1. INTRODUCTION

Weston Solutions, Inc. (WESTON®) has been contracted by the United States (U.S.) Army Corps of Engineers (USACE), Baltimore District, to perform long-term monitoring (LTM) and monitored natural attenuation (MNA) at RAAP-014, Propellant Burning Ash Disposal Area, at Radford Army Ammunition Plant (RFAAP), Radford, VA. This report provides a description of the groundwater sampling activities completed and an analysis of results from the thirty-seventh and thirty-eighth semiannual rounds conducted in 2021 (October) and 2022 (April). Further, this report provides a summary of Year Ten sampling consisting of those two sampling events.

This work was performed under Contract Number (No.) W912DR-15-D-0022, Delivery Order No. W912DR18F0492 in accordance with the *Final Master Work Plan, Quality Assurance Plan, Health and Safety Plan* (RFAAP Final MWP) (URS Corporation [URS], 2003) and with Part II (D)(11-21) Interim Measure (IM) of the RFAAP Resource Conservation and Recovery Act (RCRA) Corrective Action Permit (U.S. Environmental Protection Agency [USEPA], 2000). To maintain consistency with previous LTM and MNA sampling events (i.e., through Year Nine), the LTM and MNA activities followed the technical approach, Sampling and Analysis Plan, and quality assurance/quality control (QA/QC) procedures documented in the Final *SWMU 54 Monitored Natural Attenuation Interim Measures Work Plan* (IMWP) (Shaw Environmental, Inc. [Shaw], 2011a).

Based on the consistency of the data and the fact that quarterly monitoring had been conducted for a full 9 years, groundwater monitoring starting with Year Ten was reduced to a semiannual basis at the well locations. The Virginia Department of Environmental Quality (VDEQ) approved this recommendation, which was presented in the Year Eight report. In October 2021, VDEQ concurred with Radford's Class 1 Modification request for the permit which recommended removal of references to the sampling frequency specified in the Monitored Natural Attenuation Groundwater Monitoring Plan for SWMU-49 contained in Attachment C of the permit.

1.1 PURPOSE AND SCOPE

Soil IMs have been completed at Solid Waste Management Unit (SWMU) 54 to mitigate the threat of a contaminant release, migration, and/or exposure to the public and the environment. The IMs included site preparation, soil excavation, waste characterization and off-site disposal, confirmation sampling, and site restoration. Detailed information concerning the IMs is presented in the *Solid Waste Management Unit 54 RCRA Facility Investigation/Corrective Measures Study Report* (Final SWMU 54 RFI/CMS Report) (URS, 2008).

The corrective measures objectives (CMOs) and remedial goals (RGs) were developed and presented in the Final SWMU 54 RFI/CMS Report (URS, 2008). The site-specific CMOs for SWMU 54 Area A are: to mitigate further leaching of explosives constituents from soil to groundwater at levels that would potentially increase observed concentrations and adversely impact future beneficial use of groundwater; and, to the extent practicable, to restore site groundwater to the most beneficial use. The site-specific CMOs for SWMU 54 Area B are: to mitigate the potential hypothetical future risks that have been identified for exposure to soil under a future construction worker scenario; and to prevent leaching of contaminants of concern from soil to groundwater at levels that would potentially adversely impact future beneficial use of groundwater. The site-specific CMOs for Area A and Area B were met through the excavation and off-site disposal of contaminated soil, which was completed in 2010.

The objectives of the LTM and MNA program are to measure and track the reduction of the following compounds to levels below the RGs, as defined in **Table 1-1**:

- 2,4,6-Trinitrotoluene (2,4,6-TNT)
- Dinitrotoluene (DNT) mixture
- Cyclotrimethylenetrinitramine (RDX)
- Perchlorate

1.2 SITE DESCRIPTION AND BACKGROUND

SWMU 54 is situated in the northeastern section of RFAAP within the easternmost portion of the Horseshoe Area. The SWMU consists of two noncontiguous disposal areas, Area A and Area B. Area A is a triangular-shaped parcel located in the southeast section of SWMU 54 that covers approximately 0.58 acres. Area B is a somewhat round tract located in the northwestern section that covers approximately 1.09 acres. Both areas are open fields covered with grass and are

bordered to the east and north by the RFAAP installation security fence. The site is currently undeveloped. SWMU 54 was reportedly used as an ash disposal area in the late 1970s that received propellant ash from the Waste Propellant Burning Grounds. The location of SWMU 54 is provided in **Figure 1-1**. All figures are placed at the end of each report section.

Table 1-1 SWMU Groundwater Remedial Goals

Chemical of Interest	Groundwater RG* (mg/L)
2,4,6-TNT	0.00782
DNT Mixture	0.000932
RDX	0.0061
Perchlorate	0.0109

Notes:
*RGs were calculated using target risk 1E-5 for the lifetime resident and a target hazard of 1 for the adult and child resident (URS, 2008).
2,4,6-TNT = 2,4,6-trinitrotoluene
DNT = dinitrotoluene
mg/L = milligrams per liter
RDX= cyclotrimethylenetrinitramine
RG = remedial goal
SWMU = Solid Waste Management Unit

2. PHYSICAL CHARACTERISTICS

2.1 TOPOGRAPHY

SWMU 54 is situated on a gently sloping terrace that leads to the New River to the east. Elevations range from a high of approximately 1,716 feet (ft) above mean sea level (amsl) in the western section of the SWMU to approximately 1,696 ft amsl in the eastern section. East and outside the SWMU boundary, the elevation steepens precipitously as it reaches the New River (at approximately 1,676 ft amsl).

2.2 SURFACE WATER

The New River is situated approximately 150 ft east of SWMU 54, and a small stream is present on the southern boundary. Surface water runoff from the SWMU flows east and possibly south to the New River and the unnamed stream. SWMU 54 is located within the easternmost portion of the Horseshoe Area at RFAAP. As it currently stands, SWMU 54 is positioned within the New River 100-year floodplain.

2.3 GEOLOGY

2.3.1 Regional Geology

SWMU 54 is located in the New River Valley, which crosses the Valley and Ridge Province, approximately perpendicular to the regional strike of bedrock, and cross cuts Cambrian and Ordovician limestone or dolostone. Deep clay-rich residuum is prevalent in areas underlain by carbonate rocks. The valley is covered by river floodplain and terrace deposits; karst topography is dominant throughout the area. A more detailed description of the regional geology is presented in the RFAAP Final MWP (URS, 2003).

2.3.2 Site-Specific Geology

Characterization of the SWMU 54 subsurface lithology was conducted during the advancement of soil and monitoring well borings at the site. Based on the borehole logs, two geologic cross sections were developed and are presented in **Figure 2-1** (plan view of the cross-sectional lines), **Figure 2-2** (cross section A-A'), and **Figure 2-3** (cross section B-B').

Soil and monitoring well borings ranged from 10 to 60 ft in depth. Depths to bedrock, which were reported to be measured directly at the monitoring well borings, ranged in elevation from approximately 1,716 to 1,670 ft amsl. Based on the borehole logs, it was determined that bedrock slopes to the east.

The site lithology consists of unconsolidated sediments comprised of alluvial deposits overlying a thin zone of saprolitic carbonate (i.e., weathered bedrock), which overlies the Cambrian-aged Elbrook Formation. The alluvial deposits consist primarily of silty sand overlying channel deposits of fine- to coarse-grained sand and gravel (river jack). These paleo-channel deposits rest directly on the saprolite, which reportedly reaches 2.5 ft in thickness. It was also reported that some areas of the SWMU contain fill material to depths of 9 to 10 ft below ground surface (bgs).

Depth to competent bedrock at the SWMU ranges from 17 to 24 ft bgs. This competent bedrock belongs to the Elbrook Formation, which is a thickly-bedded, blue-gray dolostone interspersed with blue-gray to white limestone. Locally, the formation is described as interbedded green and maroon shale, yellowish-brown dolostone, and greenish- to grayish-brown limestone and dolostone.

A more detailed discussion of the geology and soil at RFAAP is presented in Sections 3.4 through 3.7 of the RFAAP Final MWP (URS, 2003) and in the *Facility-Wide Background Study* Report (IT Corporation [IT], 2001).

2.4 HYDROGEOLOGY

2.4.1 Regional Hydrogeology

Geologically, the Appalachian Plateaus and Valley and Ridge Province encompass two major tectonic domains: the southern Appalachian Basin and the southeastern part of the Eastern Interior Basin. The hydrogeologic framework is based on generalized stratigraphic succession, with indurated sedimentary rocks of the Paleozoic age forming predominant units.

Groundwater flow paths are typically short, commonly extending no more than several miles in their longest range. The largest groundwater supplies are produced from the carbonate rocks, especially where they are associated with thick regolith, an important storage reservoir throughout

the entire area. The regolith stores recharge that otherwise would be rapidly diverted to overland flow. In addition, this unit slowly releases water to underlying carbonate aquifers. Because of the widespread distribution of carbonate rocks and associated regolith, abundant precipitation in a humid climate, and relatively steep hydraulic gradients, this region (and locally) is one of the major karstlands in the eastern United States.

Groundwater supplies in the Valley and Ridge Province are generally of good quality when compared to surface water supplies (Parsons Engineering Science, Inc. [Parsons], 1996); however, because of extended contact with minerals, many groundwater supplies contain higher levels of dissolved solids than the streams into which they discharge. Because of sinkholes and underground caverns in karst aquifers, there is a high potential for groundwater to be impacted by direct infiltration of contaminated surface water.

2.4.2 Site-Specific Hydrogeology

Monitoring wells installed at SWMU 54 were screened in both the shallow (surficial aquifer) and shallow bedrock aquifers. Water levels were measured in the wells to calculate the groundwater flow direction at the SWMU. Groundwater contour maps have been prepared using water level data collected prior to each round of groundwater sampling. The maps for Year Ten of monitoring are presented in Section 4. Contour lines shown on these figures represent lines of equal elevation of the water table; consequently, groundwater flow direction is always perpendicular to the contour lines and feeds into the New River, which generally runs a south-to-north course. Groundwater at the site tends to flow east and appears to discharge to the New River along the eastern side of the site.

3. PREVIOUS INVESTIGATIONS

Four previous investigations have been conducted at this site prior to completion of an interim removal measure in 1999 by Parallax, Inc. Data obtained from previous site investigations prior to the IM were used to identify site boundaries and characteristics, and to identify chemicals of potential concern (COPCs). In 1992, the Environmental Photographic Interpretation Center provided aerial photographic analysis of SWMU 54, under the direction of USEPA. In addition, Dames & Moore conducted a RCRA Verification Investigation (VI) at the site in 1992 to identify the ash disposal at Area A under authority of the 1984 Hazardous and Solid Waste Amendments. As a follow-up to the 1992 VI, Parsons completed an RFI in 1996, as part of a multiple site investigation to, "define the extent of ash and the limits of soil contamination." In 1998, a Supplemental RFI/CMS was conducted to investigate a flat grassy area ringed by mature pine trees northwest of Area A. This area was defined as Area B within SWMU 54. The purpose of the supplemental RFI was to, "characterize the nature and extent of contamination within SWMU 54." In 1999, Parallax, Inc. completed IMs at Area A and Area B of SWMU 54 consisting of excavation of selected "hot spot" areas of lead and explosives in soil.

In 2008, URS conducted an RFI/CMS investigating both Area A and Area B to confirm the effectiveness of the IM, evaluate and assess current conditions at the sites, and provide recommendations regarding potential corrective measure requirements at the sites. Direct-push soil borings with chemical sampling were used to characterize the nature and extent of constituents in soil at SWMU 54, to identify the lateral and vertical extent of any waste material present, and to characterize soil lithology and depth to groundwater and bedrock. Additionally, monitoring wells were installed at the site, and groundwater samples were collected and analyzed. Details of these investigations are described in Section 3.0 (Field Investigation Program) of the Final SWMU 54 RFI/CMS Report (URS, 2008). A potentiometric map portraying the groundwater levels measured in 2007 is provided as **Figure 3-1**. Historical data listing chemical of interest (COI) concentrations in the on-site groundwater, New River surface water, and New River sediment pore water are provided in **Tables 3-1** through **3-6**.

The nature and extent assessment indicated that the main concern at the site is the fill material and grossly-contaminated soil directly below the material. Area A and Area B were evaluated

separately for the soil and groundwater nature and extent assessments, given the 200-ft separation between the areas, their topographic cross-gradient position, the lack of mobility of the chemicals in soil, and observed distributions of chemicals.

The main parameters of concern in Area A soil are lead, 2,4,6-TNT, DNT, RDX, amino-DNTs, nitroglycerin (NG), heptachlor epoxide, and dioxins/furans. The main parameters of concern in groundwater at Area A are explosives and perchlorate. Concentrations of COIs 2,4,6-TNT, DNT, RDX, and perchlorate in groundwater have decreased since RFI monitoring began in 2003 and 2004. The lateral extent of explosives and perchlorate in groundwater extends from Area A eastward to the New River. Sampling of the groundwater/surface water interface (sediment pore water) and surface water of the New River did not indicate detectable impacts to sediment pore water or surface water from COPCs in groundwater.

Parameters of concern in Area B soils include lead, DNT, amino-DNT, NG, RDX, dieldrin, Aroclor 1254, heptachlor epoxide, and dioxins/furans. No COIs were identified for Area B groundwater.

The human health risk assessment (HHRA) identified 8 COIs at Area A (2,4,6-TNT, DNT, RDX, perchlorate, amino-DNTs, NG, heptachlor epoxide, and 2,3,7,8-tetrachlorodibenzodioxin [2,3,7,8-TCDD]) and 10 COIs at Area B (2,4,6-TNT, DNT, RDX, amino-DNTs, NG, lead, Aroclor 1254, heptachlor epoxide, dieldrin, and 2,3,7,8-TCDD) under both an industrial and residential future-use scenario for total soil at SWMU 54. The HHRA determined that unacceptable risks to potential future residential and industrial receptors were associated with the COIs. As a result of the findings from the HHRA, it was concluded that, based on the levels detected in the soil hot spot areas, COIs could potentially leach from soil to groundwater at levels of concern, although groundwater impacts at levels of concern have not yet been identified at Area B. Because the RFI demonstrated that COI contamination is present at concentrations associated with unacceptable human health concerns, a CMS was performed to address the propellant ash material and grossly contaminated soil under the ash material at SWMU 54.

The alternatives evaluated were as follows:

- Alternative One: No Further Action.
- Alternative Two: Excavation of Soil at Area A and Area B, Off-Site Disposal, and MNA of Groundwater.
- Alternative Three: Excavation of Soil at Area A and Area B, Off-Site Disposal, and Enhanced In Situ Bioremediation of Groundwater.

These three alternatives were evaluated using the selection criteria of effectiveness, implementability, and cost. The site-specific CMO for SWMU 54 is to mitigate further leaching of explosives constituents from soil to groundwater at levels that would potentially increase observed concentrations and adversely impact future beneficial use of groundwater, and to eliminate the potential threats to human health and the environment that exist within materials found in SWMU 54. Observations from the SWMU 54 soil investigations indicate that the propellant ash consisted of a black, ashy material that was evident when encountered. Therefore, identification and removal of the propellant ash and grossly-contaminated soil were partially based on visual observations during excavation, with analytical samples collected to confirm the observations.

Alternative Two, which entails excavation and off-site disposal as the primary remediation process, was found to achieve the CMO. Therefore, Alternative Two was selected as the final alternative for SWMU 54 because it is implementable and provides a greater level of protection to human health and the environment not provided by other alternatives. In addition, Alternative Two is the sole alternative that facilitates RGs without potential adverse effects to groundwater (i.e., degradation of secondary water quality parameters) from remedial implementation activities, which would occur with implementation of Alternative Three.

The CMOs and RGs were developed in the Final SWMU 54 RFI/CMS Report (URS, 2008). The following is a summary of the findings from that process.

The site-specific CMO for SWMU 54 Area A is to mitigate further leaching of explosives constituents from soil to groundwater at levels that would potentially increase observed concentrations and adversely impact future beneficial use of groundwater, and, to the extent practicable, to restore site groundwater to the most beneficial use. The soil CMOs for Area A have

been met, and the purpose of this report is to implement the groundwater IMs to meet the CMOs for groundwater.

The site-specific CMO for SWMU 54 Area B is to mitigate the potential hypothetical future risks that have been identified for exposure to soil under a future construction worker scenario, and to prevent leaching of contaminants of concern from soil to groundwater at levels that would potentially adversely impact future beneficial use of groundwater. The site-specific CMOs have been met through the soil excavation and off-site disposal completed in 2010.

RGs for soil were used at SWMU 54 to confirm that all COIs were removed from soil to levels safe for human health and the environment. Results from the soil remedial action at SWMU 54 can be found in the approved Final *SWMU 54 Interim Measures Completion Report* (Shaw, 2011b). The groundwater RGs, included in **Table 1-1**, will be used to compare results from groundwater monitoring wells to assess the progress of the MNA process.

WESTON has been performing the LTM and MNA at SWMU 54 since October 2019, including the thirty-seventh and thirty-eighth sampling rounds, for Year Ten of sampling at RFAAP, discussed herein. Area B, although not monitored during Year Ten, is expected to have a groundwater flow velocity similar to Area A, as reported in the Year Three MNA Report (CB&I Environmental & Infrastructure, Inc [CB&I], 2014).

Notes:
*DNT mixture is the combined results of 2,4-DNT and 2,6-DNT.
=Exceeds RG
The CMOs and RGs were developed and presented in the Final SWMU 54 RFI/CMS Report (URS, 2008).
RBC values are from the October 11, 2007, RBC Table and November 2020 Alternate RBC Table.

< = less than
µg/L = micrograms per liter
2,4,6-TNT = 2,4,6-trinitrotoluene
C/N = carcinogenic/noncarcinogenic
CAS = Chemical Abstract Service
CMO = corrective measures objective
CMS = Corrective Measures Study
DL = detection limit
DNT = dinitrotoluene
ID = identifier
LQ = laboratory qualifier
MDL = method detection limit
ND = not detected
NT = not tested
r = reason code
RBC = Risk-Based Concentration
RDX = cyclotrimethylenetrinitramine
RG = remedial goal
RFI = RCRA Facility Investigation
RL = reporting limit
RPD = relative percent difference
SWMU = Solid Waste Management Unit
TIC = total inorganic carbon
URS = URS Corporation
USEPA = U.S. Environmental Protection Agency
VQ = validation qualifier

C = Carcinogenic per USEPA RBC Table (October 2007)
N = Noncarcinogenic per USEPA RBC Table (October 2007)

Data Qualifiers:
B = Not detected substantially above the level reported in laboratory or field blanks.
E = Concentration exceeded the upper level of the calibration range of the instrument for that specific analysis.
For TICs, compound not present in calibration standard, calculated using total peak areas ion chromatographs and response factor of 1.
J = Analyte present. Reported value may not be accurate or precise.
L = Analyte present. Reported value may be biased low. Actual value is expected to be higher.
N = Sample spike recovery is outside of control limits.
P = Greater than 40% difference for detected concentrations between the two gas chromatography (GC) or high-performance liquid chromatography (HPLC) columns.
R = The sample results were rejected due to gross non-conformances discovered during data validation. Data qualified as rejected are not usable.
U = Not detected. The associated number indicates the approximate sample concentration necessary to be detected.
UJ = Not detected, quantitation limit may be inaccurate or imprecise.
UL = Not detected, quantitation limit is probably higher.
c = Calibration failure.
d = Matrix spike/matrix spike duplicate (MS/MSD) or laboratory control sample/laboratory control sample duplicate (LCS/LCSD) RPD imprecision.
g = Dual column confirmation imprecision.
l = LCS recovery failure.
m = MS/MSD recovery failure.
o = Calibration blank contamination.
p = Preparation blank contamination.
s = Serial dilution failure.
w = Field and/or equipment blank contamination.
z = Method blank and/or storage blank contamination.

