associates and the client.

The standard of care for all professional engineering, environmental and surveying and related services performed or furnished by Draper Aden Associates under this Agreement are the care and skill ordinarily used by members of these professions practicing under similar circumstances at the same time and in the same locality. Draper Aden Associates makes no warranties, express or implied, under this Agreement in connection with Draper Aden Associates' services.

Conclusions presented are based upon a review of available information, the results of our field studies, and/or professional judgment. To the best of our knowledge, information provided by others is true and accurate, unless otherwise noted. Draper Aden Associates' liability, hereunder, shall be limited to amounts due Draper Aden Associates for services actually rendered, or reimbursable expenses actually incurred. Any reuse or modification of any of the aforementioned documents (whether hard copies or electronic transmittals) prepared by Draper Aden Associates without written verification or adaptation by Draper Aden Associates will be at the sole risk of the individual or entity utilizing said documents and such use is without the authorization of Draper Aden Associates. Draper Aden Associates shall have no legal liability resulting from any and all claims, damages, losses, and expenses, including attorney's fees arising out of the unauthorized reuse or modification of these documents. Client shall indemnify Draper Aden Associates from any claims arising out of unauthorized use or modification of the documents whether hard copy or electronic.

# SDG NARRATIVE
# SDG # 1107004
## Client: DRAPER
## Project: RAAP 2nd QTR.2011 UNIT 7/RE-DEVELOPMENT EVENT

The indicated Sample Delivery Group (SDG) consisting of two (2) water samples was received into the laboratory information management system (LIMS) on July 1, 2011 intact and in good condition with the Chain of Custody (COC) Records in order, unless otherwise noted in any attachments or Quality Assurance Notices. The cooler temperature indicator bottle was found with the samples and the samples temperature was 1.6 degrees Celsius. Temperature was recorded by IR temperature gun.

The samples were prepared and analyzed in accordance with SW846 and 6020A methodology for the requested total metals arsenic and cobalt. All non-detects are reported to the reporting limit (RL) with a "U" flag qualifier.

### EQUATIONS FOR LIQUID SAMPLE CALCULATIONS:

Equation for obtaining metals sample results in µg/L as presented on Analysis Data Sheet data sheets from ICP/MS instrument acquired results in µg/L (ppb).

$$\frac{C \times F}{I}$$

Where

C = concentration (µg/L)

F = final volume in liters after sample preparation

I = initial volume in liters

Example: Cobalt for sample 7W13

$$\frac{12.40392\ \mu g/L\ (C) \times 0.10\ L\ (F)}{0.10\ L\ (I)} = 12.404\ \mu g/L \text{ reported as } 12.4\ \mu g/L$$

### INSTRUMENTAL QUALITY CONTROL:

All calibration verification solutions (LLICV, LLCCV, ICV & CCV), blanks (ICB, & CCB), and interference check samples (ICSA & ICSAB) associated with this data were confirmed to be within SW-846 methodology.

AMENDED DATA

## SAMPLE PREPARATION QUALITY CONTROL:

The sample preparation procedure verifications (LCSW, LCSWD, & PBW) were found to be within acceptable ranges and the field samples were prepared and analyzed within the contract specified holding times.

## MATRIX RELATED QUALITY CONTROL:

No matrix spikes were requested for this sample.

A five-fold serial dilution of sample, CCN = SDI1107005-01 (7W13L) was performed in accordance with SW-846 requirements for ICP/MS analysis.

The adjusted sample concentrations were outside control limits.

The ICP/MS sample post digestion spike, CCN =1070509-PS1 (7W13A) was performed and passed criteria.

I certify that the tests used in this report meet all requirements of the NELAC standards unless otherwise stated in the SDG narrative or QA notice.

I certify that this data package is in compliance with the terms and conditions of the contract, both technically and for completeness, for other than the conditions detailed above. Release of the data contained in this hardcopy data package and in the computer-readable data submitted on CD has been authorized by the Laboratory Manager or his/her designee, as verified by the following signature.

| 5 | | | | | | | | | | 0 | 0 | 0 |
| | | | | | | | | | **Total Number of Signs** | | 7 | 17 |

From the Table Above, S = -10
From Table A-12a of Appendix A (Reference Document), critical value for sample size of 10 for $\alpha = 0.05$ is 21
The calculated S value is not greater than the critical value.
From Table A-12b of Appendix A for n=10, S=-10, p=0.216
Since S<0, but p=0.216 ≥ 0.05, the null hypothesis is not rejected.
Therefore there is not enough evidence to conclude that there is a decreasing trend in the data. Also, there is no evidence of an increasing trend.
**Trend Analysis shows evidence that the data are stable.**
The QL of 5 was substituted for data reported less than QL

flow line vectors over the Potentiometric Surface Map, measuring their lengths, calculating the head differential over the distances measured, and dividing the head differential by the length of the flow line vectors. The three calculated gradients were then averaged to a single value. Using this method, the average groundwater hydraulic gradient across the site based on First Quarter 1999 groundwater elevations was calculated to be 0.017 ft/ft. Historical slug test data for the site yielded an average hydraulic conductivity of $5.25 \times 10^{-5}$ ft/second. This value is consistent with literature values for karst carbonate rock and for clayey, silty sand and gravel alluvium and residuum (Domenico and Schwartz, 1990).

The estimated groundwater velocity across the site was calculated to be approximately 0.193 ft/day or 70.4 ft/year, based on the following:

- an average hydraulic conductivity of $5.25 \times 10^{-5}$ ft/second;
- an average hydraulic gradient of 0.017 ft/ft; and
- an assumed effective porosity of 0.40, based on a representative range of porosities for karst carbonate rock, weathered residuum, and clayey, silty sand and gravel alluvium (Domenico and Schwartz, 1990).

The actual groundwater flow velocities in the carbonate bedrock may vary as much as one to two orders of magnitude from the velocity presented above, depending on water level conditions and the distribution of karst conduits.

## 3.3 HWMU-5 GROUNDWATER MONITORING ANALYTE LIST

The groundwater monitoring analyte list for HWMU-5 is presented in **Table 1 (Appendix B)**. The list represents the subset of the constituents listed in Appendix VIII of 40 CFR Part 261 that previously have been detected in the groundwater and/or that are reasonably expected to be in or derived from waste contained in HWMU-5. As discussed in Section 3.5.2 below, 11 inorganic constituents, three volatile organic constituents, and two explosive/ propellant constituents have been detected in the groundwater monitoring network for HWMU-5 at statistically significant concentrations above the Unit's calculated background concentrations.

The concentration limits established for the hazardous constituents also are listed in **Table 1**. The concentration limits represent either background concentrations calculated for the constituents in this GWQAR, Maximum Concentrations of Constituents for Ground-water Protection listed in Table 1 of 40 CFR 264.94, USEPA Drinking Water Standard Maximum Contaminant Levels (MCLs), or alternate concentration limits (ACLs) established by the VDEQ (July 1998).

As Alliant discussed with the VDEQ in the past, the reliability of previous laboratory analytical data - particularly dissolved metals data - appeared to be questionable in some cases. In an April 9, 1996 letter to C. Jake (Alliant), the VDEQ agreed that only total metals concentrations in groundwater would be measured, as described in a USEPA Region III guidance on groundwater sampling in karst terrain. Therefore, all references to metals concentrations in this GWQAR refer to <u>total</u> metals concentrations.

## 3.4 HWMU-5 GROUNDWATER BACKGROUND CONCENTRATIONS

Background concentrations were calculated for each constituent in the groundwater monitoring program using the analytical data from First Quarter 1996 through First Quarter 1999 for upgradient well 5W8B. The background concentration calculations were based on site wide 95% confidence, 95% coverage upper prediction intervals. The calculated background

concentrations are listed in **Table 2 (Appendix B)**. The background concentrations were used to construct the outermost closing contours on the Isoconcentration Maps **(Appendix A)**.