Table 3-3 2006-2007 Area A Quarterly Groundwater Monitoring Results with Remedial Goals (Continued)

Notes:
*DNT mixture is the combined results of 2,4-DNT and 2,6-DNT
=Exceeds RG
The CMOs and RGs were developed and presented in the Final SWMU 54 RFI/CMS Report (URS, 2008).
RBC values are from the October 11, 2007, RBC Table and November 2020 Alternate RBC Table.
< = less than
µg/L = micrograms per liter
°C = degrees Celsius
2,4,6-TNT = 2,4,6-trinitrotoluene
C/N = carcinogenic/noncarcinogenic
CAS = Chemical Abstracts Service
CMO = corrective measures objective
CMS = Corrective Measures Study
DNT = dinitrotoluene
DO = dissolved oxygen
ID = identifier
LQ = laboratory qualifier
MCL = maximum contaminant level
MDL = method detection limit
mg/L = milligrams per liter
mS = millisiemens
mV = millivolts
ND = not detected
NTU = nephelometric turbidity unit
ORP = oxidation-reduction potential
pH = potential of hydrogen
r = reason code
RBC = Risk-Based Concentration
RDX = cyclotrimethylenetrinitramine
RFI = RCRA Facility Investigation
RG = remedial goal
RL = reporting limit
RPD = relative percent difference
SU = standard units
TIC = total inorganic carbon
URS = URS Corporation
USEPA = U.S. Environmental Protection Agency
VQ = Validation Qualifier
C = Carcinogenic per USEPA RBC Table (October 2007)
N = Noncarcinogenic per USEPA RBC Table (October 2007)
Data Qualifiers:
B = Not detected substantially above the level reported in laboratory or field blanks.
E = Concentration exceeded the upper level of the calibration range of the instrument for that specific analysis.
For TICs, compound not present in calibration standard, calculated using total peak areas ion chromatographs and response factor of 1.
J = Analyte present. Reported value may not be accurate or precise.
L = Analyte present. Reported value may be biased low. Actual value is expected to be higher.
N = Sample spike recovery is outside of control limits.
P = Greater than 40% difference for detected concentrations between the two gas chromatography (GC) or high-performance liquid chromatography (HPLC) columns.
R = The sample results were rejected due to gross non-conformances discovered during data validation. Data qualified as rejected are not usable.
U = Not detected. The associated number indicates the approximate sample concentration necessary to be detected.
UJ = Not detected, quantitation limit may be inaccurate or imprecise.
UL = Not detected, quantitation limit is probably higher.
c = Calibration failure.
d = Matrix spike/matrix spike duplicate (MS/MSD) or laboratory control sample/laboratory control sample duplicate (LCS/LCSD) RPD imprecision.
g = Dual column confirmation imprecision.
l = LCS recovery failure.
m = MS/MSD recovery failure.
o = Calibration blank contamination.
p = Preparation blank contamination.
s = Serial dilution failure.
w = Field and/or equipment blank contamination.
z = Method blank and/or storage blank contamination.

Notes:
*DNT mixture is the combined results of 2,4-DNT and 2,6-DNT
=Exceeds RG
The CMOs and RGs were developed and presented in the Final SWMU 54 RFI/CMS Report (URS, 2008).
RBC values are from the October 11, 2007 RBC Table and November 2020 Alternate RBC Table.
Water – BTAG Freshwater Screening Values (USEPA, 2006).
< = less than
µg/L = micrograms per liter
°C = degrees Celsius
2,4,6-TNT = 2,4,6-trinitrotoluene
BTAG = Biological Technical Assistance Group
C/N = carcinogenic/noncarcinogenic
CAS = Chemical Abstracts Service
CMO = corrective measures objective
CMS = Corrective Measures Study
DNT = dinitrotoluene
DO = dissolved oxygen
ID = identifier
LQ = laboratory qualifier
MCL = maximum contaminant level
MDL = method detection limit
mg/L = milligrams per liter
mS = millisiemens
mV = millivolts
ND = not detected
NTU = nephelometric turbidity unit
ORP = oxidation-reduction potential
pH = potential of hydrogen
r = reason code
RBC = Risk-Based Concentration
RDX = cyclotrimethylenetrinitramine
RFI = RCRA Facility Investigation
RG = remedial goal
RL = reporting limit
RPD = relative percent difference
SU = standard units
TIC = total inorganic carbon
URS = URS Corporation
USEPA = U.S. Environmental Protection Agency
VQ = Validation Qualifier

C = Carcinogenic per USEPA RBC Table (October 2007)
N = Noncarcinogenic per USEPA RBC Table (October 2007)

Data Qualifiers:
B = Not detected substantially above the level reported in laboratory or field blanks.
E = Concentration exceeded the upper level of the calibration range of the instrument for that specific analysis.
For TICs, compound not present in calibration standard, calculated using total peak areas ion chromatographs and response factor of 1.
J = Analyte present. Reported value may not be accurate or precise.
L = Analyte present. Reported value may be biased low. Actual value is expected to be higher.
N = Sample spike recovery is outside of control limits.
P = Greater than 40% difference for detected concentrations between the two gas chromatography (GC) or high-performance liquid chromatography (HPLC) columns.
R = The sample results were rejected due to gross non-conformances discovered during data validation. Data qualified as rejected are not usable.
U = Not detected. The associated number indicates the approximate sample concentration necessary to be detected.
UJ = Not detected, quantitation limit may be inaccurate or imprecise.
UL = Not detected, quantitation limit is probably higher.
c = Calibration failure.
d = Matrix spike/matrix spike duplicate (MS/MSD) or laboratory control sample/laboratory control sample duplicate (LCS/LCSD) RPD imprecision.
g = Dual column confirmation imprecision.
l = LCS recovery failure.
m = MS/MSD recovery failure.
o = Calibration blank contamination.
p = Preparation blank contamination.
s = Serial dilution failure.
w = Field and/or equipment blank contamination.
z = Method blank and/or storage blank contamination.

4. FIELD ACTIVITIES

The following sections provide a discussion of field activities conducted by WESTON in Year Ten of monitoring at SWMU 54.

Year Ten of groundwater monitoring consisted of two semiannual sampling events conducted in October 2021 (thirty-seventh event) and April 2022 (thirty-eighth event). Multiple wells were removed from the monitoring network after the ninth and tenth quarters and were not sampled during Year Ten. Monitoring wells that were included in Year Ten monitoring events comprised 54MW1, 54MW10, 54MW12, and 54MW13, which monitor Area A at SWMU 54, as consistent with the eleventh through thirty-sixth quarterly events. Field activities were conducted in accordance with the Final SWMU 54 MNA IMWP (Shaw, 2011a). Copies of the groundwater sampling forms and meter calibration records are presented in **Appendices A-1** and **A-2**, respectively. The monitoring wells were all in usable condition for the entire year of sampling.

4.1 THIRTY-SEVENTH GROUNDWATER SAMPLING (OCTOBER 2021)

Groundwater elevation measurements and groundwater samples were collected from monitoring wells 54MW1, 54MW10, 54MW12, and 54MW13 during the thirty-seventh event. The thirty-seventh event of groundwater sampling was conducted October 27, 2021. Groundwater elevation measurements were collected prior to sampling activities. A groundwater quality meter was calibrated at the beginning of each day before groundwater sampling was initiated. The locations of monitoring wells sampled during this semiannual event are provided in **Figure 4-1**.

4.1.1 Groundwater Elevation Measurements

Water level elevations were collected during each Year Ten semiannual event from the four monitoring wells at SWMU 54 prior to the collection of groundwater samples. **Table 4-1** provides the measured depth-to-water levels (from the top of the casing) and groundwater elevations amsl collected on October 27, 2021. **Figure 4-2** presents a groundwater elevation contour map developed from the elevation data collected during this quarterly monitoring event. Groundwater contours were derived using Esri ArcGIS Desktop Spatial Analyst 10.7.1 software and creating a spline interpolated continuous surface based on limited groundwater data.

The surface model was executed using default values in most cases and forced to cover an area inclusive of all wells using the extent polygon to define the area of interest. Contour lines were then constructed from the output splined surface at 10-ft and 2-ft intervals, depending on the site, with zero base contour. The results of the automated processing were then reviewed by subject knowledge experts and manually adjusted to accurately represent ground conditions.

Estimated groundwater flow velocity for Area A was calculated based on parameters used in the Final SWMU 54 RFI/CMS Report (URS, 2008). The Area A flow path of approximately 538.4 ft had a groundwater elevation difference of 13.55 ft, resulting in a calculated hydraulic gradient of 0.025 feet per foot (ft/ft). Using an average K value for Area A of 4.86 feet per day (ft/day) and an estimated effective porosity of 0.20, the groundwater flow velocity for Area A is approximately 0.61 ft/day (223.22 feet per year [ft/year]).

Area B, although not monitored during Year Ten as mentioned in Section 3, is expected to have a groundwater flow velocity similar to Area A, as reported in the Year Three MNA Report (CB&I, 2014).

4.1.2 Groundwater Sampling

Groundwater samples were collected from the four monitoring wells on October 27, 2021 and were analyzed for the analytical suites covering explosives, perchlorate, and RDX and its breakdown by-products hexahydro-1,3-dinitroso-5-nitro-1,3,5-triazine (DNX), hexahydro-1-nitroso-3,5-dinitro-1,3,5-triazine (MNX), and hexahydro-1,3,5-trinitroso-1,3,5-triazine (TNX). The breakdown by-products of RDX are considered MNA indicators. In addition, the following indicator parameters were collected: total organic carbon (TOC), total inorganic carbon (TIC), dissolved ferrous iron, dissolved manganese, chlorate, chloride, chlorite, nitrate, and sulfate. Water quality parameters collected during low-flow sampling included potential of hydrogen (pH), temperature, specific conductivity, dissolved oxygen (DO), oxidation-reduction potential (ORP), and turbidity. **Table 4-2** presents the suite of analytes collected for analysis during the thirty-seventh quarterly monitoring event. Groundwater sampling was accomplished without any issues.

Groundwater samples were collected via low-flow peristaltic pumps to obtain representative groundwater samples and to minimize investigation-derived waste (IDW) purge water. The following procedures were adhered to during both semiannual groundwater monitoring events:

1. A photoionization detector (PID) reading was taken upon removing the well cap to determine the presence of potentially hazardous levels of volatile gases. The PID readings were collected during the water elevation sweeps and again during sample collection. All PID readings were within acceptable levels.

2. During the water level sweep, depth-to-water and total depth measurements were recorded to determine the amount of water in the well casing and sand pack. Only approximate total well depths were measured during the semiannual events to confirm that the total depths were consistent with the data from the previous reports.

3. Groundwater samples were collected after all water level elevations had been recorded. The general practice was to lower the peristaltic pump tubing to a depth where the pump inlet was within the screened interval. Ample hydraulic head was maintained above the pump to ensure a sufficient water supply. The pump was connected to a Geocontrol PRO control unit, whereas the discharge tubing was connected to a Yellow Springs Instrument (YSI®) 556 water quality flow cell.

4. Monitoring wells were pumped at a rate of approximately 200 milliliters per minute (mL/min). Flow rate was determined by gauging the time it took to fill a 200-milliliter (mL) vial. Water quality parameters were recorded continuously including temperature, pH, DO, ORP, turbidity, and specific conductivity. Turbidity was measured using a HACH 2100Q turbidity meter, whereas concentrations of dissolved ferrous iron and manganese were measured in the field using a HACH DR900 test kit through Methods 8146 and 8149, respectively.

Table 4-3 presents a summary of the final (stabilized) water quality readings for each well from the thirty-seventh event.

Based on the DO data collected during the thirty-seventh monitoring event, groundwater within Area A exhibits slightly aerobic conditions (i.e., DO greater than 1 part per million [ppm]). The DO levels ranged from a low of 0.42 milligrams per liter (mg/L) at monitoring well 54MW1 to a high of 6.84 mg/L at monitoring well 54MW12. ORP measurements ranged from a low of 123.7 millivolts (mV) in monitoring well 54MW10 to a high of 193.4 mV at monitoring well 54MW12. Measurements of pH ranged from a low of 6.82 standard units (SU) at monitoring well 54MW12 to a high of 7.59 SU at monitoring well 54MW1. Measurements of specific conductivity

ranged from a low of 420 microsiemens per centimeter (µS/cm) at monitoring well 54MW1 to a high of 705 µS/cm at monitoring well 54MW10.

Prior to sampling, the flow cell was disconnected, and the groundwater flow rate was maintained during sample collection. Samples were collected, labeled, and packed in ice until shipment to the laboratory. Chain-of-custody (COC) forms were filled out and shipped with the samples. Copies of the COC forms are provided in **Appendix B-1** along with the raw analytical data packages.

4.1.3 Quality Control Samples

QC samples, including duplicate and temperature blanks, were collected during the thirty-seventh monitoring event.

One duplicate sample was collected during the thirty-seventh monitoring event (rate of 10 percent [%]) at 54MW10 (duplicate as 54TW10) and was analyzed for the same suite of compounds as the parent sample. Further, one matrix spike/matrix spike duplicate (MS/MSD) (at a rate of 5%) was collected at monitoring well 54MW13 (54MW13 MS/MSD) and was analyzed for the same suite of compounds as the parent sample.

In previous sampling years, one equipment rinse blank was collected during each quarter. However, because only disposable equipment was utilized during the sampling, no equipment rinse blanks were warranted. One IDW purge water sample (54-IDW) was collected and analyzed for pH, chemical oxygen demand (COD), and total metals for disposal of IDW purge water in accordance with the Final SWMU 54 MNA IMWP (Shaw, 2011a). Results of the QA/QC samples are presented in the raw analytical data package provided in **Appendix B-1** and summarized in Section 5.7.

4.2 THIRTY-EIGHTH GROUNDWATER SAMPLING (APRIL 2022)

Groundwater elevation measurements and groundwater samples were collected from monitoring wells 54MW1, 54MW10, 54MW12, and 54MW13 on April 25, 2022. Groundwater elevation measurements were collected prior to sampling activities. A groundwater quality meter was calibrated at the beginning of each day before groundwater sampling was initiated. The locations of monitoring wells sampled during this quarterly event are provided in **Figure 4-1**.

4.2.1 Groundwater Elevation Measurements

Table 4-4 provides the measured depth-to-water levels (from the top of the casing) and groundwater elevations collected on April 25, 2022, during the thirty-eighth monitoring event. **Figure 4-3** presents a groundwater elevation contour map developed from the elevation data collected during the quarter.

Estimated groundwater flow velocity for Area A was calculated based on parameters used in the Final SWMU 54 RFI/CMS Report (URS, 2008). The Area A flow path of approximately 538.4 ft had a groundwater elevation difference of approximately 15 ft, resulting in a calculated hydraulic gradient of 0.028 ft/ft. Using an average K value for Area A of 4.86 ft/day and an estimated effective porosity of 0.20, the groundwater flow velocity for Area A is approximately 0.66 ft/day (240.9 ft/year).

4.2.2 Groundwater Sampling

Groundwater samples were collected from monitoring wells 54MW1, 54MW10, 54MW12, and 54MW13 on April 25 and 26, 2022. The thirty-eighth monitoring samples were tested for the same analytes as the thirty-seventh event, which are presented in **Table 4-2**. Groundwater sampling was accomplished without any issues.

Groundwater samples were collected applying the same method and approach used during the thirty-third quarterly monitoring event, specifically, through low-flow peristaltic pumps. Monitoring wells were pumped at a rate of approximately 200 mL/min. **Table 4-5** presents a summary of the final (stabilized) water quality readings for each well from the thirty-eighth event.

Based on the DO data collected during the thirty-eighth monitoring event, groundwater within Area A exhibits aerobic conditions (i.e., DO greater than 1 ppm). The DO levels ranged from a low of 1.81 mg/L at monitoring well 54MW10 to a high of 6.19 mg/L at monitoring well 54MW12. ORP measurements ranged from a low of 52.7 mV at monitoring well 54MW1 to a high of 184.3 mV at monitoring well 54MW12. Measurements of pH ranged from a low of 6.75 SU at monitoring well 54MW10 to a high of 7.44 SU at monitoring well 54MW1. Measurements of specific conductivity ranged from a low of 428 µS/cm in monitoring well 54MW1 to a high of

521.7 µS/cm observed at monitoring well 54MW10. Copies of the COC forms are provided in **Appendix B-1** along with the raw analytical data packages.

4.2.3 Quality Control Samples

QC samples, including duplicate and temperature blanks, were collected during the thirty-eighth monitoring event.

One duplicate sample was collected at 54MW12 (duplicate as 54TW12) and analyzed for the same suite of compounds as the parent sample. Further, one MS/MSD [at a rate of 5%]) was collected at monitoring well 54MW13 (54MW13 MS/MSD) and was analyzed for the same suite of compounds as the parent sample.

In previous sampling years, one equipment rinse blank was collected during each quarter. However, because only disposable equipment was utilized during the sampling, no equipment rinse blanks were warranted. One IDW purge water sample (54-IDW) was collected and analyzed for pH, COD, and total metals. Results of the QA/QC samples are presented in the raw analytical data package provided in **Appendix B-1**.

Table 4-1 Thirty-Seventh Event Groundwater Elevations at SWMU 54

Well ID	Screen Interval (ft bgs)	Screen Length (ft)	Total Depth (ft)	Water Level (ft BTOC)	Elevation (top of casing) (ft amsl)	Water Level (ft amsl)	PID Reading (ppm)
54MW1	34.8 - 54.8	20	56	20.00	1,707.78	1,687.78	0.0
54MW10	12 - 27	15	30	16.95	1,691.10	1,674.15	0.0
54MW12	20 - 30	10	32	26.13	1,702.42	1,676.29	0.0
54MW13	12 – 25	10	25	22.65	1,698.90	1,676.25	0.0

Notes:
Elevation data collected on October 27, 2021.
amsl = above mean sea level
bgs = below ground surface
BTOC = below top of casing
ft = feet
ID = identifier
PID = photoionization detector
ppm = parts per million
SWMU = Solid Waste Management Unit

5. CHEMICAL ANALYTICAL RESULTS

5.1 SELECTION OF COMPARISON CRITERIA

The analytical data collected during this investigation were compared to RGs selected in the Final SWMU 54 RFI/CMS Report (URS, 2008). For contaminants that have no RGs, the results are compared in the text to the current USEPA Regional Screening Levels (RSLs) for tap water. Screening levels (SLs) are calculated values that are derived from theoretical risk scenarios. Compounds are grouped as carcinogens or noncarcinogens, and carcinogen SL values are the lower of values calculated to represent an increase of 1E-6 in cancer risk and a Hazard Index (HI) of 0.1. To account for potential cumulative effects of exposure to noncarcinogenic compounds, values for noncarcinogens have been recalculated to an HI of 0.1. **Tables 5-1** through **5-4** present the analytical results and summaries of the thirty-seventh and thirty-eighth semiannual monitoring data, including number of results that exceeded the RGs, frequency of detection, minimum and maximum detected concentrations, and the location of maximum concentration.

5.2 THIRTY-SEVENTH EVENT GROUNDWATER RESULTS (OCTOBER 2021)

Four groundwater monitoring wells, 54MW1, 54MW10, 54MW12, and 54MW13, were sampled during this semiannual monitoring event, with a duplicate sample collected from monitoring well 54MW10. Samples were submitted for explosives, perchlorate, RDX breakdown by-products (DNX, MNX, and TNX), and MNA indicator parameter analyses. Detected constituents are summarized in **Table 5-1**, whereas the complete results are presented in **Table 5-2**. Sample locations are provided in **Figure 4-1**. The complete laboratory analytical reports are included in **Appendix B-1**.

Explosives

Four explosives were detected in groundwater samples: 2,4,6-TNT, 2-amino-4,6-dinitrotoluene (2ADNT), 4-amino-2,6-dinitrotoluene (4ADNT), and RDX. All four explosives were detected in monitoring wells 54MW10 and 54MW13, whereas explosives detected in 54MW12 included only 2,4,6-TNT, 2ADNT, and 4ADNT. No explosives were detected at background monitoring well 54MW1.