## 3.5 HWMU-5 STATISTICAL ANALYSIS

Statistical evaluations for HWMU-5 are performed annually and submitted to the VDEQ in accordance with the annual reporting requirements specified in 40 CFR 265.94. As part of this GWQAR, statistical evaluations were performed on First Quarter 1999 analytical data in accordance with the procedures and guidance provided in the following documents:

- Title 40 of the Code of Federal Regulations, 40 CFR 264.97 and 264.98;
- VDEQ Guidance for statistical analysis titled "Data Analysis Plan," undated;
- Interim Final Guidance for Statistical Analysis of Groundwater Monitoring Data at RCRA Facilities, USEPA, April 1989;
- Addendum to Interim Final Guidance for Statistical Analysis of Groundwater Monitoring Data at RCRA Facilities, USEPA, July 1992; and
- Statistical Methods for Groundwater Monitoring, Gibbons, R.D., 1994.

Statistical threshold values were computed for the 40 constituents for which HWMU-5 is currently monitored based on the concentrations of those constituents in upgradient (background) well 5W8B. All data starting with First Quarter 1996 to First Quarter 1999 were used for this purpose. The 1996 through 1999 monitoring data have been submitted previously to the VDEQ by Alliant in quarterly monitoring reports; therefore, the data are not listed in this GWQAR. Statistical comparisons were performed for the First Quarter 1999 data set. Comparison statistical analyses were performed for all constituents which were detected in any downgradient well during that event.

### 3.5.1 Background Data and Statistical Comparisons

Statistical analyses were performed using the analytical results from upgradient well 5W8B as background data. Based on the percentage of non-detects and the distribution of the background data, methods of statistical comparisons varied. Background average, standard deviation and other descriptive statistical data were computed for all constituents and are presented in **Appendix C**.

The constituents listed below were 100% non-detected in the background data. The background threshold levels (BTLs) for these constituents were established as equal to their detection limits (DL). Detections of these constituents in the downgradient wells during First Quarter 1999 were compared to these BTLs.

| Background Threshold Level (BTL) = Detection Limit (DL) | | | | |
|---|---|---|---|---|
| Parameter | Sample Size | % Non-Detects | DL (µg/l) | BTL (µg/l) |
| Antimony | 13 | 100 | 3 | 3 |
| Arsenic | 13 | 100 | 1 | 1 |
| Selenium | 13 | 100 | 1 | 1 |
| Benzene | 13 | 100 | 0.1 | 0.1 |
| Chloromethane | 13 | 100 | 0.3 | 0.3 |
| 1,2-Dichloroethane | 13 | 100 | 0.1 | 0.1 |
| Tetrachloroethene | 13 | 100 | 0.1 | 0.1 |
| Toluene | 13 | 100 | 0.1 | 0.1 |
| trans-1,2-Dichloroethene | 13 | 100 | 0.1 | 0.1 |

| Background Threshold Level (BTL) = Detection Limit (DL) | | | | |
|---|---|---|---|---|
| Parameter | Sample Size | % Non-Detects | DL (µg/l) | BTL (µg/l) |
| 1,1,2-Trichloroethane | 13 | 100 | 0.5 | 0.5 |
| Trichlorofluoromethene | 13 | 100 | 0.5 | 0.5 |
| Vinyl chloride | 13 | 100 | 0.1 | 0.1 |
| Xylenes (total) | 13 | 100 | 0.1 | 0.1 |
| Bis (2-ethylhexyl) phthalate | 13 | 100 | 10 | 10 |
| Di-n-butyl phthalate | 9 | 100 | 5 | 5 |
| Diethyl phthalate | 13 | 100 | 5 | 5 |
| Diphenylamine | 13 | 100 | 10 | 10 |
| 2,6-Dinitrotoluene | 13 | 100 | 0.08 | 0.08 |

Non-parametric prediction intervals were computed for all of the constituents for which the data from background well 5W8B satisfied one of the following two criteria, per VDEQ regulations and guidance as well as USEPA guidance:

- Percentage of non-detects was greater than or equal to 50 and less than 100; or
- Percentage of non-detects was less than 50, but data was not normally distributed in original or log-transformed mode.

The background threshold levels for these constituents were set as equal to their upper prediction limits (UPLs). The background and relevant statistical data for these constituents are summarized below. The confidence level and false positive rate were calculated based on the number of background data points available and number of future comparisons. For all constituents, the confidence level was determined to be equal to 0.920, and the false positive rate was equal to 0.080. Since the upper control limit of a non-parametric interval cannot be adjusted for multiple comparisons and inadequate number of background data, the number of resampling events required was adjusted to account for the high error rates inherent in those situations. The number of confirmation resamples required for all constituents is 2. The background and relevant statistical data for these constituents are summarized below. Associated statistical computations are presented in **Appendix C**.

| BTL = Upper Prediction Limit of Non-parametric Prediction Interval w/false positive rate=0.067 | | | | |
|---|---|---|---|---|
| Parameter | Sample Size | % Non-Detects | DL (µg/l) | BTL (µg/l) |
| Beryllium | 13 | 54 | 0.2 | 0.7 |
| Cobalt | 13 | 46 | 1 | 7 |
| Copper | 13 | 54 | 1 | 18 |
| Lead | 13 | 69 | 1 | 10 |
| Mercury | 13 | 85 | 0.2 | 0.9 |
| Nickel | 13 | 69 | 15 | 106 |
| Silver | 13 | 85 | 0.2 | 2.3 |
| Thallium | 13 | 85 | 1 | 2 |
| Vanadium | 13 | 62 | 4 | 17 |
| Zinc | 13 | 38 | 5 | 75 |
| Acetone | 13 | 92 | 10.0 | 89 |
| Chloroform | 13 | 77 | 0.3 | 0.5 |
| Methylene chloride | 13 | 92 | 0.7 | 0.7 |
| Methylethyl ketone | 13 | 92 | 1.1 | 21.3 |
| Trichloroethene | 13 | 85 | 0.1 | 0.8 |
| 2,4-Dinitrotoluene | 13 | 92 | 0.08 | 0.18 |
| Total Organic Carbon | 13 | 69 | 1,000 | 253,000 |
| Total Organic Halides | 13 | 46 | 5 | 13.4 |

The following constituents exhibited normally distributed background data with less than 25% non-detects. One sided parametric prediction intervals were computed on the background data for all of these constituents. The UPLs for these constituents were set as their respective BTLs, with one exception. For pH, a two-sided parametric prediction interval was computed; therefore, the BTL for pH consisted of a range between the lower prediction limit (LPL) and the upper prediction limit. The background concentration calculations were based on a site wide 95% confidence, 95% coverage upper prediction intervals. When adjusted for multiple comparisons of the background data, the minimum required false positive rate was below 1% (0.01). A 99% confidence level (0.01 false positive rate) was used for all individual comparisons, which with the most conservative assumptions provided a site-wide false positive rate of >0.05 for all constituents. The background and relevant statistical data for these constituents are summarized below. The prediction interval computations for these constituents are presented in **Appendix C**.

| **BTL = UPL of one-sided Prediction Interval (exception pH) w/site-wide false positive rate>0.05 (individual comparisons false positive rate=0.01) BTL for pH = LPL – UPL of two-sided Prediction Interval** | | | | |
|---|---|---|---|---|
| **Parameter** | **Sample Size** | **% Non-Detects** | **DL (µg/l)** | **BTL (µg/l)** |
| Barium | 13 | 0 | 2 | 172.87 |
| Cadmium | 13 | 23 | 0.1 | 1.45 |
| Specific Conductivity | 8 | 0 | 1 µS/cm | 450 µS/cm |
| pH | 8 | 0 | 0.1 pH units | 2.79 - 7.47 pH units |

### 3.5.2 Results of Statistical Comparisons

The following table lists the constituents which were detected during the First Quarter 1999 event at concentrations exceeding their respective background threshold levels (BTLs), and the downgradient wells in which they were detected.

| Parameter | Monitoring Well(s) |
|---|---|
| Arsenic | S5W5 |
| Beryllium | 5W7B, 5WC21, S5W5 |
| Cadmium | 5WC21 |
| Cobalt | 5W5B, 5W7B, 5WC21, 5WC22, S5W7, 5W11A |
| Copper | 5W7B, 5WC21 |
| Lead | 5W7B, S5W5 |
| Nickel | 5WC21 |
| Selenium | 5W5B |
| Silver | 5W5B |
| Vanadium | 5W5B, 5W7B, S5W5 |
| Zinc | 5W7B, 5WC21, 5W11A |
| Chloroform | 5WC21 |
| Trichloroethene | 5W5B, 5WC21, 5WC22, 5WC23, 5W10A |
| Xylenes (total) | 5W5B |
| 2,4-Dinitrotoluene | 5W5B, 5W7B, 5WC21, 5WC22, 5WC23 |
| 2,6-Dinitrotoluene | 5W5B, 5W7B, 5WC21, 5WC22, 5WC23, 5W9A |
| Specific Conductivity | 5W5B, 5W7B, 5WC21, 5WC22, 5WC23, S5W7, 5W9A, 5W11A |
| pH | 5WC23, 5W10A, 5W11A |

**TABLE 2**
**HWMU-5**
**CALCULATED BACKGROUND VALUES**

| Constituent | Background Concentration (µg/l unless otherwise noted) |
|---|---|
| Antimony | 3 |
| Arsenic | 1 |
| Barium | 172.87 |
| Beryllium | 0.7 |
| Cadmium | 1.45 |
| Cobalt | 7 |
| Copper | 18 |
| Lead | 10 |
| Mercury | 0.9 |
| Nickel | 106 |
| Selenium | 1 |
| Silver | 2.3 |
| Thallium | 2 |
| Vanadium | 17 |
| Zinc | 75 |
| Acetone | 89 |
| Benzene | 0.1 |
| Chloroform | 0.5 |
| Chloromethane | 0.3 |
| 1,2-Dichloroethane | 0.1 |

| Methylethylketone | 21.3 |
| Tetrachloroethene | 0.1 |
| Toluene | 0.1 |
| trans-1,2-Dichloroethene | 0.1 |
| 1,1,2-Trichloroethane | 0.5 |
| Trichloroethene | 0.8 |
| Trichlorofluoromethane | 0.5 |
| Vinyl chloride | 0.1 |
| Xylenes (total) | 0.1 |
| Bis (2-ethylhexyl) phthalate | 10 |
| Di-n-butylphthalate | 5 |
| Diethyl phthalate | 5 |
| Diphenylamine | 10 |
| 2,4-Dinitrotoluene | 0.18 |
| 2,6-Dinitrotoluene | 0.08 |
| Total Organic Carbon | 253,000 |
| Total Organic Halides | 13.4 |
| Specific Conductivity | 450 µS/cm |
| pH | 2.79 to 7.47 pH units |

April 1995 letter from the DEQ to J. Redder, Hercules, Inc. (now Alliant TechSystems, Inc.). The lists incorporate requirements outlined in the Virginia Hazardous Waste Management Regulations (VR 672-10-1) Sections 9.5.C and 9.5.D. These include the Indicator Parameters, Ground Water Quality Parameters, EPA Interim Primary Drinking Water Standards, Known Hazardous Waste Constituents, and Detected VHWMR Appendix 10.6 Constituents. A demonstration was made to the DEQ that several hazardous waste constituents had not been detected for six consecutive quarters. As a result, these constituents have not been analyzed for on a regular basis. These are highlighted in the **Table 3-1.**

Additional parameters have not been detected in any of the wells. During the meeting between Alliant and DEQ on 21 May 1996, DEQ suggested that the recommendations to temporarily cease sampling additional constituents that had not been detected in six or more consecutive sampling events made in the GWQAP addendum submitted 3 November 1995 would better be addressed in the post closure permitting process. Therefore, those additional constituents will not be addressed in this report.

## 3.4 *UNIT 7 GROUND WATER BACKGROUND VALUES*

As requested in the DEQ's 23 July letter, background values were calculated for each parameter .

As discussed with DEQ, Alliant believes the analytical data to be questionable in some cases. DEQ has agreed in a 9 April 1996 letter to C. Jake (Alliant) that only total metals will be measured, as described in an EPA Region III guidance on ground water sampling in karst terrain. Another case of questionable data involves an increase in Total Organic Carbon (TOC) concentrations by a factor of 10. As such, the TOC concentrations from 1995 through 1997 were used to calculate the background values. **Table 3-2** presents the *Historical Maximum Values,* which were used to develop the isocontour maps.

As requested in the DEQ's 23 July 1998 letter, using the data from well 7W12B, background values were calculated for each parameter in the ground water monitoring program. However, as a result of the 21 May 1996 meeting and subsequent telephone conversations, these background values are being submitted in accordance with the regulations and shown on the isocontour maps but were not utilized for purposes of this report.

Additionally, calculations of background values based on the 95% confidence, 95% coverage upper tolerance limit require that data distributions be normal or lognormal. Some of the data do not fulfill this requirement

## 3.5 *UNIT 7 STATISTICAL ANALYSIS*

Statistical evaluations for Unit 7 are performed annually and submitted as part of the Annual Reporting requirements found in the VHWMR Section 9.5. As a result of the 21 May 1996 meeting between Alliant and DEQ, Alliant has established background ground water concentrations for the upgradient well, 7W12B utilizing the Virginia DEQ "*Guidance on Statistical Methods for Ground Water Data Analysis at a Solid Waste or Hazardous Waste Site, Version 2.0, 1995*". In response to Mr. Glenn von Gonten's letter dated 23 July, 1998, Alliant has revised the background concentrations to include sample data collected in 1997. These values can be found in **Table 3-3.** Methods used for background concentration computation and statsistical analysis are described below.

The following parameters were 100% Non-Detected in 20 or more sampling events. The downgradient well data points were compared to the laboratory PQLs in a nonparametric statistical manner or to the applicable MCL or VGWPS (if one exists). Background values were then estimated by using the laboratory PQL for that constituent.

| *Parameter* | *PQL (ppb)* | *Sample Size* | *% Non-Detect* | *MCL or VGWPS (ppb)* |
|---|---|---|---|---|
| **2,4-DNT** | 0.2 | 22 | 100 | None |
| **2,6-DNT** | 0.1 | 22 | 100 | None |
| **2,4 Dinitrophenol** | 11 | 11 | 100 | None |
| **Benzyl Alcohol** | 8 | 8 | 100 | None |
| **Cyanide** | 20 | 20 | 100 | 5 |
| **Bis(2- ethyl hexyl) phthalate** | 9 | 9 | 100 | None |
| **2 – Nitrophenol** | 9 | 9 | 100 | None |
| **4 – Nitrophenol** | 9 | 9 | 100 | None |
| **Acetone** | 100 | 14 | 100 | None |
| **Antimony** | 30 | 14 | 100 | None |
| **Vanadium** | 40 | 20 | 100 | None |

The following parameter has log-normally distributed data with between 15 and 50 percent Non-Detect values. As such, Cohen's Method was used as an adjustment for the mean and standard deviation, as recommended in the DEQ guidance. Results of the background analysis are summarized in **Table 3-4**

| *Parameter* | *Sample Size* | *% Non-Detect* |
|---|---|---|
| **Lead** | 23 | 34 |

The following parameters have data with greater than 50% Non-Detects, a minimum sample size of twenty (20). The data were non-normally distributed as indicated using a data distribution statistical method. According to Mr. Glenn von Gonten, DEQ in a 30 July 1996 telephone conversation, the maximum value detected will be used for plume delineation purposes for those constituents with greater than 50% non-detected values. An isocontour map for Total Organic Halides could not

be created because only one sampling point maximum concentration exceeded the background value.

| *Parameter* | *Sample Size* | *% Non-Detect* |
|---|---|---|
| **Arsenic** | 23 | 91.3 |
| **Cadmium** | 23 | 60.9 |
| **Chromium** | 23 | 56.5 |
| **Cobalt** | 20 | 65.5 |
| **Mercury** | 23 | 82.6 |
| **Nickel** | 20 | 85 |
| **Selenium** | 23 | 82.6 |
| **Thallium** | 20 | 70 |
| **Total Organic Halides** | 48 | 62.5 |

The following parameters do not have greater than four (4) sampling events and therefore could not be included in this (plume) evaluation:

- 2,4-D
- Gross Beta
- Radium
- Sulfate

The following parameters have between 15 and 50 percent Non-Detect values, and do not have normal or log-normal data distributions. Thus, Cohen's Method could not be used. Per the DEQ's 23 July letter, background concentrations were computed by calculating an upper tolerance limit based on 95% coverage, at a 95% confidence level. It should be noted that upper tolerance limits are not typically used unless the data are normally or log-normally distributed. Background concentration analysis data is summarized in **Table 3-4.**

| *Parameter* | *Sample Size* | *% Non-Detects* |
|---|---|---|
| **Total Organic Carbon** | 36 | 27.2% |
| **Silver** | 23 | 47.8% |