The explosive 2,4,6-TNT was detected at monitoring well 54MW10 at concentrations of 5.4. micrograms per liter (µg/L) and 4.0 µg/L (duplicate 54TW10), at monitoring well 54MW12 at a concentration of 9.3 µg/L, and at monitoring well 54MW13 at a concentration of 11.8 µg. The concentrations of 2,4,6-TNT at monitoring wells 54MW10 and 54MW13 exceeded the RG of 7.82 µg/L.

The explosive 2ADNT was detected at monitoring well 54MW10 at an estimated concentration of 1.5 µg/L in the original and duplicate sample, at monitoring well 54MW12 at a concentration of 3.3 µg/L, and at monitoring well 54MW13 at a concentration of 2.3 µg/L. An RG has not been established for 2ADNT. There is no USEPA maximum contaminant level (MCL) (USEPA, 2018); however, the Tap Water RSL for 2ADNT is 39 µg/L (USEPA, 2021).

The explosive 4ADNT was detected at monitoring well 54MW10 at concentrations of 1.6 µg/L and 1.4 µg/L (duplicate), at monitoring well 54MW12 at a concentration of 1.9 µg/L, and at monitoring well 54MW13 at a concentration of 1.3 µg/L. An RG has not been established for 4ADNT. There is no USEPA MCL (USEPA, 2018); however, the Tap Water RSL for 4ADNT is 39 µg/L (USEPA, 2021).

RDX was detected at monitoring well 54MW10 at concentrations of 1.4 µg/L and 1.0 µg/L (duplicate) and at monitoring well 54MW13 at a concentration of 0.58 µg/L. There were no detected concentrations that exceeded the RG of 6.1 µg/L. TNX, an RDX breakdown by-product, was not detected during this semiannual monitoring event.

The monitoring wells with detected concentrations of explosives are typically the same wells with observed hits recorded during previous sampling rounds. The monitoring well locations (54MW12 and 54MW13) where 2,4,6-TNT exceeded the RG are provided in **Figure 5-1**.

Perchlorate

Perchlorate was detected in four groundwater samples collected from monitoring wells 54MW10 and duplicate, 54MW12, and 54MW13 during this semiannual monitoring event. Perchlorate was detected at monitoring well 54MW10 at concentrations of 0.072 µg/L and 0.076 µg/L (duplicate),

at monitoring well 54MW12 at a concentration of 0.30 µg/L, and at monitoring well 54MW13 at a concentration of 0.14 µg/L. All detections were well below the RG of 10.9 µg/L.

Miscellaneous Analytes

Groundwater samples were also analyzed for MNA indicators (TOC, TIC, dissolved ferrous iron, dissolved manganese, chlorate, chlorite, chloride, nitrate, and sulfate) for the purposes of evaluating the effectiveness of the MNA process.

Observed concentrations of TOC in the four monitoring wells ranged from a low of 0.0 mg/L (non-detect) (54MW1, 54MW10, 54MW12, and 54MW13) to an estimated high of 1.5 mg/L (54TW10, duplicate of 54MW10), whereas the concentrations of TIC ranged from a low of 60 mg/L (54MW1) to a high of 91 mg/L (54MW13). Dissolved ferrous iron concentrations ranged from a low of 0.01 mg/L (54MW12) to a high of 0.10 mg/L (54MW10). Dissolved manganese concentrations ranged from a low of 0.0 mg/L (non-detect) (54MW12) to a high of 1.10 mg/L (54MW10). Chloride concentrations ranged from an estimated low of 2.3 mg/L (54MW1) to a high of 7.6 mg/L (54MW13). Detected concentrations of nitrate ranged from an estimated low of 0.25 mg/L (54MW10) to an estimated high of 0.66 mg/L (54MW12). Sulfate concentrations ranged from a low of 28.0 mg/L (54MW1 and 54MW12) to a high of 120.0 mg/L (54MW10 and duplicate). The MNA indicator parameters chlorate and chlorite went undetected during this semiannual monitoring event. **Table 5-2** presents the MNA indicator parameters sample results. A more detailed discussion of the MNA results is provided in Section 6.

5.3 THIRTY-EIGHTH GROUNDWATER RESULTS (APRIL 2022)

Four groundwater monitoring wells, 54MW1, 54MW10, 54MW12, and 54MW13, were sampled during the thirty-eighth monitoring event. Samples were submitted for explosives, perchlorate, RDX breakdown by-products (DNX, MNX, and TNX), and MNA indicator parameter analyses. However, samples for explosives, perchlorate and RDX breakdown by-products for two monitoring wells (54MW1 and 54MW12) were never received by the laboratory due to lost shipment by Federal Express. This was not identified until the receipt of the data for the other samples were evaluated several months later. A summary of detected and non-detected constituents is summarized in **Table 5-3**, and the analytical results are presented in **Table 5-4**.

Sample locations are provided in **Figure 4-1**. The complete laboratory analytical reports are included in **Appendix B-1**.

Explosives

Four explosives were detected in groundwater samples: 2,4,6-TNT, 2ADNT, 4ADNT, and RDX. The explosives 2,4,6-TNT, 2ADNT, 4ADNT, and RDX were detected in both monitoring wells 54MW10 and 54MW13 sampled during this event.

The explosive 2,4,6-TNT was detected at monitoring well 54MW10 at a concentration of 3 µg/L and at monitoring well 54MW13 at a concentration of 5.8 µg/L. The concentrations of 2,4,6-TNT at monitoring wells 54MW10 and 54MW13 did not exceed the RG of 7.82 µg/L.

The explosive 2ADNT was detected in monitoring well 54MW10 at a concentration of 1.1 µg/L and at a concentration of 1.2 µg/L at monitoring well 54MW13. An RG has not been established for 2ADNT. There is no USEPA MCL (USEPA, 2018); however, the Tap Water RSL for 2ADNT is 39 µg/L (USEPA, 2021).

The explosive 4ADNT was detected at monitoring well 54MW10 at a concentration of 4.2 µg/L; at monitoring well 54MW12 at a concentration of 2.0 µg/L; at monitoring well 54MW13 at concentrations of 1.4 µg/L, and 1.6 µg/L (field duplicate 54TW13). An RG has not been established for 4ADNT. There is no USEPA MCL (USEPA, 2018); however, the Tap Water RSL for 4ADNT is 39 µg/L (USEPA, 2021).

The explosive RDX was detected at monitoring well 54MW10 at a concentration of 0.78 µg/L and at monitoring well 54MW13 at a concentration of 0.83 µg/L. There were no detected concentrations that exceeded RG of 6.1 µg/L. No RDX breakdown by-products (DNX, MNX, and TNX) were detected at any of the monitoring wells during this quarterly monitoring event.

The monitoring wells with detected concentrations of explosives are typically the same wells with hits recorded during previous sampling rounds.

Perchlorate

Perchlorate was detected in the groundwater samples collected from monitoring wells 54MW10 and 54MW13. Perchlorate was detected at monitoring well 54MW10 at a concentration of 0.12 µg/L and at monitoring well 54MW13 at a concentration of 0.26 µg/L. Both detections are well below the RG of 10.9 µg/L.

Miscellaneous Analytes

Groundwater samples were also analyzed for MNA indicators (TOC, TIC, dissolved ferrous iron, dissolved manganese, chlorate, chlorite, chloride, nitrate, and sulfate) for the purposes of evaluating the effectiveness of the MNA process.

No TOC was detected in any of the four wells; whereas the concentrations of TIC ranged from a low of 60.0 mg/L (54MW1) to a high of 83.0 mg/L (54MW12 and 54MW13). Dissolved ferrous iron concentrations ranged from a low of 0.01 mg/L (54MW12) to a high of 2.01 mg/L (54MW10). Dissolved manganese concentrations ranged from a low of 0.0 mg/L (non-detect) (54MW10) to a high of 3 mg/L (54MW13). Chloride concentrations ranged from an estimated low of 3.1 mg/L (54MW1) to a high of 5.5 mg/L (54MW12). Detected concentrations of nitrate ranged from a low of 0.13 mg/L (54MW1) to a high of 0.75 mg/L (54MW12). Sulfate concentrations ranged from a low of 27.0 mg/L (54MW1) to a high of 59.0 mg/L (54MW12). The MNA indicator parameter of chlorate and chlorite went undetected during this semiannual monitoring event. **Table 5-4** presents the MNA indicator parameters sample results. A more detailed discussion of the MNA results is provided in Section 6.

5.4 YEAR ONE THROUGH YEAR TEN SAMPLE RESULTS

Samples collected during the first 2 years were analyzed for explosives, perchlorate, and MNA indicators. The Year Two MNA Report (CB&I, 2013) recommended elimination of the wells with no COI exceedances for the first 2 years, based on criteria established in the MNA Work Plan. The ninth quarter of sampling occurred prior to regulatory approval of the Year Two MNA Report, and the original parameters were included in that sampling event. After approval of the Year Two MNA Report, the sampling plan was modified to include RDX MNA indicators in the analytical suite and to reduce the sampling program from 14 monitoring wells to 3 wells with COI

exceedances (54MW10, 54MW12, and 54MW13), and an upgradient well (54MW1) to monitor background conditions. There have been no further modifications to the sampling plan.

Multiple wells were removed from the monitoring network after the ninth and tenth quarters and, therefore, were not sampled during Years Three through Seven. Monitoring wells that were included in these yearly events included 54MW1, 54MW10, 54MW12, and 54MW13, which monitor Area A at SWMU 54. This section discusses the results from the first 9 years (36 quarters) of MNA sampling at these wells. Except for a change from quarterly to semiannually, Year Ten of sampling did not change from Years Three through Nine and included the analyses of explosives, perchlorate, RDX, RDX breakdown by-products (DNX, MNX, and TNX), MNA indicator parameters, and water quality parameters.

5.4.1 Groundwater

Samples from the four monitoring wells within SWMU 54 were analyzed for explosives for 36 quarters and 2 semiannual events of sampling. The trends in number of detections during this period are shown in **Figures 5-3** through **5-6** and are discussed in the paragraphs that follow.

5.4.1.1 Explosives

During the Year Three sampling round (tenth through twelfth quarters), 13 explosives were detected in the samples, including DNX, MNX, and TNX. The limit of quantitation (LOQ) for all explosives during the tenth through twelfth quarters was 0.2 µg/L.

During the Year Four sampling round (thirteenth through sixteenth quarters), the number of explosives detected decreased to five compounds. The explosives included 2,4,6-TNT, 2ADNT, 4ADNT, RDX, and the RDX breakdown by-product DNX. The limit of detection (LOD) during the thirteenth through fifteenth quarters for 2,4,6-TNT, 2ADNT, 4ADNT, and RDX was 0.3 µg/L. The LOQ during the thirteenth through fifteenth quarters was 1.0 µg/L for 2,4,6-TNT and 0.5 µg/L for 2ADNT, 4ADNT, and RDX. The LODs of RDX breakdown by-products of DNX, MNX, and TNX during the thirteenth and fourteenth quarters were 0.2 µg/L, 0.1 µg/L, and 0.2 µg/L, respectively. The LOQs of RDX breakdown by-products of DNX, MNX, and TNX during the thirteenth and fourteenth quarters were 0.4 µg/L, 0.2 µg/L, and 0.4 µg/L, respectively. During the

fifteenth quarter, the LOD and LOQ for all RDX breakdown by-products decreased to 0.1 µg/L and 0.2 µg/L, respectively.

During the Year Five sampling round (seventeenth through twentieth quarters), the number of detected analytes was reduced once more to four compounds: 2,4,6-TNT, 2ADNT, 4ADNT, and RDX. The LOD and LOQ for 2,4,6-TNT, 2ADNT, 4ADNT, RDX, and RDX breakdown by-products during the seventeenth through twentieth quarters were 0.1 µg/L and 0.2 µg/L, respectively. The explosive 2,4,6-TNT was detected at concentrations above the RGs at monitoring wells 54MW12 and 54MW13, whereas RDX was detected above the RGs only at monitoring well 54MW12. The explosive 2,4,6-TNT was detected above the RG at monitoring well 54MW12 during all four quarters (seventeenth through twentieth) and at monitoring well 54MW13 during two sampling quarters (seventeenth and twentieth), whereas RDX was detected above the RG only during the nineteenth quarter at monitoring well 54MW12.

During the Year Six sampling round (twenty-first through twenty-fourth quarters), the number of detected analytes remained at four compounds: 2,4,6-TNT, 2ADNT, 4ADNT, and RDX. The LOD and LOQ for 2,4,6-TNT, 2ADNT, 4ADNT, RDX, and RDX breakdown by-products during the twenty-first through twenty-fourth quarters were 0.1 µg/L and 0.2 µg/L, respectively. The explosive 2,4,6-TNT was detected at concentrations above the RGs at monitoring wells 54MW10, 54MW12, and 54MW13, whereas RDX was detected above the RGs only at monitoring well 54MW12. The explosive 2,4,6-TNT was detected above the RG at monitoring well 54MW12 during all four quarters (twenty-first through twenty-fourth), at monitoring well 54MW10 during one sampling quarter (twenty-first), and at monitoring well 54MW13 during two sampling quarters (twenty-first and twenty-fourth). RDX was detected above the RG during all four quarters (twenty-first through twenty-fourth) at monitoring well 54MW12.

During the Year Seven sampling round (twenty-fifth through twenty-eighth quarters), the number of detected analytes expanded to five compounds: 2,4,6-TNT, 2ADNT, 4ADNT, RDX, and 2,6-DNT (and DNT mixture). The LOD and LOQ for 2,4,6-TNT, 2ADNT, 4ADNT, 2,6-DNT, RDX, and RDX breakdown by-products during the twenty-fifth through twenty-seventh quarters were 0.1 µg/L and 0.2 µg/L, respectively. The LOD and LOQ were 0.094 µg/L and 0.19 µg/L, respectively, in the twenty-eighth quarter. The explosive 2,4,6-TNT was detected at concentrations

above the RG at monitoring wells 54MW10, 54MW12, and 54MW13, whereas RDX was detected above the RG only at monitoring well 54MW12 and only in the twenty-sixth quarter. The explosive 2,4,6-TNT was detected above the RG at monitoring well 54MW12 during all four quarters (twenty-fifth through twenty-eighth), at monitoring well 54MW10 during one sampling quarter (twenty-eighth), and at monitoring well 54MW13 during one sampling quarter (twenty-eighth). RDX was detected above the RG during one quarter (twenty-sixth) at monitoring well 54MW12.

During the Year Eight sampling round (twenty-ninth through thirty-second quarters), the number of detected analytes decreased to four compounds: 2,4,6-TNT, 2ADNT, 4ADNT, and RDX. The LOD and LOQ for 2,4,6-TNT, 2ADNT, 4ADNT, and RDX during the twenty-ninth through thirty-second quarters were 0.1 µg/L and 0.2 µg/L, respectively. The LOD and LOQ were 0.2 and 0.1 µg/L, respectively, in the twenty-ninth quarter. The explosive 2,4,6-TNT was detected at concentrations above the RG at monitoring wells 54MW10 in the thirtieth and thirty-first quarters, whereas 2,4,6-TNT was detected at concentrations above the RG at 54MW12 and 54MW13 during the twenty-ninth through thirty-first quarters. RDX and perchlorate were not detected at concentrations above the RG during any quarter.

During the Year Nine sampling round (thirty-third through thirty-sixth quarters), the number of detected analytes increased to six compounds: 2,4,6-TNT, 2ADNT, 4ADNT, 2-nitrotoluene (2-NT), RDX, and TNX. The LOD and LOQ for 2,4,6-TNT, 2ADNT, 4ADNT, and RDX during the thirty-third through thirty-sixth quarters were 0.1 µg/L and 0.2 µg/L, respectively. The explosive 2,4,6-TNT was detected at concentrations above the RG at monitoring wells 54MW10 and 54MW13 in all four quarters (thirty-third through thirty-sixth), whereas 2,4,6-TNT was detected at concentrations above the RG at 54MW12 during the thirty-fourth through thirty-sixth quarters. RDX and perchlorate were not detected above the RG during any quarter.

During the Year Ten sampling round (thirty-seventh and thirty-eighth semiannual events), the number of detected analytes decreased to four compounds as compared to Year Nine: 2,4,6-TNT, 2ADNT, 4ADNT, and RDX. The LOD and LOQ for 2,4,6-TNT, 2ADNT, 4ADNT, and RDX during the thirty-seventh and thirty-eighth events were 0.1 µg/L and 0.2 µg/L, respectively. The explosive 2,4,6-TNT was detected at concentrations above the RG at monitoring wells

54MW12 and 54MW13 in the thirty-seventh event. RDX and perchlorate were not detected above the RG during either semiannual event in Year Ten.

Explosives had gone undetected at monitoring well 54MW1 in 35 of the previous 36 quarters, but 2-NT and RDX were detected in this well in the thirty-sixth quarter (**Figure 5-2**); however, explosives were noted detected in Year Ten at 54MW1. The explosive 2,4,6-TNT was detected at monitoring well 54MW10 above the RG during the tenth, eleventh, twelfth, sixteenth, twenty-first, twenty-eighth, twenty-ninth, thirtieth, and thirty-third through thirty-sixth quarterly monitoring events (**Figure 5-3**); however, it was not detected above its RG in the two Year Ten events (thirty-seventh and thirty-eight events). Monitoring well 54MW12 has had detectable concentrations of 2,4,6-TNT above the RG during all sampling events, with the exception of the sixth, seventh, sixteenth, and thirty-second quarters. The twenty-sixth quarter recorded the highest concentrations of 2,4,6-TNT at 164 µg/L (**Figure 5-4**). The explosive 2,4,6-TNT "spikes" at monitoring well 54MW12 appear fairly regularly to be not occurring in any particular season (**Figure 5-4**). Concentrations of 2,4,6-TNT at 54MW13 had historically been below the RG; however, beginning in the twentieth quarterly event, concentrations have been above the RG for most quarterly events since then, including the twenty-first, twenty-fourth, twenty-eighth, twenty-ninth, thirty-second through thirty-sixth quarterly, and thirty-seventh monitoring events of sampling where it exceeded the RG. The detected concentration in the thirty-fifth quarter was the highest value recorded to date at monitoring well 54MW13 at 19.2 µg/L, which was detected in the duplicate sample (**Figure 5-5**).

Concentrations of RDX exceeded the RG in monitoring well 54MW10 during the fifth, tenth, twelfth, and sixteenth quarters (**Figure 5-3**). Monitoring well 54MW12 had detectable concentrations of RDX above the RG during 7 of the first 12 quarters of sampling, and only one detection above the RG during Year Four (fourteenth quarter) and Year Five (nineteenth quarter) of sampling. During Year Six, however, there were two detections above the RG, once during the twenty-first quarter and once during the twenty-fourth quarter. During Year Seven, there was one RDX detection above the RG (54MW12) in the twenty-sixth quarter. It appears that elevated concentrations of RDX at 54MW12 are cyclic with periods of lower concentrations in between (**Figure 5-4**). These elevated RDX concentrations are closely aligned with those of 2,4,6-TNT with no particular seasonal pattern being apparent. Historically, monitoring well 54MW13 has not

had a detection of RDX above the RG through the first 16 quarters of sampling. This trend continued during the Year Five through Year Six monitoring events. Further, when compared to historical concentrations, the Year Nine and Ten RDX concentrations are increasing, but remain under the RG (**Figure 5-5**).

The only detections of DNX at 54MW12 occurred during the tenth and twelfth quarters, when the breakdown by-product was also detected at monitoring wells 54MW10 and 54MW13. The concentrations of these compounds were low (less than 1 µg/L), but generally mirrored the RDX concentrations in the wells. Detection of the RDX daughter products in these wells with elevated RDX concentrations suggests degradation and natural attenuation of RDX is a viable, ongoing remedial process at the site. During the Year Five through Year Seven monitoring events, DNX was not detected during any of the sampling quarters. DNX was not detected during the Year Nine or Year Ten monitoring events. TNX was detected in monitoring wells 54MW10 and 54MW13 during the thirty-third quarter but was not detected in the thirty-fourth through thirty-sixth quarters during Year Nine or during the thirty-seventh and thirty-eighth events of Year Ten.