The remaining parameters have less than 15% Non-Detect values and no data manipulation was required. Computation data for barium, copper, specific conductivity, and zinc are summarized in Table 3-4

| *Parameter* | *Sample Size* | *% Non-Detect* |
|---|---|---|
| **Copper** | 20 | 0 |
| **PH** | 92 | 0 |
| **Barium** | 23 | 13 |
| **Specific Conductivity** | 92 | 0 |
| **Zinc** | 20 | 0 |

*Table 3-3*

Notes: K = Tolerance factor for one-sided normal tolerance interval with probability level of 95% and 95% coverage.
ULT = Upper Tolerance Limit

# RADFORD ARMY AMMUNITION PLANT, VIRGINIA

# Former Lead Furnace Area
# RCRA Facility Investigation/
# Corrective Measures Study Report

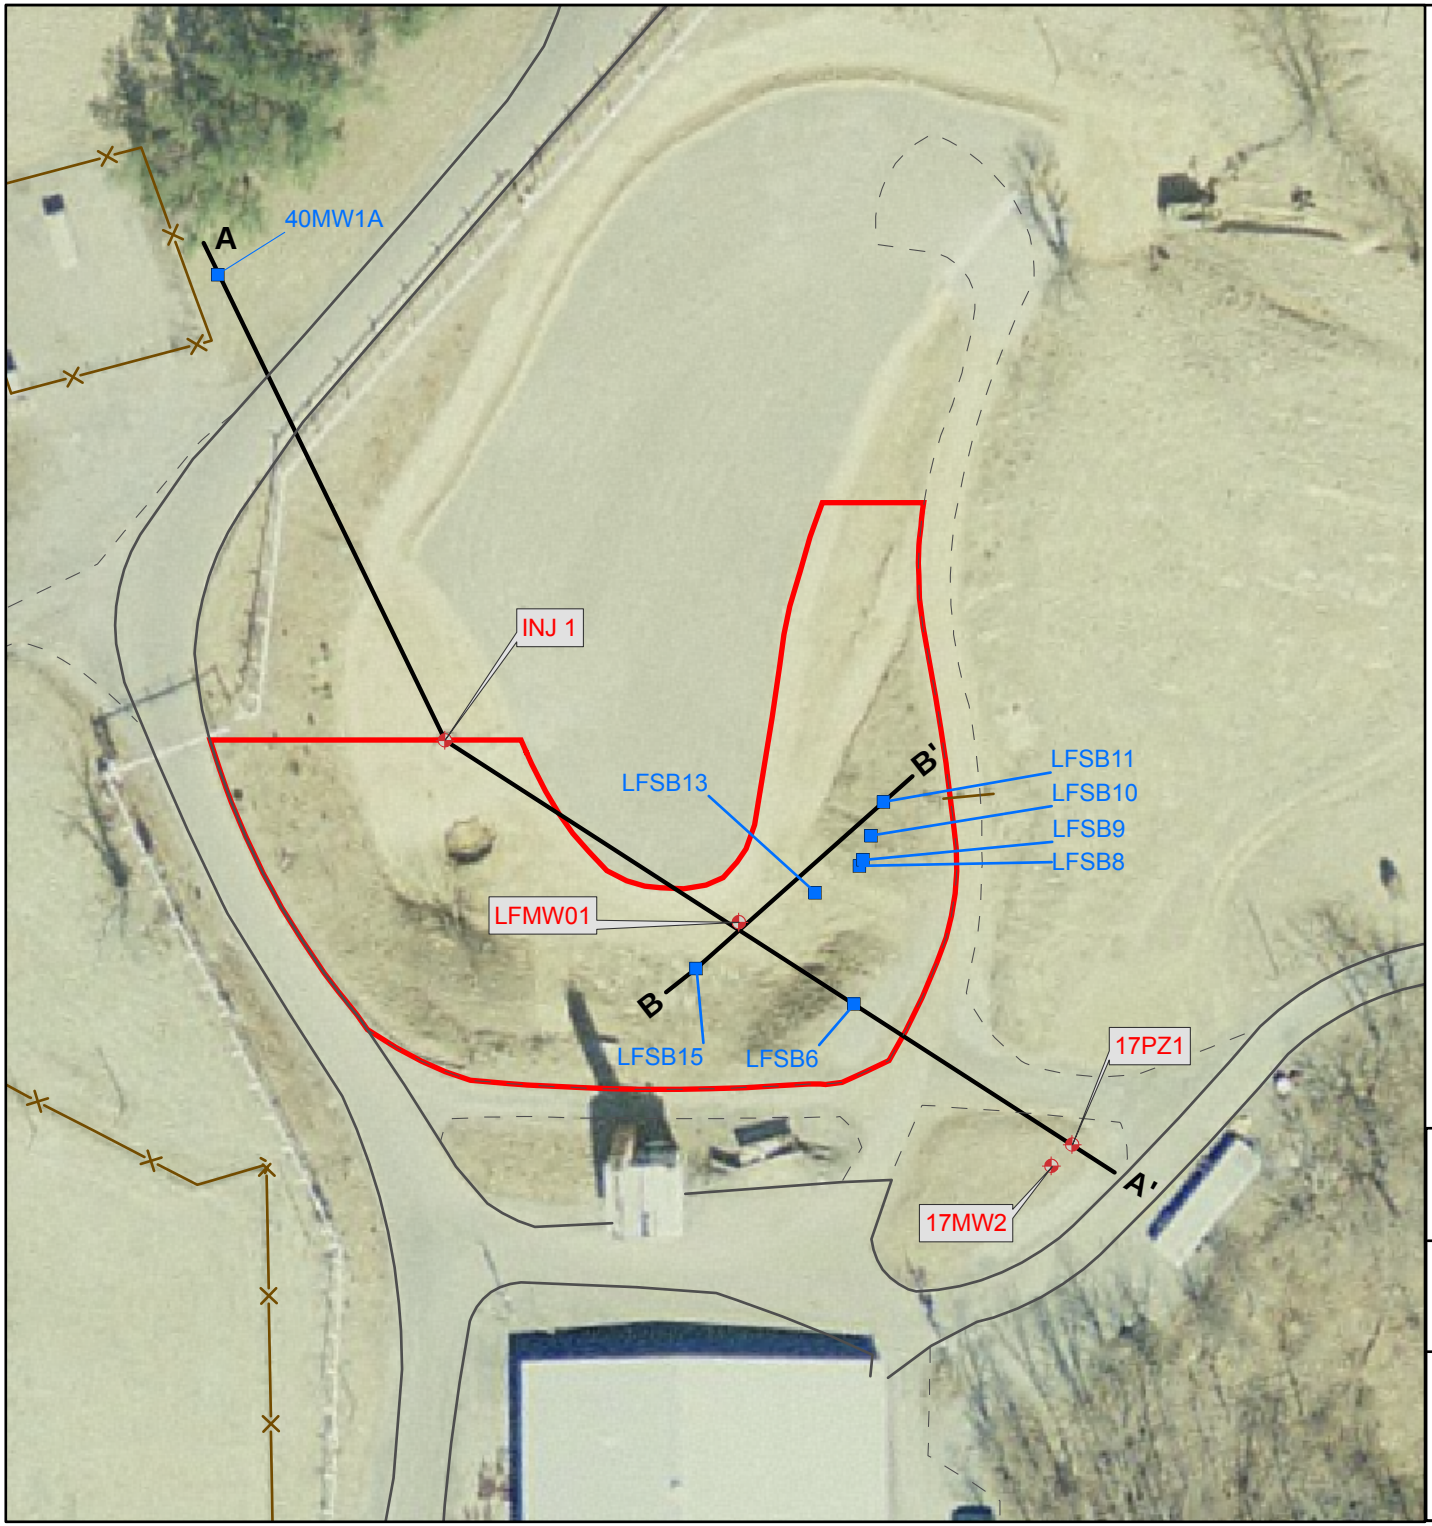
**Prepared for:**

USACE Baltimore District
10 S. Howard St.
Baltimore, MD 21201

**Prepared by:**

Shaw Environmental, Inc.
2113 Emmorton Park Rd.
Edgewood, MD 21040

**Final Document** **November 2008**



## LEGEND

- Soil Sample Location
- Monitoring Well
- Dirt Road
- Paved Road
- Fence Line
- Geologic Cross Section Line
- Former Lead Furnace Area Boundary

Notes:
1) Aerial photo, dated 2005, was obtained from Montgomery County, VA Planning & GIS Services.