Many of the intermediate and end-products of RDX degradation are relatively short-lived in the environment, and accumulation of these would not be expected. Studies on the fate and transport of explosives in the environment state that the nitroso intermediates of RDX (DNX, MNX, and TNX) have rarely been observed in the field at the few sites where analyses have been conducted for them (Brannon and Pennington, 2002). Many of these intermediates are observed only transiently due to their susceptibility to rapid mineralization, typically persisting only on the scale of several hours to several days. Significant observations of the final end-products are also not expected. Hydrazines, dimethylhydrazines, and methanol are not likely to accumulate in the environment, particularly at the low levels of concentration at which they would be produced as end-products, because these compounds biodegrade very rapidly. Therefore, the observation of intermediate and end-products of RDX biodegradation (DNX, MNX, and TNX), even at low concentrations, would be considered strong presumptive evidence of active and ongoing degradation processes.

The 2,4,6-TNT degradation intermediaries 2ADNT and 4ADNT have been detected with regularity at monitoring wells 54MW10, 54MW12, and 54MW13, the exceptions being:

the fourteenth quarter when 4ADNT went undetected in monitoring wells 54MW12 and 54MW13; the twentieth quarter when 4ADNT went undetected in monitoring well 54MW10; the twenty-first quarter when 2ADNT went undetected in monitoring well 54MW12; the twenty-second quarter when both 2ADNT and 4ADNT went undetected in monitoring well 54MW10; the twenty-third quarter when 2ADNT went undetected in monitoring well 54MW13 and 4ADNT went undetected in monitoring well 54MW12; and the twenty-fourth quarter when 4ADNT went undetected in monitoring wells 54MW10 and 54MW12. Additionally, 4ADNT went undetected in 54MW13 during the twenty-fifth quarter. The explosive 4ADNT was detected in monitoring wells 54MW10, 54MW12, and 54MW13 during the thirty-seventh and thirty-eighth events of Year Ten.

The explosive 2,6-DNT was detected twice during the Year Seven monitoring event (twenty-sixth quarter). Monitoring well 54MW12 had a concentration of 3.6 µg/L and monitoring well 54MW13 had an estimated concentration of 0.91 µg/L. DNT mixture results are obtained by adding together the results of 2,4-DNT and 2,6-DNT. The RG of 0.932 µg/L for the DNT mixture was exceeded at monitoring well 54MW12. The explosive 2,6-DNT was not detected during the Year Nine monitoring event but was detected in all four wells during the thirty-seventh event of Year Ten and the two analyzed wells during the thirty-eighth event of Year Ten.

Analysis of the historical and recent data for monitoring wells 54MW10, 54MW12, and 54MW13 shows a correlation in 2,4,6-TNT concentration spikes with increasing concentrations of both 2ADNT and 4ADNT, indicating a limited transformation process from 2,4,6-TNT (**Figures 5-6** through **5-9**, respectively). Degradation of 2,4,6-TNT leading to amino-DNTs is likely occurring at localized zones within the soil matrix where the conditions are more favorable.

5.4.1.2 Perchlorate

Site-wide perchlorate concentrations have typically been steady and below the RG with the exception of the concentrations detected at 54MW12 during the fourth and eighth quarters. These spikes were reported as correlating with peaks in 2,4,6-TNT concentration. During Year Four and Year Five of monitoring, monitoring well 54MW12 continued to exhibit the highest concentrations, with the exception of the sixteenth quarter when the greatest values were detected at monitoring well 54MW10 (**Figures 5-2** through **5-5**). A summary of these results is provided in Section 6.

5.5 LABORATORY ANALYSIS, DATA VALIDATION, AND REPORTING

The Year Ten sampling effort was collected semiannually in October 2021 and April 2022. Groundwater samples were collected in accordance with the Uniform Federal Policy – Quality Assurance Project Plan (UFP-QAPP), revised August 2015. Documentation pertaining to COC and sampling conditions was filed in field and laboratory records. **Table 5-9** summarizes the samples and analyses of the Year Ten sampling effort.

The samples were placed into coolers with ice at the time of collection. The COC forms were completed as the samples were packaged into coolers for transport. Trip blanks, temperature blanks, and ice were added as required. The coolers for the metals, pH, COD, anions, chlorate/chlorite, TIC, and TOC were shipped to CT Laboratories in Baraboo, WI; this laboratory then repacked samples for chlorate/chlorite as necessary and shipped to Eurofins Analytical in South Bend, IN (subcontractor laboratory). The coolers containing explosive and perchlorate samples were shipped to SGS Accutest in Orlando, FL.

The analytical data were reviewed for consistency with the test methods as noted in **Table 5-6** to ensure that the data set met project data quality objectives and were usable for the purposes of the project. Validation was performed following the *National Functional Guidelines for Inorganic Superfund Data Review* (USEPA, 2014a), *National Functional Guidelines for Superfund Organic Methods Data Review* (USEPA, 2014b), and professional judgment. Any anomalies with regard to the requirements for precision, accuracy, representativeness, completeness, comparability, and sensitivity are discussed below, and the data were flagged where appropriate. Analytical methods are shown in **Table 5-6**. Data validation reports are included as **Appendix B-2**.

Application of Data Flags

General data quality flagging conventions in **Table 5-7** were used to indicate QC anomalies. Data were flagged, where appropriate, in accordance with the National Functional Guidelines and the UFP-QAPP. A data quality summary is provided below.

Preservation, Temperature, and Hold Time

All sample preservation requirements were met. All sample analyses were within holding time. Refer to **Table 5-8** for holding time exceedances.

5.5.1 Precision

Precision was measured from the relative percent difference (RPD) between the parent sample/field duplicate, laboratory duplicates, laboratory control sample (LCS), MS/MSD pairs, and two columns.

Field Duplicates

Field duplicates were collected at a frequency of 10% of field samples. Except for 1,3,5-TNB for samples 54MW10 and duplicate 54TW10 in October 2021, RPDs were within control limits. **Table 5-9** lists field duplicate exceedances.

Laboratory Duplicates

Laboratory duplicate analysis was performed at a frequency of 10% of laboratory samples, for inorganic analyses. RPDs were within control limits. **Table 5-14** lists laboratory duplicate exceedances.

MS/MSD Duplicate RPD

MS/MSD samples were analyzed at a frequency of 5% per preparatory batch. Most results were within control limits except for a couple of metals for the IDW samples for both events. **Table 5-11** lists MS/MSD RPD exceedances.

RPD Between Two Columns

A few explosives were outside control limits for the October 2021 and April 2022 events. **Table 5-12** lists RPD between two columns exceedances.

5.5.2 Representativeness

The samples were collected from required sampling locations. Representativeness of the data is considered acceptable.

5.5.3 Comparability

Comparability was acceptable. Standard analytical methods were used. Standard preparatory and analytical methods were applied to the samples across sampling events. In all cases, the detection

limits (DLs) and LODs attained were below the specified LOQs. All target compounds detected below the LOQs, flagged (J) by the laboratory, are considered estimated concentrations.

5.5.4 Completeness

Completeness was measured as the number of usable results versus the total number of results. The data set completeness was calculated to be 100%. The information fulfilled the data quality objectives of this investigation.

5.5.5 Accuracy

Accuracy was measured from laboratory QC sample percent recoveries, including LCS, MS, MSD, post-digestion spike (PDS), serial dilutions, and surrogates. Accuracy was also evaluated by determining whether any deviations from method or laboratory requirements for internal standard, initial calibration verification (ICV), and continuing calibration verification (CCV) recoveries were noted in the case narrative(s).

LCS/MS/MSD Recovery

One LCS was analyzed for each batch of 20 samples or fewer.

Most recoveries were within control limits. There were no LCS recovery exceedances.

MS/MSD analysis was performed at a frequency of 5% of field samples.

Most recoveries were within control limits. **Table 5-13** presents MS/MSD recoveries outside control limits. The data for the parent sample were flagged as indicated on the table. If no flag was indicated, the data were not flagged. Data were not flagged in cases where the parent sample concentration was greater than four times the spike concentration.

Only parent samples were qualified.

PDS Recovery Exceedances

Most recoveries were within control limits. There were no PDS recovery exceedances.

Serial Dilution Percent Difference

Most percent differences were within control limits. There were no serial dilution difference exceedances.

Surrogates

All surrogate recoveries were within control limits. There were no surrogates that exceeded acceptance criteria.

Internal Standards

There were no internal standards outside control limits.

Calibration Verification

No calibration results were outside control limits. **Table 5-14** summarizes calibration exceedances.

5.5.6 Sensitivity

Sensitivity was measured by evaluating whether the LOQ was less than the RGs. All LOQs were below the RGs.

Additionally, sensitivity was evaluated by determining whether method blank and trip blanks were less than the LOQ. Some analytes were detected in some blanks, leading to qualification of sample results.

Blanks (Calibration [Instrument], Method, and Trip)

Calibration blanks were analyzed throughout analytical runs.

One method blank was analyzed with every batch of 20 samples or fewer for each matrix.

Table 5-15 presents samples flagged for blank results. Sample results greater than two times the blank concentration were not qualified. Data quality and usability were not affected.

LOQs

LOQs, before adjustments for dilutions, were below the regulatory criteria noted in the UFP-QAPP.

Data Usability Summary

In summary, all data were considered usable with the qualifications discussed above. The completeness goals for the project were met, and all sample data are usable as qualified for making project decisions and assessments. The data were considered of good quality for the project goals.

Low LCS, MS/MSD (**Table 5-13**), and PDS percent recoveries indicate that the associated results may be biased low for the associated samples.

High MS/MSD (**Table 5-13**) percent recoveries indicate that the associated results may be biased high for the associated samples.

The RPDs for field duplicate (**Table 5-9**), laboratory duplicate (**Table 5-10**), MS/MSD (**Table 5-11**), and between two columns (**Table 5-12**) exceedances indicate that the associated results were estimated or non-detect estimated for the associated samples.

The biases do not affect the overall conclusions.

This Data Quality Assessment was prepared by: Amy L. Hogan, Kevin C. Harmon, and Sandra Nacquin of Validata Chemical Services, Inc. (Validata). Validata has provided data validation services since 1990 with completion of over 350 environmental chemistry data validation contracts for all business sectors including 35 USACE and 252 additional U.S. Department of Defense (DoD) contracts. Validata has been audited by the USEPA Quality Assurance Section and the U.S. Navy Environmental Project Management Group, and was approved as a data validation service by both agencies. Data validation reports are presented in **Appendix B-2**.

Table 5-1 SWMU 54 Summary of Thirty-Seventh Event Groundwater Samples

Analyte	Units	RG	# of RG Exceedances	# of Detections	# of Samples[1]	Minimum Concentration	Maximum Concentration	Location of Maximum

Table 5-7 Data Qualifiers

Qualifier	Description
R	Rejected: The result is rejected due to deficiencies in the analytical system or the inability to meet QC criteria.
M	Matrix effect: The concentration is estimated due to a matrix effect.
J	Estimated: The analyte was positively identified, but the quantitation is an estimate due to discrepancies in meeting certain analyte-specific QC criteria.
J+	Estimated: The analyte was positively identified, but the quantitation is an estimate, possibly biased high, due to discrepancies in meeting certain analyte-specific QC criteria.
J-	Estimated: The analyte was positively identified, but the quantitation is an estimate, possibly biased low, due to discrepancies in meeting certain analyte-specific QC criteria.
B	Blank. The analyte was detected in an associated blank.
U	Undetected: The analyte was analyzed for but not detected.
UJ	The analyte was not detected; however, the result is estimated due to discrepancies in meeting certain analyte-specific QC criteria.

6. MNA EVALUATION OF SWMU 54

MNA is a remedial approach in which physical, chemical, and biological processes occur under favorable conditions, without human interferences to reduce the mass, toxicity, volume, concentration, and mobility of contaminants in soil and groundwater. The physical, chemical, and biological processes include biodegradation, dispersion, dilution, sorption, volatilization, and chemical or biological stabilization (USEPA, 1998). Analytical results from multiple groundwater sampling events at SWMU 54 were evaluated for qualitative indications of natural attenuation processes that may reduce the concentrations of the contaminants of interest (TNT, RDX, and perchlorate). The following sections present the results as they pertain to the lines of evidence used to demonstrate the potential for MNA.

6.1 FIRST LINE OF EVIDENCE: OCCURRENCE OF CONTAMINANT TRENDS

The first line of evidence consists of evaluating contaminant and daughter product concentrations for a downward trend in monitoring wells over time. SWMU 54 contains 14 wells (54MW1, 54MW2, 54MW3, 54MW4, 54MW5, 54MW6, 54MW7, 54MW8, 54MW9, 54MW10, 54MW11, 54MW12, 54MW13, and 54MW14), which targeted areas of potential nitroaromatic and perchlorate contamination. The target wells were reduced after the ninth and tenth quarters to 54MW1 (background), 54MW10, 54MW12, and 54MW13. Historical trends and the results of quarterly and semiannual groundwater sampling are discussed below, and the data are provided in **Table 6-1**, and in **Figures 6-1** through **6-3. Table 6-1** also includes the sampling month and year for the first through thirty-sixth quarters and the two semiannual events (thirty-seventh and thirty-eighth) in Year Ten.

2,4,6-TNT

The explosive 2,4,6-TNT was detected above the RG of 7.82 µg/L in wells 54MW12 and 54MW13 during the Year Ten monitoring period. TNT exceeded the RG in two wells, including one detection at 54MW12 (thirty-seventh event) and one detection at 54MW13 (thirty-seventh event).

Concentrations of 2,4,6-TNT have fluctuated in monitoring wells 54MW10, 54MW12, and 54MW13 during the 36 quarterly and two semiannual monitoring events. At monitoring well 54MW10, the 2,4,6-TNT concentration went from undetected in the ninth quarter to 50 µg/L in

the tenth quarter, which is the highest concentration recorded in this well during the 7 years of monitoring. The following five quarters of sampling (eleventh through fifteenth quarters) saw concentrations decline dramatically until a spike was observed during the sixteenth quarter. The concentration spike of 24.2 µg/L at 54MW10 exceeded the RG. Concentrations declined dramatically during the seventeenth through twentieth quarters of sampling, until the twenty-first quarter when concentrations spiked to 11.2 µg/L. During the twenty-second through twenty-fourth quarters, levels again receded, reaching a low of 0.67 µg/L during the twenty-third quarter and slightly elevating to 3.5 µg/L during the twenty-fourth quarter. The first three quarters of Year Seven showed levels receding again, reaching a low of 0.74 µg/L during the twenty-seventh quarter and elevating to 18.6 µg/L in the twenty-eighth quarter, with two additional spikes in the thirtieth and thirty-first quarters at 8.4 µg/L and 20.5 µg/L, respectively. Concentrations fluctuated in Year Nine but decreased in Year Ten as no TNT concentrations exceeded its RG in either semiannual event (5.4 µg/L in October 2021 and 3.0 µg/L in April 2022).

Monitoring well 54MW12 experienced the highest detected concentration of 2,4,6-TNT during the Year Seven monitoring period when a concentration of 164 µg/L was detected during the twenty-sixth quarter. The concentrations detected in 54MW12 in the remaining quarters, including the twenty-first through twenty-eighth quarters, were similar to historical concentrations, and a decreasing trend has been noted in the Year Eight twenty-ninth through thirty-second quarters. A spike was observed in the Year Nine thirty-fifth quarter. 2,4,6-TNT was detected at 9.3 µg/L during the thirty-seventh event in October 2021 which is consistent with concentrations noted over the past several years except for the spike noted above in the thirty-fifth event of 51.4 µg/L.

Monitoring well 54MW13 experienced the three high detections of 2,4,6-TNT during the Year Five monitoring period when two detections (8 µg/L and 8.5 µg/L [field duplicate 54TM13]) were observed during the seventeenth quarter, and one detection (8.2 µg/L) was observed during the twentieth quarter. Year Eight detections spiked in the twenty-ninth and thirty-second quarters at 12.5 µg/L and 8.3 µg/L, respectively. During the interim quarters, the levels returned to levels similar to historical concentrations. The highest detection happened during the Year Nine monitoring period when levels spiked to 17.7 µg/L during the thirty-fifth and thirty-sixth quarters. 2,4,6-TNT concentrations in Year Ten at monitoring well 54MW13 were 11.8 µg/L during the

thirty-seventh event and 5.8 µg/L during the thirty-eighth event which are consistent with historical levels except for some of the spiked levels noted above.

DNT Mixture

Previous reports noted that DNT was detected in the fourth, tenth, eleventh, and twelfth quarters of sampling at monitoring wells 54MW10, 54MW12, and 54MW13, yet the combined concentrations of 2,4-DNT and 2,6-DNT did not exceed the RG of 0.932 µg/L. During Year Six, neither 2,4-DNT nor 2,6-DNT were detected in any wells. Therefore, the combined concentrations of 2,4-DNT and 2,6-DNT did not exceed the RG in any of the four wells sampled. However, during Year Seven, 2,6-DNT was detected in 54MW12 (3.6 µg/L) and 54MW13 (0.91 µg/L); therefore, the combined concentrations of 2,4-DNT and 2,6-DNT for these two wells did exceed the RG of 0.932 µg/L in the twenty-sixth quarter. This sole RG exceedance for DNT mixture in the 7 years of monitoring coincides with a spike of 2,4,6-TNT in the well with the highest level of 2,4,6-TNT (54MW12). During Year Eight and Year Nine, levels returned to historical levels and no detections of these compounds were noted in Year Ten.

RDX

RDX concentrations fluctuated in monitoring wells 54MW10 and 54MW12 during the first 16 quarterly sampling events. At monitoring well 54MW10, a sharp increase in RDX concentrations was observed from 2.23 µg/L in the ninth quarter to 21 µg/L in the tenth quarter. The tenth quarter concentration was the highest concentration reported in this well during the 36 quarters of sampling. Concentrations decreased during the next 10 quarters of sampling (eleventh through twentieth quarters) in monitoring well 54MW10; however, during the twelfth and sixteenth quarters, RDX concentrations exceeded the RG. Concentrations again decreased during the next four quarters of sampling (twenty-first through twenty-fourth quarters) in monitoring well 54MW10. Monitoring well 54MW12 had 8 reported concentrations of RDX above the RG of 6.1 µg/L in the first 16 quarters of sampling. During the Year Five monitoring period, concentrations continued to remain below the RG, with the exception of the nineteenth quarter, when concentrations spiked to 51.4 µg/L. This concentration is the highest concentration observed at this well during all 36 quarters of sampling. The concentration then fell below the detection limit of 0.1 µg/L in the twentieth quarter. RDX was detected above the RG of 6.1 µg/L

every quarter of the Year Seven monitoring period in one monitoring well (54MW12). During the Year Seven monitoring period, the RDX concentration rose above the RG at monitoring well 54MW12 during the twenty-sixth quarter (13.5 µg/L). However, during Year Eight through Year Ten, RDX was detected below the RG of 6.1 µg/L every monitoring event.

No breakdown by-products were detected during the Year Ten monitoring period. Historically, RDX breakdown by-products have been observed in monitoring wells 54MW10, 54MW12, and 54MW13. These detections were observed in the tenth through twelfth quarters. The highest total concentrations were observed in monitoring well 54MW10 during the tenth quarter when a spike in RDX occurred. Thereafter, the RDX by-product concentrations steadily decreased. Similar correlations with RDX concentrations were observed in monitoring wells 54MW12 and 54MW13. The highest concentrations of DNX, MNX, and TNX were identified in monitoring wells 54MW12 and 54MW13 during the eleventh and tenth quarters, respectively, which coincide with the highest RDX concentrations recorded in these wells during that time period. There was no DNX, MNX, or TNX detected in monitoring well 54MW12 during the twenty-sixth quarter, when the spike of RDX was observed. TNX was detected at 0.39 µg/L in one well (54MW10) in the thirty-third quarter, and MNX was detected at 5.3 µg/L in one well (54MW12) in the thirty-sixth quarter.

Amino-DNT

As 2,4,6-TNT is biologically degraded, the two daughter products, 2ADNT and 4ADNT, are formed. During the Year Ten monitoring period, the by-products 2ADNT and 4ADNT were detected in monitoring wells 54MW10, 54MW12, and 54MW13 during both semiannual events (thirty-seventh and thirty-eighth events). There is good correlation of 2ADNT and 4ADNT concentrations with 2,4,6-TNT concentrations; i.e., as 2,4,6-TNT concentrations increase or decrease, a corresponding increase or decrease of 2ADNT and 4ADNT is observed. The increased presence of 2ADNT and 4ADNT, along with the increasing concentrations of 2,4,6-TNT, continues to suggest biological degradation of 2,4,6-TNT is occurring at these locations.

Perchlorate

Perchlorate concentrations at monitoring wells 54MW10, 54MW12, and 54MW13 continued to remain well below the RG of 10.9 µg/L during Year Ten of monitoring and are consistent with

concentrations observed through the first 9 years of monitoring. Historically, monitoring well 54MW12 has had two detected concentrations above the RG, which occurred in the fourth and eight quarters. Concentrations decreased during the Year Four monitoring event; this trend first was observed after the ninth quarterly sample event. However, one exception was observed during the fourteenth quarter when the concentration spiked to 8.85 µg/L. The fifteenth and sixteenth quarters saw a return to lower concentrations and a decreasing trend in perchlorate concentrations. During the Year Five monitoring, concentrations steadily rose from 1.6 µg/L to 4.3 µg/L through the seventeenth to nineteenth quarters, though none of the concentrations were above the RG. The twentieth quarter saw a return to a lower concentration of 1.1 µg/L. During the Year Six monitoring, concentrations fluctuated from 1.4 µg/L (twenty-first quarter) to 2.8 µg/L (twenty-third quarter) and back down to 1.7 µg/L (twenty-fourth quarter). Year Seven monitoring results mimicked those of Year Six; observed concentrations ranged from 1.4 µg/L (twenty-fifth quarter) to 3.7 µg/L (twenty-sixth quarter) and back down once again to 2.0 µg/L (twenty-seventh quarter) and to 0.61 µg/L (twenty-eighth quarter). Monitoring well 54MW12 continued to have the highest observed concentrations of perchlorate at SWMU 54 during Year Seven of monitoring but at concentrations below the RG.

Chloride, chlorate, and chlorite are daughter products of perchlorate degradation. At SWMU 54, chloride is present within the groundwater system, including monitoring well 54MW1 (background). Based on the chloride background concentrations through Year Three of monitoring, a determination could not be established that any measurable change exists due to perchlorate reduction. However, although chloride was detected at monitoring well 54MW1 during all of the Year Four monitoring events, the concentrations detected at wells 54MW10, 54MW12, and 54MW13 during the same period were all slightly higher than the concentrations in 54MW1. During the Year Five monitoring event, chloride was detected at monitoring well 54MW1 during the seventeenth through nineteenth quarters but was not detected during the twentieth quarter. The concentrations detected at monitoring wells 54MW10, 54MW12, and 54MW13 from the seventeenth through nineteenth quarter were all slightly higher than the concentrations in monitoring well 54MW1. During the twentieth quarter of the monitoring event, chloride was not detected in monitoring well 54MW10, but it was detected in monitoring wells 54MW12 and 54MW13 at concentrations similar to previous sampling quarters. During the Year Six monitoring

event, chloride was detected at all wells, including 54MW1 (background). Although chloride was detected at monitoring well 54MW1 during all of the Year Six monitoring events, the concentrations detected at monitoring wells 54MW10, 54MW12, and 54MW13 during the same period were all slightly higher than the concentrations in 54MW1. Chlorate and chlorite were not detected during the Year Six monitoring period with the exception of a detection at monitoring well 54MW10 during the twenty-second quarter (11 µg/L). Chlorate and chlorite went undetected in all of the monitoring wells during the Year Seven through Year Ten monitoring period. Chloride was detected in all monitoring wells for both monitoring events of Year Ten with the lowest concentrations observed in monitoring well 54MW1 (2.3 µg/L to 3.1 µg/L). Concentrations in the remaining three wells ranged from a low of 4.7 µg/L at monitoring well 54MW10 (thirty-seventh event) to a high of 7.6 µg/L at monitoring well 54MW13 (thirty-seventh event). This may suggest that chlorate and chlorite have been exhausted in the system and only residual amounts of chloride are being produced as perchlorate concentrations diminish.

Statistical Trends

The time series plots (**Figures 5-4** through **5-6**) show a large degree of variability in 2,4,6-TNT concentrations in wells 54MW10, 54MW12, and 54MW13; therefore, Mann-Kendall tests were run for these three monitoring wells using the USEPA software package ProUCL (USEPA, 2020). The results indicated a slight decreasing trend in 54MW12, but a slight increase at 54MW10 and a more significant increase at 54MW13 (**Appendix C**).

The contaminant concentrations for 2,4,6-TNT, RDX, and perchlorate for the three impacted wells were plotted together to assess a possible correlation between the spike timing among the three wells (**Figures 6-1** through **6-3**). None was apparent; however, there were correlations in all three wells with regard to 2,4,6-TNT, RDX, and perchlorate spikes (i.e., spikes in a given contaminant generally included spikes in the other two contaminants in each well). The two highest 2,4,6-TNT concentrations were recorded in Year Nine monitoring but presented a decrease for Year Ten.

Contaminant concentrations for 2,4,6-TNT, RDX, and perchlorate were plotted against groundwater elevation to determine whether the large spike seen in monitoring wells 54MW10, 54MW12, and 54MW13 may be related to water level changes. **Figures 6-1** through **6-3** demonstrate the correlation between the contaminant concentrations at all three wells and

groundwater elevation. At monitoring well 54MW10, when groundwater elevation rises, contaminant concentrations appear to decrease. The data suggest a direct relationship between groundwater levels and 2,4,6-TNT, RDX, and perchlorate concentrations, in that elevated concentrations of each are observed with elevated groundwater levels at monitoring well 54MW12. At monitoring well 54MW13, however, contaminant concentrations appear to rise on the backside of a groundwater elevation rise (note fifth, tenth, twelfth, sixteenth, twentieth, twenty-fourth, and twenty-ninth through thirty-second quarters; although, the Year Ten data suggest otherwise [**Figure 6-3**]).

Additionally, Mann-Kendall tests were run for monitoring wells 54MW10, 54MW12, and 54MW13 to track the trend of perchlorate. The results indicated a decreasing trend for 54MW12, with no significant trend indicated in wells 54MW10, and a slightly increasing trend at 54MW13 for perchlorate (**Appendix C**).

First Line of Evidence: Results

Although the 2,4,6-TNT concentrations have shown variability over time, the first line of evidence indicates that the presence of daughter products, 2ADNT and 4ADNT, suggests that natural attenuation through biological degradation of 2,4,6-TNT is occurring at SWMU 54. Overall decreasing trends in RDX suggest natural attenuation of RDX and perchlorate is occurring.

6.2 SECOND LINE OF EVIDENCE: GEOCHEMICAL CONDITIONS

Respiratory substrates are used preferentially during microbial metabolism based on the amount of energy that can be derived from each of them. Respiratory substrates are used in the following order:

$$O_2 > NO_3^- > Fe^{+3} > ClO_4 > SO_4^{-2} > CO_2$$

Geochemical data are available for all 36 quarterly groundwater monitoring events at SWMU 54. Field parameters (DO, ORP, pH, temperature, and specific conductivity) have been collected since 2011 as part of the low-flow sampling procedures. Laboratory analyses for nitrate, sulfate, and TOC were conducted for all 36 quarterly and both semiannual groundwater monitoring events at

SWMU 54. These geochemical data are discussed regarding the potential for biodegradation in the groundwater at SWMU 54.

The microbial degradation of nitroaromatic compounds primarily occurs under nitrate-reducing conditions, whereas perchlorate requires sulfate-reducing groundwater conditions.

DO

The preferred terminal electron acceptor during aerobic microbial respiration is oxygen, and DO is measured to determine whether the groundwater is under aerobic or anaerobic conditions. Average DO values less than 1 mg/L are supportive of anaerobic microbial activities. Further, DO values higher than 8 mg/L are considered biased high given their relative magnitude to oxygen solubility at field temperatures and are not included in this analysis.

During the Year Ten monitoring period, DO values ranged from 0.42 mg/L (54MW1) to 6.84 mg/L (54MW12) for the thirty-seventh event and from 1.81 mg/L (54MW10) to 6.19 mg/L (54MW12) for the thirty-eighth event, which were similar to the Year Eight and Year Nine monitoring results. In wells where biological degradation products were observed (54MW10 and 54MW12), the DO concentrations indicate that aerobic conditions appear to be favored (**Table 6-2**). 2,4,6-TNT has been known to be reduced under a variety of conditions (aerobic and anaerobic); however, further reduction of 2,4,6-TNT breakdown products, including 2ADNT and 4ADNT, and reduction of RDX and perchlorate are more favorable under anaerobic conditions (Spain, 1995).

The increase in concentrations of explosive constituents at monitoring wells 54MW10, 54MW12, and 54MW13 during the Year Nine monitoring event took place under aerobic conditions. Under aerobic conditions, biodegradation is not as effective in the reduction of explosives and perchlorates. As a result of the subsurface biochemistry, the decreased biological activity may have also led to an increase in the explosive and perchlorate concentrations during the Year Nine monitoring period. Explosive constituent concentrations for Year Ten were generally less than Year Nine.

ORP

ORP values indicate the groundwater's reductive potential and are used to confirm the DO measurements in groundwater. ORP values less than +50 mV typically correspond to mildly reducing anaerobic conditions, whereas ORP values less than -200 mV correspond to highly reducing anaerobic conditions. As mentioned previously, TNT reduction can occur in aerobic systems, but the reduction of TNT breakdown products, RDX, and perchlorate are favored under anaerobic conditions (generally observed when ORP values are between -100 mV and 0 mV).

ORP concentrations during the first 12 quarterly sampling events (early 2011 to May 2014) ranged from -33 to 297 mV, indicating both anaerobic and aerobic conditions were present at the site. However, it was reported that aerobic conditions appeared to be more prevalent (**Table 6-2**). Further, the Year Three ORP values and DO readings did not show a clear corresponding trend for samples taken at the same well and same sampling event. At monitoring wells with elevated concentrations of TNT and RDX (54MW10, 54MW12, and 54MW13), it was suggested that ORP readings were in agreement with DO concentrations, indicating aerobic conditions.

The Year Four ORP readings ranged from -10.1 mV to 264 mV, indicating that both anaerobic and aerobic conditions were present at SWMU 54. However, there was only one reading (at 54MW1 in the sixteenth quarter), indicating reducing conditions; as such, it would appear that aerobic conditions are more prevalent at the SWMU. The Year Four ORP trends were generally in agreement with Year Three.

The Year Five ORP readings ranged from 15.5 mV (54MW13) to 138.2 mV (54MW1), indicating aerobic conditions were present at SWMU 54. The data suggest that aerobic conditions are more prevalent at the SWMU. The Year Five ORP trends are generally in agreement with Year Four.

The Year Six ORP readings ranged from -19.9 mV (54MW10) to 204.7 mV (54MW12), indicating both anaerobic and aerobic conditions were present at SWMU 54.

The Year Seven ORP ranged from -34.5 mV (54MW1) to 238.7 mV (54MW12), once again indicating both anaerobic and aerobic conditions were present at SWMU 54. The data suggest that aerobic conditions continue to be more prevalent at the site.

ORP readings from Year Eight ranged from 32.8 mV (54MW10) to 161.5 mV (54MW12), indicating both anaerobic and aerobic conditions at minimum were present at SWMU 54. Year Eight data suggest that aerobic conditions continue to be more prevalent at the site.

ORP readings from Year Nine ranged from 19.8 mV (54MW10) to 195.9 mV (54MW12), indicating both anaerobic and aerobic conditions at minimum were present at SWMU 54. Year Nine data suggest that aerobic conditions continue to be more prevalent at the site.

ORP readings from Year Ten ranged from 52.7 mV (54MW1) to 193.4 mV (54MW12), indicating both anaerobic and aerobic conditions at minimum were present at SWMU 54. Year Ten data suggest that aerobic conditions continue to be more prevalent at the site.

pH

The pH for optimum microbial activity ranges from 6.06 SU to 7.59 SU (USEPA, 1998). Microbial activity may decrease at lower pH values. The first 6 years of pH data are within this optimal pH range (**Table 6-2**) and continued during Year Ten. In general, the pH environment at SWMU 54 is suitable for microbial activity.

Nitrate

Following oxygen, microorganisms preferentially use nitrate as a terminal electron acceptor. Diminished nitrate concentrations may indicate nitrate-reducing conditions, which promote the degradation of nitroaromatics (including 2,4,6-TNT) forming breakdown by-products. It should be noted that elevated nitrate concentrations (greater than 1 mg/L) will inhibit perchlorate reduction, and, additionally, any nitrate would preferentially be reduced to nitrite before TNT and RDX could be reduced (Interstate Technology and Regulatory Council [Perchlorate Team], 2008).

Nitrate concentrations during the first 36 sampling events were generally low (overall less than 1 mg/L) with concentrations ranging from non-detect to 4.8 mg/L, suggesting that perchlorate reduction is not inhibited (**Table 6-2**). Year Ten monitoring nitrate concentrations ranged from non-detect to 0.75 mg/L, which is consistent with previous monitoring events.

Monitoring well 54MW12, where historically the highest and more persistent perchlorate concentrations have been identified, consistently had nitrate concentrations greater than 1 mg/L during the first 16 quarters of monitoring.

During the Year Five monitoring period, however, the nitrate concentrations were only greater than or equal to 1 mg/L during two sampling events (seventeenth and nineteenth quarters).

During the Year Six monitoring period, nitrate concentrations were consistently higher than 1 mg/L for the twenty-second through twenty-fourth quarters. Only during the twenty-first quarter was the concentration below 1 mg/L.

During the Year Seven monitoring period, nitrate concentrations were consistently higher than 1 mg/L for the twenty-fifth through twenty-seventh quarters. Only during the twenty-eighth quarter was the concentration below 1 mg/L. In contrast, the corresponding reduction of 2,4,6-TNT concentrations and accrual of 2ADNT and 4ADNT present suggest the biodegradation of TNT.

During the Year Nine monitoring period, nitrate concentrations were only higher than 1 mg/L during the thirty-fifth quarter.

During the Year Ten monitoring period, nitrate concentrations were less than 1 mg/L for both semiannual monitoring events.

Ferrous Iron

Ferric iron is reduced to soluble ferrous iron in the groundwater where iron-reducing bacteria have been active. An increase in ferrous iron concentrations is indicative of iron-reducing conditions. Biological reduction of TNT is favored in iron-reducing conditions; therefore, elevated concentrations of ferrous iron are an indicator of favorable groundwater conditions for TNT degradation.

Ferrous iron concentrations for all wells during the 5 previous years of monitoring have been less than 0.2 mg/L (non-detect) or equal to 0.2 mg/L, indicating that iron-reducing conditions are not present at this time, or that the iron has been reduced previously.

During the Year Five monitoring events, ferrous iron concentrations for all wells was less than 0.2 mg/L (non-detect) with the exception of monitoring well 54MW10 during the seventeenth quarter, when concentrations increased to 0.52 mg/L and then decreased to 0.04 mg/L during the eighteenth quarter.

During the Year Six monitoring events, ferrous iron concentrations for all wells were less than 0.2 mg/L with the exception of monitoring well 54MW13 during the twenty-second quarter, when concentrations increased to 0.26 mg/L, and then decreased to 0.0 mg/L (non-detect) during the twenty-third quarter.

During the Year Seven monitoring events, ferrous iron concentrations for all wells were less than 0.2 mg/L with the exception of monitoring well 54MW12 during the twenty-seventh quarter, when concentrations increased to 0.21 mg/L, and then decreased to 0.14 mg/L during the twenty-eighth quarter.

During the Year Eight monitoring events, ferrous iron concentrations for all wells were less than 0.20 mg/L, whereas Year Nine indicated ferrous iron concentrations were less than 0.10 mg/L.

For the Year Ten monitoring events, an increase in ferrous iron concentrations was noted with concentrations noted up to 2.01 mg/L. Ferrous iron concentration ranges of 0.01 to 0.10 mg/L were noted for the thirty-seventh monitoring event and 0.01 to 2.01 mg/L noted for the thirty-eighth event.

Sulfate

Biological degradation of TNT breakdown products (2ADNT and 4ADNT), RDX, and perchlorate actively occurs under sulfate-reducing conditions. Sulfate concentrations greater than 20 µg/L may cause competitive exclusion (USEPA, 2008). Sulfate concentrations were measured in the groundwater during each of the first 12 quarterly monitoring events and were found to generally be greater than 20 mg/L (ranging from 15.0 mg/L to 403 mg/L), indicating that biological degradation of 2ADNT and 4ADNT may be inhibited at SWMU 54 (**Table 6-2**).

During Year Four of monitoring, sulfate concentrations were slightly lower (ranging from 19 mg/L to 93 mg/L), but again suggested inhibition of biological degradation of the 2,4,6-TNT by-products 2ADNT and 4ADNT.

During Year Five of monitoring, sulfate concentrations were found to be greater than 20 mg/L (ranging from 28.0 mg/L to 150.0 mg/L), again indicating that biological degradation of 2ADNT and 4ADNT is inhibited at SWMU 54.

During Year Six of monitoring, sulfate concentrations were again greater than 20 mg/L (ranging from 25.0 mg/L to 100.0 mg/L).

During Year Seven of monitoring, sulfate concentrations were again greater than 20 mg/L (ranging from 23 mg/L to 69 mg/L) for all monitoring wells with the exception of 54MW13, where concentrations dropped to 16 mg/L and 15 mg/L (twenty-fifth and twenty-sixth quarters, respectively).

Year Eight sulfate concentrations were generally greater than 20 mg/L (ranging from 17 mg/L to 140 mg/L) for all monitoring wells, where concentrations dropped to 17 mg/L in the thirty-second quarter.

Sulfate concentrations were lower in Year Nine than Year Eight, but similar to Year Seven, with a concentration range of 24 mg/L to 96 mg/L. This indicates that biological degradation of 2ADNT and 4ADNT is inhibited at SWMU 54, but conditions clearly appear to be improving.

Sulfate was detected at a concentration range of 28 mg/L to 120 mg/L in Year Ten which is slightly higher than Year Nine.

TOC

Organic carbon is a required source of reduced carbon and energy needed to sustain microbial degradation of nitroaromatics and perchlorate. TOC concentrations greater than 20 mg/L are considered adequate to support microbial activity. For the majority of the first 3 years of monitoring, TOC concentrations were found to be considerably lower than what is considered adequate to support microbial activity. TOC concentrations during this timeframe ranged from less

than 0.50 mg/L (non-detect) to 7.47 mg/L (**Table 6-2**). However, measured TOC concentrations during the twelfth quarter exceeded 20 mg/L in monitoring wells 54MW1 (51.0 mg/L) and 54MW10 (63.0 mg/L). The Year Four, Year Five, Year Six, and Year Seven TOC results, however, again indicated low concentrations considered inadequate to support microbial activity. The range of TOC during the Year Four, Year Five, Year Six, and Year Seven monitoring periods ranged from 0.3 mg/L to 13 mg/L. This trend continued throughout the Year Eight monitoring events, with concentrations ranging from 0.53 mg/L to 0.99 mg/L, whereas Year Nine indicated TOC concentrations ranging from non-detect to 2.4 mg/L. Year Ten indicated TOC concentrations ranging from non-detect to 1.5 mg/L which is similar to the past two years.