N

Scale:

0 37.5 75 150 Feet

U.S. Army Corps of Engineers

HORIZ. SCALE: 0 50 100

VERT. SCALE: 0 15 30 45 60 75

LEGEND

- CLAY AND SILT, LITTLE SAND, RED-BROWN (CL)
- SILT AND CLAY (ML/CL)
- WEATHERED BEDROCK
- LIMESTONE, GRAY-BROWN, ARGILLACEOUS (LMSN)
- STATIC GROUNDWATER LEVEL

NOTES

1) WATER LEVELS MEASURED DECEMBER 2007 (17MW2 AND 17PZ1) AND AUGUST 2007 (LFMW01)
2) SOME DATA POINTS ARE PROJECTED ONTO PROFILE.
3) 40MW1A AND 17PZ1 LITHOLOGY FROM DAMES AND MOORE.
4) 40MW1A IS A BORING.
5) INJECTION WELL IS AN OPEN HOLE AT THE BEDROCK INTERFACE.

## LEGEND

- Monitoring Well Location
- Dirt Road
- Paved Road
- Fence Line
- Former Lead Furnace Area Boundary
- Other Site Boundary

Notes:
1) Aerial photo, dated 2005, was obtained from Montgomery County, VA Planning & GIS Services.
2) All water levels measured in December 2007, except LFMW01, which was measured in August 2007.
3) Water levels are expressed in feet above mean sea level.
4) Groundwater flow direction is based on the 1994 dye trace study results (Engineering Science, 1994).

# Table 4-7
# Legend

| | | |
|---|---|---|
| 12 | J | Shading and black font indicate an MCL exceedance. |
| 12 | J | Bold outline indicates a tw-RBC exceedance. |
| *12* | *12* | Shading in the MDL/MRL columns indicates the MDL exceeds a criterion. |

tw-RBCs for non-Carcinogenic compounds have been recalculated to an HI of 0.1.
The pyrene tw-RBCs were used for acenaphthylene, benzo(g,h,i)perylene and phenanthrene.
Secondary MCLs were used for aluminum, iron, manganese, silver, and zinc.
MCL Action Levels were used for copper and lead.
MCL = Maximum Contaminant Level (USEPA, 2006).
tw-RBC = Tap Water Risk-Based Concentration (USEPA, October 2007).
tw-RBC value in table is for the more conservative chromium VI.
tw-RBC value for chromium III is 5,500, which was not exceeded.
ng/L = nanograms per liter (parts per trillion).
µg/L = micrograms per liter (parts per billion).
NA = not applicable.
NT = analyte not tested.

**LQ = Lab Data Qualifiers**

B = (organics) Blank contamination. Value detected in sample and associated blank.
A (Dioxins) = B = (metals) Value <MRL and >MDL and is considered estimated.
E (metals) = Reported value is estimated because of the presence of interferences.
EMPC (Dioxins) = The ion-abundance ratio between the two characteristic PCDD/PCDF ions was outside accepted ranges. The detected PCDD/PCDF was reported as an estimated maximum possible concentration (EMPC).
J = (organics) Value <MRL and >MDL and is considered estimated.
U = Analyte not-detected at the method reporting limit.
X = (dioxins) Ion abundance ratio outside acceptable range. Value reported is EMPC.

**VQ = Validation Data Qualifiers:**

B = blank contamination. Value detected in sample and associated blank.
J = estimated concentration
K = estimated concentration bias high
L = estimated concentration bias low
N = presumptive evidence for tentatively identified compounds using a library search
U = analyte not detected
UJ = estimated concentration non-detect
UL = estimated concentration non-detect bias low

| | | | | | | | | | | |

Key:
< = Not detected (lab reporting limit shown).
/D = Field duplicate sample.
J = Estimated value
ug/L = micrograms per liter
mg/L = milligrams per liter
For blank cells the samples were not analyzed
Shaded/bolded cells indicate concentration or reporting limit greater than residential RBC.

Note:
Perchlorate –O(18) is a perchlorate isotope using oxygen with a molecular weight of 18 instead of 16. It is a marker added to the sample during analysis. The laboratory is required to report it since it determines matrix effects and data quality issues. Perchlorate –O(18) is shown in the laboratory reports in Appendix E; however, it is not reported in the final data table.

# DRILLING LOG FOR MW-01

Project Name RADFORD ARMY AMMUNITION PLANT

Site Location RADFORD, VA.

Date Started/Finished 05/03/07 - 05/03/07

Drilling Company BEDFORD WELL DRILLING CO

Driller's Name STEPHEN RIPLEY

Geologist's Name HUSSEIN ALDIS

Geologist's Signature Hussein Aldis

Rig Type (s) INGERSOLL RAND T3W TRUCK MOUNTED

Drilling Method (s) MR ROTARY

Bit Size (s) 6INCH Auger Size (s) N/A

Auger/Split Spoon Refusal N/A

Total Depth of Borehole Is 50ft

Total Depth of Corehole Is 20ft (SB-17)

DRILLING LOG FOR MW-06

Project Name RADFORD ARMY AMMUNITION PLANT

Site Location RADFORD, VA

Date Started/Finished 05/03/07 - 05/03/07

Drilling Company Bedford Well Drilling Co.

Driller's Name Stephen Ripley

Geologist's Name Hussein Aldis

Geologist's Signature Hussein Aldis.

Rig Type (s) Ingersoll Rand T3W Truck Mounted

Drilling Method (s) AIR ROTARY

Bit Size (s) 6 inch Auger Size (s) N/A.

Auger/Split Spoon Refusal N/A.

Total Depth of Borehole Is 80ft bgs.

Total Depth of Corehole Is 20ft (SB-12)

**Notes:**
ft = feet
msl = mean sea level
bgs = below ground surface
TOC = Top of Casing
DTW = Depth to Water
BTOC = Below Top of Casing
RFI = RCRA Facility Investigation
NA = Not Available

Table 4-7
Summary of Detected Chemicals in Groundwater Analytical Samples at SWMU 37

**Notes:**

CAS = Chemical Abstracts Service
µg/L = Microgram Per Liter
TAL = Target Analyte List
TCL = Target Compound List
VOC = Volatile Organic Compound
MDL = Method Detection Limit
RL = Reporting Limit
LQ = Laboratory Qualifier
VQ = Validation Qualifier
r = Reason Code
NT = Not Tested

mg/L = Milligram Per Liter
mV = millivolt
SU = Standard Units
mS = milliSiemen
°C = degrees Celcius
ntu = Nephelometric Turbidity
RBC = USEPA Region III Risk-Based Concentration (RBC) values from the October 11, 2007, RBC Table and October 11, 2007, Alternate RBC Table
C = Carcinogenic per EPA RBC Table (October 2007)
N = Noncarcinogenic per EPA RBC Table (October 2007)
MCL = Maximum Contaminant Level

* Re-sampled 6/24/08 for Pesticides only

[1] = Chromium VI RBC used for screening
[2] = USEPA Action Level used for screening
[3] = Chlordane RBC used for screening
[4] = alpha-BHC RBC used for screening
[5] = Endosulfan RBC used for screening

=Exceeds MCL

=Exceeds Adjusted T-RBC

Data Qualifiers:
B = Not detected substantially above the level reported in laboratory or field blanks.
J = Analyte present. Reported value may not be accurate or precise.
,J = The analyte was positively identified; the associated numerical value is the approximate concentration of the analyte in the sample.
U = Not detected. The associated number indicates the approximate sample concentration necessary to be detected.
UJ = Not detected, quantitation limit may be inaccurate or imprecise.
c = Calibration failure; poor or unstable response
m = MS/MSD recovery failure.
p = Preparation blank contamination
x = Trip blank contamination
z = Method blank and/or storage blank contamination