TIC

Inorganic carbon species include carbon dioxide, carbonic acid, and carbonate. The presence of TIC is a useful source of carbon needed to sustain microbial degradation. The oxidation of organic matter should lead to an increase of TIC in groundwater. TIC concentrations during this monitoring period ranged from 60 mg/L to 91 mg/L with only slight variations noted during each semiannual monitoring event (**Table 6-2**). In addition, TIC concentrations have shown little variation over the last five years of monitoring, which is consistent with the general low variability of organic contaminant concentrations in groundwater samples over the same period.

Specific Conductivity

Figure 6-4 provides a time series plot of specific conductivity at all four wells. Specific conductivity is the indirect measure of the presence of dissolved solids, such as chloride, nitrate, sulfate, iron, and all degradation by-products. **Figures 6-5** through **6-7** provide time series plots of MNA indicators sulfate and nitrate alongside water quality parameters iron and manganese at monitoring wells 54MW10, 54MW12, and 54MW13 for all 9 years. Additionally, **Figures 6-8** through **6-10** provide time series plots of MNA indicator TOC alongside water quality parameters DO and ORP at monitoring wells 54MW10, 54MW12, and 54MW13 for all nine years. Biodegradation of 2,4,6-TNT, RDX, perchlorate, and more dissolved inorganic ions (such as chlorides, nitrates, sulfates, and iron) would create the electrical current witnessed in the specific conductivity readings.

Monitoring wells 54MW10, 54MW12, and 54MW13 all appear to have similar specific conductivity activity according to **Figure 6-4**. Additionally, **Figures 6-5** through **6-7** demonstrate that iron and dissolved manganese have been reduced to concentrations at or very near zero at all three wells. Overall, there are sulfate-reducing conditions at all three wells, which is indicative of biodegradation of 2ADNT, 4ADNT, RDX, and perchlorate. Nitrate concentrations at monitoring well 54MW13 have always been at or slightly above zero. Nitrate reducing conditions remain present at monitoring well 54MW12.

Figures 6-8 through **6-10** demonstrate that ORP conditions at monitoring well 54MW10 support mildly anaerobic conditions; at monitoring wells 54MW12 and 54MW13, ORP is declining overall and beginning to support mildly reducing anaerobic conditions, although both of these wells saw increases in ORP in the thirty-first and thirty-second quarters. DO conditions at all three wells are aerobic. TOC conditions at monitoring well 54MW10 fluctuate between inadequate and adequate conditions. Since the seventeenth quarter and continuing through the thirty-eighth event (Year Ten), TOC concentrations have remained below 20 mg/L, which is considered inadequate. Meanwhile, conditions at monitoring wells 54MW12 and 54MW13 have consistently been considered inadequate and have remained so since the first quarter. TOC concentrations at monitoring wells 54MW12 and 54MW13 have ranged between less than 0.5 mg/L and 13 mg/L; these concentrations are considered inadequate for sustaining microbial degradation of nitroaromatics and perchlorate. Overall, the data suggest that MNA conditions are still favorable at all three wells.

Notes:
All units are µg/L.
'-- = not sampled
Bolded data indicate exceedances of RGs.
2,4,6-TNT = 2,4,6-trinitrotoluene
µg/L = micrograms per liter
DNT = dinitrotoluene
ND = not detected
RDX = cyclotrimethylenetrinitramine
RG = remedial goal
SWMU = Solid Waste Management Unit

7. SUMMARY AND CONCLUSIONS

This report covers the first 10 years (36 quarters and 2 semiannual events) of groundwater monitoring, herein Year Ten's data are discussed in detail. The first 9 years were described in previous annual reports. Fourteen groundwater monitoring wells were sampled on a quarterly basis for over 2 years (nine quarters) at SWMU 54. After the ninth and tenth quarters, the monitoring program was reduced to the three wells (54MW10, 54MW12, and 54MW13), which have had COI concentrations above RGs, and an upgradient well (54MW1). Sampling of the monitoring wells associated with Area B were also discontinued after the tenth quarter because no concentrations were detected above their RGs.

Samples collected during the first 12 quarters were analyzed for explosives, perchlorate, and MNA indicators. During the tenth through thirty-sixth quarters, samples were also analyzed for RDX breakdown by-products. Sample results were compared to RGs and evaluated to determine whether MNA is occurring at the SWMU. This report presents and summarizes the analytical results of the first 10 years (36 quarters and 2 semiannual events) of monitoring.

Based on contaminant concentrations and biological indicator parameters measured in groundwater at SWMU 54 during Year Ten, concentrations of 2,4,6-TNT remain above RGs for Year Ten at 54MW12 and 54MW13. MNA processes have been reducing the concentrations; however, TNT concentrations decreased during the Year Ten results as compared to the Year Nine results at 54MW10.

In summary, the following conclusions and recommendations are made regarding the potential for MNA in contaminated groundwater at SWMU 54:

- Presence of 2,4,6-TNT daughter products 2ADNT and 4ADNT is further evidence that biological degradation has occurred, which may be aiding in removing mass in the groundwater.
- Identification of RDX breakdown by-products DNX, MNX, and TNX indicates active degradation of RDX. Historically, RDX concentrations at monitoring wells 54MW10, 54MW12, and 54MW13 are consistently below the RG of 6.1 µg/L. During the Year Ten monitoring period, no detections were noted above the RG in any of the two semiannual events (thirty-seventh and thirty-eighth events).
- All perchlorate concentrations in Year Three through Year Ten of monitoring are below the RG and showed a steady decline in concentrations during this 7-year period, with the exception of results at monitoring wells 54MW10 and 54MW12 in the thirty-third quarter.

Observed concentrations of DO and ORP during Year Ten indicate both aerobic and anaerobic conditions exist at SWMU 54. However, aerobic conditions were determined to be more prevalent. Although TNT has been known to be degraded under a variety of conditions (aerobic and anaerobic), further degradation of 2ADNT and 4ADNT, and reduction of RDX and perchlorate, are more favorable under anaerobic conditions (Spain, 1995).

The source removal efforts at SWMU 54 appear to have been effective in significantly lowering the site-wide COIs in groundwater. This is evident by the fact that 11 of the 14 monitoring well locations (54MW1 through 54MW9, 54MW11, and 54MW14) observed concentrations below the site-selected RGs for eight consecutive quarters for 2,4,6-TNT, DNT mixture, RDX, and perchlorate. As recommended in the Final SWMU 54 MNA IMWP (Shaw, 2011a), and Year Two MNA Report (CB&I, 2013), these wells were removed from the MNA sampling program after the ninth and tenth quarters.

Explosive concentrations through 36 quarters and 2 semiannual events of groundwater monitoring indicate that limited biodegradation at well locations 54MW10, 54MW12, and 54MW13 (SWMU 54 Area A wells) is occurring. Based on the localized distribution of elevated constituents, the generally declining concentrations site-wide, and the fact that groundwater is bounded within RFAAP by the New River and its use can be controlled by RFAAP, an active groundwater remedy at SWMU 54 does not appear necessary at this time.

The direction and speed of groundwater flow is consistent across all reporting periods and the current network of groundwater monitoring wells is adequate for future groundwater monitoring events.

Well ID: 54MW10	Weather: Mostly fair, 45°F
Sampling Team: M. Ewald / P. Taylor	Sampler's Signature:

WELL INSPECTION

Protective Casing: Intact/Damaged	Well ID Tag Condition: None
Locked: YES / NO	Measuring Point Marked: YES / NO
Concrete Base: Intact/Damaged	Comments:
Casing Diameter: ½ in., ¾ in., 1 in., 1 ½, 2 in., 3 in., 4 in., 6 in., 8 in.	

WELL EVACUATION INFORMATION

Total Depth (feet Below Top of Casing = ft. BTOC): 30.1	Well Evacuation Method (peristaltic, bladder pump, other):
Depth to Water (ft. BTOC): 16.95	Screen Interval (ft. BGS):
Begin Well Evacuation (Time): 1008	Evacuation Rate (Lpm): 0.15
Stop Evacuation (Time/Reason):	Restart Time:
	Headspace (ppm): 0.0

INDICATOR PARAMETERS

Time: (5 minute intervals)	Volume Purged (L):	Depth to Water (ft. BTOC):	Temperature (°C): (3%)	Specific Conductivity (µS/cm): (3%)	D.O. (mg/L): (10%)	pH: (±0.1)	ORP (mV): (±10 mV)	Turbidity (NTU): (10%)
1013	0.75	17.05	13.4	723	0.62	7.50	119.4	10.1
1018	1.5	17.08	13.3	720	0.48	7.38	121.5	9.02
1023	2.25	17.08	13.2	715	0.45	7.33	122.4	7.2
1028	3.0	17.08	13.4	705	0.46	7.28	123.7	7.3

Red font indicates stabilization criteria to be achieved over three consecutive readings.

Final Depth to Water (ft. BTOC):	Drawdown Observed (ft): 0.03
Odor: YES / NO Sulfur	Well Pumped Dry: YES / NO
End Well Evacuation (Time):	Total Volume Purged (L): 3.0

SAMPLE COLLECTION INFORMATION

Sample ID: 54MW10	PARAMETERS (Circle all applicable):
Sample Date & Time: 10/27/2021 1040	SWMU 49: VOCs, MEE, Chloride/Nitrate/Sulfate, TOC, Ferrous FE, & Mn
Duplicate Sample ID: 54TW10	SWMU 54: Explosives, Perchlorate, Chlorate/Chlorite, Chloride/Nitrate/Sulfate, TIC, TOC, Ferrous FE, & Mn
Manganese (mg/L): 1.1	Sample Collection Method: Low Flow (LF) Other:
Ferrous Iron (mg/L): 0.1	Sample Collection Depth (ft. BTOC): 28

LABORATORY ANALYTICAL REPORTS

CT LABORATORIES

delivering more than data from your environmental analyses

ANALYTICAL RESULTS FOR:

ANTHONY PACE
WESTON SOLUTIONS, INC.
2 EATON STREET
SUITE 603
HAMPTON, VA 23669

PROJECT SITE:	RFAAP SWMU-54; RADFORD, VA
DOD CONTRACT #:	
PROJECT #:	
SDG:	***165486***
PREPARED:	December 3, 2021
TOTAL # OF PAGES:	629

The data contained in the following report have been reviewed by the appropriate CT Laboratories' LLC staff members. In addition, CT Laboratories LLC certifies that to the best of our knowledge that the analyses reported herein are true, complete and correct within the limits of the methods employed and that they follow the applicable requirements as specified by the project plan, state-specific, NELAC or DOD QSM requirements. The estimated uncertainty of measurement is only available upon request. The reported results relate only to the tested samples. This report shall not be reproduced, except in full, without written approval of CT Laboratories LLC.

Case Narrative

Client: Weston Solutions
Project: RFAAP SWMU-54, Radford, VA
Sample Receipt Date: 10/28/2021
SDG #: 165486

Six water samples were received for a variety of analytical parameters, including: Metals, pH, COD, Anions, Chlorate/Chlorite, TIC, and TOC. The Chlorate/Chlorite analysis was subcontracted to Eurofins Eaton Analytical in South Bend, IN. The assigned sample ID number, date sampled, and date received are indicated in the attached Project Summary. The samples were received intact and at a temperature within method specified acceptance limits. A breakdown of sample receipt information can be found on the Sample Condition Report located in the last section of the data package and any exceptions are noted below. The analyses were performed following DOD QSM 5.3 requirements.

Manual integrations may have been performed on the data provided with this package. If manual integrations were performed, a Reason #(s) was included on the raw data that corresponds to the "Index Key for Manual Integration Rationale." The raw data includes a "Before" and "After" manual integration illustration. The manual integrations were initialed and dated by the analyst, as well as, by the person reviewing the data.

Sample Analysis and Quality Control

Metals Analysis:

The samples were analyzed using US EPA Methods 6010C (ICP) and 7470A (Hg). All samples were analyzed within the holding time. The following summaries of quality control procedures are included:

Initial and Continuing Calibration Verification
Blanks Summary
ICP Interference Check Data
Spike Sample Recovery
Duplicates Data
Laboratory Control Sample Data
Analysis Run Log

All analysis results met the method specified quality control criteria with the following exceptions:

ICP Metals (6010C) Water Analysis

Continuing Calibration Verification (CCV) standards were analyzed at two levels (CCV1 & CCV2) with potentially differing wavelengths. Data associated with CCV's were evaluated based on the concentration of the element in the samples and compared to the appropriate CCV level/wavelength.

Some samples may have been analyzed and/or reanalyzed diluted to obtain results for all target analytes within the calibration range of the instrument.

Analytical Run # 196907

Iron was detected in the Method Blank (MB) greater than the Method Detection Limit (MDL) but less than ½ the Reporting Limit (RL). The sample was reported and not qualified because the MB result was less than 1/10th of the sample result.

The Duplicate (DUP) for sample # 1066849 was not applicable for aluminum, antimony, arsenic, beryllium, cadmium, chromium, cobalt, copper, lead, manganese, nickel, selenium, silver, thallium, vanadium, and zinc because the parent sample results were less than five times the Limit of Quantitation (LOQ). A Matrix Spike Duplicate (MSD) was analyzed to demonstrate precision and was acceptable. The parent sample was reported and not qualified.

The Matrix Spike (MS) and/or MSD for sample # 1066849 had recoveries outside the specified limits for aluminum, calcium, copper, iron, and silver. A Serial Dilution (L) was analyzed and was not applicable for aluminum, copper, iron, and silver because the parent sample raw results were less than 50 times the LOQ. The L was not acceptable for calcium because the result exceeded the Relative Percent Difference (RPD) limit. A Post Digestion Spike (PDS) was analyzed and was unacceptable for silver. The parent sample was reported and qualified with an "M" flag for the failing element.

ICP Sodium & Potassium (6010C) Water Analysis

Analytical Run # 194020

The DUP for sample # 1030878 was not applicable for potassium because the parent sample result was less than five times the LOQ. An MSD was analyzed to demonstrate precision and was acceptable. The parent sample was reported and not qualified.

CVAA Mercury (7470A) Water Analysis

Analytical Run # 194190

The DUP for sample # 1030878 was not applicable for mercury because the parent sample result was less than five times the LOQ. An MSD was analyzed to demonstrate precision and was acceptable. The parent sample was reported and not qualified.

Inorganic Analysis:

The samples were analyzed using US EPA Methods 9060A (TIC/TOC), 9040C (pH), 410.4 (COD) and 9056A (Anions). All samples were analyzed within the holding time unless noted below. The following summaries of quality control procedures are included:

Duplicate Analysis Data
Laboratory Control Spike Data
Method Blank Data
Initial Calibration Summary
Calibration Check Summary
Analysis Run Log
Prep Log

All analysis results met the method specified quality control criteria with the following exceptions:

Some samples may have been analyzed and/or reanalyzed diluted to obtain results for all target analytes within the calibration range of the instrument.

Anions (9056A) Water Analysis

Analytical Run # 196892

The MS and the MSD for sample # 1066840 had a low recovery for sulfate. The parent sample result for this analyte was qualified with an “M” flag.

COD (410.4) Water Analysis

Analytical Run # 197021

All analytical results for this run met the method/project specified quality control criteria.

pH (9040C) Water Analysis

Analytical Run # 196890

All analytical results for this run met the method/project specified quality control criteria.

TIC (9060A) Water Analysis

Analytical Run # 197009

All analytical results for this run met the method/project specified quality control criteria.

TOC (9060A) Water Analysis

Analytical Run # 197156

All analytical results for this run met the method/project specified quality control criteria.

Data Qualifiers

Code	Description
A	Analyte averaged calibration criteria within acceptable limits.
B	Analyte detected in associated Method Blank.
C	Toxicity present in BOD sample.
D	Diluted Out.
E	Safe, No Total Coliform detected.
F	Unsafe, Total Coliform detected, no E. Coli detected.
G	Unsafe, Total Coliform detected and E. Coli detected.
H	Holding time exceeded.
J	Estimated value.
L	Significant peaks were detected outside the chromatographic window.
M	Matrix spike and/or Matrix Spike Duplicate recovery outside acceptance limits.
N	Insufficient BOD oxygen depletion.
O	Complete BOD oxygen depletion.
P	Concentration of analyte differs more than 40% between primary and confirmation analysis.
Q	Laboratory Control Sample outside acceptance limits.
R	See Narrative at end of report.
S	Surrogate standard recovery outside acceptance limits due to apparent matrix effects.
T	Sample received with improper preservation or temperature.
U	Analyte concentration was not above the detection level.
V	Raised Quantitation or Reporting Limit due to limited sample amount or dilution for matrix background interference.
W	Sample amount received was below program minimum.
X	Analyte exceeded calibration range.
Y	Replicate/Duplicate precision outside acceptance limits.
Z	Calibration criteria exceeded.

MANUAL INTEGRATION REASON CODES

CTLaboratories has identified four general cases with valid reasons supporting the use of manual integration techniques. These codes are used on chromatograms in this data package to document the reasons for manual integrations per CTLaboratories' SOP SS-10 current revision.

#1: **Data system failed to select the correct peak or missed the peak entirely.**
In some cases the chromatography system selects and integrates the "wrong peak". In this case the analyst must correct the selection and force the system to integrate the proper peak. In other instances the system may miss the peak completely. In this case the analyst manually integrated the peak

#2: **Data System Splits the Peak Incorrectly or Integrates a False Peak as a Rider Peak.**
This phenomenon is common at low concentrations where the signal to noise ratio is low. A single compound (peak) is incorrectly split into multiple peaks or integrated as a main peak with one or more rider peaks resulting in low or high area counts for the target compound.

#3: Improperly Integrated Isomers and/or coeluting compounds.
For when the system fails to distinguish coeluting compounds and or isomers. The integration areas and concentrations may be inaccurate, and they must be corrected by manual integration. Prime examples are compounds that are unresolved and integrated improperly when present at low concentrations in standards or samples.

#4: System Established Incorrect Baseline.
There are numerous situations in chromatography where the system establishes the baseline incorrectly. Some baseline errors will be obvious to the analyst and may be corrected via manual procedures.

#5: Miscellaneous.
Some situations involving integration errors may require in-depth review and technical judgment. These cases should be brought to the attention of the group supervisor. If the form of manual integration is not clearly covered by these four cases, then review and approval by the group supervisor or the *QA/QC* Supervisor will be required.

Data Review Checklist

	Method: Anions by Ion Chromatography 300.0/9056	Independent Data Review Checklist	Instrument: Aquion - System 4

LIMS Run #(s)	Analysis Date	Analyst/Data Interpreter	Independent Reviewer	Date of Review	Approved? (Yes/No)
196891 196892	10/28/2021	TMG	RLD	10/29/2021	Yes

Instructions: Complete one checklist per *analytical sequence* . Enter the appropriate response for each question. Each "No" response requires an explanation in the Comments section, and may require the initiation of a Nonconformance Report.

Requirement	Acceptance Criteria	Analyst Review		Independent Review		Comments
		Yes	No	Yes	No	(Indicate reference to an attachment if necessary)
1. Were the samples analyzed within hold time?	28 days for Cl, F, SO_4;14 days for preserved NO_2+NO_3; 48 hours for O.Phos, and unpreserved NO_2 and NO_3	Yes		Yes		
2. Was the calibration performed using the required number of standards?	Minimum three plus a blank	Yes		Yes		
3. Is the standard prep log number noted on the analytical report bench sheet?	---	Yes		Yes		
4. Was the correlation coefficient acceptable?	≥ .995	Yes		Yes		
5. Were the ICV and ICB run immediately after the calibration check standard?	---	Yes		Yes		
6. Was the ICV recovery acceptable?	90 – 110 % or contract/program specific	Yes		Yes		
7. Was the ICB result acceptable?	< LOD or contract/program specific	Yes		Yes		
8. Were the CCV's and the CCB's analyzed at the required frequency?	1 / 10 samples or contract/program specific	Yes		Yes		
9. Were the CCV recoveries acceptable?	90 – 110 % or contract/program specific	Yes		Yes		
10. Were the CCB results acceptable?	< LOD or program/project specific	Yes		Yes		
11. Was the MB analyzed at the required frequency?	1 / 20 samples or contract/program specific	Yes		Yes		
12. Were the MB results acceptable?	< LOD or contract/program specific	Yes		Yes		

13. Was a LCS run at the required frequency?	1 / 20 samples or contract/program specific	Yes		Yes		
14. Was the LCS recovery acceptable?	Within in-house or contract/program specific limits	Yes		Yes		
15. Was the LCS used before the indicated expiration date?	---	Yes		Yes		
16. Were the MS and MSD (when required) prepared at the required frequency?	1 per 20 samples per matrix or contract/program specific	Yes		Yes		
17. Were the MS and MSD (when required) recoveries acceptable?	Within In-house or contract/program specific limits		No		No	Affected sample results were "M" flagged
18. Was the RPD between the MS and MSD (when required) acceptable?	Within in house or contract/program specific limits	Yes		Yes		
19. Was a sample duplicate prepared at the required frequency?	Contract/program specific or 1 per 20 samples (1 / 10 for SDWA samples)	Yes		Yes		
20. Was the duplicate within precision limits?	Within in-house or contract/program specific limits	Yes		Yes		
21. Were all chromatograms checked to ensure accurate peak identification?	---	Yes		Yes		
22. Are all samples on the job lists accounted for?	---	Yes		Yes		
23. Were all samples having analytes detected in amounts exceeding the calibration range diluted, reanalyzed and DF applied to the final results?	---	Yes		Yes		
24. Were non-matrix related nonconformities (if applicable) documented in the NCR spreadsheet?	---	Yes		Yes		

Non-Applicable Yes/No Cells Are Left Blank

COD Data Validation Checklist

		Method: Chemical Oxygen Demand EPA 410.4			
LIMS Run #(s)	**Analysis Date**	**Analyst / Data Interpreter**	**Independent Reviewer**	**Date of Review**	**Approved? (Yes or No)**
196967, 197021	11/3,5/2021	RLB			

Instructions: Complete one checklist per *analytical run* . Enter the appropriate response for each question.
Each "No" response requires an explanation in the Comments section, and may require the initiation of a Nonconformance Report.

Requirement:	**Acceptance Criteria**	**Analyst Review**		**Independent Review**		**Comments:**
		Yes	No	Yes	No	(indicate reference to an attachment if necessary)
1. Does a digestion sheet accompany the data package?	---	Yes				
2. Does the digestion sheet include all reagent and standard prep log numbers?	---	Yes				
3. Was a passing calibration test applied to sample analysis?	≥0.995	Yes				
4. Was a passing ICV analyzed immediately after the calibration?	90-110%	Yes				
5. Was a passing ICB analyzed immediately after the ICV?	< |LOD| or client/project specific	Yes				
6. Were CCVs and CCB analyzed at the required frequency?	1 per 10 samples	Yes				
7. Did analyzed CCVs meet the required acceptance criteria?	90-110%	Yes				
8. Did analyzed CCBs meet the acceptance criteria?	< |LOD| or client/project specific	Yes				
9. Was a Method Blank prepared at the required frequency?	1per 20 samples or at contract/program specific frequencies	Yes				
10. Was the method blank within acceptance criteria?	< |LOD| or client/project specific	Yes				
11. Was an LCS prepared at the required frequency?	1per 20 samples or at contract/program specific frequencies	Yes				
12. Did the LCS meet the acceptance criteria?	90-110% or Within in-house or contract/program specific limits	Yes				
13. Was an MS and MSD prepared at the required frequency?	1per 10 per batch or at contract/program specific frequencies	Yes				
14. Did the MS/ MSD's meet the acceptance criteria?	90-110% or Within in-house or contract/program specific limits		No			M flagged affected sample.

15. Did the MS/MSD's meet the RPD criteria?	Within in-house or contract/program specific limits	Yes				
16. Was a Duplicate prepared at the required frequency?	1per 10 per batch or at contract/program specific frequencies	NA				
17. Did the Duplicate meet the RPD criteria?	Within in-house or contract/program specific limits	NA				
18. Were the samples digested within hold time?	28 days	Yes				
19. Was the max temperature(s) for reactor(s) documented?	---	Yes				
20. Was the method specifed temperature reached?		Yes				
21. Were reagents/standards used before expiration date?	---	Yes				
22. Are all samples on the job lists accounted for?	---	Yes

Requirement	**Acceptance Criteria**	**Analyst Review**		**Independent Review**		**Comments**
		Yes	No	Yes	No	(Indicate reference to an attachment if necessary)
1. Were the samples preserved prior to analysis and analyzed within hold time?	pH <2, 28 days or program/project specific	Yes		Yes		
2. Was the calibration curve performed using the required number of standards?	3 standards and a blank	Yes		Yes		
3. Was the correlation coefficient acceptable?	r ≥ .995	Yes		Yes		
4. Were the ICV and ICB analyzed?	---	Yes		Yes		
5. Was the ICV result acceptable?	90 – 110 % Rec. or contract/program specific	Yes		Yes		
6. Was the ICB result acceptable?	< LOD or contract/program specific	Yes		Yes		
7. Was an LCS & MB run with each batch of samples?	One each per analytical batch or contract/program specific frequency.	Yes		Yes		
8. Was the LCS recovery acceptable?	In-house derived or contract/program specific limits.	Yes		Yes		
9. Were the MB results acceptable?	< LOD or project/ program specific (<1/2 RL for DOD-QSM).	Yes		Yes		
10. Were the CCV's analyzed at the required frequency?	Beginning, after every 10 sample, & at the end of a sequence.	Yes		Yes		
11. Were the CCB's analyzed at the required frequency?	After each CCV (unless MB analyzed after CCV)	Yes		Yes		
12. Were the CCV recoveries acceptable?	90 – 110 % Rec. or project/ program specific	Yes		Yes		
13. Were the CCB results acceptable?	< LOD or project/ program specific	Yes		Yes		

14. Were all positive results that were reported within the calibration curve?	---	Yes		Yes		
15. Was an MS and MSD analyzed at the required frequency?	1 / 20 of the same matrix or project/ program specific	Yes		Yes		
16. Were the MS and MSD recoveries acceptable?	In-house derived or project/ program specific limits	Yes		Yes		
17. Was the RPD between the MS and MSD acceptable?	In-house derived or project/ program specific limits	Yes		Yes		
18. Was a Duplicate analyzed at the required frequency?	1 per 20 of the same matrix or contract/program specific	Yes		Yes		
19. Was the RPD between the Duplicate (if valid) and the sample acceptable?	In-house derived or project/ program specific limits (QSM samples, duplicate only valid when sample result ≥5x the LOQ)	Yes		Yes		
20. Are all samples on the job lists accounted for?	---	Yes		Yes		
21. Is the standards prep log numbers noted on the analytical report?	---	Yes		Yes		
22. Were post analysis corrections addressed and/or the Audit Trail function turned on (if available)?	Correction should be initialed, dated, and reason given. Audit trail must be on (if available)	Yes		Yes		
23. Were non-matrix related nonconformities (if applicable) documented in the NCR spreadsheet?	---	Yes		Yes

Qualifier	Qualifier Description
F1	MS and/or MSD recovery exceeds control limits.

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
¤	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CFU	Colony Forming Unit
CNF	Contains No Free Liquid
DER	Duplicate Error Ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL	Detection Limit (DoD/DOE)
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision Level Concentration (Radiochemistry)
EDL	Estimated Detection Limit (Dioxin)
LOD	Limit of Detection (DoD/DOE)
LOQ	Limit of Quantitation (DoD/DOE)
MCL	EPA recommended "Maximum Contaminant Level"
MDA	Minimum Detectable Activity (Radiochemistry)
MDC	Minimum Detectable Concentration (Radiochemistry)
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
MPN	Most Probable Number
MQL	Method Quantitation Limit
NC	Not Calculated
ND	Not Detected at the reporting limit (or MDL or EDL if shown)
NEG	Negative / Absent
POS	Positive / Present
PQL	Practical Quantitation Limit
PRES	Presumptive
QC	Quality Control
RER	Relative Error Ratio (Radiochemistry)
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)
TNTC	Too Numerous To Count

Comments
No additional comments.

Receipt
The samples were received on 10/29/2021 9:15 AM. Unless otherwise noted below, the samples arrived in good condition, and where required, properly preserved and on ice. The temperature of the cooler at receipt was 1.8º C.

HPLC/IC
Method 300.0: The matrix spike (MS) recoveries for Chlorate in analytical batch 810-6747 were outside control limits at 84% (90-110% Limit). Sample matrix interference is suspected because the associated laboratory control sample (LCS) recovery was within acceptance limits.

Method 300.0: The matrix spike duplicate (MSD) recoveries for Chlorate in analytical batch 810-6747 were outside control limits at 83% (90-110% Limit). Sample matrix interference is suspected because the associated laboratory control sample (LCS) recovery was within acceptance limits.

Method 300.0: The matrix spike (MS) recoveries for Chlorate in analytical batch 810-6747 were outside control limits at 82% (90-110% Limit). Sample matrix interference is suspected because the associated laboratory control sample (LCS) recovery was within acceptance limits.

Method 300.0: The matrix spike duplicate (MSD) recoveries for Chlorate in analytical batch 810-6747 were outside control limits at 82% (90-110% Limit). Sample matrix interference is suspected because the associated laboratory control sample (LCS) recovery was within acceptance limits.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

Detection Summary

Client: CT Laboratories
Job ID: 810-6301-1
Project/Site: Chlorite, Chlorate

Client Sample ID: 1066840 54MW13 — Lab Sample ID: 810-6301-1

No Detections.

Client Sample ID: 1066845 54MW10 — Lab Sample ID: 810-6301-2

No Detections.

Client Sample ID: 106846 54TW10 — Lab Sample ID: 810-6301-3

No Detections.

Client Sample ID: 1066847 54MW12 — Lab Sample ID: 810-6301-4

No Detections.

Client Sample ID: 1066848 54MW1 — Lab Sample ID: 810-6301-5

No Detections.

This Detection Summary does not include radiochemical test results.

Question	Answer	Comment
The cooler's custody seal, if present, is intact.	True	
Sample custody seals, if present, are intact.	True	
Samples were received on ice.	True	
Cooler Temperature is acceptable.	True	
Cooler Temperature is recorded.	True	
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	True	
There are no discrepancies between the containers received and the COC.	True	
Samples are received within Holding Time (excluding tests with immediate HTs)	True	
Sample containers have legible labels.	True	
Containers are not broken or leaking.	True	
Sample collection date/times are provided.	True	
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True	
Containers requiring zero headspace have no headspace or bubble is <6mm (1/4").	True	
Samples do not require splitting or compositing.	True	
Container provided by EEA	True

ANALYTICAL SUMMARY REPORT

This report at a minimum contains the following information:

Analytical Report of Test Results
Description of QC Qualifiers
Chain of Custody (copy)
Quality Control Summary (if applicable)
Case Narrative (if applicable)
Correspondence with Client (if applicable)

This report has been specifically prepared to satisfy project or program requirements. These results are in compliance with NELAC requirements for parameters where accreditation is required or available, unless otherwise noted in the case narrative.

Unless specifically stated to the contrary, soil/sediment/sludge sample results reported on a Dry Weight Basis

Unless specifically stated to the contrary, soil/sediment/sludge sample results reported on a Dry Weight Basis

Notes:

^ Indicates the laboratory is NELAP accredited for this analyte by the indicated matrix and method . DL (detection limit), LOD (limit of detection), loq (limit of quantitation) as defined by most recent DOD QSM version.

All samples were received intact and properly preserved unless otherwise noted . The results reported relate only to the samples tested. This report shall not be reproduced, except in full, without written approval of this laboratory. The Chain of Custody is attached.

This report has been specifically prepared to satisfy project or program requirements. These results are in compliance with NELAC requirements for the parameters where accreditation is required or available, unless noted in the case narrative.

QC Qualifiers

Code	Description
B	Analyte detected in the associated Method Blank.
C	Toxicity present in BOD sample.
D	Diluted Out.
E	Safe, No Total Coliform detected.
F	Unsafe, Total Coliform detected, no E. Coli detected.
G	Unsafe, Total Coliform detected and E. Coli detected.
H	Holding time exceeded.
I	Incubator temperature was outside acceptance limits during test period.
J	Estimated value.
L	Significant peaks were detected outside the chromatographic window.
M	Matrix spike and/or Matrix Spike Duplicate recovery outside acceptance limits.
N	Insufficient BOD oxygen depletion.
O	Complete BOD oxygen depletion.
P	Concentration of analyte differs more than 40% between primary and confirmation analysis.
Q	Laboratory Control Sample outside acceptance limits.
R	See Narrative at end of report.
S	Surrogate standard recovery outside acceptance limits due to apparent matrix effects.
T	Sample received with improper preservation or temperature.
U	Analyte concentration was below detection limit.
V	Raised Quantitation or Reporting Limit due to limited sample amount or dilution for matrix background interference.
W	Sample amount received was below program minimum.
X	Analyte exceeded calibration range.
Y	Replicate/Duplicate precision outside acceptance limits.
Z	Specified calibration criteria was not met.

Preliminary Data

Definitions/Glossary

Client: CT Laboratories
Project/Site: Chlorite, Chlorate

Job ID: 810-6301-1

Qualifiers

HPLC/IC

Qualifier	Qualifier Description
F1	MS and/or MSD recovery exceeds control limits.

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
¤	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CFU	Colony Forming Unit
CNF	Contains No Free Liquid
DER	Duplicate Error Ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL	Detection Limit (DoD/DOE)
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision Level Concentration (Radiochemistry)
EDL	Estimated Detection Limit (Dioxin)
LOD	Limit of Detection (DoD/DOE)
LOQ	Limit of Quantitation (DoD/DOE)
MCL	EPA recommended "Maximum Contaminant Level"
MDA	Minimum Detectable Activity (Radiochemistry)
MDC	Minimum Detectable Concentration (Radiochemistry)
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
MPN	Most Probable Number
MQL	Method Quantitation Limit
NC	Not Calculated
ND	Not Detected at the reporting limit (or MDL or EDL if shown)
NEG	Negative / Absent
POS	Positive / Present
PQL	Practical Quantitation Limit
PRES	Presumptive
QC	Quality Control
RER	Relative Error Ratio (Radiochemistry)
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)
TNTC	Too Numerous To Count

Comments
No additional comments.

Receipt
The samples were received on 10/29/2021 9:15 AM. Unless otherwise noted below, the samples arrived in good condition, and where required, properly preserved and on ice. The temperature of the cooler at receipt was 1.8º C.

HPLC/IC
Method 300.0: The matrix spike (MS) recoveries for Chlorate in analytical batch 810-6747 were outside control limits at 84% (90-110% Limit). Sample matrix interference is suspected because the associated laboratory control sample (LCS) recovery was within acceptance limits.

Method 300.0: The matrix spike duplicate (MSD) recoveries for Chlorate in analytical batch 810-6747 were outside control limits at 83% (90-110% Limit). Sample matrix interference is suspected because the associated laboratory control sample (LCS) recovery was within acceptance limits.

Method 300.0: The matrix spike (MS) recoveries for Chlorate in analytical batch 810-6747 were outside control limits at 82% (90-110% Limit). Sample matrix interference is suspected because the associated laboratory control sample (LCS) recovery was within acceptance limits.

Method 300.0: The matrix spike duplicate (MSD) recoveries for Chlorate in analytical batch 810-6747 were outside control limits at 82% (90-110% Limit). Sample matrix interference is suspected because the associated laboratory control sample (LCS) recovery was within acceptance limits.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

Preliminary Data

Detection Summary

Client: CT Laboratories
Project/Site: Chlorite, Chlorate

Job ID: 810-6301-1

Client Sample ID: 1066840 54MW13 — Lab Sample ID: 810-6301-1

No Detections.

Client Sample ID: 1066845 54MW10 — Lab Sample ID: 810-6301-2

No Detections.

Client Sample ID: 106846 54TW10 — Lab Sample ID: 810-6301-3

No Detections.

Client Sample ID: 1066847 54MW12 — Lab Sample ID: 810-6301-4

No Detections.

Client Sample ID: 1066848 54MW1 — Lab Sample ID: 810-6301-5

No Detections.

Preliminary Data

This Detection Summary does not include radiochemical test results.

The data contained in the following report have been reviewed by the appropriate CT Laboratories' LLC staff members. In addition, CT Laboratories LLC certifies that to the best of our knowledge that the analyses reported herein are true, complete and correct within the limits of the methods employed and that they follow the applicable requirements as specified by the project plan, state-specific, NELAC or DOD QSM requirements. The estimated uncertainty of measurement is only available upon request. The reported results relate only to the tested samples. This report shall not be reproduced, except in full, without written approval of CT Laboratories LLC.

Case Narrative

Client: Weston Solutions
Project: RFAAP SWMUs 49&54, Radford, VA
Sample Receipt Dates: 04/26/2022, 04/28/2022, 04/29/2022, 04/30/2022
SDG #: *169098* (Folder #'s 169098, 169156, 169199, 169227)

Twenty-four water samples were received and analyzed for a variety of parameters, including: VOCs, Dissolved Gases, Metals, pH, COD, Anions, Chlorate/Chlorite, TIC and TOC. Three Trip Blanks were included with the VOCs. The Chlorate/Chlorite analysis was subcontracted to Eurofins Eaton Analytical in South Bend, IN. The assigned sample ID number, date sampled, and date received are indicated in the attached Project Summary. The samples were received intact and at a temperature within method specified acceptance limits. A breakdown of sample receipt information can be found on the Sample Condition Report located in the last section of the data package and any exceptions are noted below. The analyses were performed following DOD QSM 5.4 requirements.

Manual integrations may have been performed on the data provided with this package. If manual integrations were performed, a Reason #(s) was included on the raw data that corresponds to the "Index Key for Manual Integration Rationale." The raw data includes a "Before" and "After" manual integration illustration. The manual integrations were initialed and dated by the analyst, as well as, by the person reviewing the data.

Sample Receipt

Several of the samples that arrived at CT Labs on 04/28/2022 were past the 48-hour hold time for Nitrate upon receipt. The client instructed the lab to proceed with the analysis of these samples.

Sample Analysis and Quality Control

Volatile Analysis:

The samples were analyzed using US EPA Methods 8260C (VOC) and RSK-175 (Dissolved Gases). All samples were analyzed within the holding time. The following summaries of quality control procedures are included:

Surrogate Recovery Data
Matrix Spike/Matrix Spike Duplicate Recovery Data
Laboratory Control Spike Data
Method Blank Data
Initial Calibration Summary
Calibration Check Summary
Analysis Run Log
Prep Log
Chromatograms

All analysis results met the method specified quality control criteria with the following exceptions:

Detailed reports were provided for the 8260 data for all detected compounds, as well as, for those compounds manually integrated (if applicable). Compounds not reported on the form 1's were either not detected or did not meet identification criteria so they were reported as non-detects.

Some samples may have been analyzed and/or reanalyzed diluted to obtain results for all target analytes within the calibration range of the instrument.

VOC (8260C) Water Analysis

Analytical Run # 211603

All analytical results for this run met the method/project specified quality control criteria for the targeted compounds.

Dissolved Gases (RSK-175) Analysis

Analytical Run # 211667 (Methane, Ethene, Ethane)

All analytical results for this run met the method/project specified quality control criteria.

Metals Analysis:

The samples were analyzed using US EPA Methods 6010C (ICP) and 7470A (Hg). All samples were analyzed within the holding time. The following summaries of quality control procedures are included:

Initial and Continuing Calibration Verification
Blanks Summary
ICP Interference Check Data
Spike Sample Recovery
Duplicates Data
Laboratory Control Sample Data
Analysis Run Log

All analysis results met the method specified quality control criteria with the following exceptions:

ICP Metals (6010C) Water Analysis

Continuing Calibration Verification (CCV) standards were analyzed at two levels (CCV1 & CCV2) with potentially differing wavelengths. Data associated with CCV's were evaluated based on the concentration of the element in the samples and compared to the appropriate CCV level/wavelength.