**Notes:**

CAS = Chemical Abstracts Service
mg/L = Milligram Per Liter
µg/L = Microgram Per Liter
TAL = Target Analyte List
TCL = Target Compound List
SVOC = Semi-volatile Organic Compound
MDL = Method Detection Limit
RL = Reporting Limit
LQ = Laboratory Qualifier
VQ = Validation Qualifier
r = Reason Code
NT = Not Tested

mV = millivolt
SU = Standard Units
mS = milliSiemen
°C = degrees Celcius
NTU = Nephelometric Turbidity
RBC = USEPA Region III Risk-Based Concentration (RBC) values from the October 11, 2007, RBC Table and October 11, 2007, Alternate RBC Table
C = Carcinogenic per EPA RBC Table (October 2007)
N = Noncarcinogenic per EPA RBC Table (October 2007)
MCL = Maximum Contaminant Level

[1] = Chromium VI RBC used for screening
[2] = USEPA Action Level used for screening
[3] = Endosulfan RBC used for screening

* Re-sampled on 6/24/08 for Manganese only

=Exceeds MCL

=Exceeds Adjusted T-RBC

Data Qualifiers:
B = Not detected substantially above the level reported in laboratory or field blanks.
J = Analyte present. Reported value may not be accurate or precise.
U = Not detected. The associated number indicates the approximate sample concentration necessary to be detected.
f = Field duplicate imprecision
m = MS/MSD recovery failure.
p = Preparation blank contamination
x = Field and/or equipment blank contamination
y = Trip blank contamination
z = Method blank and/or storage blank contamination

URS

- It was not understood why the majority of fluorescein detections were considered false positive detections. The basis of this observation is unclear considering a lack of background and laboratory confirmation results.

- It was not apparent why certain samples were selected for laboratory confirmation and others were not. There was no apparent consistency in the selection of samples for laboratory confirmation.

- Samples were submitted for confirmation laboratory analyses three months or more following the collection of the samples in the field. No information was provided regarding the custody and/or storage of the samples. The samples were submitted to the analytical laboratory with incomplete chain-of-custody (COC), and the COC documentation was not completed by the laboratory.

In summary, the data from the study do not provide the basis for meaningful interpretation. Any attempt to formulate conclusions from the data as presented regarding the presence of preferred or predominant groundwater flow patterns is not warranted or recommended.

## 3.3 HWMU-16 GROUNDWATER MONITORING ANALYTE LIST

The groundwater monitoring analyte list for HWMU-16 is presented in **Table 1 (Appendix B)**. The list represents the subset of the constituents listed in Appendix III of 40 CFR Part 261 that previously have been detected in the groundwater and/or that are reasonably expected to be in or derived from waste contained in HWMU-16. As discussed in Section 3.5.2 below, 12 inorganic constituents and two explosive/propellant constituents have been detected in the groundwater monitoring network for HWMU-16 at statistically significant concentrations above the Unit's calculated background concentrations. The inorganic constituents may be derived from the aquifer formation materials; however, the two explosive/propellant constituents (2,4-Dinitrotoluene and 2,6-Dinitrotoluene) are byproducts of wastes derived from explosives. Therefore, the two explosive/propellant constituents detected could only be from HWMU-16.

The concentration limits established for the hazardous constituents also are listed in **Table 1**. The concentration limits represent either background concentrations calculated for the constituents in this GWQAR, Maximum Concentrations of Constituents for Ground-water Protection listed in Table 1 of 40 CFR 264.94, USEPA Drinking Water Standard Maximum Contaminant Levels (MCLs), or alternate concentration limits (ACLs) established by the VDEQ (July 1998). Certain organic constituents on the list do not have USEPA MCLs or VDEQ ACLs; they also do not have calculated background concentrations because they have not been detected in the Unit's upgradient well. Therefore, the concentration limits for these constituents are equal to their respective method detection limits.

As Alliant discussed with the VDEQ in the past, the reliability of previous laboratory analytical data - particularly dissolved metals data - appeared to be questionable in some cases. In an April 9, 1996 letter to C. Jake (Alliant), the VDEQ agreed that only total metals concentrations in groundwater would be measured, as described in a USEPA Region III guidance on groundwater sampling in karst terrain. Therefore, all references to metals concentrations in this GWQAR refer to <u>total</u> metals concentrations.

## 3.4 HWMU-16 GROUNDWATER BACKGROUND CONCENTRATIONS

Background concentrations were calculated for each constituent in the groundwater monitoring program using the analytical data from 1996 through 1998 for upgradient well 16C1.

The background concentration calculations were based on site wide 95% confidence, 95% coverage upper prediction intervals. The calculated background concentrations are listed in **Table 2 (Appendix B)**. The background concentrations were used to construct the outermost closing contours on the Isoconcentration Maps **(Appendix A)**.

## 3.5 HWMU-16 STATISTICAL ANALYSIS

Statistical evaluations for HWMU-16 are performed annually and submitted to the VDEQ in accordance with the annual reporting requirements specified in 40 CFR 265.94. As part of this GWQAR, statistical evaluations were performed on Fourth Quarter 1998 analytical data in accordance with the procedures and guidance provided in the following documents:

- Title 40 of the Code of Federal Regulations, 40 CFR 264.97 and 264.98;
- VDEQ Guidance for statistical analysis titled "Data Analysis Plan," undated;
- Interim Final Guidance for Statistical Analysis of Groundwater Monitoring Data at RCRA Facilities, USEPA, April 1989;
- Addendum to Interim Final Guidance for Statistical Analysis of Groundwater Monitoring Data at RCRA Facilities, USEPA, July 1992; and
- Statistical Methods for Groundwater Monitoring, Gibbons, R.D., 1994.

Statistical threshold values were computed for the 54 constituents for which HWMU-16 is currently monitored based on the concentrations of those constituents in upgradient (background) well 16C1. All data starting with First Quarter 1996 to Fourth Quarter 1998 were used for this purpose. The 1996 through 1998 monitoring data have been submitted previously to the VDEQ by Alliant in quarterly monitoring reports; therefore, the data are not listed in this GWQAR. Statistical comparisons were performed for the Fourth Quarter 1998 data set. Comparison statistical analyses were performed for all constituents which were detected in any downgradient well during that event.

### 3.5.1 Background Data and Statistical Comparisons

Statistical analyses were performed using the analytical results from upgradient well 16C1 data as background data. Based on the percentage of non-detects and the distribution of the background data, methods of statistical comparisons varied. Background average, standard deviation and other descriptive statistical data were computed for all constituents and are presented in **Appendix C**.

The constituents listed below were 100% non-detected in the background data. The background threshold levels (BTLs) for these constituents were established as equal to their detection limits (DL). Detections of these constituents in the downgradient wells during Fourth Quarter 1998 were compared to these BTLs.

| Background Threshold Level (BTL) = Detection Limit (DL) | | | | |
|---|---|---|---|---|
| Parameter | Sample Size | % Non-Detects | DL (µg/l) | BTL (µg/l) |
| Antimony | 12 | 100 | 3 | 3 |
| Arsenic | 12 | 100 | 1 | 1 |

| 123789-HXCDF | 12 | 100 | 0.0415 ppt | 0.0415 ppt |
| 1234678-HPCDF | 12 | 100 | 0.0615 ppt | 0.0615 ppt |
| 1234789-HPCDF | 12 | 100 | 0.0709 ppt | 0.0709 ppt |
| OCDF | 12 | 100 | 0.1307 ppt | 0.1307 ppt |

Non-parametric prediction intervals were computed for all of the constituents for which the data from background well 16C1 satisfied one of the following two criteria, per VDEQ regulations and guidance as well as USEPA guidance:

- Percentage of non-detects was greater than or equal to 50 and less than 100; or
- Percentage of non-detects was less than 50, but data was not normally distributed in original or log-transformed mode.