Some samples may have been analyzed and/or reanalyzed diluted to obtain results for all target analytes within the calibration range of the instrument.

Analytical Run # 211581

The Initial Calibration Verification Low-Level (ICVLL) standard had a recovery outside the specified limits for selenium. The samples were reanalyzed using an acceptable ICVLL standard.

The Duplicate (DUP) for sample # 1136212 was not applicable for aluminum, antimony, arsenic, beryllium, cadmium, chromium, cobalt, copper, iron, lead, manganese, nickel, selenium, silver, thallium, vanadium, and zinc because the parent sample results were less than five times the Limit of Quantitation (LOQ). A

Matrix Spike Duplicate (MSD) was analyzed to demonstrate precision and was acceptable. The parent sample was reported and not qualified.

Analytical Run # 211628

Silver was detected in the Method Blank (MB) greater than the Method Detection Limit (MDL) but less than ½ the Reporting Limit (RL). The sample was reanalyzed for silver.

The DUP for sample # 1137439 was not applicable for aluminum, antimony, arsenic, beryllium, cadmium, chromium, cobalt, copper, lead, nickel, selenium, silver, thallium, vanadium, and zinc because the parent sample results were less than five times the LOQ. An MSD was analyzed to demonstrate precision and was unacceptable for aluminum and iron. The parent sample was reported and qualified with a "Y" flag for the failing elements.

The Matrix Spike (MS) and MSD for sample # 1137439 had recoveries outside the specified limits for aluminum and iron. A Serial Dilution (L) was analyzed and was not applicable for aluminum and iron because the parent sample raw results were less than 50 times the LOQ. A Post Digestion Spike (PDS) was analyzed and was acceptable. The parent sample was reported and not qualified.

ICP Sodium & Potassium (6010C) Water Analysis

Analytical Run # 211582

The DUP for sample # 1136212 was not applicable for sodium and potassium because the parent sample results were less than five times the LOQ. An MSD was analyzed to demonstrate precision and was acceptable. The parent sample was reported and not qualified.

Analytical Run # 211629

The DUP for sample # 1137439 was not applicable for sodium and potassium because the parent sample results were less than five times the LOQ. An MSD was analyzed to demonstrate precision and was acceptable. The parent sample was reported and not qualified.

CVAA Mercury (7470A) Water Analysis

Analytical Run # 211699

The DUP for sample # 1136212 was not applicable for mercury because the parent sample result was less than five times the LOQ. An MSD was analyzed to demonstrate precision and was unacceptable. The parent sample was reported and qualified with a "Y" flag for mercury.

The MS and MSD for sample # 1136212 had recoveries outside the specified limits for mercury. The parent sample was reported and qualified with an "M" flag for the failing element.

Inorganic Analysis:

The samples were analyzed using US EPA Methods 9060A (TIC/TOC), 9040C (pH), 410.4 (COD) and 9056A (Anions). All samples were analyzed within the holding time unless noted below. The following summaries of quality control procedures are included:

Duplicate Analysis Data
Laboratory Control Spike Data
Method Blank Data
Initial Calibration Summary
Calibration Check Summary
Analysis Run Log
Prep Log
Some samples may have been analyzed and/or reanalyzed diluted to obtain results for all target analytes within the calibration range of the instrument.

Anions (9056A) Water Analysis

Analytical Run # 211440

The MS and the MSD for sample # 1134804 had a low recovery for sulfate. The parent sample result for this compound was qualified with an "M" flag.

Analytical Run # 211534

Sample #'s 1136203 & 1136204 were received past the 48-hour hold time for the nitrate analyses. The nitrate results for these samples were qualified with an "H" flag.

The MS for sample # 1136203 had a low recovery for sulfate. The parent sample result for this compound was qualified with an "M" flag.

Analytical Run # 211592

The MS and the MSD for sample # 1136674 had a low recovery for sulfate. The parent sample result for this compound was qualified with an "M" flag.

Analytical Run # 211602

All analytical results for this run met the method/project specified quality control criteria.

COD (410.4) Water Analysis

Analytical Run # 211565

All analytical results for this run met the method/project specified quality control criteria.

Analytical Run # 211650

All analytical results for this run met the method/project specified quality control criteria.

pH (9040C) Water Analysis

Analytical Run # 211555

All analytical results for this run met the method/project specified quality control criteria.

Analytical Run # 211639

All analytical results for this run met the method/project specified quality control criteria.

TIC (9060A) Water Analysis

Analytical Run # 211530

All analytical results for this run met the method/project specified quality control criteria.

Analytical Run # 211613

All analytical results for this run met the method/project specified quality control criteria.

TOC (9060A) Water Analysis

Analytical Run # 211696

All analytical results for this run met the method/project specified quality control criteria.

Analytical Run # 211697

All analytical results for this run met the method/project specified quality control criteria.

CT LABORATORIES

Data Qualifiers

Code	Description
A	Analyte averaged calibration criteria within acceptable limits.
B	Analyte detected in associated Method Blank.
C	Toxicity present in BOD sample.
D	Diluted Out.
E	Safe, No Total Coliform detected.
F	Unsafe, Total Coliform detected, no E. Coli detected.
G	Unsafe, Total Coliform detected and E. Coli detected.
H	Holding time exceeded.
J	Estimated value.
L	Significant peaks were detected outside the chromatographic window.
M	Matrix spike and/or Matrix Spike Duplicate recovery outside acceptance limits.
N	Insufficient BOD oxygen depletion.
O	Complete BOD oxygen depletion.
P	Concentration of analyte differs more than 40% between primary and confirmation analysis.
Q	Laboratory Control Sample outside acceptance limits.
R	See Narrative at end of report.
S	Surrogate standard recovery outside acceptance limits due to apparent matrix effects.
T	Sample received with improper preservation or temperature.
U	Analyte concentration was not above the detection level.
V	Raised Quantitation or Reporting Limit due to limited sample amount or dilution for matrix background interference.
W	Sample amount received was below program minimum.
X	Analyte exceeded calibration range.
Y	Replicate/Duplicate precision outside acceptance limits.
Z	Calibration criteria exceeded.

MANUAL INTEGRATION REASON CODES

CTLaboratories has identified four general cases with valid reasons supporting the use of manual integration techniques. These codes are used on chromatograms in this data package to document the reasons for manual integrations per CTLaboratories' SOP SS-10 current revision.

#1: **Data system failed to select the correct peak or missed the peak entirely.**
In some cases the chromatography system selects and integrates the "wrong peak". In this case the analyst must correct the selection and force the system to integrate the proper peak. In other instances the system may miss the peak completely. In this case the analyst manually integrated the peak

#2: **Data System Splits the Peak Incorrectly or Integrates a False Peak as a Rider Peak.**
This phenomenon is common at low concentrations where the signal to noise ratio is low. A single compound (peak) is incorrectly split into multiple peaks or integrated as a main peak with one or more rider peaks resulting in low or high area counts for the target compound.

#3: Improperly Integrated Isomers and/or coeluting compounds.
For when the system fails to distinguish coeluting compounds and or isomers. The integration areas and concentrations may be inaccurate, and they must be corrected by manual integration. Prime examples are compounds that are unresolved and integrated improperly when present at low concentrations in standards or samples.

#4: System Established Incorrect Baseline.
There are numerous situations in chromatography where the system establishes the baseline incorrectly. Some baseline errors will be obvious to the analyst and may be corrected via manual procedures.

#5: Miscellaneous.
Some situations involving integration errors may require in-depth review and technical judgment. These cases should be brought to the attention of the group supervisor. If the form of manual integration is not clearly covered by these four cases, then review and approval by the group supervisor or the *QA/QC* Supervisor will be required.

FVO4-01 Data Review Checklist

FORM #: FVO4-01
Rev. #: 2.2
Effective Date: 08/05/19

INDEPENDENT DATA REVIEW CHECKLIST			Method: GCMS (EPA SW-846 8260C)					
Analysis Date	**LIMS Run #(s):**	**Analyst/Data Interpreter**	**Independent Reviewer**	**Date of Review**	**Approved?**			**Instrument**
					Yes	No		
05/05/2022	211603	DGS	RLD	05/06/2022				VMS3

Instructions: Complete one checklist per *analytical sequence* . Enter the appropriate response for each question. Each "No" response requires an explanation in the Comments section and may require the initiation of a Nonconformance Report.

Requirement	Acceptance Criteria	Analyst Review		Independent Review		Comments
		Yes	No	Yes	No	
I. BFB Tune Check						
Was a BFB tune check analyzed with acceptable results?	Relative abundance criteria met?	Yes		Yes		
II. Initial Calibration Verification (ICV)						
Was initial calibration performed using a minimum of five standard concentration levels (minimum of 6 levels for quadratic curves)?	Lowest standard at or below RL?	Yes		Yes		
Were the Average Relative Response Factors (ARRF) acceptable?	ARRF<or= specified limits (<15%D.)see SOP)	Yes		Yes		
Was a second-source ICV(s) analyzed (for Quadratic Curve)?	Required before sample analyses.	Yes		Yes		
Were all target compound %Deviation or %Drift acceptable?	%D < 20% or project/program specific	Yes		Yes		
Was Initial Calibration Blank (ICB) analyzed?	Required before sample analyses.	Yes		Yes		
Were the ICB results for all target analytes less than the limit of detection (LOD).	<LOD or < project/program specific limits	Yes		Yes		
III. Continuing Calibration Verification (CCV)						
Was an acceptable BFB tune check run at the beginning of every twelve hour shift?	Relative abundance criteria met?	Yes		Yes		
Was a CCV analyzed after every 12 hour tune check?	Required before sample analyses.	Yes		Yes		
Was a second CCV (CCV2) for compounds calibrated using quadratic curves analyzed after every 12 hour tune check?	Required before analyses of WI samples (above the inflection point of the curve).					
Were all target compound %Deviation or %Drift acceptable?	%D < 20% or project/program specific	Yes		Yes		
If necessary, were the results for outlying compounds qualified?						

IV. Blanks						
Was a Method Blank (MB) analyzed prior to analysis of samples?	1 per 20 samples or project/program specific.	Yes		Yes		
Were the MB results for all target analytes less than the limit of detection (LOD)?	*All target analytes <LOD or < project/program specific limits (<1/2 RL for DoD-QSM)	Yes		Yes		
If analytes were detected in the MB with no associated positives in the samples, no further action is needed. If the analyte detects in the MB were greater than the acceptance criteria and there were detects in the samples, was the data qualified.?						
V. Laboratory Control Spike (LCS)						
Was a LCS (and LCSD if needed) analyzed at the required frequency?	1 per 20 samples or project/program specific.	Yes		Yes		
Were the LCS (LCSD) recoveries for all analytes within acceptance criteria?	Default 70-130%, or see internally generated limits, or project/program specified limits.	Yes		Yes		
If applicable, were associated sample detects (and non-detects for low recoveries) qualified?						
Is the relative percent difference (RPD) for each analyte between the LCS and LSCD (if applicable) acceptable?	Default 20%, or see internally generated limits, or client specific limits.					
VI. Matrix Spike/Matrix Spike Duplicate (MS/MSD)						
Was a Martrix Spike (MS) and a Matrix Spike Duplicate (MSD) analyzed at the required frequency?	1 per 20 samples or project/program specific.	Yes		Yes		
Were the MS/MSD recoveries for all analytes within acceptance criteria?	Default 70-130%, or see internally generated limits, or project/program specified limits.	Yes		Yes		
Is the relative percent difference (RPD) for each analyte between the MS and MSD acceptable?	Default 20%, or see internally generated limits, or client specific limits.	Yes		Yes		
VII. Sample Analyses						
Are chromatogram characteristics, including peak shapes and areas, consistent with those of the CCV?		Yes		Yes		
Were surrogate recoveries for all samples and QC within acceptance criteria?	Default 70-130%, or see internally generated program limits, or client specified limits.	Yes		Yes		
If possible, were the affected samples reanalyzed?						
**Were reported sample results with failing surrogate recoveries qualified?						
Were all samples having analytes detected in amounts exceeding the calibration range diluted and reanalyzed? If not qualify (X).	Target upper middle range of calibration curve.					
Did all samples meet hold time and preservation criteria as defined by method/program?	H2O sample: pH < 2 = 14 days, pH >2 = 7 days. Soil samples: 14 days (other criteria may apply)	Yes		Yes		
Were all samples and QC injected within 12 hours of BFB tune check?		Yes		Yes		
Were internal standard recoveries acceptable relevant to associated ICAL?	Response = -50 to +200%; Ret. time = +/- 30 sec.	Yes		Yes		

VIII. Records and Reporting						
Is sequence file / injection log present in the data package?		Yes		Yes		
Were all data, calculations, and values verified in LIMS (including removal of non-detections) upon completion of data capture?		Yes		Yes		
Were manual integrations performed correctly?	Manual integration must be initialed, dated, and reason given, along with before & after chromatograms.	Yes		Yes		
Was the rational for the manual integration verified?		Yes		Yes		
Are reported results whose amounts exceeded the acceptance criteria flagged with an appropriate qualifier and, if needed, were any non-matrix related nonconformities documented in the NCR spreadsheet?		Yes		Yes		

ᵏNon-Applicable Yes/No Cells Are Left Blank*

FVO1-01 Data Review Checklist

	FVO1-01 Method: Dissolved Gases (EPA SW-846 8015 / RSK 175 Modified)					
LIMS Run #(s)	**Analysis Date (s)**	**Analyst / Data Interpreter**	**Independent Reviewer**	**Date of Review**	**Approved? (Yes or No)**	**Instrument**
211667	05/04/2022	DGS	RLD	05/05/2022	Yes	PVOC4

Instructions: Complete one checklist per *analytical sequence*. Enter the appropriate response for each question. Each "No" response requires an explanation in the Comments section, and may require the initiation of a Nonconformance Report.

Requirement	**Acceptance Criteria**	**Analyst Review**		**Independent Review**		**Comments**
1. INITIAL CALIBRATION (ICAL)		**Yes**	**No**	**Yes**	**No**	(Indicate reference to an attachment if necessary)
a. Was the initial calibration performed using a minimum of five concentration levels?	Lowest standard at or below RL	Yes		Yes		
b. For each analyte/component is the variation between calibration response factors for all concentration levels <20% RSD or is $r^2 \geq .99$ or $r \geq .995$ for the regression line?	RSD <20% or $r^2 \geq .99$ or $r \geq .995$ or program/project specific	Yes		Yes		
c. Are the identification and date of the ICAL listed on the printout (or PDF) of the analytical run and in the method file?	ID# and date of ICAL listed	Yes		Yes		
d. Was an Initial Calibration Verification (ICV) analyzed after the ICAL?	Analyzed prior to sample analyses	Yes		Yes		
e. Were the recoveries for each analyte in the ICV within required limits?	Recoveries 85 - 115% or within program/project specific limits	Yes		Yes		
f. Was an Initial Calibration Blank (ICB) analyzed?		Yes		Yes		
g. Were the ICB results for all target analytes/components less than the reporting limit (RL)?	<RL or < program/project specific	Yes		Yes		
2. CONTINUING CALIBRATION VERIFICATION (CCV)						
a . Was a CCV analyzed at the beginning and end of a sequential analysis run, as well as after ever 10 samples?		Yes		Yes		
b. Were the recoveries for each analyte/component in the CCV within acceptance criteria?	Recoveries 85 - 115% or within program/project specific limits	Yes		Yes		
3. METHOD BLANKS (MB)						
a. Was a method blank (MB) analyzed?	1 / 20 or program/project specific	Yes		Yes		
b. Were the MB results for all analytes/components less than reporting limit?	All target analytes/components <RL or within program/project specific limits (DoD-QSM: <1/2 the RL)	Yes		Yes		
4. LABORATORY CONTROL SAMPLE (LCS)						
a. Was a LCS analyzed at the required frequency?	1 / 20 or program/project specific	Yes		Yes		
b. Were LCS recoveries for all analytes within the acceptance criteria?	Default = 70-130%, or within In-house generated or program/project specific limits	Yes		Yes		
c. If LCS recoveries exceed acceptance criteria, was the LCS reanalyzed in an effort to eliminate the possibility of a preparation error?		Yes		Yes		

5. MATRIX SPIKE (MS)/ MATRIX SPIKE DUPLICATES (MSD) and DUPLICATE						
a. Was a MS, MSD, and/or Duplicate (if valid) Vial analyzed with each batch of 20 samples (or program-specified frequency)?	1 / 20 or program/project specific frequency (QSM samples, duplicate only valid if sample result ≥ 5x the LOQ)	Yes		Yes		
b. Were MS/MSD recoveries for all analytes within acceptance criteria?	Default =70-130%, or within In-house generated or program/project specific limits	Yes		Yes		
6. PRECISION						
a. Is the relative percent difference (RPD) for each analyte between duplicate QC samples (i.e. parent sample / Duplicate vial), or for each MS/MSD within the acceptance criteria?	Default = 20 % RPD, or within In-house generated or program/project specific limits	Yes		Yes		
7. SAMPLES (INCLUDING BLANKS, STANDARDS, AND QC SAMPLES)						
a. Are chromatogram characteristics, including peak shapes and areas, consistent with those of the CCV?		Yes		Yes		
b. Were all samples having analytes detected in amounts exceeding the calibration range diluted and reanalyzed or reanalyzed using a smaller sample aliquot? Affected analyte detects should remain above the limit of quantitation (LOQ) after reanalysis.		Yes		Yes		
c. Was the correct ambient temperature recorded on sample spreadsheets?		Yes		Yes		
d. Were all samples adequately preserved and analyzed within holding time?	CO_2 samples received unpreserved (analyze within 7 days or program/project specific) Methane, Ethene, Ethane samples received preserved to <2 (analyze within 14 days or program/project specific)	Yes		Yes		
8. RECORDS AND REPORTING						
a. Is a sequence run file present in the raw data file?		Yes		Yes		
b. Is the data initialed and dated by analyst?	Analysis Run sheet is initialed & dated by the analyst processing the raw data.	Yes		Yes		
c. Do all values, units, etc. listed match the raw data and associated calculations and records?		Yes		Yes		
e. Has the data been electronically transferred to the LIMS and were the applicable qualifiers assigned?		Yes		Yes		
f. Were manual integrations addressed properly and were the audit trails turned on (where applicable)?	Manual integration must be initialed, dated, and reason given, along with before & after chromatograms. Audit trail must be on (if available).	Yes		Yes		
g. Are reported results whose amounts exceeded the acceptance criteria flagged with an appropriate qualifier in LIMS and, if needed, were any non-matrix related nonconformities documented in the NCR spreadsheet?		Yes		Yes		

* Non-Applicable Yes/No Cells Are Left Blank*

CERTIFICATE OF ANALYSIS

Grade of Product: CERTIFIED STANDARD-SPEC

Part Number:	X04HE99C353Q80	Reference Number:	54-401204472-1
Cylinder Number:	P180959	Cylinder Volume:	31.6 CF
Laboratory:	124 - Chicago (SAP) - IL	Cylinder Pressure:	2013 PSIG
Analysis Date:	May 17, 2018	Valve Outlet:	350
Lot Number:	54-401204472-1		

Expiration Date: May 17, 2021

Product composition verified by direct comparison to calibration standards traceable to N.I.S.T. weights and/or N.I.S.T. Gas Mixture reference materials.

ANALYTICAL RESULTS

Component	Req Conc	Actual Concentration (Mole %)	Analytical Uncertainty
ETHANE	200.0 PPM	198.9 PPM	+/- 2%
ETHYLENE	200.0 PPM	198.3 PPM	+/- 2%
METHANE	200.0 PPM	198.3 PPM	+/- 2%
HELIUM	Balance		

Approved for Release