The background threshold levels for these constituents were set as equal to their upper prediction limits (UPLs). The background and relevant statistical data for these constituents are summarized below. The confidence level and false positive rate were calculated based on the number of background data points available and number of future comparisons. For all constituents, the confidence level was determined to be equal to 0.933, and the false positive rate was equal to 0.067. Since the upper control limit of a non-parametric interval cannot be adjusted for multiple comparisons and inadequate number of background data, the number of resampling events required was adjusted to account for the high error rates inherent in those situations. The number of confirmation resamples required for all constituents is 2. The background and relevant statistical data for these constituents are summarized below. Associated statistical computations are presented in **Appendix C**.

| BTL = Upper Prediction Limit of Non-parametric Prediction Interval w/false positive rate=0.067 | | | | |
|---|---|---|---|---|
| Parameter | Sample Size | % Non-Detects | DL (µg/l) | BTL (µg/l) |
| Beryllium | 12 | 75 | 0.2 | 0.7 |
| Cadmium | 12 | 75 | 0.1 | 0.2 |
| Cobalt | 12 | 75 | 1 | 5 |
| Copper | 12 | 50 | 1 | 13 |
| 1,1-Dichloroethane | 12 | 0 | 0.2 | 9.5 |
| 2,4-Dinitrotoluene | 12 | 92 | 0.08 | 0.10 |

| BTL = Upper Prediction Limit of Non-parametric Prediction Interval w/false positive rate=0.067 | | | | |
|---|---|---|---|---|
| Parameter | Sample Size | % Non-Detects | DL (µg/l) | BTL (µg/l) |
| 2,6-Dinitrotoluene | 12 | 75 | 0.08 | 0.11 |
| Lead | 12 | 42 | 1 | 10 |
| Nickel | 12 | 92 | 15 | 16 |
| Silver | 12 | 75 | 0.2 | 0.5 |
| Thallium | 12 | 67 | 1 | 6 |
| TOC | 12 | 75 | 1000 | 7000 |
| 1,1,1-Trichloroethane | 12 | 17 | 0.3 | 9.2 |
| Vanadium | 12 | 83 | 4 | 151 |
| Vinyl Chloride | 12 | 92 | 0.1 | 0.1 |
| Xylene (total) | 12 | 92 | 0.1 | 0.2 |
| Zinc | 12 | 50 | 5 | 51 |

Chromium exhibited normally distributed data (excluding non-detects) with between 25% and 50% non-detects in the background well. The mean and standard deviation of the background data for chromium were adjusted using Cohen's Maximum Likelihood Estimator Method (1959, 1961). A one-sided parametric prediction interval was then computed for chromium based on the adjusted mean and standard deviation. The Upper Prediction Limit was set as the BTL for chromium. The background and relevant statistical data for chromium are summarized below. Cohen's adjustment computations and prediction interval computations are presented in **Appendix C**.

| BTL = Upper Prediction Limit of Prediction Interval w/false positive rate=0.05<br>Original Mean = 3.54, Original SD = 1.933<br>Adjusted Mean = 3.642. Adjusted SD = 1.95 | | | | |
|---|---|---|---|---|
| Parameter | Sample Size | % Non-Detects | DL (µg/l) | BTL (µg/l) |
| Chromium | 12 | 25 | 1 | 6.2 |

The following constituents exhibited normally distributed background data with less than 25% non-detects. One sided parametric prediction intervals were computed on the background data for all of these constituents. The UPLs for these constituents were set as their respective BTLs, with one exception. For pH, a two-sided parametric prediction interval was computed; therefore, the BTL for pH consisted of a range between the lower prediction limit (LPL) and the upper prediction limit. The background concentration calculations were based on a site wide 95% confidence, 95% coverage upper prediction intervals. When adjusted for multiple comparisons of the background data, the minimum required false positive rate was below 1% (0.01). A 99% confidence level (0.01 false positive rate) was used for all individual comparisons, which with the most conservative assumptions provided a site-wide false positive rate of >0.05 for all constituents. The background and relevant statistical data for these constituents are summarized below. The prediction interval computations for these constituents are presented in **Appendix C**.

| BTL = UPL of one-sided Prediction Interval (exception pH) w/site-wide false positive rate>0.05<br>(individual comparisons false positive rate=0.01)<br>BTL for pH = LPL – UPL of two-sided Prediction Interval | | | | |
|---|---|---|---|---|

### 3.5.2 Results of Statistical Comparisons

The following table lists the constituents which were detected during the Fourth Quarter 1998 event at concentrations exceeding their respective background threshold levels (BTLs), and the downgradient wells in which they were detected.

| Parameter | Monitoring Well(s) |
|---|---|
| Arsenic | 16-5, 16WC2B |
| Barium | 16-2, 16-3, 16-5, 16WC1A, 16WC1B, 16WC2B, 16SPRING |
| Beryllium | 16WC1B, 16WC2B |
| Cadmium | 16WC1B |
| Chromium | 16-3, 16-5, 16WC1B, 16WC2B |
| Cobalt | 16-5, 16WC1B, 16WC2B |
| Copper | 16-5, 16WC1B, 16WC2B |
| Lead | 16WC1B |
| Mercury | 16WC1B |
| Nickel | 16-5, 16WC1A, 16WC2B |
| Selenium | 16-5, 16WC1B, 16WC2B |
| Zinc | 16WC1B |
| 2,4-Dinitrotoluene | 16-3, 16-5, 16WC1B, 16WC2B, 16SPRING |
| 2,6-Dinitrotoluene | 16WC1A, 16WC1B |

Any HWMU-16 target constituents not listed above were not detected in the downgradient monitoring wells at concentrations exceeding their respective BTLs.

## 3.6 HWMU-16 PLUME DELINEATIONS

In accordance with VDEQ instructions presented during the May 19, 1999 meeting between Alliant and the VDEQ, Isoconcentration Maps were produced to depict constituent plumes in the groundwater beneath the site (**Appendix A**). In order to evaluate the shape and position of constituent plumes over time, historical Isoconcentration Maps were developed using the historical maximum concentrations for the constituents monitored at the site for the time periods of 1992 through 1995 and 1996 through 1998. The historical maximum concentrations for these time periods are listed in **Tables 3** and **4**, respectively (**Appendix B**).

Groundwater analytical data collected prior to 1992 were not included in the evaluation of historical maximum concentrations. The data collected prior to 1992 are considered unreliable due to "order-of-magnitude" variations in parameter concentrations from quarter to quarter, as well as a general lack of laboratory QA/QC. Additionally, the groundwater monitoring analyte lists prior to 1992 did not include many of the parameters on the current groundwater monitoring analyte list for HWMU-16.

**TABLE 2**
**HWMU-16**
**Calculated Background Values**

| Constituent | Background Concentration (µg/l unless otherwise noted) |

## *Target Analyte Monitoring Results - HWMU-16 Point of Compliance Wells*
## *Radford Army Ammunition Plant, Radford, Virginia*

*Upgradient well = 16C1* *All Results in ug/L.*

| *Analtye/Quarter* | *16C1* | *16MW8* | *16MW9* | *16WC1A* | *16WC1B* | *QL* | *GPS* | *Method* |
|---|---|---|---|---|---|---|---|---|
| Second Quarter 2011 | U | U | 2.77 J | 9.24 | U | 5 | 313 | 6020A |
| Fourth Quarter 2011 | U | U | U | U | 6.09 | 5 | 313 | 6020A |

**Definitions:**

***The following definitions apply to results reported for Appendix IX monitoring events. All Appendix IX monitoring results for compliance wells are reported to the detection limit.***

*Appendix IX Monitoring Events: 3Q2003, 2Q-2004, 2Q-2005, 3Q2006, 2Q2007, 2Q2008, 2Q2009, 2Q 2010, 2Q 2011*

**QL** Denotes permit required quantitation limit.
**U** denotes not detected at or above the detection limit.
**UA** denotes not detected at or above the adjusted detection limit.
**J** Denotes result is estimated. When used with "U" (i.e., "UJ"), denotes analyte not detected at or above the detection limit and detection limit and QL are estimated. When used with "UA" (i.e., "UAJ"), denotes analyte not detected at or above adjusted detection limit and adjusted detection limit and QL are estimated.
**UN** Denotes analyte concentration is less than the quantitation limit and/or five times the blank concentration. Not reliably detected due to blank contamination. This qualifier used only for Appendix IX monitoring event when compliance well results are reported to at or above the project detection limit.
**R** Denotes result rejected.
**Q** Denotes data validation qualifier. **X** Denotes mass spectral confirmation not obtained-result suspect.
Background Denotes background concentrations listed in Appendix F to Attachment 5 in the Final Hazardous Waste Post-Closure Care Permit for Hazardous Waste Units 5, 7, 10, and 16 (October 4, 2002), where applicable.
**CAS#** Denotes Chemical Abstract Services registration number.
**GPS** Denotes Groundwater Protection Standards listed in Appendix G to Attachment 5 in the Final Hazardous Waste Post-Closure Care Permit for Hazardous Waste Units 5, 7, 10, and 16 (October 4, 2002).
**NS** denotes not sampled. **NA** denotes not analyzed.
"–" denotes not detected (pre-2nd Quarter 2003) or not available / not sampled (beginning 2nd Quarter 2003).

***The following definitions apply to results reported for non-Appendix IX monitoring events. All non-Appendix IX monitoring results for compliance wells are reported at or above the quantitation limit.***

**QL** Denotes permit required quantitation limit.
**U** Denotes analyte not detected at or above QL.
**UA** Denotes analyte not detected at or above adjusted sample QL.
**J** Denotes result is estimated. When used with "U" (i.e., "**UJ**"), denotes analyte not detected at or above QL and QL is estimated. When used with "UA" (i.e., "**UAJ**"), denotes analyte not detected at or above adjusted QL and adjusted QL is estimated.
**R** Denotes result rejected.
**Q** Denotes data validation qualifier.
**Background** Denotes background concentrations listed in Appendix F to Attachment 5 in the Final Hazardous Waste Post-Closure Care Permit for Hazardous Waste Units 5, 7, 10, and 16 (October 4, 2002), where applicable.
**CAS#** Denotes Chemical Abstract Services registration number.
**GPS** Denotes Groundwater Protection Standards listed in Appendix G to Attachment 5 in the Final Hazardous Waste Post-Closure Care Permit for Hazardous Waste Units 5, 7, 10, and 16 (October 4, 2002).

**NOTE:**

Fourth Quarter 2008:
Due to laboratory error all HWMU 16 samples were analyzed using Method 8260B 5 ml purge instead of a 25 ml purge which resulted in a higher QL. For these samples, all results were evaluated to the detection limit, which is comparable to the permit QL. Results below the laboratory QL but at or above the permit QL are reported and qualified as estimated.
Second Quarter 2009:
Verification event 6/11/2009 - 16MW8 for acetone. Verification result reported as not detected.
4/ 2010 event -Per DEQ, tin analyzed by Method 6010B instead of Method 6020. Verification event: 16MW9 1,1-dichloroethene and benzene. 16WC1B 4,4-DDD. Verification result reported as not detected.

## *Target Analyte Monitoring Results - HWMU-10 Point of Compliance Wells*

## *Radford Army Ammunition Plant, Radford, Virginia*

***Upgradient well = 10D4*** ***All Results in ug/L.***

| *Analyte/Quarter* | *10D4 Q* | *10D3 Q* | *10D3D Q* | *10DDH2R Q* | *10MW1 Q* | *QL* | *GPS* | *Method* |
|---|---|---|---|---|---|---|---|---|

**Definitions:**

**QL** Denotes permit required quantitation limit.
**U** Denotes analyte not detected at or above QL.
**UA** Denotes analyte not detected at or above adjusted sample QL.
**J** Denotes associated result is estimated. When used with "U" (i.e., "**UJ**"), denotes analyte not detected at or above QL and QL is estimated. When used with "UA" (i.e., "**UAJ**"), denotes analyte not detected at or above adjusted QL and adjusted QL is estimated.
**UN** Denotes analyte concentration is less than the quantiation limit and five times the blank concentration. Not reliably detected due to blank contamination. This qualifier used only for Appendix IX monitoring event when results are reported to at or above the detection limit.
**R** Denotes result rejected.
**Q** Denotes data validation qualifier.
**CAS#** Denotes Chemical Abstract Services registration number.
**GPS** Denotes Groundwater Protection Standards listed in Appendix G to Attachment 4 in the Final Hazardous Waste Post-Closure Care Permit for Hazardous Waste Units 5, 7, 10, and 16 (October 4, 2002). For cobalt, vanadium, acetone and 2-propanol, these analytes are not listed in Appendix VIII to 40 CFR Part 261; therefore, GPSs will not be established for these constituents.
**NS** denotes not sampled.
**NA** denotes not analyzed.
**"–"** denotes not detected (pre-2nd Quarter 2003) or not available / not sampled (beginning 2nd Quarter 2003).

**Appendix IX Monitoring Events:**
***First Quarter 2003,***
***Second Quarter: 2004, 2005, 2007, 2008, 2009, 2010, 2011***
***Third Quarter 2006***

For Appendix IX monitoring, compliance well results reported/evaluated to detection limit. See data validation Qualifier definitions noted below.

***The following definitions apply to results reported for Appendix IX monitoring events.***
***All Appendix IX monitoring results for compliance wells are reported to the detection limit.***

**QL** Denotes permit required quantitation limit.
**U** denotes not detected at or above the detection limit or QL.
**UA** denotes not detected at or above the adjusted detection limit or adjusted QL.
**J** Denotes result is estimated. When used with "U" (i.e., "UJ"), denotes analyte not detected at or above the detection limit or QL and detection limit and QL are estimated. When used with "UA" (i.e., "UAJ"), denotes analyte not detected at or above adjusted detection limit or adjusted QL and adjusted detection limit and adjusted QL are estimated.
**UN** Denotes analyte concentration is less than the quantitation limit and/or five times the blank concentration. Not reliably detected due to blank contamination. This qualifier used only for Appendix IX monitoring event when compliance well results are reported to at or above the project detection limit.

Verification events: 12/12/03, 06/17/04, 7/25/2005.
6/17/04. Verification event. Acetone: 10D3D was not detected during verification event. Verification event result reported.
7/25/05. Verification event. All wells: ethyl acetate. 10D3D: alpha-BHC, acetone and 2-propanol. All verification results: Not detected except for acetone and 2-propanol. Verification results presented in table.
7/17/2008. Verification event. 10MW1. Technical chlordane, diethyl phthalate. Verification results reported-all not detected.
6/11/2009 – Verification event, 10DDH2R, Diethyl ether, Verification results reported in table-all not detected.

**RE:** Alternate Source Demonstration for Cobalt in monitoring wells 7WCA and 7W13
HWMU #7, Radford Army Ammunition Plant, Radford, Virginia
Radford Army Ammunition Plant, Radford, VA
EPA ID# VA1210020730

Dear Ms. Holt:

The above-noted Alternate Source Demonstration (ASD) investigation, submitted on behalf of Radford Army Ammunition Plant, by Alliant Techsystems Inc., dated December 2011, has been reviewed for technical content and consistency with the requirements of 40 CFR 264.99.(i). The need to submit an ASD was triggered by an exceedance of the Cobalt Groundwater Protection standard reported to the Department for monitoring wells 7WCA and 7W13.

As defined under 40 CFR 264.99.(i), the Alternate Source Demonstration (ASD) report must show one of the following in order to obtain approval:

1) The contamination was caused by natural variation in groundwater.
2) The contamination was a result of an error in field sampling.
3) The contamination was the result of an error in lab analysis.
4) The SSI contamination was result of an error in statistical analysis.

The ASD report focused on proving the applicability of item #1 by presenting a statistical trend analysis that shows no increasing trends of total cobalt concentrations in groundwater, presenting data showing that cobalt is widely observed at significant concentrations in non-waste derived materials and native soils at the site, and providing data that shows cobalt present at similar levels in other upgradient wells serving other waste management units at the site. The report concluded that the total cobalt

concentrations observed in groundwater monitoring wells 7WCA and 7W13 are derived from ambient, naturally-occurring and naturally variable trace elements in the aquifer matrix, and not from a temporally-varying source such as a release from the closed hazardous waste management unit (HWMU-7).

Based on the above discussion and the body of evidence presented to the Department, the content of the ASD is determined to be sufficient to meet the Regulatory criteria for approval and as a result, the facility does not have to remediate the cobalt GPS exceedances observed in wells 7WCA and 7W13. Please note that future exceedances of the GPS for Cobalt noted in 7WCA and 7W13 will not require the submittal of a separate ASD unless the monitoring results reveal a change in site conditions that may indicate a release from HWMU-7. Please make sure that this approval is reflected in future correspondence to the Department where appropriate.

If you have any additional technical questions, you may contact me at 276-676-4867 or by email at Vincent.Maiden@deq.virginia.gov.

Sincerely,

Vincent A. Maiden
